The special object of the Society beside the personal sanctification of its members is to propagate the Christian faith chiefly by teaching and preaching. Their teaching is restricted mainly to the higher studies, and includes literature, mathematics, science, philosophy, theology, and the cognate branches. Their preaching addresses itself to all classes, but, by predilection, and at stated periods in a Jesuit's life, by express injunction, it concerns itself with catechizing the ignorant, and instructing the inmates of hospitals and penal institutions, while it addresses itself also to more cultured and spiritual audiences. One special and characteristic feature of its ministry is known as the "Spiritual Exercises" or "Retreats" which it may be regarded as having introduced, or revived in the modern church, and are now a universal ascetic practice with the clergy and religious communities as well as with a considerable number of the laity. A "Retreat" is a withdrawal from worldly occupations for a more or less protracted period in order to scrutinize the state of the soul and to take means to amend one's life, or to strive for higher Christian perfection. The method of these "Exercises" is laid down in a small manual written by the founder of the Society. The book itself, which is at first sight fragmentary, and only suggestive in its character, is not easily understood or explained except by those who are trained to interpret it.

The Society was founded by Ignatius Loyola, a Spanish nobleman, who after being disabled in fighting for his country, betook himself to the solitude of a cave near the little town of Manresa, Spain, where he passed some months in prayer and severe bodily austerities. Later, desirous of working more effectively for the salvation of his fellow men, he determined to become a priest, and for that purpose studied in the universities of Alcala and Salamanca, and finally in Paris, where he gathered about him six companions, among whom were Francis Xavier, the future Apostle of Japan, Peter Faber, whom, with Ignatius and Xavier, the Church was to honor subsequently as a saint, and also Salmeron and Laynez, who were conspicuous luminaries at the Council of Trent which was then about to be convened against the doctrines of Luther, Calvin, and others who had just then arisen.

On 15 Aug. 1534 these seven men organized themselves into a society, and pronounced their vows in the crypt of a little chapel in what is now Rue Antoinette, a short distance below the crest of the hill of Montmartre in Paris. It was only six years afterward that Pope Paul III. gave them and the others who had joined them meantime his solemn approval.

The peculiarities of their organization were the occasion of much antagonism at the very outset on the part of some of the most eminent men of the Catholic Church. The Inquisition strongly suspected its purposes and doctrines. The name of the "Society of Jesus" was objectionable to Pope Sixtus V. Unlike other orders they were to be dispensed from reciting the divine office in common, and were to wear no distinctive habit. The length of probation and the general structure of the Society were unusual. The members were first the professed who were relatively few. In them the governing power resided, and they were distinguished by a special vow of obedience to the pope. Then came the spiritual coadjutors, or priests, who did not take the special vow of obedience to the pope. Preparing for either category were the students or scholastics, and lastly there were lay brothers who were to devote themselves to domestic duties. Those who applied for admission were to pass two years of noviceship, and not one as in other religious orders, and were then admitted to what are called simple vows which could be easily dispensed with by proper authority if the subject were subsequently found unfit. Following the noviceship, two years were given to a review of the classical studies; then came three years of philosophy, mathematics, and the physical sciences; five years of college teaching and four years of theology, to end only with another year of seclusion and prayer, after which the candidate was permitted to take the solemn vows which bound him irrevocably to the order as a spiritual coadjutor or professed. The probation of the lay brothers was protracted to ten years. The Jesuit renounces by vow all ecclesiastical dignities, and accepts them only in unusual circumstances and by express command of the pope, under pain of sin in case of refusal. As the establishment of the Society of Jesus coincided with the Protestant Reformation the efforts of the first Jesuits were naturally directed to combat that movement. Under the guidance of Canisius so much success attended their work in Germany and other northern nations, that, according to Macaulay, Protestantism was effectually checked. In England where Elizabeth had inaugurated a movement against her Catholic subjects, and previous to that under Henry VIII. the Jesuits stopped at no danger to go to the rescue of their brethren in the faith; and what they did there was repeated in other parts of the world. "In spite of oceans and deserts, of hunger and pestilence, of spies and penal laws, of dungeons and racks, of gibbets and quartering blocks, the Jesuits were to be found under every disguise, in every country; scholars, physicians, merchants, servingmen, in the hostile court of Sweden, in the old manor houses of Cheshire, among the hovels of Connaught arguing, instructing, consoling, animating the courage of the timid, holding up the crucifix before the eyes of the dying."

Such is the testimony of Macaulay, a Protestant historian. Though many died as martyrs on the scaffolds and in the prisons of England and elsewhere, yet their skill in evading detection as well as their courage in living in the midst of their enemies and their great success in winning converts well explain the hatred with which they were regarded in Protestant countries from the very beginning, while it gives us

the historical origin of the tradition of cunning and deceit which has always been associated with the name of Jesuit.

Under James I. they were accused of complicity in an alleged attempt to blow up both houses of Parliament, and though clearly proven to be innocent of the charge, Father Garnet, who was said to have been cognizant of the plot, was executed, and the accusation is still believed. Guy Fawkes' Day commemorates the event and perpetuates the calumny. It is probably in connection with this occurrence that the supposed Jesuit doctrine of "the end justifying the means" was first accredited to them and the accusation made that "it was their office," as Macaulay assures his readers, "to plot against the thrones and lives of apostate kings, to spread evil rumors, to raise tumults, to inflame civil wars and to arm the hands of the assassin." The first one who is accused of formulating the doctrine of the end justifying the means is Father Wagemann of Innsbruck 1762. Even the murders of Henry III. and Henry IV. of France were ascribed to them, and under Charles II. of England six Jesuits were accused by Titus Oates of conspiracy and put to death. These and other charges have been repeatedly disproved, yet writers of romance, and even writers of history, never fail to find readers credulous enough to accept them as true.

While the Jesuits were propagating the faith in Europe they were sending missionaries to every part of the world to preach the Gospel to heathen nations. Greatest of all these apostles was St. Frances Xavier whom all Protestant writers unite in glorifying and whom the pagans almost worshipped as a deity. His name is still mentioned with enthusiasm among the pagans in Japan and the Occident. The conversions which he effected and the miracles he wrought almost defy belief. It is a testimony to the solidity of his teaching that although Catholicity was apparently obliterated in Japan by a series of bloody persecutions, the French missionaries who entered the country in 1860 found 30,000 Japanese Christians there. In spite of the absence of priests, the doctrines and practices received from Francis Xavier which meant death to profess openly had been handed down from father to son for a period of nearly 300 years. One blot on the reputation of the Society in this field was the shameful apostasy of one of their superiors; but he atoned for his sin by a subsequent martyrdom.

In America the French Jesuits undertook the task of evangelizing the Indians, and at one time had 3,000 civilized and christianized Hurons under their control. In what is now New York, Father Jogues was cruelly tortured and slain on the banks of the Mohawk in 1646. In 1649 Garnier, Daniel and others were shot to death; and at the same time De Brébeuf and Lallemant were burned at the stake while their flesh was slashed with knives and their hearts cut out and eaten by the Indians of Lake Superior. Others died from want and exposure. It was Jogues who discovered Lake George to which he gave the name of Lac du St. Sacrement. Later on Le Moyne came upon the salt springs near Syracuse. Marquette discovered the Mississippi which he named the River of the Immaculate Conception. He explored it as far as the mouth of the Arkansas, and returning home was the first white man with his companions to travel over the territory of what is now the city of Chicago. Wisconsin has erected a statue to his honor. Other Jesuits reached the Pacific coast and established the missions of California which they handed over to the famous Franciscan Junipero Serra when the Society was suppressed. English Jesuits had come over with Lord Baltimore; and before that five Spanish members of the order had been slain by the Indians on the banks of the Rappahannock. The "Relations" of the French Missions have been recently published by an American publishing house and form 72 volumes of missionary and scientific information which the 'Atlantic Monthly' considers the most precious material that could be desired for the history of this country. Similar records have been kept by the Jesuits of other nationalities. Marquette's diary and maps of the discovery of the Mississippi decided the controversy between France and England about the possessions of the western territory.

The missions of South America conducted by the Spanish and Portuguese Jesuits were remarkable in their character and extent. Father Anchieta, a native of Brazil, was particularly distinguished for his missionary success as well as his gift of miraculous powers. Peter Claver devoted himself to the thousands of negro slaves who were brought to the port of Cartagena. Other Jesuits traveled through Chile and Peru. Seventy of them on their way thither were said to be killed by Calvinists who intercepted them at sea. But their most famous work was what are known as the 'Reductions' or Christian Commonwealths of Paraguay. The description of these missions forms one of the most brilliant chapters of Chateaubriand's 'Génie du Christianisme;' but a recent work entitled 'A Vanished Arcadia' by Cunningham-Graham gives a more reliable and scholarly account of what was accomplished there. Voltaire says: 'When in 1768 the missions of Paraguay left the hands of the Jesuits, they had arrived at perhaps the highest degree of civilization to which it is possible to conduct a young people."

"For nearly two hundred years they controlled a district as large as France," writes Cunningham-Graham, "where they had established 32 towns in which there were 160,000 Indians whom they had converted and civilized, teaching them agriculture, the mechanical arts, commerce, and even forming among them a small army of defense. The annual income of the country was about 1,000,000 reales. The missionaries were finally expelled by Charles III. and the country fell back into its primitive condition of a tangled wilderness."

The reasons of their expulsions were first the jealousy of the Spaniards at being excluded from the territory, secondly the anger of the colonists at being prevented from enslaving the Indians, and thirdly the ungrounded suspicion that there were gold mines in the missions. An impression in the royal mind that the Jesuits had reflected on the circumstances of his birth made him an easy instrument in the hands of the enemies of the Society. "Curious as it may appear," writes Cunningham-Graham, "the bitterest opponents of the Jesuits were Catholics, and Protestants have often been their apologists. Buffon, Raynal, and Montesquieu with Voltaire, Robertson, and Southey have written favorably of the internal gov-

ernment of the mission and the effect it produced. When the Spanish general was sent to dispossess them, he set about it with more preparation than Cortes or Pizarro made for the conquest of Mexico or Peru. But there was no resistance, and all the wealth the fathers had was the poor clothes on their backs." The destruction of these missions was probably a part of the prearranged plan for the annihilation of the whole Society.

The missions of Japan which Francis Xavier had inaugurated continued after his death in spite of the fierce persecutions in which many Jesuits perished. He had been unable to reach China and died on a lonely island off the coast. Ricci, Verbiest, Schall and others carried out his project and became the advisers of the emperor as well as his astronomers, mathematicians and mechanicians. The great bronze astronomical instruments carried off by Germany on the occasion of the recent invasion of that country by the allied powers of Europe were the work of the Jesuits of the 17th century. As soon as the mission was started, great numbers of Jesuits came from Europe, half of them generally dying on the passage. In 1661 they possessed 151 churches and 38 residences there, and had written as many as 131 works on religion, 103 on mathematics, and 55 on physical and moral sciences.

Numberless other missions were established elsewhere; de Nobili for instance lived like a Brahman in India to reach that particular caste, and was almost suspected of apostasy for doing so. He is said to have made 100,000 converts. Jesuits overran the whole Indian peninsula and crossed the Himalayas into Tibet. Africa had long before been penetrated, and one of the first members of the Society was Patriarch of Ethiopia. The present explorers of the Dark Continent find remnants of former missions far in the interior. They had gone from Mexico to the Philippines in the earliest days; they had entered Tartary and Lebanon, and when their own efforts were thwarted they induced others to take their places. Thus De Rhodes, a Jesuit expelled from Japan, founded the Société des Missions Etrangères, a body of secular priests who have given a great number of saints and martyrs to the Catholic Church.

While the Jesuits were engaged in missionary work among the uncivilized peoples of the world they erected splendid churches all over Europe, and furnished such orators to the pulpit as Bourdaloue in France, Vieyra in Portugal, and Segneri in Italy. The 'Book of Spiritual Exercises," according to St. Francis de Sales, "has converted as many souls as it has letters." But their apostolic work was not restricted to preaching, and we hear of a single French Jesuit who during his 40 years of ministry had established as many as 146 hospitals for the poor. They founded orphan and Magdalen asylums. They were the confessors of kings and princes and delegates of the Holy See, but they extricated themselves from these honorable charges as soon as it was possible to do so. At the time of the suppression they controlled and directed the majority of the ecclesiastical seminaries of Europe.

The success of the Society in the work of education forms a great chapter in its history. Their method is found in what is known as the 'Ratio Studiorum' or Plan of Studies. It is a complete system of pedagogy and covers the whole field from the lowest class of grammar up to philosophy and theology. The plan was first conceived by Ignatius himself, and subsequently elaborated by one of his successors, Claudius Aquaviva. Compayré, one of the chief pedagogists of the present time, denounces it as a mere system of memorizing. Bacon says of it: "never has anything more perfect been invented." Their colleges at one time covered all Europe, and in the single school of Louis le Grand they had as many as 3,000 students. Kings assisted at its public academic exercises. Among their scholars they can claim some of the greatest men of modern times, as for instance Popes Gregory XIII., Benedict XIV., Pius VII., St. Francis de Sales, Bossuet, Fleury, Flechier, Montesquieu, Malesherbes, Tasso, Galileo, Corneille, Descartes, Molière, Mezzofanti, Muratori, Buffon, Gresset, Canova, Tilly, Wallenstein, Condé, the emperors Maximilian, Ferdinand and others. Even Voltaire was one of their pupils. The disturbed conditions of modern times prevent a similar brilliant showing, but many of the most distinguished Catholic churchmen of to-day have studied in their schools, and notably Leo XIII. who was trained by them from his college classes to the end of his theological course.

Within their own ranks they have furnished great scholars in all branches of philosophy, theology, history, philology, literature, and science. It is sufficient to name such men as Suarez, De Lugo, Bellarmine, Toletus, Lessius, á Lapide, and to note that the treatises of Jesuit writers form the text-books in all the theological seminaries of the Catholic Church to-day. They have written in almost every language and on every conceivable subject, and the mere catalogue of their writers, though not yet complete, already fills more than seven large quarto volumes. Their missionary enterprises were never disjoined from scientific investigation.

Their history is marked by ceaseless activity in launching new schemes for the spread of the Catholic faith, and by absolute fearlessness in opposing error regardless of any consequences to themselves. These two characteristics may explain why even by some Catholics they are regarded as a disturbing element in the church. One of their most noted disputes with churchmen was with the Dominicans on grace, during which the Jesuit doctrine of grace was formulated. The contest lasted for nine years, and although great theological learning was adduced on both sides a truce was imposed by the Pope without any decision being arrived at. Of far greater consequence was their war with the Jansenists. It was chiefly on this occasion that the Society was accused of laxity in their moral code and that their great antagonist Pascal won fame by his 'Lettres Provinciales,' which like the famous 'Monita Secreta' of former times purported to be the private instruction of superiors to members of the order. After this contest their expulsion from France was an easy task, as the Jansenists wielded great political influence and were backed by the irreligious element which was growing rapidly there.

They have been expelled over and over again from almost every Catholic country in Europe, always, however, coming back again to

renew their work when the storm had subsided; and this fact has been adduced as a proof that there is something iniquitous in the very nature of the organization. Worse still in 1773 the entire order was suppressed by a brief of Pope Clement XIV. and all their goods confiscated. They then numbered 24,000 members and had establishments in all parts of the world and flourishing missions, all of which were immediately destroyed, but not one Jesuit uttered a word of complaint or protest. What is remarkable is that while Catholic popes expelled them they were protected by the schismatic Catherine of Russia, and the Protestant Frederick of Prussia, the friend of Voltaire. This very protection was urged as a reproach against them and as a proof of their guilt.

With the exception of the disastrous financial speculation of Lavalette, which was the sin of an individual and not imputable to the entire Society, as commercial transactions were absolutely prohibited by the statutes, the Society is proved to be guiltless both in its partial suppressions and in its total abolition. This is clear from the very brief of Clement XIV. which dealt the blow. In that document all the charges are enumerated, but not one is pronounced to be true. The Society was suppressed as a political necessity and for nothing else. The encyclopædists of France regarded it as their most redoubtable opponent and had vowed its destruction. "Destroy the Jesuits," said Voltaire, "and we shall make an end of the beastly Church." In this work the Bourbon kings had to be enlisted. Madame de Pompadour, the king's mistress, whom the Jesuits had refused to absolve, influenced Louis XV.; the Spanish and Portuguese ministers wrought on the fears of their sovereigns by forged documents containing threats and plans of assassination, and when all was ready the monarchs gave the pope a choice of suppression of the Society or schism. The pope yielded, and is said by Pius VI. and Pius VII. to have lost his mind in consequence. The vindication of the Society came immediately. The very pope who suppressed them approved of their corporate existence in Russia. Pius VI. who succeeded him in the following year readmitted them into Italy, and Pius VII. on the fall of Napoleon re-established the Society in all its integrity on 7 Aug. 1814.

Since its rehabilitation the Society has continued to increase in spite of constantly increasing difficulties. In the beginning of 1902 it counted 15,231 members, of whom 6,743 were priests, and 4,542 scholastics in preparation for the priesthood. The general of the Society is Louis Martin, a Spaniard, who was elected in 1893. In the United States they number about 1,800, with colleges and churches in the principal cities and with flourishing missions among the Indians of the Rocky Mountains and Alaska. In Cuba and the Philippines their schools have achieved remarkable success, and the great meteorological observatories of Havana and Manila were established and are at present controlled by them. The chief houses for studies for the American members of the order are at Woodstock, Md., St. Louis, Mo., and Montreal, P. Q.

In some countries of Europe the same hostility still pursues them. In the revolutions of 1830 and 1848 their houses were closed and the members driven out of the country. In the Kulturkampf inaugurated by Bismarck they were the first victims, and all the efforts of the Centre party have hitherto failed to secure their re-entrance into Germany. Similarly they were the first to be struck in the present religious persecution in France. On the other hand they have been the recipients of countless marks of esteem and affection on the part of Leo XIII., and he has placed the stamp of his approval on the Society by adding very many new names to its already long list of canonized saints and martyrs.

T. J. CAMPBELL, S. J.

Jes'up, Morris Ketchum, American banker: b. Westport, Conn., 21 June 1830. He was engaged in banking in New York 1852–84, but retired from business in the latter year. In 1881 he became president of the New York City Mission and Tract Society, for which he subsequently erected the DeWitt Memorial Church in Rivington Street, in memory of Rev. T. DeWitt, his father-in-law. He was made president of the Five Points House of Industry in 1872; was a founder of the Young Men's Christian Association, of which he was president in 1872. He was also elected president of the Metropolitan Museum of Natural History in 1881, and of the New York Chamber of Commerce in 1899. To the Metropolitan Museum of Art he has given a collection of native woods valued at $100,000; to the Woman's Hospital in New York city, $100,000; and to Yale University and Williams College, large sums likewise.

Jesup North Pacific Expedition, The, an American organization for archæological research, supported by Morris K. Jesup (q.v.), and conducted under the auspices and direction of the American Museum of Natural History. The work began in 1897 in British Columbia. In that year Prof. Harlan I. Smith began to dig in the Thompson River district. In successive years he worked a little farther east, and also around Puget Sound, and down the west coast of Washington. Results of these explorations have been compared and conclusions drawn as to the class of people who inhabited these regions in prehistoric times. Very interesting differences were found among them. Some were more highly developed than others. In particular, one small section east of the city of Vancouver was found to reveal traces of a people much more highly developed than any others of the section, and interesting in many ways to the archæologist. Some of the regions explored revealed the remains of coast tribes; others of interior tribes. At some points these characteristics merged, producing a different

type. New discoveries of one season explained things not understood in previous explorations. So to gather up missing links and further elucidate the whole region, especially that interesting little people near Vancouver, it was necessary to take up some new territory and thoroughly explore it. Prof. Smith, therefore, went into the Yakima Valley in northern Washington in 1903. On the map this section does not look far from the Thompson River district in British Columbia. And when one reflects how very similar are the white people now inhabiting the two sections and how near the two districts are, it is interesting to find that the prehistoric peoples inhabiting them differed at least as much as the Spanish and the Germans, according to Prof. Smith's conclusions. Not only their culture, but their skulls were different, as known by the skeletons brought back by the expedition. These ancient tribes seemed to have lived, each in its little nook of coast or river valley, for unnumbered ages, never going to see what was on the other side of the mountain; developing each its own little morsel of civilization in its own little way, its life and culture and development modified by the little corner of the earth's surface in which it sat down, seemingly to stay forever. Sometimes shell heaps are found miles in length, and with tree stumps six feet in diameter standing on nine feet of these layers, of which each is only an inch or two in thickness. It took a good many generations of Indians to pile up those successive layers with the shells from their shell-fish dinners. A stump of Douglas fir, over six feet in diameter, stood on a shell heap eight feet below the surface which contained human remains. The tree indicated an age for the top layers of more than 500 years. The material brought back included carved and sculptured pipes, stone mortars, pestles, and sinkers, bone implements used on spears, deer antlers used as handles, stone adzes differing from those found anywhere else, bone needles, shell ornaments, and the like. The expedition also found many paintings and sculptures on rock walls, which were photographed.

Jesus Christ, the founder of the Christian religion. Four documents dating from the second half of the 1st century, the "Gospels," give some account of the life of Jesus, chiefly confined to his brief public work and death. Beyond what they give little is known as to his history. Some of the most important facts are referred to in other writings of the New Testament, especially in the letters of Paul; secular history contains mere references to him; a number of later writings, the so-called "Apocryphal Gospels," purport to give additional information, but they are fictitious and worthless; and beyond a very few sayings which were probably rightly attributed to Jesus, called "Agrapha," tradition has preserved nothing of value which was not embodied in the Gospels. These narratives vary, but are rarely inconsistent: usually they may best be regarded as complementary, and the picture of the life and work of Jesus which may be drawn from them has been accepted as trustworthy throughout Christendom in all centuries, and while on many points confirmation from other sources cannot be expected, the investigations of impartial scholars have rather confirmed its accuracy than invalidated it.

Birth and Parentage.—According to the Gospels, Jesus was born in the family of a carpenter named Joseph, living in Nazareth (q.v.), a small town in southern Galilee. Descent from the line of kings of Judah which began with David is positively claimed for Joseph, and, as some understand the genealogical tables, for Mary, his wife, as well, but during the centuries of national disaster the descendants of David seem to have sunk into poverty and inconspicuousness. While Nazareth was the family home, the birthplace of Jesus was Bethlehem (q.v.), the village of Judea in which David himself was born, a fact which is explained by mention of a census said to have been made under Roman authority while Quirinius was Roman representative in Judea, and to have required that all citizens should be enrolled at the original home of the family. Though no other record of this enrollment has yet been discovered, late discoveries make the fact seem more plausible than it was formerly regarded by some scholars.

The Gospels represent Jesus as born of a virgin, conception having been due to special divine power. The date of his birth cannot be given with certainty as to day, month or even year. Since it must have somewhat preceded the death of Herod (April 4 B.C.), it probably occurred sometime in the year 5 B.C. (possibly 6). It is reported that Mary, in a village strange to her, and at the time overcrowded with visitors, could find no place to lay her new born babe but in a manger. But at the presentation in the Temple for the offering of the sacrifices which Jewish ritual prescribed after childbirth, the infant was joyously hailed by Simeon and Anna, aged saints profoundly possessed by the common Messianic expectation of the nation at that time, and, as shepherds from not far away had come in the night of his birth in obedience to a vision of angels, so, later, the Magi (q.v.) from afar guided by a star sought the child to offer him obeisance and rich gifts. This visit of the Magi, however, made Herod aware of the birth of a child who might grow up to be a dangerous rival of the dynasty which he hoped to found, and it is handed down to us that unable to trace it he ordered the slaughter of all the infants of the village up to the age of two years. But his parents, divinely warned, had taken the child to a safe refuge in Egypt, where they remained till the death of Herod, presumably only a short time. If they returned in the expectation of bringing him up in the ancient home of his line, they were deterred by fear of Archelaus who had succeeded his father as ruler in Judea, and consequently they turned aside to Nazareth where they were secure under the milder rule of Antipas.

Early Manhood.—Of the life of Jesus up to manhood nothing is known, except the mere mention of his visit to Jerusalem when 12 years old. It can be supposed only that he was subjected to the natural influences of a religious Jewish family of the time, of synagogue and of school, of a village at once quiet and yet close to the thronging traffic on one of the great thoroughfares of that age, and finally of the work of a carpenter, for such he is said to have been, till 30 years of age. It was about this time, possibly in the year 26 (or 27) that John the Baptist (q.v.) began his public career, and at once aroused great religious and patriotic fervor in the nation.

The careers of neither John nor Jesus are intelligible without an understanding of the expectant attitude of the Jewish people in the 1st century. The ancient prophets of the nation had centuries earlier foretold a renaissance of the Hebrew kingdom under a descendant of David, through the generations this hope smouldered in the hearts of the people, only fanned to a brighter flame by blasts of persecution and national disaster, and the whole influence of the sect of the Pharisees (q.v.), popular and powerful out of proportion to their numbers, increased its intensity under Herod and his successors. The people were ready to be fired by the proclamation so strikingly made by the gaunt desert-dweller that the fulfilment of the national hopes and dreams was near: "The kingdom of heaven is at hand." The preaching of John was, however, no less moral and religious than patriotic. His message was "Repent"; let the nation prepare by penitence to meet the king coming in his kingdom. This prophetic voice set the country in a blaze. Throngs gathered to listen to the new preaching and by a striking symbol, a plunge in the rushing Jordan, to pledge themselves to the new movement. After a time Jesus joined the crowds which attended the ministry of John. It is impossible to say what connection may have existed between John and Jesus. Not only were their families related, but there may have been constant intimacy. John, however, based his later testimony as to Jesus, not at all on his own knowledge of him, but entirely on the divine revelation which was his commission. Jesus offered himself for baptism, insisting that the reluctant preacher should perform the rite, and thus pledged himself to the Coming Kingdom. While it is not claimed that the wonders which attended the baptism were known to others than John and Jesus himself, the story of the Gospels is that a heavenly voice asserted the Messiahship of Jesus, and that with the appearance of a dove the Divine Spirit came to him. The conviction of his mission to his nation and the world was no new thought to the carpenter of Nazareth, and it was with this thought in mind that he recognized the significance of the Baptist's public appearance, joined his auditors, and submitted to the ordinance which he administered. Yet it is not surprising, on the other hand, that he felt constrained, when his own conviction was confirmed, to seek the desert of Judea that alone he might adjust himself to the new responsibilities and burdens of the mission which he must undertake. Amid the solitude of the barren rocks and gloomy caves of that desolate region he meditated and struggled. Of this period we know only the striking story, necessarily autobiographic in origin, in which he depicts the struggles which he underwent as due to Satan's influence. Temptations thus forced in upon him to selfish use of his power, to sensational fanaticism and to compromise with evil in order to advance his ends, were successively resisted, and at the end of 40 days he came forth the victor in all these spiritual conflicts, ready to enter actively on his ministry.

The Ministry.—Jesus returned to the Jordan where John was still at work, and aided by his testimony associated with himself a little group who instinctively recognized in him a future leader of the nation. He went from there first to his home district, where he and his companions were guests at a wedding at Cana, a little town which has been hallowed in all the Christian centuries by John's report of the changing of the water into the wine needed for the entertainment of the company in the prolonged merrymaking incident to such an occasion. Then, as it was near the Passover time, Jesus, accompanied by his mother and brothers as well as his few followers, after staying a short time at Capernaum, went on to Jerusalem. How long he remained in or near the capital city must continue a matter of inference from a few doubtful phrases, but it seems most probable that he remained in Judea for some months, perhaps from April to December. The chief events ascribed to this period are the first cleansing of the Temple and the night interview with the influential rabbi, Nicodemus, and while the effect on city or nation was not great, it was presumably at this time that Jesus formed the strong friendships in Judea, to which incidental reference is often made afterward. The closing of this portion of his ministry seems to have been due, on the one side, to the hostile jealousy of the dominant Pharisees which would hinder success in Judea, and, on the other, to the imprisonment of John the Baptist which made it possible for Jesus to work in Galilee without what might have seemed competition, and, indeed, made it advisable for him to take up the work which John had been obliged to drop.

On his return to Galilee Jesus soon recalled his disciples, who, if they had accompanied him throughout his work in Judea, had scattered for a time to their homes, and associated himself with them in a companionship which was thereafter unbroken till his death. He made Capernaum the central point of his ministry, returning thither from each of his repeated tours throughout the many scores of cities and villages which then existed in Galilee. Wherever he went the keynote of his preaching was the same as John's had been, "Repent, for the kingdom of heaven is at hand;" but as time passed his instructions, exhortations and warnings swept throughout the whole scale of human experience and touched every note of religious and moral truth. The keynote of his teaching about God was his love, infinite, untiring, eternal. On the ground of this love he proclaimed pardon to every penitent, even though a harlot or an outlaw. But this certainty and freeness of forgiveness was not allowed to diminish the loftiness and imperativeness of the standard of duty which he held up. Indeed, the high moral tone of his teaching, accompanied as it was by a constant and insistent demand for absolute sincerity, and his disregard for all mere forms, without the spirit in particular, his teaching and practice in reference to fasting, ceremonial purifications and Sabbath keeping, combined to set against him the Pharisees and through their influence the leaders and officials of the nation.

Popularity.—For a long time his popularity was great and throngs gathered to see and hear him, attracted in part by the reports of his miracles. Far and wide the stories were told that diseases yielded to his command, that the fevered, the palsied, the blind, the deaf and dumb, the lepers, the demonized, were restored to soundness, and, later, that on repeated occa-

sions he brought the dead to life. But these great works were distinctly secondary. He was first and foremost the Prophet of Nazareth, the Preacher. As such he spoke with peculiar attractiveness and power. His style was simple and direct, and his discourse was frequently adorned with unequaled parables, illustrations drawn from nature or common life, which, though sometimes veiling the truth from the thoughtless, sometimes added immensely to its clearness and effectiveness. His activity as a preacher at first won him steadily increasing popularity among the people at large, until, about two years after his work began, 5,000 men, whose hunger had been satisfied by his power on the lakeside, determined to make him king. But in this purpose they lacked all real sympathy with the character and aims which Jesus exemplified. The kingdom which centuries before the prophets of the nation had foretold was a kingdom to be sure, but a kingdom which should be based on a right relation of its subjects to God and existing only to serve the divine ends. The Jews as they read these prophecies had seen in them, only something political, worldly and selfish. Now when Jesus in fulfilment of prophecy had come to offer himself to the nation as its promised king, he would be king only as his kingdom might be the expression and instrument of a religious people, deeply, purely, unselfishly religious. So at the very climax of popular favor his clear vision instantly recognized how widely their ideals and purposes differed from his.

The Twelve Apostles.— For some time this condition of affairs had been anticipated, and Jesus had laid his plans and shaped his work accordingly. Since the Jewish people would have no such kingdom as he was about to establish, he had several months previously organized under the name of apostles a group of 12 of his disciples, to whom he would impart himself, and on whom he would so far as possible stamp himself, that they in turn might repeat his activity in their relations to others. Although he retained the name kingdom, what he looked forward to establishing was not a political but a spiritual community or body.

After the choice of the apostles the discourses of Jesus had been largely shaped for their special benefit: after his rejection of the offer of kingship from the unappreciative multitude, who in turn instantly deserted him when they saw that he would refuse to gratify their selfish hopes, his work was mainly for the benefit of the twelve, although he neglected no opportunity which came within his reach of trying to touch the soul of the nation or of individuals. Much of the last year of his life Jesus spent in seclusion. He made a journey, doubtless traveling in leisurely fashion, northwest from Capernaum to Sidon, returning as it appears by a roundabout route through the Decapolis, and another journey northeast to Cæsarea Philippi; some time was spent in Perea to the east of the Jordan; and though he seems more than once to have shown himself conspicuously in Jerusalem or its immediate neighborhood, yet during most of the time which he spent in Judea he secluded himself in an obscure village named Ephraim.

So far as the work of Jesus was concerned, the most significant event of the last year, if not of all the three years of his ministry, was the conversation with the apostles near Cæsarea Philippi as to the opinion of him which generally prevailed and as to their own convictions. While Jesus is reported at least once to have claimed to be the expected Messiah, and while this claim was necessarily implied in much that he had said of himself, and while some of the twelve had very early expressed the opinion that they had found the one of whom Moses and the prophets had spoken, yet this view had never found expression as their matured conviction. Such expression Jesus at last sought. His first question was as to the common sentiment concerning him, and the frank answer was that while he was generally recognized as one far beyond the ordinary, he was not at all recognized as the Promised One. In face of this answer Jesus pressed the further question, "What am I to you?" and the answer of Peter, one speaking for all, was that he was the Christ. This answer assured the ultimate success of his mission, for these followers would win more. But he could not fail at the same time to foresee the irrepressible conflict between himself and the leaders of the nation, and so, relying on their faith in him as the Christ, he immediately began to familiarize them with the fact of his death, though this only confused and offended them, and at the same time to add promises of resurrection which they do not seem to have grasped at all.

The apparent failure of the mission of Jesus which he thus foretold, culminating as it did in his rejection and death, was due alike to what he was, what he taught and what he demanded. He himself was devoted with absolute singlemindedness to his work, sincere, unselfish, loving, beneficent, and pure with such perfect and manifest purity that only a few voices of detraction have ever been out of harmony with the else unanimous recognition and assertion of the sinlessness of his whole life. His teaching, while not in all respects original in matter or form, was in spirit and effectiveness such an advance on the Old Testament which he confirmed or the rabbis with whom he largely agreed that it seemed "a new teaching." He demanded of others the same perfection of sincerity, altruistic self-forgetfulness and supreme devotion to the will of God which he himself practised, and he as sternly denounced hypocrites as he tenderly welcomed penitents. All his teaching came with a unique tone of authority and this was made more significant by the claims which he advanced for himself. He occasionally asserted and constantly implied that he was a special messenger from God and unique representative of him, and from time to time he distinctly claimed divine attributes and powers. Thus he spoke; to confirm this he pointed to his miracles; as such he held himself up as the proper object of supreme and absolutely limitless devotion; the recognition of tl is supremacy he demanded of all and gladly accepted from his disciples, a self-assertion which in view of his sincerity and simplicity of soul is as significant as in view of his transparent honesty coupled with unsurpassed sensitiveness to evils is the absence of ever confessing a fault. Between such a one with such a message and such demands and the rulers of the nation at the time there was necessarily an irreconcilable antagonism which could end in no way but in his death.

The Messiah.— In the spring of the year 29 (possibly 30), after Jesus had been before the public for three years, the task of implanting the spiritual kingdom in the hearts of the select 12 was so far completed that it would be permanent, and at the same time the conflict with the authorities could not wisely be longer postponed. Accordingly Jesus went up to Jerusalem to the Passover with the throngs which assembled at that time from every part of the country. While he gave repeated proofs that in spirit he was walking in the shadow of the cross which he foresaw at the end of the road, yet this journey, unlike those which had preceded it, was intentionally made, by the sending of 70 messengers before him to proclaim his coming, a significant progress through the country. Reaching the neighborhood of Jerusalem, he stopped for the Sabbath at the neighboring village of Bethany, to which he returned each night till the end, and then on the following day he made a somewhat formal entry into the capital city. It needed only that he should mount a riding ass that those who accompanied him should be reminded of an ancient prophecy, and they, with another throng which came out from Jerusalem to meet him, acclaimed him as the promised and coming king, carpeting the road before him with green branches from the trees at the roadside and with their own clothes thrown before him in the zeal of their loyalty. Thus they led him to the Temple, where the procession dispersed. While informal and at first thought only a failure in its lack of definite result, this "triumphal entry" had deep significance as a public claim of his right to rule the nation as God's appointed representative, and he stopped short of assuming this office only because he desired and demanded first the acceptance of him by the nation. During the days that followed he repeated this claim in various ways; again he drove out of the Temple the huckstering crowds so out of harmony with its proper use, and in prolonged controversy with the representatives of all the parties of the time he bore himself as their Master and proved himself such. All this goaded his enemies at last to action, and through the treachery of Judas Iscariot, one of the inner circle of 12 disciples, almost at once an unlooked-for opportunity presented itself to them.

The Last Supper.— On Thursday evening of Passover week, after special precautions to keep secret the place of their assembling, Jesus sat down at a last supper with his apostles to what he knew would be his last interview with them before his death. While the traitor has gone out to secure his arrest, he pours out his soul to the others in words too tender and profound for their comprehension; he warns them that they will speedily desert him to go alone to his fate; he tells them something of the unique significance of his death in language which contains in germ the later doctrines of the Church, on this point; presenting them bread and wine, he instituted the second of the two rites of the universal church and finally commends them and all future believers in him to God in a prayer of incomparable elevation and pathos. He then went out to a resort familiar to him and his friends, an olive grove named Gethsemane in a valley close to the walls of the city. There the horror of the coming hours, not craven fear of death, but distress at the very thought of the tremendous experience which he must undergo in soul, drew from him a thrice repeated prayer of such intensity that the very blood was forced through the pores of the skin, but on the prayer followed serenity of resignation and purpose which continued unruffled to the end. Then he awakened his disciples who to his disappointment had repeatedly been overcome by sleep and so had left him to his spiritual distress without even the sympathy of his friends, and went to meet the force of Roman soldiers and Temple guards which in needless precaution the officials guided by the traitor brought to seize him. He quietly submitted to arrest, and his followers struck but a single blow in his defense and then scattered in the darkness, two of them, however, John and Peter, following at a distance, the latter only to deny later all discipleship and even acquaintance.

Trial for Blasphemy.— While some details of the four accounts of the trials of Jesus are obscure, if not inconsistent, yet their general course may easily be made out. At the house of the high priest Caiaphas, or of the still more nfluential Annas, his father-in-law, and an ex-high priest, there was before daylight an informal session of all the Sanhedrin who could be gathered. Unable to find even perjured testimony which was sufficiently consistent to warrant his condemnation, the high priest as president of the great court of the nation put Jesus under oath, and asked him if he claimed to be the Christ. Firmly and positively Jesus answered that he was, whereupon his enemies without even pretense of investigation declared this claim to be blasphemy for which according to Jewish law he must die. But this verdict would be legal only if rendered in the daytime, and so, having been left during the interval to be the object of mockery by the guards, as soon as the day broke, he was formally arraigned and condemned. As, however, the right to inflict the death penalty had been reserved to himself by the Roman procurator, in order to accomplish their purpose they must secure his condemnation of Jesus in addition to their own, and accordingly the Sanhedrin conduct him to Pilate and demand his execution. But Pilate refused to order his execution without investigation, and when they charged him with instigating sedition against the Roman government, the judge instantly recognized their malicious insincerity and the innocence of the prisoner. In his consequent desire to release him Pilate in turn pronounced him innocent; sent him to Antipas, who only made sport of him and returned him: vainly tried to stir up the populace to demand his release according to the custom that a prisoner should be released at Passover time; ordered him scourged in hope that that cruelty would satisfy his enemies; displayed him bloody from the torturing lash and crowned by the soldiers with thorns in cruel jest, fancying that this sight would surely evoke pity; but finally, terrified at the mutterings of the crowd and fearing lest should he persevere charges might be made to the emperor against himself, Pilate ordered the crucifixion of Jesus.

The Crucifixion.— The execution took place at once, scarcely later than the middle of

the forenoon. Although so far weakened by the sufferings of the night and morning that the sufferer fainted under the cross which, as was customary, was laid on him to bear to the place of execution, he bore himself throughout with majestic patience and dignity. Under the jeers of his triumphant enemies, in sight of his mother and friends, in the unexplained and portentous darkness which beginning at noon lasted for hours, amid the indescribable physical tortures of the cross, he spoke but to pray forgivingly for those who were the agents of his suffering, and to commend his mother to John, her nephew and his most intimate and beloved disciple. At mid afternoon he uttered a cry to God, "Why hast thou forsaken me?" which can be understood only as expressive of intensest soul agony. As if this agony culminated and ended with the cry, he then spoke calmly of his thirst and took the drink which a sympathetic bystander pressed to his lips, then commended his spirit to God, and with a loud shout expired, it would seem with a literally broken or ruptured heart. Although death seldom came so soon to the crucified, yet the fact is undeniable in the case of Jesus, for when somewhat later the criminals who had been crucified with him received a blow intended to hasten their death, the soldiers recognized that he was already dead, and yet one of them thrust a spear deep into his side, apparently touching the heart, and on Pilate's inquiry the officer in charge certified to his death. By leave of the governor two members of the Sanhedrin, who were secretly disciples, took down the body and hurriedly but reverently buried it at the close of day not far from Calvary, where he had been crucified, in a rockhewn tomb, which later was officially sealed.

Of the facts relating to Jesus during the next few weeks, no less than five (if the last verses of Mark are by another hand, then six) separate accounts are preserved, no two precisely agreeing, but, on the other hand no two being mutually contradictory, and one of these accounts, that of Paul, was written within 25 years of the events narrated. It is told that first women going at the dawn of Sunday entered the open tomb but found not the body of Jesus; that later Peter and John also found it empty; that Peter, then ten of the apostles together, and also two other men miles from Jerusalem, as well as Mary Magdalene, saw Jesus that same day in recognizable human form and talked with him; that these appearances and conversations were repeated at different places and in varying circumstances for about six weeks; that on one occasion he was seen by as many as 500 at the same time, some of whom were at first doubtful as to the facts: and that then these manifestations entirely ceased, except for the experience of Paul. It is certain that the disciples in these few weeks had come to be convinced that Jesus had actually been with them and that consequently they passed out of a state of gloom and despair into joyous and unflinching boldness; that the belief in the physical resurrection of Jesus was an essential part of the creed and preaching of the primitive church; and that the first day of the week became the Christian day of worship. No plausible explanation of these facts, of the empty tomb; of the reports and convictions of the disciples; who claimed to have seen and talked with Jesus in human form, especially of the case of Paul; of the revulsion of feeling on their part; of the consequent foundation of the Christian Church, and of the consecration of the first day of the week, has ever been given except that after his death Jesus, in this as in so much else unlike all other men, entered by resurrection and later ascension upon a new course of life and a new course of activity. Without the resurrection as well as the life and death of Jesus historical Christianity could never have come into existence; by it he became the founder of the Church and the dominating personality of the ages.

DAVID FOSTER ESTES,
Professor of New Testament Interpretation, Hamilton Theological Seminary, Colgate University.

Jesus Christ, Logia of, the sayings of Christ, a title given to certain first century papyri, discovered in the course of excavations at Oxyrrhynchus carried on under the direction of Professors Grenfell and Hunt. The first find of these logia was made in 1897, but in 1903 a second collection was discovered. It has been suggested that these may be remains of the so-called Gospel of St. Thomas. Each of the recently unearthed sayings, like those of 1897, is introduced with the sentence 'Jesus saith.' These sayings are for the most part new, though one of them is in part known to have occurred in the Gospel according to the Hebrews. The new sayings are not so well preserved as the 1897 papyrus, in which the deep blackness of the ink was wonderful. In the later discovered papyri the ends of the lines are lost throughout, but there is this advantage: the introduction to the entire collection of sayings, of which both papyri are probably a part, is given, stating that these were the sayings in the logia which Jesus spoke through Thomas and perhaps another disciple.

The first saying is that one of which a part is already known to have occurred in the Gospel according to the Hebrews. It is one of the most remarkable sayings ascribed to Christ. It says: "Let not him that seeketh cease from his search until he find and when he finds he shall wonder; wondering he shall reach the kingdom and when he reaches the kingdom he shall have rest."

The kingdom of heaven is also the subject of the second saying, which is much the longest and most important. The kernel of it is that most remarkable and profoundly mystical saying recorded by St. Luke alone: "The Kingdom

of God is within you,» but the saying in the papyrus appears in quite different surroundings from those attributed to it by St. Luke and extends far into another region. When published the sayings will doubtless be widely discussed by the critics as the logia of 1897 were. They are of enormous interest on account of the variations they disclose from the accepted texts.

One variant which Prof. Hunt quotes as of great value is Luke xi., 52, which reads: «Woe unto you, lawyers; for ye have taken away the key of knowledge, ye entered not in yourselves, and them that were entering in ye hindered.» The papyrus, however, reads: «Ye have hidden the key of knowledge, ye entered not in yourselves and to them that were entering in ye did not open.»

The recently discovered papyrus contains part of the discourse of Christ closely related to certain passages in the Sermon on the Mount in St. Matthew and to the parallels thereof in St. Luke; and secondly, part of the conversation between Christ and his disciples. The latter presents a striking resemblance to the well known story recorded in the Gospel according to the Egyptians and in the uncanonical gospel used side by side with the canonical gospels by the author of the Second Epistle of Clement, which was written about the middle of the second century. It consists of an answer to the question put in the Gospel according to the Egyptians into the mouth of Salome; in the uncanonical gospel quoted by Clement into the mouth of some unnamed person, but by the recently discovered papyrus into the mouth of the disciples. The question, with some variations of form between the three, was: «When will Christ's kingdom be realized?» The answer as recorded in the Gospel according to the Egyptians was: «When ye shall trample on the garment of shame; when the two shall be one and the male as the female neither male nor female.» The papyrus differs somewhat from this, and incidentally shows that the interpretation generally given to «When ye shall trample on the garment of shame» is incorrect. It is usually considered to signify «when ye put off the body; that is, to die.» But the papyrus shows that the real point lies in a mystical allusion to Genesis iii., the phrase meaning, «When ye have returned to the state of innocence which existed before the fall.»

Jesus College, Cambridge, England, founded by Alcock, bishop of Ely, in 1496. It has 16 foundation fellowships, open without restriction to all his majesty's subjects. Five were of the original foundation, and the others have been added by subsequent benefactors. Six of the fellows are required to be in orders. The mastership and one fellowship are in the absolute appointment of the bishop of Ely. To the other fellowships on a vacancy the master and fellows nominate two candidates, one of whom is elected by the bishop. There are numerous scholarships.

Jesus College, Oxford, England, founded by Queen Elizabeth in 1571 on the petition of Dr. Hugh Price, treasurer of St. David's, Wales, who left lands for the maintenance of a principal, eight fellows, and eight scholars. It was increased by different benefactors until it came to consist of a principal, 19 fellows, and 18 scholars; but by the ordinance of the university commissioners the fellowships have been reduced to 13, a half of which as near as may be are to be filled up by natives of Wales, the other to be under no restriction by reason of birth. A fellowship founded by Charles I. for natives of Guernsey and Jersey has been converted into two scholarships for natives of these islands or persons educated at Elizabeth College, Guernsey, or Victoria College, Jersey. This was the first college founded on Protestant principles.

Jesus Island, Canada, an island in the Saint John River not far from where it joins the Saint Lawrence River; area, about 1,200 square miles.

Jet, a mineral, which is found in compact masses so hard and solid as to be susceptible of being turned on a lathe and manufactured into ornamental articles. It has been worked for centuries in Whitby, England. It is found in thin laminations, which subsequently thicken out to 2 or 3 inches in the upper lias strata in that neighborhood; a lower bed, from which the best quality is obtained, has a thickness of 20 feet, and is known as jet rock. Jet is supposed to have been worked in England as far back as the time of the Romans. Jet rosaries and crosses were common in the Abbey of Whitby when it was a resort of pilgrims. The jet manufactures of Whitby fell away about the time of Queen Elizabeth, and were revived in 1800. It is also manufactured at Scarborough, England.

Jetties are dikes at the mouth of a river or across a harbor bar to increase the riverine or tidal current by narrowing the channel, and thus scour out a deeper bed, to accommodate navigation. Single jetties are solely at the mouths of rivers with strong currents, to deflect these to one side of its natural channel, but in most rivers, and in all harbors they are double, forming an entire artificial channel. Briefly, the physical principles are: The power of water to transport solid matter varies as the square of its velocity, so that increasing the strength of current two fifths will about double its sand-carrying capacity; the velocity increases with increase of slope and decrease of friction; the slope is increased by narrowing the channel, since it forces flood waters inside or outside to rise higher at the entrance, and the friction decreases as the width of the channel; and lastly, if a channel of a given depth and width passes a given quantity of water, then a narrower channel involves either a permanently greater height of water if the bed were rigid, or the scouring of the bed to a depth which, multiplied by the new width, will produce an equal cross-section with the old. The increased slope and the correspondent velocity vanish as the water cuts a deeper basin; but the velocity due to lessened friction does not, nor do the deepened channel, the greater discharge through it, and the greater tidal fluctuation due to the larger basin. The channel is scoured along until the deepening sea establishes an equilibrium of action.

The system is not new. A number of important European rivers were jettied even before the middle of the last century, and others not much later. The Danube at Sulina had been deepened to 21 feet, from 8 feet before; and in 1874 Eads found seven German rivers, including the Oder and Vistula, improved so that with

initial channels of 4 to 7 feet, they then had 13 to 23.5. Several of these are still deeper now, the result increasing somewhat for many years under the same conditions. The Neva in Russia has also such works; as also the harbors of Calais and Dunkirk in France. In the United States a very great number have been constructed, both for rivers and harbors; the greatest of all are the jetties at the mouth of the Mississippi, and as the general principles are alike in all, these may be briefly described.

The Mississippi discharges its waters to the Gulf not by one channel, but in the main by three, running through "passes" 12 to 17 miles long from the delta land to the sea, and widely divergent. The largest is the Southwest Pass; next the easternmost, Pass à l'Outre, with two branches. In the middle is the smallest, South Pass, 600 to 800 feet wide, and taking not over a tenth the total discharge, with a shoal at its head only 15 feet deep, and a bar at its mouth only 8 feet; so that, with 30 feet of water through the delta, it was unserviceable for deep-water navigation. Capt. James B. Eads offered to build jetties to deepen the bar at Southwest Pass from its then 13 to 28 feet; but Congress preferred South Pass, as cheaper and simpler, needing work only at the head and foot. Work was begun in June 1875, and within nine months the water was 13 feet on the bar; by 1879 it was 29 feet; it is now over 30.

The west side of the pass had silted up into land 4,000 feet farther out than the east, so that the west side of the two parallel dikes built out to 30 feet depth in the Gulf was about 7,800 feet, while the east was 11,800. First piles were driven in two rows 1,000 feet apart (the piles 12 feet apart) to mark the lines of the projected jetty-walls. Then mattresses were built, of willow branches, or young willows 15 feet long, cut with the leaves on, laid in four courses, each crosswise to the next, and fastened together at top and bottom by pine planking 2½ inches thick, doweled with hickory pins; this compressed the willows to a thickness of about 2 feet, and their brush-ends projected 3 or 4 feet. These mattresses were 100 feet long; for the bottom course they were made 50 feet wide, but steadily narrowed for each of the four courses at first needed to bring them to the surface of the water, the top one being 20 feet wide. Wider ones were used in deep water. These were built on shore, on ways as for launching boats; towed by tugs to the places indicated by the line of piles, and sunk by loading one or two tons of stone on top. Once down, they speedily filled with sediment and became solid. At the sea ends foundations of mattresses 200 to 300 feet broad were laid. For two or three years these stone-laden mattresses gradually sunk in the soft bottom, and new ones were added at the top to bring the surface even. The willows not imbedded in sediment were revetted with stone. Where exposed to storms, they were considerably sloped, and more thoroughly revetted. The sea ends were afterward capped with concrete blocks. The jetties have undergone considerable repairs since then, but have essentially done their work of making the river navigable for large vessels.

One of the difficulties was this: If obstacles were placed in the way of a free flow of water, the river would by so much at least desert this pass and run through the others; so that their heads had to be closed up to a sufficient extent to prevent this. Plans for improving the Southwest Pass in like manner have been prepared by the government engineers, but have not been executed.

At the mouth of the Brazos, west of Galveston, Texas, an ingenious plan was adopted for avoiding interference in the work by flood-tides: A long trestle was built out to deep water above high tide, the mattresses hung under it by ropes, and the stone dropped on them from above to sink them. Instead of being launched from shore and towed, they were carried on a portable railway running on top of the trestle, and let down.

The Columbia River jetty is the most conspicuous example of the single instead of the double dike. It is 42¾ miles in length, the longest in the world. The bar at the mouth of the river, ever shifting and sometimes not over 12 feet deep, had half spoiled this superb river for navigation, and was greatly dreaded. But the river has a mean high-water discharge of 600,000 cubic feet per second, a mean tidal ebb of 1,000,000, with tides of 6.2 feet; and in 1884 a single curved line of brush mattresses with rubble-stone copings was begun, completed in 1894, to turn the current away from spreading itself on both sides and scour out the channel on one. This was finished in 1894; it has formed a permanent channel 30 feet deep, and made the river a highway of the heaviest ocean commerce, with lines to all Pacific lands.

Others are too numerous for more than brief mention. At Yaquina Bay, Oregon, 115 miles south of the Columbia — an estuary 20 miles long discharging into the sea through a narrow, tortuous, shifting channel, and over a sand-bar with 7 feet of water — parallel jetties about half a mile long, one of rubble-stone on a rock bed, one of brush and stone on a sand bed, have doubled the depth of water and made the channel calculable. At Galveston, the single jetty was a relative failure, it needing a double one to converge the tides; and in 1896 the government completed it, with sides of 35,000 and 25,000 feet, costing over $8,000,000, and furnishing 27 feet of water between the island and the mainland. Other notable ones are at the mouth of St. John's River, Florida, beginning at the sides of the river-mouth and converging to 1,000 feet apart at the crest of the bar. Charleston's double one has sides of 15,000 feet each.

Jeune, Lady **Mary Stewart-MacKenzie,** English writer on social topics. She is the wife of Sir Francis Jeune and has long been prominent in efforts to relieve the condition of the poor of London. A volume of essays selected from her contributions to periodicals has been published under the title 'Lesser Questions' (1894).

Jev'ons, William Stanley, English logician and economist: b. Liverpool 1 Sept. 1835; d. Bexhill, near Hastings, 13 Aug. 1882. He was graduated from University College, London. Having obtained an appointment in the Royal Mint, he went to New South Wales in 1854, but afterward returned to England, and in 1866 became professor of logic, philosophy and political economy in Owens College, Manchester, and this post he held until his resignation in 1876 in order to accept the chair of political economy in London University. He retired from this

position in 1880 for the purpose of devoting his whole time to literary pursuits. His writings include: 'Pure Logic' (1864) and 'The Substitution of Similars' (1869), in which he sought to popularize symbolic logic through a modification of Boole's mathematical methods; 'Elementary Lessons in Logic' (1870); 'Theory of Political Economy' (1871); 'The Principles of Science' (1874); 'Money and the Mechanism of Exchange' (1875); 'Primer of Logic' (1876); 'Primer of Political Economy' (1878); 'Studies in Deductive Logic' (1880); and 'The State in Relation to Labour' (1882). Among works published posthumously are: 'Methods of Social Reform' (1883); 'Investigations in Currency and Finance' (1884); and 'Pure Logic' (1890). In a pamphlet on the 'Coal Question,' he presented a mass of evidence to show that England's progress would be checked by want of coal; in his work in political economy he attempted to put the chief definitions in the form of mathematical quantitative formulæ, and in this way did important work in revealing the nature and relations of economic facts; he also developed the theory of marginal utility. His 'Life and Letters' edited by his wife were published in 1886.

Jew, The Wandering, a poetical personage of popular traditions, who owes his existence to a story connected with the well-known scene in the history of Christ's passion. As Jesus was on the way to the place of execution, overcome with the weight of the cross, he wished to rest on a stone before the house of a Jew, whom the story calls Ahasuerus, who drove him away with curses. Jesus calmly replied, "Thou shalt wander on the earth till I return." The astonished Jew did not come to himself till the crowd had passed and the streets were empty. Driven by fear and remorse, he has since wandered, according to the command of the Lord, from place to place, and has never yet been able to find a grave. Shelley, Lewis, Croly, and Mrs. Norton in England, Schubart and Schlegel in Germany, and Sue in France, have turned this legend to account. Goethe has sketched Ahasuerus with great spirit and humor as a philosophic cobbler at Jerusalem who opposes Christ with a cold worldly logic which will not look above the things of earth.

Jew of Malta, The, a tragedy written by Marlowe (q.v.) about 1587, first acted 1592, and first published in 1633, edited by Heywood. Shakespeare was largely indebted to Marlowe's play for his 'Merchant of Venice.'

Jewel-weed, Touch-me-not, or **Snap-weed,** popular names for two plants, *Impatiens aurea* and *I. biflora,* of the natural order Geranaceæ, well known in damp shady places throughout the cooler parts of North America, where they form dense masses. They are characterized by sac-like pendulous yellow or orange, more or less spotted flowers, and by their sensitive seed pods which when mature burst with the slightest touch and throw the seeds to a considerable distance. Hence the second and third names above. The first name is probably a survival of their use as antidotes for so-called Rhus poisoning.

Jewell, joo'ĕl, **Marshall,** American statesman: b. Winchester, N. H., 20 Oct. 1825; d. Hartford, Conn., 10 Feb. 1883. He learned the tanning trade in his father's leather belting business; went West, where he was a telegraph operator for three years, and in 1850 returned and re-entered his father's business. In 1868 he was the unsuccessful Republican candidate for governor of Connecticut, but in 1869 he was elected, and re-elected in 1871. During his administration as governor the present militia system was adopted, and the erection of the new State House begun. In 1873 he was appointed United States minister to Russia, and was recalled to become postmaster-general in President Grant's cabinet in 1874. He resigned in 1876 on account of disagreement with the President's policy in the Whiskey Ring frauds. His work in the Post-office Department was very effective and led to the discovery of the Star Route scandal, and to the introduction of several reforms. In 1880 he was chairman of the Republican National Committee and managed the Garfield campaign.

Jew'elry, ornaments for personal adornment, usually made of gems and precious metals. At some remote period primitive man gradually migrated northward from the tropical belt in which he probably first came into existence, and as he felt the colder temperature inconvenient, especially at night, he found it advisable to invent some sort of covering or clothing, by means of which he could obtain warmth. What the first clothing was it is of course impossible to say, but it may be conjectured to have consisted of belts of grass or leaves knotted together either by their own stocks or by accessory vegetable fibres. When men became hunters, which they did not do until they had progressed far enough to have invented offensive weapons, they no doubt soon used dried skins for clothing. A rough tanning of such skins could have been managed by rubbing them with fat. Then came the difficulty of fastening them. Some savage tribes still wear cloaks which have only a hole cut for the head to go through, and this is likely enough to be a primitive type; then also they might have been tied up with strips of sinew, but at an early stage they were pinned together with a bone or large thorn. Here is the germ of the brooch. Numbers of such pins have been found in all places where the remains of primitive man exist, and they range from the simplest forms to quite ornamental ones. The heads of the carved specimens show a certain amount of progression, and are often decorated with engraved lines, dots, and circles. Ivory, wood, and bone are all commonly used, and in time, as metal workings became known, these carved pins are imitated in bronze or gold. From the Stone Age, through the Bronze Age, up to the Iron Age, in which we are still considered to be, pins and their derivatives, brooches and buckles, have been universally used, and it is an interesting study to endeavor to trace their utilitarian development as well as their artistic and technical beauties. Starting with the earliest metal pins, which are of bronze, it soon appears that the head or thickened end is treated ornamentally, hammered flat, and pierced. Into the pierced hole in the top of pins are often found wire rings coiled several times, or single rings, as in plenty of specimens found in Ireland. In other cases of Roman pins found in Britain, there are chains of which a few links

only are left, and in one case at least a pin the head of which was threaded with a chain of several links, was found among the debris of one of the Swiss lake dwellings. The modern safety-pin is quite the same in all essential points as one which was found by Dr. Schliemann at Mycenæ, and the same form, with the arch more or less specialized in design, has been very largely used North and South, East and West. The Greeks made the arch short, and enlarged and ornamented the nose or hollow for the pin to rest in; the Romans made the arch big, and set it with beads of amber and bronze, and fretted it out in innumerable ways, curves, spirals, and all sorts of twists and turns which the fancy of the artist could devise. The Roman fibulæ are more usually made of bronze or silver, but the Greek are largely of gold, and of exquisite workmanship.

Among the Romans of about the Augustan age, cameos were largely used as pendants; coins also, richly set, were so used. Charlemagne, in the 8th century, wore a splendid reliquary as his necklace, which was sent to him by Haroun-al-Rashid. This was buried with him, and was found on his neck when the body was exhumed in 1169. The use of ornamental monograms in jewelry began during the 14th century. Diamonds used in jewelry before the beginning of the 17th century are always cut, either as "tables" or "roses," the "brilliant" not being then invented, and all colored stones were cut in the rounded form known as "cabochon."

A French jeweler, named Daniel Mignot, during the beginning of the 17th century, is supposed to have first set rows of jewels close together in consecutive order. This notion was, of course, very suitable for working the monograms then so prevalent, and it has been more or less used ever since. From the 16th century pearls were much in fashion, and pendants commonly have single pearls or groups of pearls dependent from them. Toward the end of the 17th century pendants are found made of gold only, but exquisitely pierced, chased, and engraved, and some specimens of Portuguese work are remarkable for delicacy of execution; these are sometimes set with very small diamonds. Sprays of leaves and flowers, and knots of ribbon, during the 17th century, are made in metal, and thickly set with crystals — paste or real jewels — particularly by Venetian, French, and Portuguese, followed at a safe distance by English workmen. The best of these are by Giles Légare, and in the 18th century his follower, Pierre Bourdon.

The jewelers of the beginning of the 18th century did not hesitate to mix gold and silver in their jewelry. Gold was commonly used for the settings of colored stones, and silver for diamonds. Summarized briefly: (1) Savage tribes have used for their ornaments natural objects easily worked. (2) The cultured nations of antiquity have generally made their finest pieces of personal ornament of gold. (3) During the period of the Renaissance gold and silver, colored precious stones, and vitreous enamels were very largely used. (4) During the 19th century the diamond particularly claimed the attention of jewelers. See DIAMOND; GEMS; PEARL, etc.

Jewelry Trade, The. The making of jewelry is one of the oldest trades of which the American historian can find record, for while the manufacture of such articles of adornment occupied a position of little commercial importance until several years after the settlement of this country by the colonists, the fact remains that jewelry was made by the native Indians many years before the first European set foot upon American soil.

Prim and precise as the Puritans are supposed to have been, it is a mistake to imagine that they were too primitive in their opinions to appreciate the advantages of a little jewelry in the adornment of their persons. Both the Dutch and the English brought such ornaments with them to the new world, and one's personal attire was considered incomplete without the buckles, brooches, and rings which were in vogue at that time. As the natural result gold and silver smithing was one of the first industries to be established in the colonies, and every large town had its smiths who produced the most popular articles of jewelry, as well as certain kinds of trinkets for the Indians, medals, snuff-boxes, etc.

One of the most important products of the early silversmith's art was the making of elaborate boxes from rare woods, or sometimes, shell, inlaid with gold or silver. Snuff-boxes were manufactured in this way, while other boxes were made to contain the parchments which conferred the freedom of the city upon distinguished guests. Sometimes these boxes were made entirely of silver and were lined with gold. Occasionally the metal was gold, studded with precious stones. It was such a box as this in which the people of New York presented the "freedom" to Alexander Hamilton, after his elaborate defense of the liberties of the press in New York, in 1784; while similar boxes were later conferred upon Lafayette, Washington, and Scott. The making of such boxes and other ornamental insignia conferred upon distinguished men represents but one of the branches of the art of the smith, for there were so many demands made upon the craft that its ranks were constantly extending. In 1788, when the adoption of the Federal Constitution was celebrated in Philadelphia, there were no less than 35 goldsmiths and jewelers in the procession, while, more than 20 years before, it had been the profuse display of jewelry, silverware, etc., in the homes of the prominent New Yorkers that had incited Townshend to introduce the historic bill known as the "Stamp Act," which was undoubtedly the entering wedge in the struggle which finally separated the colonists and the Crown. At this period in the history of the nation the colonies that could boast of the richest inhabitants, and which could, therefore, afford to spend the greatest amount of money for jewelry and other articles of personal adornment, were South Carolina, Virginia, Maryland, New York, Pennsylvania, and Massachusetts.

When compared to the facilities afforded to jewelers at the present day the tools of the old-time silversmiths were crude enough. The only noticeable difference between them and those used by workers in other metals was in their size, a factor which fitted them for finer work.

The extreme tenuity and the lack of brittleness of gold and silver gave room for the exhibition of great ingenuity on the part of the artist who aspired to forget the ordinary patterns in the creation of more fanciful designs, while the attainment of the polished, or burnished surface, made a more tender treatment imperative. In the beginning of the century the art of frosting gold, like that of satin-finishing silver, was unknown. Gold and silver both came from the workshop with a glittering surface, and such ornamental and decorative work as may then have been attempted, was either crude enameling, applied work, or engraving. Later, of course, came all the new processes by means of which the precious metals have been used conjointly with other metals, or with wood, mother-of-pearl, glass, porcelain, pearls, and gems.

In those days everybody who engaged in the industry of jewelry-making learned his trade so thoroughly and in such an old-fashioned manner that it was impossible to draw the close distinctions between the several different but associated occupations that are so clearly drawn to-day. At that time, to say that a man was a "jeweler" indicated that he was a goldsmith and silversmith, a watchmaker and clockmaker, and a maker of fine mechanical instruments, for each of these branches involved a knowledge of the others. At the same time the trade was thoroughly a mechanical one, and any attempt to realize a higher ideal in the making of jewelry and other ornaments was most unusual. Instead of "wasting his time" over such inventions the artisan devoted all the hours of labor to such work as might be assigned to him, even dividing his time and skill between his own and kindred trades. To a similar degree the seller of such goods was more frequently a workman than a dealer. While a merchant in the strict sense of the word, he was unusually a person who could take his place at the bench if necessity required, and who owed his success as a salesman to his knowledge of the various kinds of metal and fancy work for the adornment of the person. Gradually, as the demand for such goods increased, the more progressive of these merchants began to manufacture the simple articles which they sold, although it was some time before this branch of the industry had extended beyond the making of spoons, forks, rings, and similar small pieces.

From the earliest days in the history of the jewelry trade, Providence, R. I., has been one of the great centres of this industry. It was shortly after the close of the Revolutionary War that Messrs. Sanders & Pitman and Cyril Dodge began to make silverware in that city. As early as 1805 there were no less than four establishments located there. They were operated by Nehemiah Dodge, John C. Jenckes, Ezekiel Burr, and Pitnam & Dorrance, and their product, to make which they employed about 30 men, included silver spoons, gold beads, and the simplest designs in finger rings. A few years later some of these manufacturers began to turn their attention to cheap jewelry in which silver and other alloys were used with a small fraction of gold. These included many small articles like breast-pins, ear-rings, key-rings, sleeve-buttons, etc., as well as some large articles which were plated by the hammering process. The first jewelry establishment at Attleboro, Mass., a town which has continued to hold pre-eminence in the trade, was opened about 1805, while the establishment of the businesses in Newark, N. J., by the firm of Hinsdale & Taylor, dates from about the same time. Philadelphia also became identified with the early jewelry interests. The firm of Bailey & Company, a house which is still conducting business, although under another name, was one of the first manufacturers in that city, and its trade with the west and south soon became so extensive that the concern became known as one of the most prosperous in the business.

Maiden Lane, New York, did not become the centre of the American jewelry trade until about 1830. The steady increase in the demand for jewelry inspired new ideas in manufacture, and, as much of the desire for novelties originated in New York, that city naturally became the market for the introduction of such products. In the New York "Mercantile Register" for 1848–9, one may find the advertisements of the following houses, which were then prominently identified with the manufacture of jewelry, watches, and silverware: Ball, Tompkins & Black (late Marquand & Company), 247 Broadway; Allcock & Allen, 341 Broadway; Gale & Hayden, 116 Fulton street; Tiffany, Young & Ellis, 271 Broadway; Wood & Hughes, 142 Fulton street; Samuel W. Benedict, 5 Wall street; George C. Allen, 51 Wall street; Squire & Brother, 92 Fulton street and 182 Bowery. Some of these houses have since gone out of existence; only one now retains its original name, but three are still conducted under firm names which retain some portion of the early title.

Although great advances have been made in every branch of American art there is no particular in which it is more pronounced than in the metal work which is so conspicuous a part of the art of the gold and silver smiths, and the fact that the American product is now regarded as superior to that of any other country of the world is not only due to our knowledge of the art in itself, but is largely the result of our wider knowledge of the articles into whose manufacture good taste enters. To-day the designers employed by the great gold and silver smiths of America are not only men of refinement and liberal education, but they are so truly artists, in the best sense of the word, that they could, if required, draw or model from life, or paint in oils or water-colors. It is largely due to the efforts of such men that so much advance has been made in the making of ornamental gold and silver ware during the past half century, a progress which is indicated by our exhibitions of such articles as loving-cups, vases, and presentation pieces, among which one may mention the gold medals, valued at $1,000 and $500, which were presented by the State of New York to Dr. E. K. Kane and Commander H. S. Hartstein, the Arctic explorers, in 1858; the silver vase made in honor of William Cullent Bryant, now a part of the exhibit at the Metropolitan Museum of Art, and the several testimonials presented to Cyrus Field, upon the completion of the transatlantic cable, in 1866. Among the other conspicuous specimens of this art are the silver service which was presented to the arbitrators of the Alabama claims, in 1873, the silver centrepiece duplicating the statue, "Liberty Enlightening the World,"

which was presented to August Bartholdi, in 1886; the elaborate testimonial presented to William Ewart Gladstone, in 1877; the Edwin Booth loving-cup, and the many yachting trophies that have been manufactured on the occasion of international and other important regattas.

The discovery of gold in California, in 1848, naturally gave a great impetus to the manufacturing jewelry industry, for it gave assurance of an ample supply of metal needed for all purposes without the cost of importation, and, if, at that time, we were lacking in knowledge as to the various forms in which the art of the smiths had been developed, it needed but such expositions as those at London and Paris to perfect our education in that respect. With such secrets revealed to us, however, it took but a comparatively short time for us to acquire the inventions in machinery and tools necessary to the reduction of the cost of production, and it is largely due to our success along these lines that we have been able to lead the nations of the world in this branch of the fine arts.

The process of electro-metallurgy was introduced about 1860, and since that time all kinds of goods in which plating has been employed have been made by this method, the centres of production being located chiefly throughout Connecticut, although there are other large plants at Newark, N. J., and Providence, R. I. Speaking from a strictly commercial point of view it is almost impossible to overestimate the value of this process, for it has brought within the reach of people of limited means an attractive line of tableware and other articles of utility that are now deemed indispensable in every household. If not as artistic and as highly finished as solid silverware they are extremely serviceable and there can be no question but that the better grades of such goods possess considerable artistic merit. In fact, for a time at least, the silver-plated ware encroached upon the province of solid silver, but during more recent years the low valuation of silver bullion, and the mechanical inventions which have further reduced the cost of production, have tended to reverse the tables.

The production of watches is so closely related to the jewelry trade that some reference must be made to it in any review of that industry. It was but a comparatively short time ago that all watches were imported, whereas, to-day we have progressed so far that it is only some very small watches for ladies' use and some particularly complicated chronographs that are now obtained in Europe. All others are made in this country, the industry being largely centred in New Jersey, Massachusetts, and Illinois. In its consumption of diamonds and other precious stones America will also compare favorably with other nations, New York being the largest market for such gems in the world. Although it was but a few years ago that the art of diamond cutting and polishing was established in the United States, our wise tariff regulations have given such an impetus to this branch of the trade that some of the most expert cutters from Holland have now located in this country.

So far as statistics go we have but little material concerning the early history of the jewelry industry. We know that, in 1812, the value of the Providence product was but $100,000, and that, as late as 1860, the returns from all parts of the country were small as compared to those of the present day. In that year, for example, the jewelers and watchmakers of Philadelphia produced but $691,430 worth; the silverware manufacturers, $516,000 worth, and the makers of watch-cases and chains, $1,714,800. The production of gold chains and jewelry at New York was $2,497,761; of gold watch-cases, $337,690, and of silverware, $1,250,695. In Newark, the total product was $1,341,000, while Providence produced $2,251,382 in jewelry, and $490,000 in silverware. The following census statistics, covering the years from 1880 to 1900, indicate the great advances which have since been made in the trade:

	1880	1890	1900
Establishments	719	783	908
Capital	$11,431,164	$22,246,508	$28,120,939
Employees	12,607	13,880	20,676
Wages	$6,441,188	$8,038,327	$10,746,375
Value of product	$22,201,621	$34,761,458	$46,501,181

Unfortunately, however, such statistics cannot indicate what great things have been accomplished from an artistic standpoint, for the time has now come when the American jeweler, instead of going to Europe for his ideas and models, leads the best European producers in both correctness and originality of designs and workmanship. More than 12 years ago the London "Art Journal" summarized America's progress in this branch of the fine arts, as follows: "Judging by the productions exhibited, one may well be in doubt whether our much-boasted European pre-eminence in these things is to last much longer, and whether, after all, we shall not in the near future be compelled to regard the firms of New York as at least our equals, if not our superiors, in the production of high-class gold and silver work."

These words written in October 1893, were a prophesy which has certainly been realized, as is evidenced by the victories of the American jeweler, both at home and abroad.

Jewett, joo'ĕt, **Milo Parker,** American educator: b. Saint Johnsbury, Vt., 27 April 1808; d. Milwaukee, Wis., 9 June 1882. He was graduated from Dartmouth College in 1828, from the Andover Theological Seminary in 1833, and was professor of rhetoric and political economy in Marietta College (Ohio) in 1833–8. Having become a Baptist, he resigned his professorship, in 1839–55 was principal of the Judson female institute established by him in Marion, Ala., and at the same time edited the 'Alabama Baptist.' He then established a young ladies' seminary at Poughkeepsie, N. Y., assisted Matthew Vassar (q.v.) in founding Vassar College, was its first president in 1862–4, and subsequently was active in educational and religious work at Milwaukee, Wis. Among his writings are a treatise on 'Baptism' (1840), and pamphlets on 'The Relations of Boards of Health and Intemperance' (1874) and 'The Model Academy' (1875).

Jewett, Sarah Orne, American novelist and writer of short stories: b. South Berwick, Maine, 3 Sept. 1849. She was educated at Berwick Academy and became a contributor to the 'Atlantic Monthly' in 1869, in which periodical the larger part of her work has appeared. Her usual theme is the New England character seen

from its most attractive side, its gentler aspects given greater prominence, and its harsher ones not unduly emphasized. Her works include: 'Deephaven' (1877); 'Play Days' (1878); 'Old Friends and New' (1879); 'Country By-Ways' (1881); 'The Mate of the Daylight, and Friends Ashore' (1883); 'A Country Doctor,' a novel (1884); 'A Marsh Island,' a novel (1885); 'A White Heron and Other Stories' (1886); 'The Story of the Normans,' an historical work (1887); 'The King of Folly Island, and Other People' (1888); 'Betty Leicester' (1889); 'Strangers and Wayfarers' (1890); 'A Native of Winby, and Other Tales' (1893); 'The Life of Nancy' (1895); 'The Country of the Pointed Firs' (1896); 'The Queen's Twin and Other Stories' (1899); 'Betty Leicester's Christmas' (1899); etc. Her literary style possesses great charm.

Jew'fish, a huge Californian game-fish (*Stereolepis gigas*) of the sea-bass family (*Serranidæ*). It has a single dorsal fin, the soft part of which is shorter than the spinous portion, and is brown with black blotches and becomes much darker with age. Among the dense growths of kelp in moderately deep water along the coast of southern California the jewfish finds a congenial home. It haunts the neighborhood of islands and is especially abundant about Santa Catalina. Belonging to a family of game-fishes and reaching a weight of 300 to 500 pounds, it has long been a favorite object of sport for ambitious anglers. It is commonly taken on hand-lines baited with small fish, is exceedingly gamy, and brings a good price in the market.

Two other fishes of the same family but more closely related to the groupers are known as the Florida or black jewfish (*Garrupa nigrita*) and the spotted jewfish (*Promicrops guttatus*). The former ranges from Florida to Brazil, and the latter widely through the warm parts of both Atlantic and Pacific oceans. The black jewfish is quite common about the coral reefs, in the caverns of which it lurks. Although not especially gamy, its enormous size and weight, sometimes reaching even 1,000 pounds, have induced a few anglers to essay its capture with rod and reel. It is easily distinguished from the Californian jewfish by its greater robustness, strong canine teeth, and rounded caudal fin. Consult Jordan and Evermann, 'American Food and Game Fishes' (1903); Holder, 'Big Game Fishes of the United States.'

Jewish Calendar. The Jews date their era from the Creation, which according to their tradition was 3760–1 years before the Christian era. The Jewish year is a lunar year and consists of twelve months, with an additional one for leap year. The months have alternately 29 and 30 days, the first and thirtieth days being called New-moon. Each cycle of 19 years has 7 leap years, the 3d, 6th, 8th, 11th, 14th, 17th, and 19th. The spring months are called Nisan (in which the Passover is celebrated), Iyar, Sivan; summer includes Tammuz, Ab, Elul; autumn Tishri, Heshvan, Kislev; and winter Tebeth, Shebat, Adar, with 2d Adar for leap year. The civil year began with the month of Nisan; the religious with Tishri. Rules for the computation of the calendar were issued, after various methods had been employed in earlier centuries, by Hillel II. (330–365). The date usually assigned by Jewish writers to the year when Hillel fixed the calendar is 670 of the Seleucidan era, or 4119 A.M., or 359 of the Christian era.

Jewish Charities. On 26 April 1655, the board of directors of the Dutch West India Company wrote to Governor Stuyvesant as follows: "After many consultations, we have decided and resolved upon a certain petition made by said Portuguese Jews, that they shall have permission to sell and to trade in New Netherland and to live and remain there, provided the poor among them shall not become a burden to the company, or to the community, but be supported by their own nation."

The records of the Department of Charities of the city of New York on 31 Dec. 1902 show that in a Jewish population approximating 600,000 in Greater New York, in the almshouse on Blackwell's Island there were 17 pauper Jews, of whom the majority were blind, idiotic or possessed of some peculiar defect which prevented admission to existing Jewish charitable institutions. These figures indicate how thoroughly the Jews of New York have assumed the responsibility imposed upon them over 250 years ago. The same is true of Jews throughout the United States. In our modern day, under more favorable conditions and auspices, the Jew has, to some extent, become non-sectarian in his philanthropies. Hospitals, as a rule, supported and endowed by Jews, throw open their doors to sufferers irrespective of creed, color or nationality. Other instances could be cited of charities not medical, organized along similar lines. The free employment bureau of the United Hebrew Charities of New York makes no distinction with its applicants. The Educational Alliance in the same city offers its clubs and classes to Jew and Gentile alike. Jewish agencies, giving material relief, or to use a better term, those which care for the needy in their own homes, in the main confine their work to beneficiaries of their faith, without, however, making any rigid distinction. On the other hand, the trend of Jewish charity has been in the direction of caring for the Jewish poor, solely through Jewish agencies, and without the intervention or co-operation of other sectarian or non-sectarian societies or institutions.

The problem of the Jewish charitable societies of the United States to-day is the problem of the care of the immigrant. As such, it passes beyond merely local lines. In some of its manifestations it is national in character and in a few it has an international significance. The fact that the large bulk of the needy Jews in the United States reside in New York is accidental, and concerns the Jews of Denver and San Francisco equally with those of the eastern seaboard cities. In so far the problem is a national one. Moreover, to deal intelligently with the question requires a knowledge of the immigrant's antecedents, the impelling motive which brought him to the United States, and an acquaintance with his previous environment. And here the international phase of the question comes in. Roughly speaking, it may be said that there are no American-born Jewish poor. Of the 10,924 families who applied for assistance to the United Hebrew Charities of New York during the year ending 30 Sept. 1903, 2 per cent

were born in the United States. And of these the majority of heads of families were of the first generation. Jewish dependents who have an ancestry in the United States of more than two generations are practically unknown.

In the year 1881 began that great wave of emigration from eastern Europe, the end of which is not yet. Driven by a relentless persecution, which endangered not only their homes but frequently their lives, thousands of Jews were compelled to flee from their homes to seek new residence on these shores. The Russo-Jewish committee which originally undertook the work of caring for these immigrants turned it over very shortly to the Hebrew Emigrant Aid Society, which came into existence in December 1881. In one year this society spent $250,000, $50,000 less than had been spent by the United Hebrew Charities of New York in the seven years of its existence. In the first and only annual report of the Emigrant Aid Society, its president outlined as tersely as possible the efforts that had been made to provide homes and occupations for the thousands of fleeing exiles who reached these shores during the momentous summer of 1882. In the month of July the committee spent for board and lodging alone over $11,700.

With the gradual falling off in immigration, the Emigrant Aid Society went out of existence, and the care of the needy immigrant who remained in New York and who became impoverished after residence, reverted to the United Hebrew Charities. In 1885 immigration again began to grow heavier and continued to grow in such numbers that in the following five years over 120,000 immigrants arrived at Castle Garden. In 1890 the immigration reached the figures of 32,321, the largest number ever recorded up to that time. With all that had been done, the real work of the charities was but to begin. In 1891 the religious persecution of the Russian Jews reached a climax. In the year ending 30 September 62,574 immigrants arrived at New York, of whom nearly 40,000 arrived between June and September. The entire charitable effort of the New York Jewish community was for the time directed out of the ordinary channels and applied to this monumental question of caring for the arriving Russian Jews. The Baron de Hirsch Fund, instead of utilizing its income for its educational work, appropriated over $67,000 to the United Hebrew Charities to assist in the work of the immigration bureau. Over $175,000 was spent by the United Hebrew Charities during this year. In September of 1891 it became apparent that there would be no cessation to the immigration, and that much larger funds would be necessary to give anything like adequate assistance to the unfortunates who were arriving at the rate of 2,000 per week. The enthusiasm which was aroused at a banquet tendered to the late Jesse Seligman brought into existence the "Russian Transportation Fund," which added over $90,000 to the revenues of the United Hebrew Charities and which was given by citizens of New York, irrespective of creed. Later in the year, a standing committee of the society, known as the Central Russian Refugees Committee, was organized and was made up of representatives of the Baron de Hirsch Fund, the Russian Transportation Fund, the United Hebrew Charities and the American Committee for Ameliorating the Condition of the Russian Exiles. The last committee was organized to secure the co-operation of relief societies in other cities, in order that the various European societies who were assisting the persecuted Russians to emigrate should thoroughly understand the attitude of the New York organization. The year, October 1891 to September 1892, will ever be a memorable one in the history of Russian emigration and of Jewish philanthropy; 52,134 immigrants arrived at the Barge office in that time. The treasurer of the United Hebrew Charities paid out the enormous sum of $321,311.05, of which $145,200 was spent by the Russian Refugees Committee between February and September.

Since the year 1881, fully 600,000 Jewish immigrants have arrived at the port of New York alone. Of these the bulk comprise refugees from Russian and Rumanian persecution, Austrians and Galicians. They came from countries in which many of them lived under conditions of appalling poverty. The records of the immigration bureau show that from the standpoint of material wealth, these immigrants are below the average of immigrants from other European countries. Due to their previous condition, a goodly percentage is illiterate. On the other hand, the number of skilled artisans and craftsmen is so large as to be distinctly noticeable. From the standpoint of dependency, it will be of interest to study to what extent this large body of immigrants has added to the dependent and delinquent classes of the communities in the United States. The only figures that are at hand are those of New York, which are higher than would be found in other cities and towns for reasons that are obvious.

In December 1899 a study was made of 1,000 families who had originally applied to the United Hebrew Charities for assistance in October 1894. Of these 1,000 applicants it was found that 602 had not applied for assistance after December 1894. Of the balance, 67 families were dependent on the society to a greater or lesser extent in January 1899. More detailed investigation disclosed the fact that nearly all of these 67 applicants were made up of families where the wage-earner had died, leaving a widow with small children, or of respectable aged and infirm couples unable to be fully self-supporting, or of families in which the wage-earner had become incapacitated through illness. In other words, after five years over 93 per cent of the cases studied were independent of charitable interference. The marked feature in the care of the Jewish poor in the United States is the almost entire absence of the so-called pauper element. Even the 67 families above mentioned cannot be included in this category. Widowhood is the resultant of purely natural conditions, and when it afflicts the poor mother with a family, it frequently produces a condition of dependence which has in it no characteristics of demoralization.

If there is one cause more than another leading up to this condition, it is the absence of the drink evil among Jews. The instances in which drunkenness lies at the bottom of Jewish dependency are so infrequent that they may be ignored. Combined with the absence of this vice, there are other virtues engrafted on the Jew for centuries, all of which tend to the preservation of his self-respect and his self-esteem. Among these are the love of home,

the inherent desire to preserve the purity of the family, and the remarkable eagerness which he shows for education and self-improvement.

From what has preceded, it will be comprehensible that the Jewish charities of the United States, having a special problem with which to deal, have instituted special methods for its solution. In the main, relief organizations have followed the organized methods of sister societies. In the past 25 years, new organizations of all kinds have sprung into existence to meet the demands made by the constantly increased immigration. To revert to New York, when the Central Russian Refugees Committee went out of existence in January 1893, the decrease in immigration no longer warranting its continuance, the active work of assisting the arriving immigrants devolved upon the United Hebrew Charities. The work of this society is typical of similar Jewish organizations throughout the United States. The report of the fiscal year ending 30 Sept. 1903, shows that 10,924 individuals and families applied for assistance. Of these, 6,260 had applied for the first time. Material relief was granted to 7,290; 1,802 were found not to require assistance of this kind, and 1,202 were refused assistance for some cause or other. The society conducts an employment bureau which is free to employer and employee, and during the last fiscal year found employment for 3,892 applicants. It grants relief in kind, including groceries, clothing, shoes, furniture, etc. The extent of the society's work in this direction will be gathered from the statement that 51,875 garments and pieces of furniture were distributed last year. The annual disbursements for material relief alone amount to over $150,000 per annum. Ever since its organization 30 years ago, the society has endeavored to uphold the principles of organized charity. In some instances it has antedated the charity organization societies themselves; as in the giving of relief in amounts adequate to make the recipient independent of further intervention on the part of the relief-giving agency, and the establishment of a graded, carefully regulated and supervised system of pensions covering if necessary a long period of years. As a rule, these pensions are given only to families where the wage-earner has died, and where, unless such provision were made, no recourse would be left, except the breaking up of the family and the commitment of the children to orphanages and similar institutions. To obviate the necessity of such commitment, the United Hebrew Charities disburses annually over $35,000 in pensions. In the history of the society there is no form of relief which shows such good returns for the investment made. Families so supported do not become pauperized, since the subsidy which is granted enables the surviving parent to devote her time to the proper rearing of her children so that they may become useful and intelligent citizens.

Along the lines of making families self-supporting the United Hebrew Charities frequently grants assistance, presumably as a loan, in amounts varying from $50 to $250. These loans are made in special cases where it is not possible to make the applicant self-supporting through the ordinary channels of employment, etc. A wage-earner who has been incapacitated through illness or injury and hence unable to follow any routine work, may still be established in some small business venture and be able to support his family. Thousands of dollars have been spent by the United Hebrew Charities along these lines with the most gratifying results — not only have beneficiaries become independent of the society, but many of them have managed to repay the loans made to them. Of all the problems which confront the average charity organization, possibly the most perplexing is the one of the family in which the mother must be the wage-earner. The kindergarten and the day nursery have by no means solved the problem. They are at best but makeshifts in an attempt to solve a situation which has its root in economic and industrial conditions. Again, the factory removes the mother from her sphere of influence over her children, and opens up opportunity for the growth of incorrigibility and waywardness on the part of the latter. In the hope of partially overcoming this difficulty, the United Hebrew Charities has for some years conducted a work-room for unskilled women in which the latter are taught various needle industries, in the hope that they may eventually be sufficiently accomplished to work in their own homes, and in this fashion supplement the family income. The amount of such work that can be found is limited. More and more, daily, the factory is competing with home industry to the exclusion of the latter. A study made by the society in 1902 showed that work could be obtained for women to do at home in industries such as silk-belt making, men's and women's neckwear, garters and hose supporters, paper boxes, slip covers for the furniture trade, overgaiters and leggings, dressing sacques, hats and caps, flowers and feathers, beaded purses and other beadwork, dress shields, incandescent light mantles, embroidery and art embroidery, passementerie work, bibs, knit goods, etc. In the society's work-room the effort has been made to teach such industries to unskilled women, so as to enable them to become at least partially self-supporting.

It is needless to state that in a system as comprehensive as the United Hebrew Charities desires to be, provision has been made to alleviate distress in all its forms. Under the plan of dividing the city into districts, immediate relief can be given to emergency cases. These districts are in charge of co-operating societies known as Sisterhoods, who are responsible for the condition of the poor who have been placed in their care. Each of these agencies is practically a miniature United Hebrew Charities. Not only have they organized centres for the distribution of material relief, but along the lines of a more progressive philanthropy, the sisterhoods have developed day nurseries, kindergartens, clubs and classes of various kinds, employment bureaus, mothers' meetings, and in fact have become a social centre for the poor of their neighborhoods. Since a large percentage of the distress which is met with is occasioned by illness, medical relief of all kinds has been organized. Each district as a rule has its physician and its nurse, and where these are not at hand, co-operation has been effected with other organizations specially equipped for such work.

In very recent years, the spread of tuberculosis among Jews has merited the earnest attention of the society, and among its other activities it has been a pioneer in developing a

systematic plan for caring for such tuberculous applicants in their own homes, for whom no provision could be made in existing sanatoria. The campaign thus begun has been not only a charitable, but a social one. Not only have these unfortunates been given food, nourishment and medical care to aid them toward recovery, but in addition thereto, instruction has been given them in the rudiments of sanitation, and in the prevention of infection. It is significant that the work of the United Hebrew Charities in this field has been followed to some extent by the recently organized Committee on Tuberculosis of the Charity Organization Society.

The name "United Hebrew Charities" as applied to the New York organization is somewhat of a misnomer, since it does not include all Jewish charitable agencies in the city of New York. It would be more proper to speak of it as the consolidation of all the purely relief societies which existed in New York prior to 1874. Aside from these, there are to-day hospitals, orphanages, technical schools for boys and girls, trade schools, day nurseries and kindergartens, guilds for crippled children, burial societies, loan societies, societies for maternity relief, and a goodly number of smaller organizations which have been founded by the immigrants of the last twenty years. Among the most important large organizations and institutions in New York may be mentioned: The Mount Sinai Hospital, Lebanon Hospital, Beth Israel Hospital, Montefiore Home, Hebrew Orphan Asylum, Hebrew Sheltering Guardian Society, Hebrew Infant Asylum, and Hebrew Free Loan Association. It is estimated that there are over 1,000 Jewish organizations and societies in the city of New York to-day, whose activities to a greater or lesser extent are directed along philanthropic lines. Practically all of the larger organizations, such as the hospitals, etc., work in co-operation with the United Hebrew Charities. In some of the other cities in the United States, where the question of the care of the poor is not so complex as in New York, closer co-operation has gone by leaps and bounds. In cities like Philadelphia, Cincinnati, Chicago, Cleveland, and others, the individual societies have formed federations of charities, the purpose of the federation being to express the philanthropic impulse of the community in terms of greatest economy, the smallest amount of friction and the highest possible efficiency. In Philadelphia the federation is the common treasury. It acts as the common collection agency of all moneys and distributes them pro-rata among the various societies and institutions whose autonomy is not impaired by this method. In other cities, this plan with some slight variations is in force. In New York sporadic attempts to form a federation have been unsuccessful owing to the immensity of the problem. There are indications at present that federation may become a possibility in the near future.

In addition to these local federations, the various societies throughout the United States have joined together to form a national body known as the National Conference of Jewish Charities. At present it comprises the relief organizations of 53 cities. Two biennial conferences have been held and the third will be held in the city of New York in May 1904. The published reports of these meetings indicate conclusively the wisdom and the necessity of founding such a national organization. The rules governing the transportation of dependents which have been in force in the National Conference of Jewish Charities since its inception were adopted with alterations and additions at the last meeting of the National Conference of Charities and Correction at its meeting in Atlanta in May 1903. At the meeting of the National Conference of Jewish Charities held in Detroit in May of the same year, the writer introduced a resolution advocating the establishment of a central bureau for the placing out and boarding out of dependent Jewish children in private homes. At that time the work of devising such a plan was delegated to the Independent Order B'nai B'rith, a fraternal Jewish order, which at present has the entire subject under discussion, and has drafted a plan which has been submitted to the various Jewish societies and institutions throughout the country. In New York city, under local auspices a similar movement has been inaugurated. Since July 1903, at which time work was begun, applications have been received for children from 84 Jewish families. Sixteen children have been placed in boarding homes and four in free homes.

Some idea of the extent to which Jewish charities have been developed in the United States may be gathered from the following: In practically every city and town there are benevolent societies which look after the interests of the poor in their midst. Jewish orphan asylums are established in the cities of Atlanta, Baltimore, Boston, Brooklyn, Chicago, Cincinnati, Cleveland, Newark, New Orleans, New York, Philadelphia, Pittsburg, Rochester, and San Francisco. In New York there are three institutions and in Philadelphia there are two. New York has four Jewish hospitals and Philadelphia has two. Baltimore, Chicago, Cincinnati, Denver, New Orleans, and San Francisco have each one. Homes for the aged and infirm are found in most of the large cities. Similarly, educational movements along philanthropic lines are developing throughout the country. These include organizations such as the Hebrew Educational Society of Brooklyn, the Hebrew Education Society of Philadelphia, the Jewish Training School of Chicago, the Hebrew Free and Industrial School Society of Saint Louis, the Hebrew Industrial School of Boston, the Clara de Hirsch Home for Working Girls, the Hebrew Technical School for Girls, the Hebrew Technical Institute and the Baron de Hirsch Trade School, the last four being situated in the city of New York. The Maxwell Street Settlement of Chicago and the Neighborhood House in Saint Paul are under Jewish auspices. Cincinnati, Milwaukee, and Cleveland have Jewish settlements. In New York the Educational Alliance, the largest institution of its kind in the United States, has within the past few years developed a settlement with resident workers. Along educational lines, the Jewish Chautauqua Society, a national organization, has for the past two years conducted a summer school in philanthropy in connection with its summer assembly held in Atlantic City, N. J. At these sessions, important communal problems of interest to Jewish workers in philanthropy have been considered.

Other national organizations of importance are the Jewish Agriculturalists' Aid Society, the

Baron de Hirsch Fund, and the Jewish Agricultural and Industrial Aid Society. The first named, with headquarters in Chicago, is engaged in placing farmers throughout the Northwest, particularly in Dakota. The work of this society while not on an extended scale, has nevertheless given results and has demonstrated the fact that it is possible to take residents of congested centres, remove them to country districts, and make farmers of them. The Baron de Hirsch Fund was established under a foundation of the late Baron de Hirsch, the deed of trust being incorporated in March 1890. Its activities at present are directed to the conduct of the Baron de Hirsch Trade School in New York city and the Agricultural Colony at Woodbine, N. J., where the Fund has an Agricultural and Industrial School. The Fund likewise gives moneys to co-operating societies in various cities for the purpose of granting tools and teaching trades to recently arrived immigrants. The Jewish Agricultural and Industrial Aid Society is an off-shoot of the Baron de Hirsch Fund, receiving money from the latter society and from the Jewish Colonization Society, which was created under a de Hirsch endowment. Its purpose is to find agricultural and industrial positions for Jewish immigrants. Under the care of this organization are the various colonies in south Jersey, aside from Woodbine, and the organization has made farm loans to farmers in various parts of the United States, particularly in Connecticut. Probably the most important phase of this organization's work is the attempt to remove residents of the congested centres of large cities to places throughout the United States, where work has previously been found for them. In the first year the organization sent away 1,800 persons. In the second year 3,200 persons. During its present fiscal year, beginning 1 Jan. 1903, it has sent out 5,190 individuals, and its work is constantly increasing. The plan of the society is to find industrial positions anywhere in the United States, and having found them, to obtain individuals able to fill them from New York and other large cities like Philadelphia, Chicago, and Boston. In order to carry on the work as effectively as possible, the society co-operates with the Independent Order B'nai B'rith, which has lodges distributed throughout many of the smaller towns and communities in the United States, and with the benevolent organizations and societies represented in the National Conference of Jewish Charities. It has an office in New York city known as the Industrial Removal office, which is the centre of the activities of the society. From here all applicants who desire to leave the city are sent away, provided with the necessary transportation and with the guarantee that provision will be made for them at their destination until such time as they become full-fledged wage-earners. Should conditions require it, it is not uncommon for the society to send the wage-earner in advance and to make provision for the care of the family remaining here through the United Hebrew Charities. As soon as the society hears from its correspondent that the wage-earner is in a position to care for his family the latter is sent on and a reunion of the family accomplished.

On the literary side of Jewish philanthropy, it is interesting to note that the United Hebrew Charities of New York city is publishing a monthly magazine, 'Jewish Charity,' which is devoted to the consideration of all topics of interest to workers in Jewish philanthropic fields.

LEE K. FRANKEL,
United Hebrew Charities, New York City.

Jewish Chautauqua, founded in 1893 by Rev. Dr. Henry Berkowitz of Philadelphia, and incorporated in 1899, with a body of officers representing the chief cities in the United States. This society has about 3,000 members, divided into various sections. Its courses include preparatory, two years, with readings in Jewish history and literature; Bible, four years; and special courses in post Biblical history and literature, 'Jewish Characters in English Fiction.' 'Beginners and Advanced Hebrew.' Its chief work of late years has been embodied in its summer assembly, at Atlantic City, N. J., which is held annually in July and lasts three weeks. It includes a summer school, popular lectures and conferences, literary and social entertainments, in which many prominent speakers participate. During the session of 1903 the condition of religious schools, dependent and delinquent children, how to relieve congestion in large cities, the status of the Jews of Russia, the attitude of Jewish university students toward Jewish problems, were the topics discussed. The average attendance at the morning sessions was from 150 to 350 persons and at the evening from 300 to 800 persons. During the summer of 1903 an English organization on the plan of the Jewish Chautauqua was formed at Ramsgate.

Jewish Exchequer, a special division of the Court of Exchequer of England (1200–90) which dealt with lawsuits between Jew and Christian, chiefly in reference to debts due the former, and recorded the taxes imposed on the Jews. The fact that it was found necessary to have a centre for Jewish business indicates the prominence in trade and finance of the Jews in England from the reign of Henry II. to the period of their expulsion (1290). The court did not long survive their departure. Many important data from its records have been jointly published by the Selden Society and the Jewish Historical Society of England.

Jewish Fraternities. While societies for mutual benefit exist in large numbers among the Jews in every land, in the United States, the fraternities or orders have acquired special popularity, and promote not alone Jewish solidarity but aid in maintaining many charitable institutions. These organizations as a class give pecuniary benefits in case of illness, and death-endowments, which latter insurance feature is now being made optional. The oldest and most influential is the Order of Benai Berith ("Sons of the Covenant"), formed 60 years ago, and having a membership of 30,000. Its 315 lodges extend over the entire country, and it has 13 lodges in Algeria, Bulgaria, Egypt, Turkey, and Palestine, 42 in Germany, 16 in Rumania, and 10 in Austria. It supports orphan asylums in Cleveland, Ohio, Atlanta, Ga., San Francisco, Cal., a home for the aged at Yonkers, N. Y., a free library in New York, while it co-operates with an orphan home in New Orleans, a technical school in Philadelphia, and a hospital for consumptives in Denver, Colo. The next leading order is the Free Sons of Israel, founded in 1849, with 103 lodges and 11,000 members. The Free Sons of Benjamin (1879) has 192 lodges; 14,088 male and 1,361

female members. The Berith Abraham (1859) has 288 lodges and 42,000 members. The I. O. Berith Abraham, with 302 lodges and 56,949 members, was founded in 1887. The Ahavas Israel Order (1890) counts 124 lodges. In addition there are seven other fraternities which have been recently started. The Order of Kesher Shel Barzel, founded a home for the aged at Cleveland. Special efforts are now being made by the Benai Berith to institute lodges among the Russian and Rumanian immigrants, and the project of establishing a Jewish University of the highest rank has been brought to its attention.

Prof. German Literature, New York University.

Jewish Sects. To the fact that Judaism has never been a sluggish stream, but was ever in active movement, we owe the existence of sects among the Jews. The right of liberty of thought was always exercised, and to the conflict of opinion the survival of Judaism is largely due. Apart from the individualism which is a marked element in Jewish character, the influence of surroundings has had a formative effect, and the rise of sects in the nations among which he lived accustomed the Israelite to the spectacle of sects in his own community, due usually to the interpretation of text or ceremony, or to the initiative of some resolute leader. The history of Jewish sects displays the same bitterness and hostility that characterize sectarian feuds in general, although since the dispersion there has been more rattle than fang in the conflict between schools and parties in Jewry. The synagogue has never proclaimed any dogma of infallibility, and the rabbi was never regarded as absolute authority over conscience and soul. Climate, temperament, and environment were often the determining factors in precipitating the conflict which was waged, not by fierce encounters on the bloody field, but by debate in the schools and in polemical treatises that aroused partisan outcry and led to peaceful secession within the fold. Judaism and the law were never at stake — it was only the interpretation of one body of teachers or individual opinion which had to shift its ground.

Samaritans.— A brief summary of Jewish sects may best begin with the oldest of all. The Samaritans, termed in the Talmud (q.v.) "Cuthim," are traced to the mixed multitude who were made to settle in Samaria on the fall of the kingdom of Israel. The religion of the new colonists was a blending of Mosaism and heathenism, which led to a gradual separation from the Jewish body. They took no part in the revived commonwealth under Ezra and Nehemiah, but formed their own community, with their own temple, which was destroyed about 120 B.C. by John Hyrcanus I. (q.v.). The Samaritans gradually lost whatever prestige they had claimed. They now exist as a small sect, with constantly dwindling numbers, at Nablûs (the Arabic form of Neapolis, the name given to Shechem under Vespasian). Here perhaps 100 survivors follow their traditional rites, and sacrifice as of old on Gerizim. The Samaritans now possess interest only from an archæological point of view, although their ritual and literature have value for students of the Bible and of post-Biblical history.

Pharisees.— This party, often misunderstood and maligned, and which has had the ill-fortune (similar to that of the Jesuits, for example), of supplying the term "pharisaic," in the sense of hypocritical, was the great popular party in Judea, including the representative leaders and men of learning in the Asmonæan era, who strove to maintain the traditional faith and ceremonies at all hazards and despite political entanglements. It is the opinion of Graetz, the best-known Jewish historian, that, deriving their name from *Perushim,* "the explainers" (of Scripture), they formed the learned body of the nation, and can only be called a party by way of distinction from the Sadducees and the Essenes. The Pharisees were the religious enthusiasts of their day, loyal to every traditional observance, naturally with the defects of their virtues when such rigid adherence became formalism. But it is faulty generalization to stigmatize all Pharisees as hypocrites because some were insincere, as occurs in the history of every creed.

Sadducees.— This sect, probably named from one of their leaders, Sadok, constituted the party of wealth and political power, who made the law subordinate to the exigencies of the national life, and to whom the traditions of their religion were secondary when the independence of the nation was to be upheld. Hence the differences in interpretation of the law, which led to violent feuds and internecine conflict at a critical era when union might have checked the advancing Roman legions.

Essenes.— Sprung from the Assideans of the early Maccabæan days, resembling in some respects the Nazarites, the Essenes were rigid separatists from contamination, large numbers of whom were ascetics, favoring celibacy and forming a kind of religious brotherhood whose relation to early Christian practices, like baptism, is a suggestive topic for study. They were mystics, too, the logical forerunners of the sect of Chasidim, which was to acquire more notoriety than good repute in later centuries. The Essenes exercised no political influence. It was reserved for the Pharisee and the Sadducee to employ intrigue, hatred, and bloodshed against each other until Jerusalem fell.

Karaites.— About the middle of the 8th century this important sect arose among the Jews in Moslem lands. Their name means "readers," and they were followers of the Old Testament, but not the Talmud or rabbinical interpretations. Just as a sect in Islam rejected the traditional ruling, so almost contemporaneously a sect in Jewry abandoned rabbinical tradition. The leader in the movement was Anan ben David, a native of Babylon, who, chagrined at his failure to become an ecclesiastical dignitary, resolved to organize a revolt against tradition. For a time the movement made headway, but it never gained many adherents, and to-day exists in remnants only in Jerusalem and parts of Turkey, in Egypt, Galicia, and the Crimea. The Karaites, however, contributed largely to the study of the Old Testament, for the conflict between the Talmudists and their opponents led to closer and more accurate inquiry, and Scriptural investigation was followed with scientific thoroughness. The Karaites were keen disputants, and their polemical onslaughts on the Talmudists furnish a piquant phase in the history of Jewish thought. They failed, however, in their protest, and no reformation resulted. It is of interest to note that to-day in Russia the Karaites receive special consideration from the government, and

apparently are not subjected to all the harsh exactions under which the rabbinical Jews suffer. Their very limited numbers, however, may account for the toleration.

Sabbatians.— In the 17th century a remarkable sect arose among the Jews, the followers of Sabbathai Zebi (1626–76), who was born in Smyrna, went to Jerusalem in 1664, and there proclaimed himself the Messiah and predicted his approaching rule over the universe, with his headquarters in Jerusalem, restored and made glorious. The news spread rapidly and produced profound excitement in Turkey and elsewhere. It was a century of gloom and anxiety for the Israelite, the era of Jewish massacres in the Ukraine, and with the greater avidity he turned to hopes of a revived nationality; many in sober European lands began to prepare for the journey eastward. Such Zionistic dreams are of frequent recurrence, and numerous have been the false Messiahs in Jewish history. Sabbathai's career, however, was to receive a sudden check: the Sultan of Turkey, Mahomet IV., disliking popular excitement, imprisoned the prophet when he visited Constantinople, and after two months' confinement his pretensions faded away. He made a tame confession of his dishonesty and became a convert to Islam when the Sultan suggested the step. Many of his adherents in Turkey, Poland, Italy, Austria, Holland, and Germany were not discouraged by his conversion, but still believed in his Messiahship. In 1668 on the Passover he declared that he had received revelations from the Holy Ghost and was permitted by the Turks to preach in the synagogues. A sect of Sabbatians was gradually formed, with special doctrines and rites of their own, gradually dissolving into minor bodies of no influence. The Sabbatians in Turkey adopted Islam in 1687, with Sabbathai's successor, his brother-in-law Jacob Querido, at their head. On his death, his son became their Messiah (1695–1740). This Jewish-Turkish sect still exists and numbers about 4,000 adherents. Sabbathai's followers in Poland fell into crass mysticism, with harmful influences on Jewish development. In Italy they soon ran their course, and in Holland and Germany they were unmasked and sought flight.

Frankists.— These were a sect named after their founder, Jacob Leibovicz Frank, born in Podolia about 1726, died at Offenbach 1791, who was one of the apostles of Sabbathai Zebi. His vagaries were as pronounced as those of his master. Ultimately, after heated disputes with the rabbinical Jews, he abolished the law, and his sect became Catholic and was absorbed by the dominant religion in Poland.

The Chasidim.— The people who bear this name, meaning "the pious ones," constitute a sect dating from about the middle of the 18th century, and which exercised a profound influence on the Jews of eastern Europe. In its inception, as Dr. Schechter states in his 'Studies in Judaism,' it was a revolt against the excessive casuistry of the contemporary rabbis and "a protest of an emotional but uneducated people against a one-sided expression of Judaism" without feeling and affection. It was to develop rapidly into mysticism, the reveries and revelries of the Cabala, which produced incalculable evil wherever it spread. Its founder was Israel Miedzibocz (1698–1759), later called Israel Baal Schem, shortened into Bescht, born in a small village in Bukowina, and about whose childhood and youth wondrous legends are narrated. He became a rabbi in Podolia and Wallachia, teaching his doctrines to eager disciples and working miracles. In some respects he was an Essene of the 18th century, and he has been both condemned and admired. A religious revivalist, he drew much of his inspiration from the 'Sohar,' aptly called the Bible of the Cabalists, a clever literary forgery of the 13th century; but his idealism became a downward development in the sect's subsequent history. Under his successor, Beer of Mizriez, Chasidism extended to a more learned circle, who in their turn exercised a wider influence which led to many divisions and degeneracy. They were fiercely opposed by the rabbinical Jews. In Wilna their writings were publicly burnt (1772), and they were put under the ban. Solomon Maimon in his autobiography gives an account of this sect. It is still in full swing in eastern Europe, an aberration that will pass away with the spread of modern culture.

Other Sects.— The Falashas of Abyssinia, the Daggatouns of the Sahara, the Black Jews of India and Cochin-China, may be regarded as sects or colonies, along with the few remaining Jews in Kai-Fung-Fu, Province of Honan, China, and are mentioned to show the variety of type in present-day Israel. The divisions into "orthodox," "conservative" and "reform" Jews are largely arbitrary, and await more exact classification.

Prof. German Literature, New York University.

Jewish Women's Council. Founded September 1893, this organization has been of marked value in awakening the interest of American Jewesses in the history and literature of their special creed as well as in developing among them modern methods in educational and charitable. Affiliating with the National Council of Women it has arrayed on a common platform its representatives. The latest survey of its condition and workings was given at its third triennial in Baltimore, Md., 2–11 Dec. 1902. There were present 3 officers, 7 directors and 52 delegates from 26 sections, with 2 delegates from Junior sections. Addresses were made by Miss Jane Addams, of Hull House, Chicago, on 'The New Social Spirit'; other topics discussed were: 'Aspects of Judaism in Cities and Small Towns,' 'Federated Charities,' 'The Juvenile Court.' The Council consists of 64 active sections, with about 8,000 members, and 16 junior sections, with about 500 members. There are 82 study circles, 2,000 members, studying Jewish history and literature, and 12 circles studying methods in philanthropy. It has 18 religious schools among the poor, with 19 paid and 141 volunteer teachers, reaching 2,500 pupils. Thirty-three sections carry on activities in philanthropy, with settlements, sewing and industrial schools, five kindergartens, one manual training school, two gymnasiums, two free baths, two day nurseries, four personal service groups, two kitchen gardens, and other forms of useful activity, often open to all creeds. Cooperation is encouraged with the State Federation of Women, International Congress of Women, the National Jewish Hospital for Consumptives at Denver, Colo.,

the National Needlework Guild and the Consumers' League.

Jews, The Lost Ten Tribes of. After the downfall of the kingdom of Israel, the ultimate fate of the people who were led into captivity by Assyria has been the subject of much discussion, wholly conjectural, and many theories have been advanced as to their continued existence. The question of the literal fulfilment of Old Testament prophesies as to the return of Israel seems to be connected with the existence of the Ten Tribes; for if so large a body has totally disappeared, doubt would necessarily be cast in the eyes of many upon the credibility of Scripture. Hence various attempts have been made to identify the Ten Tribes. Without referring to the traditions in the Apocrypha and Talmud—in fact the famous Rabbi Akiba asserted that the Ten Tribes would never return—the chronicler Eldad of the seventh century claimed that they existed in his day in parts of Southern Arabia or possibly Abyssinia. Farissol, a Jewish geographer (b. 1451), sees in the Beni Israel (q.v.) of India their descendants, while alleged traces have been discovered in Persia, Cochin China, and Yemen, among the Nestorians in Mesopotamia and the Jezidis or devil-worshipers of the same religion. The Afghans with their Jewish appearance and traditions are identified by Mohammedan writers and by G. Moore in his 'Lost Tribes' (London 1861) with the Ten Tribes and the latter goes so far as to derive the Hindus from the same origin, through the Scythians. The Anglo-Israelites identify the entire English, if not the whole Teutonic race, with the Ten Tribes. As recently as 1879 McLeod in his 'Epitome of the Ancient History of Japan' advocated the theory that the Shindai or holy class of Japan were descendants of Ten Tribes; the same origin is claimed by others for the Australians and the Masai of British East Africa. The legend of such descent has been affirmed of the aboriginal inhabitants of Central and South America as well as of the North American Indians. Jewish customs having been traced among them. It is possible that long before the compulsory migration of the Israelites under Assyrian supremacy, many had intermarried with the Jews of the neighboring kingdom, while others had amalgamated with the people of Central Asia, to whom they may have imparted some of their ceremonies and ideas and who by subsequent migration, so frequent in those ages, may have still further spread Jewish customs and opinions. Consult Newbauer, in the London Jewish Quarterly Review I.; A. F. Hyamson, J. Q. R. XV.; Mallory, 'Israelite and Indian' (New York 1889).

Jews in America. Although the Jewish population of America has been greatly increased by immigration only since 1881, Jews have been closely identified with American history for centuries.

Before taking up the history of the Jews in America, some statistics concerning the American-Jewish population at various periods will be in order, as tending to throw light on more isolated historical incidents relating, for the most part, to the experience of a small fraction only.

Statistics.—The latest and most authoritative statistics as to the present Jewish population of the United States are furnished by the 'American Jewish Year Book' (September 1903), wherein it is computed that the total number of Jews in this country is 1,127,268, of whom 500,000 are credited to New York State, 28,000 to California, 75,000 to Illinois, 25,000 to Indiana, 26,500 to Maryland, 60,000 to Massachusetts, 50,000 to Missouri, 25,000 to New Jersey, 50,000 to Ohio, and 95,000 to Pennsylvania; all the other States and Territories, including Hawaii, Porto Rico, and the Philippine Islands, and also the District of Columbia, likewise containing some Jewish residents. In making up this total, account is taken of the fact that 761,598 Jewish immigrants arrived at the ports of New York, Philadelphia, and Baltimore from 1881 to 1 July 1903. The same authority computes the Jewish population of America, exclusive of the United States, as follows: Canada and British Columbia, 25,000; British West Indies, approximately, 2,500; Argentina, 22,500; Brazil, 3,000; Cuba, 4,000; Mexico, 1,000; Curaçao, 103; Surinam (Dutch Guiana), 1,121, and Venezuela 411; making 1,186,903 in all for America. These figures are mere estimates, than which nothing more accurate is at present obtainable; but they are no doubt approximately correct, being based upon partial actual counts, analyses of death-rates, and reports of competent judges in the various localities; and having also been reviewed from time to time in the light of criticism and new data. If anything, the figures are probably somewhat too low, the city of New York, in its five boroughs, being credited by competent judges in 1903 with a population of over 600,000 Jews, which would make the estimate for the State above quoted about 150,000 too low. Estimates for other districts are also likely to be low; although that given for Cuba is undoubtedly too high. In rough figures, then, the Jewish population of the United States today is about 1,200,000.

The first systematic attempt to secure statistics of the Jewish population in the United States culminated in the publication of a report by the Union of American Hebrew Congregations in 1880, giving estimates for each State and city in the Union, and aggregating 230,257 persons. In connection with the national census of 1890 statistical information was gathered regarding Jewish congregations in the United States, and the total number of Jewish communicants was estimated at 130,496, belonging to 533 church organizations. Of these, 316 organizations, having 122 church edifices, valued at $2,802,050, and 51,597 communicants, are to be credited to Orthodox Judaism, while Reform Judaism counted 217 organizations, having 179 church edifices, valued at $6,952,225, and 72,899 communicants. A very large majority of the Jewish immigrants arriving in the United States since 1890 belong to the orthodox wing, and even the figures of 1890 undoubtedly disregard numerous small, often unorganized, orthodox congregations, from whom it was relatively more difficult to secure reports. In 1818 the Jewish population of the United States was estimated at 3,000 only; in 1848, at 50,000. In South America there were several thousand Jews prior to 1650, the greater part of whom were in Brazil, as noted below; but hostile laws and the persecutions of the Inquisition, while driving some

to the West Indies, and even as far north as New Netherlands, caused several thousand Jewish settlers in Spanish and Portuguese territories to totally give up their Jewish identity.

It might be said that there were successive tides of Jewish emigration to America from European countries, fairly well separated from each other in point of time. During the first 250 years after the discovery of America the settlers were mainly Jewish immigrants of Spanish-Portuguese stock, with only an occasional sprinkling of German, French, English, and Polish Jews. German Jewish emigration becomes considerable only a short time before the American Revolution (though evidence is accumulating that it took upon itself larger dimensions and at an earlier period than is commonly believed); it was stimulated by the reactionary measures following the Napoleonic wars and the revolution of 1848, and began to include emigrants from the Austro-Hungarian empire, and later on an increasing number of Poles. The Russian-Jewish exodus, which began about 1881, was by far the heaviest of these various currents of emigration, and was itself succeeded or joined by a Rumanian-Jewish wave about 1900. For Jewish statistics of other countries see JEWS AND JUDAISM.

Jews in the Spanish and Portuguese Colonies.— Before the discovery Jews were actively identified with the fate of America, as may be said without reference to the curious and once widely accepted theory that the American Indians are descendants of the lost Ten Tribes. Emilio Castelar, the late Spanish statesman and historian, referring to the coincidence that the Jews were expelled from Spain in the year that Columbus started on his first voyage of discovery — a circumstance noted by Columbus himself in his journal, and repeatedly thereafter commented upon by Jewish historians — makes this observation:

> It chanced that one of the last vessels transporting into exile the Jews expelled from Spain by the religious intolerance of which the recently created and odious Tribunal of the Faith was the embodiment, passed by the little fleet bound in search of another world, whose creation should be new-born, a haven be afforded to the quickening principle of human liberty, and a temple reared to the God of enfranchised and redeemed consciences.

But Jewish aid to Columbus was not limited to Jews accompanying him on this first voyage (including Luis de Torres, a new convert to Christianity, who went as interpreter because of his knowledge of Arabic, and settled before 1500 in America), nor to the circumstance that Columbus carried with him, as aids on his voyage, a sea-quadrant called "Jacob's Staff," invented by a Spanish Jew, and astronomical tables and charts invented by another Jew. The more significant and important fact is that Jewish financiers at the Spanish court were his leading patrons, and advanced the money for his voyage, as evidenced by original account-books still found in the Spanish archives; so that it was a mere recognition of this circumstance that induced him to address the first two letters (now justly famous, and the earliest copies of printed editions of which command thousands of dollars from book-fanciers) narrating his discovery to those two secret Jewish friends, Louis de Santangel, chancellor of Aragon, and Gabriel Sanchez, royal treasurer. In the light of such facts the late Herbert B. Adams wrote that "not jewels, but Jews, were the real financial basis of the first expedition of Columbus." The revenues needed to fit out the second expedition were secured from the proceeds of the property, of which the expelled Spanish Jews were despoiled by the Inquisition at the time of their expulsion from Spain.

In spite of prohibitions upon Jewish settlement in Spanish and Portuguese America, many Jews rapidly emigrated to the New World from among those exiled from Spain and Portugal; occasionally, in spite of the inconsistency involved, in view of those prohibitions, Jews and Jewesses were forcibly transported to America by the state through the agency of the Inquisition. By 1548 Jews are referred to not merely as having settled in Brazil, but as introducing sugar-culture there, which they transplanted from Madeira. The smoking of tobacco had been introduced to Europeans even before 1500 by Luis de Torres, a companion of Columbus. Occasionally, enormous sums of money had to be raised and given to the crown in order to effect suspensions or revocations of prohibitions upon Jewish settlement in the Spanish and Portuguese colonies. But the Inquisition and its terrors were introduced even into the New World; hence Jews found it advisable to try to conceal their faith under the cloak of Christianity; and it is principally in the records of the Inquisition that we find proofs of the Jewish practices of many of these settlers — called Marranos or secret Jews — whose trials commonly resulted in imprisonment, frequently in death at the stake, and were at all events followed by confiscation of their property.

In Brazil, Jewish settlers actively aided the Dutch in effecting their conquest of that country, about 1620, after which the Jews *en masse* threw off their Christian disguise and publicly professed their own religion. The Dutch West India Company (q.v.), which obtained the proprietorship of Brazil, had many influential Jewish stockholders, and under their auspices large numbers of Jews from Portugal, Holland, and Germany immigrated. Jewish residents are referred to about 1640 as owning the principal sugar-plantations of Brazil, and as heavily interested in the diamond industry then developing there; and there is also evidence that a Jewish literature sprang up in Brazil at this time. Some idea of their numbers may be gathered from the fact that at the time of the surrender of Recife (Pernambuco) to the Portuguese, after its recapture from the Dutch, soon after the middle of the 17th century, that city alone contained about 5,000 Jews, even after many had departed from the city. In smaller numbers they were also established in other cities of Brazil, in Mexico, Peru, the West Indies, and at other points. The Dutch capitulation of Brazil in 1654 led to their flight in large numbers from that country, their migrations leading them northward, particularly to the West Indies, and one party of refugees even becoming the nucleus of a Jewish settlement at New Amsterdam (New York city) in 1654. Many, however, remained in the South American colonies, and their Jewish identity was gradually lost under the hostile influences at work. The settlements under Dutch auspices at Surinam,

Cayenne, and Curaçao, are deserving of particular attention.

Of the professing Jewish inhabitants now to be found in these districts, enumerated in the statistics just considered, very few are descendants of the original Spanish settlers, the great bulk of them being comparatively recent arrivals from Germany, Russia, and Rumania. Through the munificence of Baron de Hirsch (q.v.) millions of dollars were employed about 1891 in the purchase of land and equipment for the use of agricultural colonies of Russian Jews established under his auspices in Argentina, where several thousand Jews settled, though they have met with only moderate success.

West Indies.— Reference has already been made to early settlements of Jews in Cuba and other West Indian islands. Their settlement in Jamaica was particularly important on account of their numbers and the once great commercial importance of the island. For the latter reason, their residence in the Barbados, at St. Eustatius, Martinique, and in the Danish West Indian colonies also led to important consequences. Reference will be made hereafter to this circumstance. Except in Cuba, the decline of the above named places commercially has caused a decided diminution in the number of their Jewish inhabitants, and to-day the chief interest in the settlements is historical.

Early Settlements in the United States before the Revolution.— There are indications of some isolated and casual arrivals of individual Jews within the present limits of the United States prior to the arrival of the party from Brazil in colonial New York during the Dutch régime, in 1654; these were in Maryland, Virginia, and New England, to say nothing of a party of Jewish soldiers and sailors who seem to have reached New Netherlands (New York) in 1652. These instances (other than those in the Dutch colony) are purely casual, however, and unimportant, because Jews were not allowed at this time to live as avowed Jews in any of the principal countries that then had colonies in America except Holland. Prohibitions against their settlement were in force (though occasionally ignored) in Spain, Portugal, England, and to some extent in France. Holland alone at this time welcomed the Jewish refugee, to her great commercial advantage; and this "common harbor of all opinions and of all heresies" was, logically enough, destined to establish a precedent for granting religious liberty also in the New World. It is true that in New Netherlands Governor Peter Stuyvesant (q.v.) was decidedly hostile to the Jewish arrivals, as were also some of the early Dutch ecclesiastical authorities; but, thanks to the leveling and humanizing influence of commerce, and to Jewish holdings of stock in the Dutch West India Company, the directors of that company, 26 April 1655, instructed their governor that the "Jews shall have permission to sail to and trade in New Netherlands, and to live and remain there, provided the poor among them shall not become a burden to the company, or to the community, but be supported by their own nation"; and Stuyvesant was strongly reproved soon after for seeking to thwart these clearly expressed wishes of the company. The emancipation of Jews was, however, only gradual; certain restrictions were continued through the whole colonial period, though they decreased from time to time, and in importance. Public worship, as distinguished from private religious services, was forbidden them till near the close of the 17th century, as was also selling at retail, and certain political rights of citizenship were also denied; but these restrictions in the course of time were largely removed in practice, so that the adoption of the first constitution of the State of New York, in the Revolutionary period, which established absolute religious liberty, conferred in effect few, if any, privileges on the Jewish residents of that State, which they had not already virtually enjoyed. In the interior, the number of Jewish residents had grown somewhat by emigration from Germany, Hungary, Poland, and also from England, which, under Cromwell, readmitted the Jews soon after the time of their settlement in New Netherlands; but the increase in numbers through immigration was not great till after 1800, for there were few Jews in England, and still fewer who desired to emigrate from there, while emigration to New York and New England prior to the above date from any of the other designated countries was very small.

To Newport, R. I., Jews emigrated very soon after they first settled in New Amsterdam, and Roger Williams (q.v.) in terms included them in his programme for establishing a colony where religious liberty would be accorded to all sects and creeds. In the course of time they erected a synagogue here also, as well as in New York, and established a community which contributed most materially to the commercial prosperity of Newport, which city far outrivaled New York for some decades before the Revolution, and until, during that struggle, its shipping interests received a blow from which they never wholly recovered. Here also, there were some retrogressions during the colonial period from Roger Williams' enlightened declaration of principles; but on the whole, Jews were most prosperous residents of Newport during the latter portion of the colonial period. Even though the colony never was numerous, it embraced such merchant princes as Aaron Lopez and Jacob Rodrigues Rivera, and its fortunes were commemorated, after all the old-time residents had departed, in Longfellow's famous lines on "The Jewish Cemetery at Newport." Already in the colonial period Jewish settlers occasionally found their way into Connecticut, also to Boston, and even, it would seem, to Maine, but they were very few in number, and the present Jewish residents of New England date almost entirely from the period of German settlement after 1848, followed by a much more considerable Polish and Russian-Jewish settlement toward the end of the 19th century. About 1820 Major Mordecai M. Noah, at one time United States Consul to Tunis, developed a fantastic plan for founding a Jewish state for the oppressed Jews of other lands under his own "judgeship," near Niagara Falls, at a place he named, "Ararat, City of Refuge," and attempted to tax all the Jews throughout the world for this purpose, but the scheme merely aroused amused attention. Other less ambitious early colonization schemes also were formed.

Pennsylvania, under William Penn's generous plan for founding a home for victims of persecution, attracted Jewish settlers, and in the early

decades of the 18th century a little stream of immigration began which brought a number of German, English, and Polish Jewish settlers to the colony, whose numbers were increased, after the capture of New York by the British in 1776, by the arrival of Portuguese Jews from that city. The Jewish settlement in Lancaster, Pa., was made about the time of the American Revolution; and there was a small Jewish immigration into Maryland and Virginia, with communities in Schaefersville, Easton, Baltimore, and Richmond. Before the close of the Revolution a Portuguese synagogue had been erected in Philadelphia; soon a German Jewish congregation was established there; and about the same period one was erected in Richmond, Va. The laws of Maryland prohibited Jewish settlement, and as early as 1658, Dr. Jacob Lumbrozo, "the Jew physician," figured there as defendant in a blasphemy trial, which nearly cost him his life. Baltimore is of particular interest because it was the only city in the United States in which systematic and long-continued efforts were necessary, subsequent to the Revolution, in order to secure full civil and political rights for Jews as such: they acquired them finally in 1826. Georgia attracted Jews almost immediately after the founding of the colony, parties of both German and Portuguese Jewish settlers having arrived at Savannah in 1733. Some of these were indigent Jews, who were assisted to emigrate by coreligionists in England. Offshoots from this colony migrated to South Carolina before the first half of the 18th century, and a congregation was formed in Charleston in 1750. By the time of the Revolution, and for some decades thereafter, Charleston contained one of the most important and prosperous Jewish communities in the United States. In both of these colonies Jews seem to have figured as holders of responsible civil office before the close of the Revolutionary War.

The various places which contained Jewish communities prior to the Revolution have now been enumerated; the total Jewish population embraced in them and in other and more isolated settlements was, as seen, somewhat less than 3,000 in the year 1800.

Interior Settlements.— Space does not permit consideration of the various Jewish settlements and their date of establishment outside of the limits of the 13 colonies. The great majority of Jewish residents of the United States still reside along the eastern coast-line. In time, the westward movement carried Jewish settlers along with it, some into interior cities in the original 13 States, others farther west. By 1800 there were several Jewish residents at Pittsburg. Judah Touro (q.v.), the well-known Jewish philanthropist, went to New Orleans about 1801, and Jews were destined, during the latter half of the 19th century, to achieve considerable political distinction there, though probably there were some Jewish settlers in the Louisiana Territory nearly a century earlier, who were persecuted by reason of the prohibitions in the French "Code Noir" upon Jewish settlement. The first indisputable Jewish resident of Kentucky seems to have settled there about 1808. Ohio appears to have received its first Jewish residents about 1817–19, and after 1830 a considerable tide of German-Jewish immigration flowed toward Cincinnati. In Illinois, which has to-day a considerable number of Jewish inhabitants (see above), especially in and about Chicago, the first Jewish settler probably arrived about 1841; and after a couple of years, numbers of German Jews began to come. A little later this same tide reached Detroit, Mich. Texas, while still belonging to Mexico, had quite a contingent of Jewish settlers, who began to arrive about 1821. California attracted a considerable number of Jews at the time of the gold discovery in 1849, and in 1850 they had two congregations in San Francisco. It will be observed that the great majority of Jews in the United States are to be found in the large cities.

The reactionary movement that followed the Napoleonic wars in Germany, early in the 19th century, and particularly the barbarous Jewish marriage laws of some of the German states (which, among numerous disabilities from which Jews suffered, were possibly the most objectionable, as they forbade more than a certain number of Jewish couples to live in any district), greatly stimulated German Jewish emigration to the United States from about 1815. After the revolutions of 1848 the political and economic unrest in Germany and throughout Europe caused a particularly valuable and intelligent class of Jewish immigrants to come to this country, including, in addition to Germans, also Hungarians, Poles, and Bohemians; while after 1881 the Russian-Jewish exodus assumed large dimensions, and the Rumanian-Jewish emigration began to be heavy about 1900. The volume of these tides can be gauged by comparing the estimates of Jewish population at various periods, already quoted, with these various dates. The forced emigration of recent years from Russia and Rumania has naturally had the effect of bringing to these shores persons less adequately equipped, and who had known fewer opportunities for development and self-improvement than the earlier immigrants, generally speaking, had enjoyed.

The Jews in American Commerce, Industries, and the Professions.— Reference has already been made to early Jewish activities in the field of commerce, exhibited in Brazil and the West Indies particularly. It is most important here to note the consequences which followed the dispersion of the Jews throughout so many different lands and districts, resulting in their opening of international and intercolonial trade relations with each other long before those having no such ties of relationship or confidence, and no such common language or commercial abilities, were ready for any such mutual intercourse. The result was that in early colonial days Jews were pioneers and prime promoters of intercolonial and foreign commerce in America, which became not merely profitable, but actually indispensable, for the maintenance of the colonies. The most distant points thus became interlinked by means of their Jewish residents. Every industry and branch of trade engaged their attention. Among persons who were particularly prominent in these fields, besides Lopez, Rivera and Touro, already referred to, were Lewis Gomez and his sons, who were exporters of wheat on a very large scale in colonial New York, early in the 18th century; Hayman Levy, the fur-dealer of New York, who had close relations with the

American Indians, and was at one time the employer of the first John Jacob Astor; David Gradis of Bordeaux, who is described as having "controlled the trade of France with the West Indies," in the 18th century, etc. Aaron Lopez of Newport had a fleet of over 30 vessels shortly before the Revolution, engaged in trade between Newport, the West Indies, and Africa. Newport Jews also created the spermaceti industry. Jews were among the founders of the New York Chamber of Commerce, and one figures on its seal as a member of the committee receiving its charter from the colonial governor. They were also among the founders of the New York Stock Exchange, and ever since that time have been growing in importance in America as bankers, brokers, financiers, and railroad magnates. They have been particularly influential in certain lines of trade, including the cotton, tobacco, sugar, coffee, jewelry, leather, hides, meat-packing, and clothing industries, and department-store activities.

The Jews of America have produced distinguished inventors, lawyers, physicians, rabbis, journalists, scientists, artists, dramatists, and professors, filling chairs at all the leading universities, far in excess of the proportional number of their race in the population of the country. On the other hand, the large immigration of unskilled laborers into the United States has led to the employment of thousands of Jews here in every industrial pursuit, frequently at very low wages and under unfavorable conditions.

Jews in the Army, Navy, and Public Service Generally.— Prior to the American Revolution there were Jews serving in the militia and in the colonial wars. During the Revolutionary War, their numbers on the army rolls far exceeded their ratio to the total population, and a number achieved distinction above the ranks. The New York Jewish congregation concluded, by a decisive majority vote, to disband, rather than to sacrifice patriotism on the altar of religion, and many of its members fled to Philadelphia, just prior to the British occupancy of New York. In the South a corps of volunteer infantry, known as Captain Lushington's company, composed principally of Jews, was organized in Charleston in 1779, and fought in the patriot ranks. A number of Jews had figured as signers to the Non-Importation Agreement of 1765. Among those on the Revolutionary rolls who achieved military distinction are Col. Solomon Bush; Col. David S. Franks, aide-de-camp to Gen. Arnold before the latter's treason, and who was the bearer of the signed definitive treaty of peace, sent abroad by Congress for delivery there; Isaac Franks, who became colonel of Pennsylvania's volunteers soon after the Revolution, after having served long during the war in the ranks; Capt. Jacob de la Motta; Maj. Nones; Lieut. Seixas; and Deputy Commissary-General of Issues Sheftall, of Georgia. During our War of 1812 and the Mexican War many Jews served in the ranks, and occasionally as holders of important military positions; while during the Civil War the number of Jewish soldiers in the field far exceeded their ratio to the whole population of the country, and they held military positions from brigadier-general down. Hon. Simon Wolf, in his work, 'The American Jew as Patriot, Soldier and Citizen,' has, by means of enormous labor and investigation, collected available names and records of Jewish soldiers in the Federal army and navy, in which he reports that during the Civil War, no fewer than 7,884 Jews served, and even these numbers are necessarily incomplete. As the Jews were Union men in the North, so those living in the South generally espoused the cause of the Confederacy; but Mr. Wolf's figures include less than 2,000 Confederate Jewish soldiers. The number included by him as serving in the Union and Confederate navies is almost negligible. A similar list of Jews who served during the Spanish-American War has been compiled (American Jewish Year Book 1900–01, pp. 527–622), and includes thousands of names, again exceeding the relative ratio based on that of the total number of persons serving to the total population; and President Roosevelt, years later, felt called upon to compliment them publicly upon their bravery, as indicated by instances of Jews who served under him and were commended for gallantry. Neither have Jews failed to enlist in our navy, for since the latter was instituted, a number of Jews have notably risen from the files to naval distinction, as witness the careers of Capt. Etting, Maj. David M. Cohen of the United States Marine Corps, Capt. Levi M. Harby, Capt. Jonas P. Levy, and "Commodore" Uriah P. Levy, who at the time of his death in 1862 was the ranking officer in the United States navy. Nor have Jews failed to render the government signal services in private life. Haym Salomon, the associate of Robert Morris and Madison, was broker to the Office of Finance, and it was through his hands that the loans from France and Holland to the infant republic passed; he made heavy advances to the government, which at the time of his death was indebted to him in hundreds of thousands of dollars, which have never been repaid, in spite of repeated Congressional reports in favor of the claim. During the Revolutionary period, there were still others who aided the government's hazardous financial fortunes. Among the most distinguished Jewish patriots of the Revolution stands Francis Salvador, who was a member of the South Carolina Provincial Congress and of the General Assembly of that State. On the other hand there were, naturally enough, also a few Tories among the Jews, chief among whom were David Franks of Philadelphia, who had been British commissary-general, during the French and Indian war, together with his father, Jacob Franks. David Franks' daughter, Rebecca Franks, was one of the leading belles and wits of Philadelphia and New York during the Revolution. A number of Jews have served in Congress, both in the Senate and the House of Representatives, the most prominent among them having been Judah P. Benjamin (q.v.), who resigned his seat in the Senate to become attorney-general, secretary of war, and then secretary of state of the Confederate States, and subsequently became leader of the English bar. Several Jews have been U. S. ministers to Turkey and consuls-general, one of the former, Oscar S. Straus, now being a member of the Permanent Court of Arbitration at The Hague. Many have been judges in different States, and several have been attorneys-general of their States. A number have been mayors of leading cities, while many others have held local and

State offices. Among those who rendered our government most valuable services in trying financial times are J. & W. Seligman & Co. Several Jews, particularly Moritz Pinner, David Einhorn, and M. Heilprin, were active workers for individual liberty in the anti-slavery movement.

Charities and Other Institutions.— The Jewish charities of the United States are unequaled in magnitude and efficiency, compared with the total Jewish population. Naturally enough, the enormous exodus of well-nigh indigent Jews to these shores has greatly increased the burden falling on their more fortunate coreligionists. The amounts disbursed by the organized Jewish charities in New York city alone exceeds $1,000,000 per annum. Almost every possible field of charitable endeavor is attended to. New York city, for example, contains three Jewish hospitals, a home for incurables, two Jewish orphan asylums, two Hebrew technical schools, an educational alliance, a home for aged and infirm, and an organization of United Hebrew Charities for direct relief; and these are but a few out of scores of charitable societies and institutions. The pure milk depots opened by Nathan Straus, at a heavy loss to himself, in New York — an example which has been followed in other cities — is one of the most effective forms of charitable endeavor, and has saved thousands of infant lives. Various Jews of the United States have contributed hundreds of thousands of dollars at a time in individual instances to charitable purposes, best known among whom Mr. Jacob H. Schiff of New York, who is credited with observance of the old Jewish practice of giving a tithe of his income to charity. The arbitration movement for settling controversies between capital and labor, known as the Civic Federation, has enlisted several Jews in its directorate. The Jewish charities of the United States are being systematized and organized more and more from year to year; aid is being afforded by the newly instituted annual national conferences of Jewish Charities, and under their auspices, removal offices have been opened within the United States to aid indigent immigrants after arrival, to seek locations for them in the interior of the country, and thus somewhat relieve the congestion of the large Eastern cities. Of course all the local New York charities deal particularly with recent arrivals, but the Baron de Hirsch Fund and the Educational Alliance especially address their efforts toward them.

A number of very large mutual benefit and mutual development societies, taking the form of fraternities of Jewish lodges, exist within the United States and do much good, chief among them being the Independent Order B'nai B'rith, the Independent Order Free Sons of Israel, and the Independent Order Sons of Benjamin. The recently organized Zionist movement has appealed greatly to many thousands of Jews in America, particularly to the more orthodox, and they have organized numerous societies to aid in establishing a Jewish state, in Palestine or elsewhere, for the benefit of the persecuted Jews of eastern Europe.

Jew's Harp, a small musical instrument held between the lips, the sound coming from the vibrations of a tongue of metal, bent at a right angle, which is set in motion by being twitched with the fore-finger. The sound is increased in intensity by the breath, and altered in pitch by the shape of the cavity of the mouth, which acts as a reflector. The name some derive from *jeu,* play, from the fact of its being a toy; but more probably it is a derisive allusion to the harp of David.

Jew's Mallow, a pot-herb. See CORCHORUS.

Jex-Blake, Sophia, English physician: b. Sussex January 1840. She was the daughter of a physician, studied medicine in Boston, Mass., 1866–8, and returning to England matriculated at the University of Edinburgh, but was not allowed to complete her studies there and take the degree of M.D., which she subsequently obtained at the University of Bern. She founded the London School of Medicine for Women, the Edinburgh School of Medicine for Women in 1886, and retired from active practice in 1899. She has published 'American Schools and Colleges' (1866); 'Medical Women' (1872); 'Puerperal Fever' (1877); 'The Care of Infants' (1884).

Jez'ebel, the Phœnician wife of Ahab, king of Israel. She was the evil genius of her husband, favored the idolatrous worship of Baal in Palestine, and persecuted the prophets of Jehovah. Her name left a dark stain upon the annals of Israel and survived to the later dispensation where it occurs in the Book of Revelations (Rev. xi., 20) as a symbol of feminine depravity and impiety.

Jhelam, jē'lam, or **Jhelum** (ancient HYDASPES), a river which has its rise in Kashmir. An octagonal tank has been built in a garden at Vernag, and into this reservoir flow springs

from the Western Himalayas, which form the head waters of the Jhelam. The river flows northwest to the Wulur Lake, about 10 miles from Srinagar; then southwest and northwest, forming a curve from Wulur Lake through Barambula Pass to Mazufurubad, where it turns south, and flows along the boundary between Punjab and Kashmir, a distance of about 100 miles. Leaving the boundary line at Jhelam it flows southwest into the Chenab River. Its whole course is about 500 miles, nearly all of which is navigable. The first part of its course is through remarkable mountain scenery and the last through a rich agricultural region. It is the thoroughfare for a number of large cities and small towns. This is the river upon the banks of which Alexander the Great built a war fleet in 326 B.C. and fought a battle with Porus.

Jig, a light quick tune or air to be found in the sonatas of Corelli, Handel, and other composers till toward the middle of the 18th century. The Irish jig, played to a dance also called a jig, is a lively tune of two or three sections written in 6–8 time. The jig is popular among many nations, is distinguished by various titles, and has a certain amount of difference in the steps according to the habits and customs of the people by whom it is adopted. With some it is a sober, steady country dance; with others it is a wild, savage exercise, without point of meaning. With some it is made a means of displaying the agility of the lower limbs of a combined company of dancers; with others it is a terpsichorean drama for two performers, in which all the emotions excited by love are represented by gestures and cries.

Jig'ger, the corrupt current form of "chigoe," the South American name of a small arachnid, or red bug (*Sarcopsylla penetrans*), which abounds in tropical America, and is troublesome by working its way under the skin, especially of the feet, where, unless speedily removed, it produces eggs and forms a bad sore.

Jihad, jĭ-häd', **Jehad,** or **Tihad** (Arab. "zeal, endeavor"), the term applied to the religious war, as undertaken by Mohammedans against those who did not believe in the mission of the Prophet, for the purpose of promoting the spread of Islam. The Jihad was a religious duty, imposed upon the faithful both by the Koran and the concurrence of sacred tradition. Its purpose was ostensibly the Mohammedanization of the unbelieving, and it was carried on in a systematic manner. The disposition of the peoples conquered in the Jihad was prescribed by law. Captives and others who fell into the hands of the Mohammedan hosts had the choice of three things given them. Either they were to deny their own faith and accept that of Islam, or to consent to pay a toll tax to their conquerors. If they refused both of these alternatives they were put to death by the sword. Consult: Baillie, 'Of Jihad in Mohammedan Law' (1871); T. T. Hughes, 'Dictionary of Islam' (1886).

Jim'son-weed. See DATURA.

Jingal, jĭn'gâl, a large heavy musket used in eastern Asia, especially by the Chinese. It is fired on a rest, or swivel, from a wall, or the bulwark of a boat or ship.

Jingo, a word first used as a political term in the Russo-Turkish War of 1877–8, and was applied to a class of British politicians who continually urged on Disraeli, then the prime minister, the necessity of taking sides with the Turks. The word was adopted from "McDermott's War Song"—that is, the song sung in music halls by McDermott and very popular at the time. The chorus ran thus:

> We don't want to fight, but, by Jingo! if we do,
> We've got the ships, we've got the men, we've got the money, too.

Jinrikisha, jĭn-rĭk'ĭ-shạ ("man-power vehicle"), a two-wheeled carriage, resembling a gig, and drawn by a human runner between the shafts, universally used in Japan since 1868.

Jiu Jitsu, the Japanese method of personal attack and self-defense, literally means the gentle art of making one's opponent use his strength to his own disadvantage. There are many methods, but only one is recognized as official, that devised by Prof. Jiguro Kano, principal of the High Normal School of Tokyo, and is taught to every officer and enlisted man of the Japanese army, navy and police departments. Included in the one hundred and sixty feats of the Kano system are the "serious tricks," by which death may be caused at the will of the adept, and the process of kuatsu or revivification, by which the apparently lifeless victim is restored to the full use of his functional powers. Jiu Jitsu is not a system of muscle building by physical training, but rather a means of offsetting the effectiveness of powerful muscles, by performing the most skilful yet simple maneuvers. The United States Government has recognized its importance as science by having it taught at West Point and Annapolis as a special training. Consult Skinner, 'Jiu Jitsu' (New York 1904).

Joab, jō'ăb, the son of King David's sister Zeruiah, and commander-in-chief of David's army. He is first mentioned as the leader of David's men in an expedition against Abner. When Joab treacherously murdered Abner in revenge for the death of Asahel, David dared not punish the deed, and thus showed the ascendency which Joab had acquired over him. After David had been established king in Jerusalem, Joab conducted all his wars with uniform success. He remained faithful to him during the rebellion of Absalom. When he had slain that ungrateful son, David made a weak attempt to supersede him in favor of Amasa, the general of Absalom. Joab slew Amasa and resumed his post, a proceeding in which the king tacitly acquiesced. He further supported David by assisting in the murder of Uriah the Hittite. Toward the close of David's reign he joined in the rebellion of Adonijah, for which Solomon, by the advice of David, put him to death.

Joachim, yō'ä-hĭm, **Joseph,** Hungarian violinist: b. Kittsee, near Presburg, 28 June 1831; d. Berlin 15 Aug. 1907. He studied under Szervaczinsky at Budapest, with Böhm at Vienna, and Hauptmann at the Vienna Conservatory, and after appearances in concert, continued his studies at Leipsic. In 1849 he became concert-meister of the Weimar grand-ducal orchestra, of which Liszt was then conductor, in 1854–66 was solo-violinist and conductor of concerts to the king of Hanover, and in 1868 became director of the Hochschule für ausübende Tonkunst at Berlin. He became known, both

as an interpreter of the best music and as an executant, as the greatest violinist of his time, and particularly as a quartette player gained an almost classic reputation. His compositions include the 'Hungarian Concerto' in D-minor for violin and orchestra, his most important work; ballads, trios, overtures, marches, and works for violin and pianoforte.

Joachim, jō'a-kĭm, Saint, Order of, an order of knighthood founded 20 June 1755, under the title "Order of Jonathan for the purpose of defending the honor of Divine Providence." It consisted of 14 dukes, princes, counts and nobles, and its grandmaster was Prince Franz Christian of Saxe-Coburg. Its object was by the establishment of commanderies to stir up the rich to philanthropic work among the lower classes. This order was still in existence in 1820, but it has since then been dissolved.

Joan (jo-ăn or jōn) **of Arc** (JEANNE D'ARC — properly DARC), the Maid of Orleans, heroine in French history: b. Domrémy, Basse Lorraine, now department of the Vosges, 6 Jan. 1412; d. Rouen 30 May 1431. While she was still a girl she began to be deeply affected by the woes of her country, much of which was conquered by the English and their Burgundian allies, leaving only a small portion to the French king, Charles VII. From about 13 she declared she heard heavenly voices, which at last became very definite in their commands to go to the aid of Charles and liberate France. At first she was regarded as insane, but eventually she found her way to the king and his councillors, and having persuaded them of her sincerity, received permission to hasten with Dunois to the deliverance of Orleans. In a male dress, fully armed, she bore the sword and the sacred banner, as the signal of victory, at the head of the army. The first enterprise was successful. With 10,000 men she marched from Blois, and on 29 April 1429 reached Orleans with supplies. By bold sallies, to which she animated the besieged, the English were forced from their intrenchments, and Suffolk abandoned the siege (8 May 1429). Other successes followed; Charles entered Rheims in triumph; and at the anointing and coronation of the king, 17 July, Joan stood at his side. She then asked to be allowed to return home, but at the urgent request of King Charles, remained with the army. She was later less successful and failed to capture Paris. On 24 May 1430 she entered Compiègne, then besieged by the Burgundians, and on the same day, in a sally from the town, was taken prisoner. Subsequently she was delivered to the English, who, with the University of Paris and the bishop of Beauvais, demanded her execution as a sorceress. She was taken to Rouen, and after a long mock-trial, accompanied with many shameful circumstances, condemned to death. On submitting to the church, however, and declaring her revelations to be the work of Satan, her punishment was commuted to perpetual imprisonment. But pretexts were soon found to treat her as a relapsed criminal, and as such she was burned at Rouen, and her ashes were thrown into the Seine. She died with undaunted fortitude. Her recantation is now doubted by some historians. Voltaire, in a notorious burlesque, 'La Pucelle,' Southey, Schiller, and others have made her the subject of their verse. Schiller's drama, 'Die Jungfrau von Orleans,' still remains the worthiest monument of her fame. A revision of the trial was later had, and she was declared innocent (1456). From 1875 the question of her canonization was discussed at Rome, and in 1902 she had been pronounced "venerable." Consult: Quicherat, 'Condemnation et Rehabilitation de Jeanne Darc' (1841–9); Marin, 'Jeanne Darc, Tacticien et Stratégiste' (1891); Oliphant, 'Jeanne d'Arc' (1896); Murray, 'Jeanne d'Arc' (1902).

Joan of Arc, Personal Recollections of, a historical novel by "Mark Twain" (S. L. Clemens), published in 1896. It professes to be a translation by Jean François Alden from the ancient French of the original unpublished MS. in the national archives of France, written by the Sieur Louis de Conte, her page and secretary. The historical facts are closely followed.

Job, jōb, Book of, title of a book in the Old Testament, so called from the man whose history it relates. It cannot be ascertained with certainty when the book was produced. Job himself belongs to the patriarchal age, but the book was written at a period when great calamities had fallen upon the people of God, and they had been driven by bitter experience to consider the nature and object of His providential workings. It is probably later than Jeremiah (626 B.C.) or Habakkuk (604 B.C.), both of whom had paid some attention to this problem.

The prologue (ch. i. ii.) is written in prose. Satan is permitted to test Job's trust in God, and the patriarch is suddenly stripped of his possessions and bereaved of his children. Yet Job ascribes no wrong to God. He himself is smitten with deadly leprosy. Job's three friends came to see him and he bursts into a despairing cry for death.

The debate between Job and his three friends (ch. iv.–xxxi.) is written in poetry. These friends attribute Job's affliction to his sin and hypocrisy. They are answered by Job's self-vindication; he adjures God to reveal the cause of his chastisement. In the speech of Elihu, a youth, who has listened to the debate, the goodness of God is asserted. He afflicts men to deter them from sin.

Then the Lord speaks out of the whirlwind (ch. xxxviii.–xlii. 6) and shows his power as Creator and Preserver of all things in the material world. Job answers, "I have heard of Thee with the hearing of the ear, but now mine eyes see Thee." The epilogue is in prose. Job is restored to health and prosperity.

The meaning of the book seems to be, that suffering or calamity is not a proof of guilt in the sufferers; the ways of God are so high, His power so vast in creation, in the government of nations and in the realm of mind, that man is incapable of gauging His methods of overruling human life.

Job's Tears, a stout grass (*Coix lachryma-jobi*), allied to maize, and which is sometimes seen six or eight feet in height. It is a native of southern Asia, is naturalized in Spain, and in other countries is sometimes grown in hothouses. The hard, round, shining seed-capsules, from whose fanciful resemblance to tears the plant derives its name, are used in making rosaries and ornamental articles, as medicine by the Chinese, and as a staple food among some of

the hill-tribes of northern India. See also, GRASSES IN THE UNITED STATES.

Jocelyn, jŏs'ĕ-lĭn, **Ada Maria Jenyns,** English novelist: b. Aldershot, Hampshire, 7 Sept. 1860. She was married to Colonel R. J. O. Jocelyn in 1892. Among her numerous fictions may be mentioned 'A Distracting Guest' (1889); 'Only a Horse Dealer' (1892); 'Pamela's Honeymoon' (1894); 'Lady Mary's Experiences' (1897); 'The Seat of Fortune' (1901).

Jocelyn, Nathaniel, American portrait painter: b. New Haven, Conn., 31 Jan. 1796; d. there 13 Jan. 1881. At 18 he was apprenticed to an engraver, but after three years his early love for painting asserted itself and he established himself as a portrait painter at New Haven in 1820. He was for some time resident in Savannah, where he painted many portraits, but returned to his native town where his work was very popular and where from 1825 to 1835 he painted the portraits of many notables, not a few of which are preserved in Alumni Hall at Yale. His fame extended beyond the limits of his State and he exhibited at the Academy of Design on several occasions. At the age of 80 he painted 'Ocean Breezes,' a successful work of fancy, and his only one. His portraits have been greatly prized by critics. Jocelyn was a staunch anti-slavery man, and his home in New Haven was long one of the stations on the Underground Railroad. He was for many years the senior partner of a bank-note engraving company in New York which subsequently became the American Bank Note Company, resigning from the latter in 1867.

Joe Miller, the name attached to a well known collection of jests, first published in 1739. The name belonged to a comic actor, Joseph Miller (1684–1738), who had then a great reputation as a wit and humorist. The real compiler, however, was a certain John Mottley, an obscure author (1692–1750). The term is now often applied to any stale or worn out jest.

Joe Pye Weed. See EUPATORIUM.

Joel, jō'ĕl, one of the minor prophets. He most probably flourished about 770 B.C., a few years before Amos and Hosea, whose writings have many correspondences with his. Joel's prophecy is full of Oriental symbolism, and is pervaded by a tone of solemn warning. He announces what he calls "a day of Jehovah," that is, a day of judgment and vengeance for Judah and Jerusalem. This is typified by a plague of locusts whose devastations are vividly described. The prophet appeals to the people to meet the impending judgment by prayer and fasting. Jehovah himself is represented as giving his answer to the cry for help; relief from famine, abundant rain, rich harvests are to bring relief. Moreover a new spirit is to be poured out upon the people so that in the day of trial they shall call upon God and be saved. The people of Jehovah sold into captivity by Phœnicians and Philistines are to be restored. The nations are to be called to judgment, and in that fearful day Jerusalem shall find refuge in Jehovah. The style of the prophet is gorgeous in its profusion of imagery; metaphor and hyperbole have to be interpreted, and fact discerned amid the maze of fancy. Yet the language is smooth and flowing without the strain and abruptness of Hosea and Jeremiah, and we are compelled to look upon Joel as a man of calm and settled mind, without any of the doubts and struggles that racked the minds of other Hebrew poets and prophets.

Jogues, zhōg, **Isaac,** French missionary among the North American Indians: b. Orleans 10 Jan. 1607; d. Ossernenon, near the present Awnesville, Montgomery County, N. Y., 18 Oct. 1646. He became a Jesuit at Rouen in 1624, and, after some years passed in study and teaching, was ordained in 1636. At his own request he was immediately sent to the Huron mission in Canada. In 1639 he undertook a mission to the Tobacco Nation, in 1641 preached to the Algonquins at Sault Sainte Marie, not long after went to Three Rivers for supplies for the Huron Mission, and upon his return was captured by the Mohawks and severely tortured. He remained among the Indians as a slave, until the summer of 1643, when he made his escape to the Dutch settlement of Rensselaerswyck (Albany), and was conveyed thence to New Amsterdam. He finally reached France, where he was treated with great consideration, and invited to court. Returning to Canada, he traveled to the Mohawk country in May 1646, in the capacity of an ambassador to conclude a treaty between that people and the French. Ascending the Sorel, he passed through Lake Champlain and Lake George, which he named Lac Saint Sacrement. Having ratified the peace he returned to Quebec, and after a few days' rest set out for the Mohawks again, this time as the founder of the Mission of the Martyrs. He was soon tortured as a sorcerer, and finally killed. Consult: Martin, trans. by Shea, 'Father Isaac Jogues' (1896); Parkman, 'The Jesuits in North America' (new ed. 1898).

Johannesburg, yō-hän'nĕs-boorg or jō-hăn'nĕs-bĕrg, South Africa, the metropolis of the Transvaal Colony, situated 5,500 feet above the sea, about 30 miles southwest of Pretoria, with which and with Delagoa Bay 397 miles, Durban 483 miles, East London 668 miles, Port Elizabeth 715 miles, and Cape Town 1,015 miles, it is in railway communication. It is the recognized business centre of the rich gold fields of the Witwatersrand, and the largest town in the Transvaal. In 1886 it was represented by a few shanties, but the discovery of gold and the development of gold mining made it within a comparatively few years one of the most important towns of South Africa. Municipal government was conferred upon the city by the Transvaal authorities in 1896, when the population within a three-mile radius was 102,078, of whom 50,907 were whites, 67 per cent of these being of British origin, while the Boer citizens numbered 6,205. The great Uitlander agitation which culminated in the Transvaal war 1899–1902, centred in Johannesburg, which was occupied by Lord Roberts in 1900. Since the close of the war, important public improvements to cost $30,000,000 have been begun. These include many miles of well-paved streets, an elaborate electric car system, new waterworks, sanitation system, a factory section, and handsome suburbs. Mementoes of the former Boer rule are an imposing but dismantled

fortress which dominates the town, and the monument near Krugersdorp which commemorates the declaration of Boer independence in 1880. Among the notable buildings and institutions are: many fine hotels, clubs, etc.; a handsome railway station lighted by electricity; the market buildings, in the large Market Square, where also are the post and telegraph offices and the buildings of the chamber of mines; the fine public library building; the stock exchange; the court-house; many churches; a synagogue; a good hospital; a jail and a police barracks, and a new theatre and opera house. The town is lighted partly by gas but mainly by electricity.

In 1903 there were 160 incorporated mining companies employing 40,000 natives. Prior to the war 96,000 natives were working in the mines; 124 of the mining claims are located on the main reef and the others in the neighborhood of Klerksdorp. Prior to the war the gold production was valued at $7,000,000 a month, and the machinery employed was estimated at $100,000,000. The industry is fast recovering itself, and it is estimated that within a few years the annual production of gold will be equal to $121,500,000. The international peace exhibition of South Africa, to be held at Johannesburg 1904–5, is expected to fully rehabilitate commercial interests, and it is predicted that within six years Johannesburg will have a population of 200,000.

John, the name of 23 popes, as follows:

John I., Saint: b. Tuscany; d. 526. He succeeded Hormisdas in 523, and was a friend of Boethius, who dedicated to him several of his works. Theodoric sent him to Constantinople, to induce the Emperor Justin to adopt milder measures toward the Arians. Though received with uncommon pomp, his mission was fruitless, and on his return Theodoric threw him and his companions into prison, where he died. He is commemorated by the Roman Catholic Church 27 May.

John II. (Mercurius, mėr-kū′rĭ-ŭs): d. Rome 27 May 535. He was a Roman and was surnamed Mercurius by reason of his eloquence. He became pope in 532.

John III.: d. Rome 12 July, 572. He was a Roman and became pope in July 560. During his time the Lombards frequently ravaged Italy.

John IV.: b. Salona in Dalmatia; d. Rome 11 Oct. 642. He was elevated to the papal chair in December 640 and was noted for zeal and orthodoxy. He formally condemned the Monothelitic statement of faith which Sergius had drawn up at the desire of the Emperor Heraclius.

John V.: b. Antioch, Syria; d. Rome 2 Aug. 686. He was the earliest of several pontiffs of Oriental origin and had been sent to the sixth General Council by Pope Agatho as legate. He became pope, 24 July 685.

John VI., he was a Greek by birth; d. Rome 9 Jan. 705. He became pope in 701, and when appealed to with reference to the long dispute between Saint Wilfred of York and the archiepiscopal see of Canterbury, decided in favor of the latter.

John VII., a Greek: d. Rome 17 Oct. 707. He became pope 1 March 705.

John VIII., a Roman: d. Rome 15 Dec. 882. He became pope in 872. The Saracens during his pontificate pushed their ravages to the gates of Rome, and he was compelled in 877 to pay them tribute. He crowned three emperors, Charles the Bald, 875; Louis the Stammerer, 878; and Charles the Fat, 881. He attempted, but unsuccessfully, to unite the Greek and Latin churches.

John IX.: b. Tibur; d. May 900. He belonged to the Benedictine order and became pope, as the choice of the Frankish party, in June 898.

John X.: b. Romagna; d. July 929. He was a man of great ability and of virtuous character notwithstanding the aspersions Liutprand casts upon him. He was archbishop of Ravenna in 905 and became pope in 914. He placed himself at the head of an army and drove the Saracens from Italy, but his determination to rule independently of any faction aroused the anger of his opponents and he was imprisoned, and at length murdered, by Theodora's daughter, Marozia, whose ambitions he had thwarted.

John XI.: b. 906; d. 936. He was the son of Marozia (q.v.) and Guy, duke of Spoleto. He was elected pope while under age in 931, and governed through the influence of his mother. His brother Alberic II. revolted and imprisoned the pope and his mother in the castle of San Angelo, where John died.

John XII. (Octavian): d. Rome 14 May 964. He was the son of Alberic and grandson of Marozia. He became pope in 956, after the death of Agapetus II., though only 18, and was the first pope who changed his name on accession to the papal dignity. He applied to the emperor Otho I. for assistance against Berengarius II., crowned the emperor 962, and swore allegiance to him, but soon after revolted against Otho, who caused him to be deposed by a council, in 963, and Leo VIII. to be elected. On Otho's death, in 964, John returned and excommunicated his rival.

John XIII., a Roman: d. Rome 6 Sept. 972. He was bishop of Narni, was made pope in 965 by the influence of the emperor Otho I., and was expelled by the Roman nobles. Otho II. restored him to Rome, and was crowned by him. The Poles and Hungarians were converted during his pontificate.

John XIV. (Peter): b. Pavia; d. Rome 20 Aug. 984. He was bishop of Pavia and had been chancellor to Otho II. who made him pope in November 983, in place of the anti-pope Boniface VII. The latter had seized the papacy after the death of Otho I. Boniface now returned from Constantinople and imprisoned John in the castle of San Angelo, where he died soon after.

John XV.: d. Rome April 996. He did not reach the blood-stained throne of his predecessor. He died within the month of his election, even before his consecration.

John XVI. (Philag′athus), a Greek of Calabria: d. 996. He became pope in 986. He solemnly canonized St. Udalbric, bishop of

Augsburg. This is the first historical mention we find of a solemn pontifical canonization.

John XVII. (Sic'co): b. Ripa Jani; d. Rome 7 Dec. 1003. An anti-pope intruded during the pontificate of Gregory V.

John XVIII. (Phasianus, fa-sē-ā'nŭs). He became pope on Christmas Day 1003, and in May 1009, resigned his office and entered a monastery.

John XIX., a Roman: d. January 1033. He succeeded his brother Benedict VIII. He was disposed to concede the title Ecumenical to the Patriarch of Constantinople, but this met with so much opposition from the Latin Church that he was obliged to withdraw the concession.

John XX., frequently called **John XXI.** (Pedro, pā'drō): b. Lisbon, Portugal; d. Viterbo, Italy, 20 May 1277. He became in 1273 cardinal-bishop of Frascabi and pope in September 1276. He was learned in philosophy and medicine and wrote several treatises still of interest as showing the status of mediæval medicine.

John XXI. See John XX.

John XXII. (Jacques D'Euse, zhäk dēs): b. Cahors about 1244; d. Avignon 4 Dec. 1334. He was archbishop of Avignon, and was elected pope at Lyons 1316, after the death of Clement V. He resided at Avignon, but had many adherents in Italy. He is important in German history on account of the active part he took in the disputes of the emperors Louis of Bavaria and Frederick of Austria. Louis intruded the anti-pope Nicholas V. and declared John XXII. deposed. Several theological controversies filled his pontificate with ecclesiastical strife, the most notable being the question of absolute Evangelical poverty raised by the Franciscans and that of hominalism led by William Ockam. He published in 1317 the 'Constitutions of Clement V.,' a manual of canon law, since known by the title 'Clementines' (q.v.). He was also the author of the decretals called 'Extravagantes.' See Canon Law.

John XXIII. (Baldassare Cossa, bäl-däsä'rā kōs'sä): b. Naples; d. Florence 22 Dec. 1419. He was elected pope in 1410, by the Council of Pisa, after the death of Alexander V., on condition that, if Gregory XII. and Benedict XIII. would resign, he would also retire to end the schism. He summoned the Council of Constance, demanded by the Emperor Sigismund, in 1415, where he confirmed his resignation 2 March; but 20 March he fled secretly from Constance to Schaffhausen, and revoked his resignation. He was cited before the council, but not appearing, he was suspended, and finally deposed. He was imprisoned four years. Pope Martin V. subsequently pardoned him and made him cardinal bishop of Tuscoli, and dean of the college of cardinals.

John, king of England: b. Oxford 24 Dec. 1166; d. Newark, Nottinghamshire, 19 Oct. 1216. He was the youngest son of Henry II., by Eleanor of Guienne. Being left without any particular provision he received the name of *Sans Terre* or Lackland; but his brother, Richard I., on his accession conferred large possessions on him. He obtained the crown on the death of Richard in 1199, although the French provinces of Anjou, Touraine, and Maine declared for his nephew, Arthur of Brittany, who was lineally the rightful heir, then with the king of France. A war ensued, in which John recovered the revolted provinces and received homage from Arthur. In 1201 disturbances again broke out in France, and Arthur, who had joined the malcontents, was captured and confined in the castle of Rouen, and never heard of more. John was universally suspected of his nephew's death, and in the war which followed, he lost Normandy, Anjou, Maine, and Touraine. In 1205 his quarrel with the pope began regarding the election to the see of Canterbury, to which the pope had nominated Stephen Langton. The result was that Innocent III. laid the whole kingdom under an interdict, and 1211 issued a bull deposing John. Thereupon John made abject submission to the pope, even agreeing to hold his kingdom as a vassal of the pope (1213). His arbitrary proceedings led to a rising of his nobles, and he was compelled to sign the Magna Charta or Great Charter 15 June 1215. But he did not mean to keep the agreement, and obtaining a bull from the pope annulling the charter, raised an army of mercenaries and commenced war. The barons, in despair, offered the crown of England to the dauphin Louis, who accordingly landed at Sandwich 30 May 1216, and was received as lawful sovereign. The issue was still doubtful when John died. Consult: Stubbs, 'Constitutional History of England,' Vol. I.; Norgate, 'England under the Angevin Kings' (1887), and 'John Lackland' (1902).

John II., king of France, surnamed the "Good": b. about 1319; d. London 8 April 1364. He was the son of Philip VI. and was a monarch distinguished alike for his incapacity and his misfortunes. In 1356 he was defeated and taken prisoner by the Black Prince at the battle of Poitiers, and detained at Bordeaux and at London till released at a heavy expense to his country by the Peace of Brétigny in 1360. On learning that his son, the duke of Anjou, who had been left as a hostage in England, had effected his escape, he returned to London, where he died.

John III. (Sobieski), king of Poland: b. Olesko, Galicia, 2 June 1624; d. 17 June 1696. John Casimir appointed him standard-bearer to the crown, and he distinguished himself in the war against the Russians and Swedes, which terminated with the Peace of Oliva in 1660. In 1669 Michael Koribut was chosen king on the resignation of John Casimir against a party who preferred Sobieski. On the death of Michael he was chosen king, 21 May 1674. A new war with the Turks was concluded after varying success by a peace, 27 Oct. 1676. The anarchy in which Poland was constantly kept by the turbulence of its aristocracy was aggravated during the reign of Sobieski by the intrigues of his wife, and his own talent for administration was not equal to his capacity as a general. Besides internal troubles, European politics at this time occupied the attention of Sobieski, whose alliance was solicited both by Louis XIV. and the emperor. He at length concluded (31 March 1683) an alliance with the latter against the Turks, who had allied themselves with the

malcontents in Hungary and threatened a most formidable invasion of the empire. Uniting with the Austrian forces 9 September, at the head of a combined force of 83,000 men, he inflicted a decisive defeat on the Turks, and compelled them to raise the siege of Vienna, 12 Sept. 1683. He terminated the campaign with the capture of Gran (27 October), which had been in the possession of the Turks for nearly a century and a half. In 1686 he overran Moldavia and Wallachia, but failed to make a permanent conquest.

John of Austria, commonly called **Don John of Austria,** Spanish general: b. Ratisbon, Bavaria, 24 Feb. 1547; d. near Namur, Belgium, 1 Oct. 1578. He was an illegitimate son of the emperor Charles V. In 1570 he conducted a campaign against the Moors of Granada with great vigor and relentlessness, and in the following year commanded the allied fleet which won the great naval battle of Lepanto over the Turks (7 Oct. 1571). In 1576 he was appointed governor of the Netherlands, and had won with the Prince of Parma the victory of Gembloux (1578) over William the Silent, when he died, not without suspicion of having been poisoned by his jealous half-brother, Philip II., but for this belief there is no evidence. Consult: Motley, 'The United Netherlands'; Stirling-Maxwell, 'Don John of Austria' (1883).

John of Gaunt, gänt or gânt, Duke of Lancaster, English soldier: b. Ghent, Flanders, (whence his name) 1340; d. London 3 Feb. 1399. He was the fourth son of Edward III. and his queen, Philippa of Hainaut. He was created Duke of Lancaster in 1362; served in the French wars, and became governor of Guienne. He assumed in right of his wife the title of King of Castile, invaded that kingdom to assert his claims, but relinquished them in favor of Prince Henry of Castile, his son-in-law. He was a supporter of the reformer John Wiclif, and a patron of the poet Chaucer. Shakespeare introduces him as a prominent figure in the play of 'Richard II.' His eldest son, Bolingbroke, became king of England as Henry IV. Consult: Longman, 'Life and Times of Edward III.' (1869); Trevelyan, 'England in the Age of Wycliffe' (2d ed. 1899).

John of Leyden, lī'dĕn. See Anabaptists.

John, Epistles of, three letters upon Christian doctrine and conduct attributed to Saint John the Divine, the fourth Evangelist.

The First Epistle of Saint John.— This epistle was attributed to the apostle and evangelist by writers of the generation succeeding that in which he lived. Its thought, diction and style are those of the fourth gospel, though nothing indicates whether it was written before or after that book. Its date cannot be earlier than 90 A.D. nor later than 100 A.D. Critics generally agree that it was written from Ephesus. It was addressed to certain Christians of Ephesus and its vicinity who had fallen into error. These were Docetæ (q.v.) and failed therefore to reach true fellowship in Christ. The apostle presents Jesus as Christ and shows that we come into fellowship with God through Him, and inculcates faith in a real Redeemer, as a means of crushing the practical error whose result was barrenness in religion.

The book is a pastoral letter of instruction and exhortation, not a theological tract or a commentary on the Gospel. The purpose is set forth in chapter v. 13. The epistle falls into three main divisions: (1) God is light (i. 5–ii. 28), (2) God is righteous, or God is love (ii. 29–v. 5), (3) Jesus is the Son of God; fellowship with God comes through him. Sometimes the second division is subdivided under the headings (1) God is love, (2) God is righteous. But the writer evidently intends these two truths to stand as different aspects of the same truth, for as the love of God springs from his righteousness so his righteousness is the outcome of his love.

The Second Epistle of Saint John.— All evidence conclusively points to the apostle Saint John as author of this epistle. It is directed "to the elect lady and her children," who must have been an individual Christian woman; other views are attended with grave grammatical difficulties, whether we translate it to "the lady Elect" or "the elect Kyria." Her name is in fact unknown. The apostle had been met by some of her children and had rejoiced in their conduct, but warns them against defection.

The letter opens with a greeting; expresses joy in her sons' behavior (verse 4); exhorts all to abound in love (verses 5, 6); warns against deceivers (verses 7, 8), in closing the writer expresses a hope of visiting her, and delivers her sister's greeting.

The Third Epistle of Saint John.— It is addressed to Gaius, who cannot be identified with any person of that name mentioned in the New Testament (Acts xix. 29; xx. 4; Rom. xvi. 23; 1 Cor. i. 14). He lived near Ephesus, and was hospitable to the preachers sent by the apostle (verses 2–4). The character of Diotrephes (verses 9–11) Demetrius, who probably bore the letter is commended (verse 12). A vivid glimpse of church life at the close of the 1st century is given in these letters which reveal the Church in Asia Minor infected with speculative error, personal ambition, and insubordination to apostolic authority, and points to opposition which local leaders sometimes exhibited toward the delegates of the central authorities.

John, Order of Saint, a military religious order of mediæval origin. The Knights Hospitallers of Saint John, subsequently known as Knights of Rhodes, and lastly as Knights of Malta, were once a great power in Christian Europe. The origin of the order is unknown, but most probably it was early in its history that a rich merchant of Amalfi built not far from the Holy Sepulchre at Jerusalem a certain church known as Santa Maria della Latina, with a monastery for monks, under the rule of Saint Benedict, and a hospital for pilgrims. The first patron of the order seems to have been Saint John the Compassionate, patriarch of Alexandria in the 7th century. Afterward Saint John the Baptist was chosen patron, and the Benedictine brethren assumed the title of Johannites, or Brothers Hospitallers of Saint John. Pope Paschalis II. in 1113 gave them the privilege of electing their own rector. Later, in addition to the vow of poverty, chastity and obedience they were pledged to make war upon the infidels, and assumed a black cloak with a white cross on the left side. The members were divided

into three classes, knights of noble birth, the fighting class, priests bound to the service of the church, and brethren of service who took care of the sick and acted as guides to the pilgrims. In 1291 the order was driven from Palestine by the conquests of the Saracens, and after holding Cyprus for a time they occupied Rhodes in 1309, from which they were ultimately driven by Sultan Soliman II. in 1522. After that the knights retired to Candia and other places, but finally to Malta, which Charles V. granted them in 1530. Here they continued to be a bulwark of western Europe against the Turkish navies till modern times. The chief of this order, which had great possessions in almost every part of Europe, was called "Grand-master of the Holy Hospital of St. John of Jerusalem, and Guardian of the Army of Jesus Christ." He lived at Valetta, in the island of Malta.

The military duty of the knights consisted in taking the field at least three times against the Turks or the pirates of Barbary. In war they wore a red jacket or tabard, charged with a white cross. In 1798 Malta was unexpectedly attacked and taken by Bonaparte, and about the same time the extensive properties belonging to the order in various countries were confiscated. This may be considered the end of the order as a vital institution, although shortly after the capture of Malta, Paul I., who had been chosen grand-master, took the order under his protection, and it still exists nominally at least. After the death of Paul the nomination of the head of the order was vested in the pope.

John, yŏn, **Eugenie,** "E. Marlitt," German novelist: b. Arnstadt, Thuringia, Germany, 5 Dec. 1825; d. there 22 June 1887. She was the daughter of a portrait painter, and after pursuing the study of music at Vienna, lived at court for some years. She then returned to her native town and took up novel writing, using the pseudonym of "E. Marlitt." Her works, which are very numerous, have been translated into English by Mrs. A. L. Wistar, and have been very popular in this country. Among them are 'Gold Elsie' (1868); 'Old Mamselle's Secret' (1868); 'Countess Gisela' (1870); 'Princess of the Moor' (1872); 'The Second Wife'; 'In the Counselor's House'

John, Saint. See Saint John.

John, Saint, Gospel of. See Gospels.

John B. Stetson University, a coeducational school founded in 1883, at De Land, Fla., under the auspices of the Baptist denomination. The institution was first called De Land University, but in honor of John Batterson Stetson (q.v.), who has given large gifts to the institution, nearly all of the buildings and the campus, the name has been changed. The departments are a preparatory, schools of music, law, art, and technology, a normal and practice school for teachers, a business college, and a college of liberal arts. The courses lead to the degrees of bachelor of arts, laws, and philosophy, and to degrees of bachelor of civil, electrical, and mechanical engineering. The school in 1898 made arrangements with the University of Chicago, whereby the graduates of the college of liberal arts, who have a high standing in their studies, may receive corresponding degrees from the Chicago institution. In 1902 the number of students in attendance was nearly 450, the number of professors and instructors 40. The endowment fund amounted to about $210,500.

John Baptist, the forerunner of the Messiah and the Elijah, or Elias of the New Testament. About five years before the Christian era the Angel Gabriel, according to St. Luke's Gospel, appeared to the aged priest Zacharias and announced the birth of John by Elizabeth, the priest's wife. John was to be filled with the Holy Ghost and to go before the Lord in the spirit and power of Elisha to prepare a people for Him. This was some months before the angel announced in Nazareth, to a maiden called Mary that she should bear a son, whose name was to be Jesus, "the son of God." John Baptist, born 5 B.C. spent his early manhood in the desert. He announced the coming Messiah, and preached repentance, baptizing as a symbolic rite of purification and pardon. He was naturally the first publicly to recognize Jesus Christ and salute him as the "Lamb of God." Herod Antipas (q.v.) then ruled Palestine, his throne being under the protection of Augustus, and he imprisoned the Baptist in the gloomy fortress of Machaerus, east of the Dead Sea, being offended by the plain speaking of the stern ascetic. At a birthday feast given to his Galilean nobles Herod was fascinated by the dancing of Salome, the daughter of Herodias, the wife of his brother Philip, whom he had taken to wife, although her lawful husband still survived. The rebuke administered to Herod for his adultery by John had incensed Herodias and she was bent on vengeance. When Antipas swore to give Salome whatever she might ask to the half of his kingdom, she at her mother's suggestion, asked for the head of John Baptist on a charger or large dish. This was the occasion of the Baptist's martyrdom. The place where this incident happened was the Golden House of Tiberias, whose ruins are still pointed out as Kasr Bint-el-Melek, "Palace of the King's Daughter."

John Brown's Body, a famous marching song of the Civil War, the origin of which has for years been in dispute. It has been generally credited to C. S. Hall of Charleston, Mass., (1861). The words were applied to an old tune common in England in the 18th century.

John Bull, a name first used by the English humorist, Arbuthnot, and since popularized as a typical name suggesting a humorous or burlesque representation of the English character. He is represented as a bluff, jolly, bull-headed farmer.

John C. Green School of Science. See Green, J. C.

John Chrysostom. See Chrysostom, John.

John Doe, a fictitious name given to unknown plaintiffs or defendants in law. In former times the name was applied to the fictitious lessee of the plaintiff in the mixed action of ejectment, that of the fictitious defendant being "Richard Roe."

> But if the lessor made out his title in a satisfactory manner, then judgment and a writ of possession were awarded to John Doe, the nominal plaintiff, who by this trial had proved the right of John Rogers, his supposed lessor.— Blackstone.

John Dory. A fish. See Dory.

John Halifax, Gentleman, a novel by Dinah Maria Muloch Craik (1856), in which the hero, John Halifax, one of "nature's noblemen," beginning life as a poor boy, works his way up to prosperity and happiness, by means of his high principles, undaunted courage, and nobility of character. The heroine is Ursula March; and the simple domestic story includes few minor characters. The interest lies in the development of character: and the author's assertion is that true nobility is of the soul, and does not inhere in wealth, in learning, or in position; and that integrity and loftiness of purpose form the character of a true gentleman.

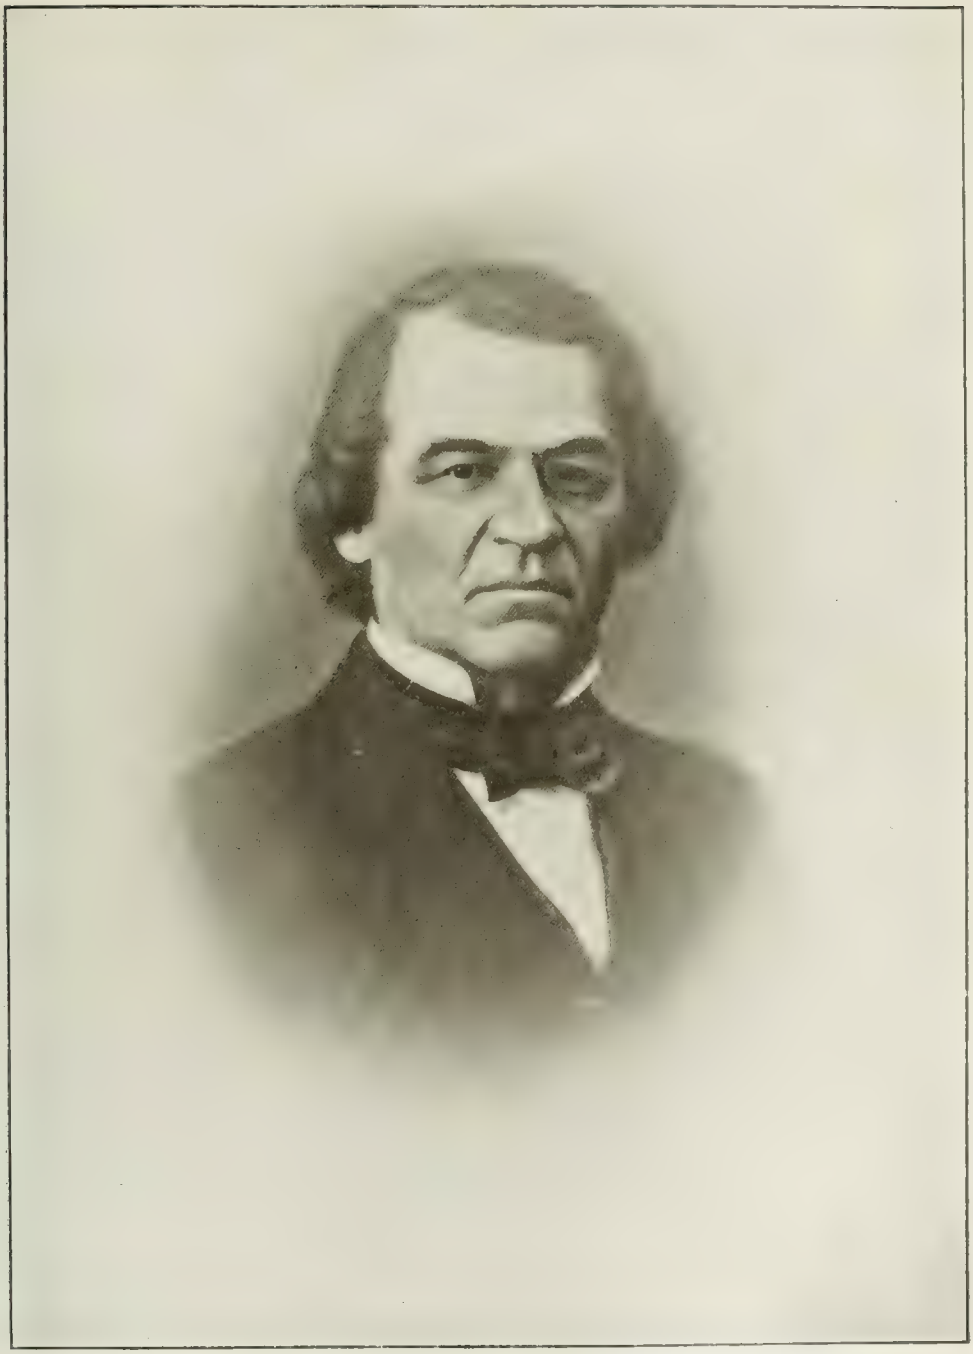
John Paw, a large and beautiful grouper (*Epinephelus Drummond-Hayi*), which is dark umber brown densely covered with small white pearly spots. It inhabits the Gulf of Mexico and is valued as a food fish in Florida. It is also known in the Bermudas, where it is called "speckled hind."

John Strange Winter. See STANNARD, HENRIETTA.

John Ward, Preacher, a novel by Margaret Deland, published in 1888. A Presbyterian minister named Ward, a logical Calvinist, is assured that belief in election and reprobation, eternal punishment, and kindred doctrines, is necessary to salvation; and so preaches them with force and conviction. While his congregation agrees with him, his wife entertains decidedly broad theological views in general. The couple love each other with that singleness of devotion without which the course of the story would be manifestly improbable; for it depends upon the question whether love will be able to hold together what conscientious habits of thought and ethical convictions tend to drive apart.

John's, Eve of Saint, the survival of a popular celebration of remote antiquity, held on the 23d of June, which in Christian times became the vigil or eve of the feast of the nativity of St. John Baptist, 24 June (Midsummer Day). On the eve of the feast it was the custom in former times to kindle fires called St. John's fires. This was indeed a continuance of those Teutonic and Scandinavian pagan festivals, which at the winter solstice were observed with Yule-fires, and at the summer solstice with similar beacon-fires, originally intended to communicate through the country the changes in the seasons announced by the priesthood, so as to direct the activities of agriculture and navigation. The burning of the Yule log at Christmas is a survival of these observances.

Johns Hopkins University, a university at Baltimore, Md., founded by Johns Hopkins, who was born in Maryland and amassed a fortune in Baltimore. He died in 1873 and bequeathed $3,500,000 to found a university. Opened in 1876, it is now one of the foremost universities in the United States. The students are distinguished by the title of graduates and undergraduates, the former being such as have received a degree at this university or elsewhere, and who desire to carry their studies further, special attention being here given to the most advanced subjects, as well as to original research. The buildings of the university include McCoy Hall, in which are the library, assembly room, and rooms appropriated to literary and historical studies: Levering Hall, the building of the Young Men's Christian Association; Hopkins Hall, equipped for the study of geology and mineralogy; a chemical laboratory; a biological laboratory; a physical laboratory; a gymnasium; an administration building; and four buildings for medical instruction.



In 1902 a large tract of land in the suburbs of the city, comprising 176 acres, was presented by several friends as a future site for the University, and it is expected that before many years it will be possible to remove the philosophical department thereto. This noteworthy gift was followed within a few months by a generous contribution, from alumni and citizens of Baltimore, of $1,000,000 toward the permanent endowment of the institution.

Connected with the university is the Johns Hopkins Press, from which issue the 'American Journal of Mathematics'; 'The American Chemical Journal'; 'The American Journal of Philology'; 'Memoirs from the Biological Laboratory'; 'Studies in Historical and Political Science'; 'Journal of Experimental Medicine'; 'Beiträge zur Assyriologie'; 'Modern Language Notes'; 'Johns Hopkins University Circulars'; 'Terrestrial Magnetism and Atmospheric Electricity'; etc.

The degrees of Bachelor of Arts, Doctor of Philosophy, and Doctor of Medicine are conferred. Advanced and graduate students have elective courses, but each instructor has a discretion of his own with regard to admission to his classes. The university reported at the close of 1903: Professors and instructors, 147; students, 695; number of graduates, 1,535; volumes in the library, 115,000; productive funds, $3,488,843; grounds and buildings valued at $1,157,881; value of books and apparatus, $350,000; income, $250,454.

An important place at Johns Hopkins University has always been held by the "fellows." Twenty fellowships are awarded each year to the most promising among the many candidates, without preference of college; each fellowship is of the annual value of $500, though it does not exempt from charges for tuition. In the language of the official announcement of the university, the fellowships are bestowed "almost exclusively on young men desirous of becoming teachers of science and literature, or proposing to devote their lives to special branches of learning which lie outside of the ordinary studies of the lawyer, the physician and the clergyman." The university also extends the privilege of "fellowships by courtesy" (without emolument) to certain individuals.

The university receives as students the following classes: (1) College graduates, who may proceed to the degree of doctor of philosophy, or may work for longer or shorter periods in the various seminaries or laboratories without reference to a degree. (2) Undergraduate students looking forward to the degree of bachelor of arts and following one of seven parallel groups of study. (3) Candidates for the degree of doctor of medicine, for whom a four-year course is provided, and who may be either men or women. (4) Doctors of medicine desiring to pursue certain special courses. (5) Students

ANDREW JOHNSON,

SEVENTEENTH PRESIDENT OF THE UNITED STATES.

who have not taken a degree, and are not looking forward to a degree, but who desire to avail themselves for a brief period of the opportunities here offered. The courses of study under 1, 3 and 4 are entirely closed to those who are still candidates for a baccalaureate degree. The Johns Hopkins University, although giving little attention to applied science and technology, has been a very large factor in determining the character and methods of instruction to which these schools owe their success. It is impossible to overestimate its influence upon higher education in this country, and especially is this true in all things relating to science. There is scarcely an American college faculty that has not been enriched by the presence of one or more of its graduates, bringing with them at least something of the spirit of that institution, its respect for exact scholarship and regard for scientific truth.

Johnson, jŏn'sŏn, **Alvin Jewett,** American publisher: b. Wallingford, Vt., 28 Sept. 1827; d. New York 22 April 1884. He worked on a farm, taught school in Virginia, went to New York in 1853, published 'Johnson's Illustrated Atlas,' a reconstruction of 'Colton's Atlas,' and thereafter several works, including 'Johnson's Universal Cyclopædia,' now known in a revised form as 'The Universal Cyclopædia.'

Johnson, Andrew, the 17th president of the United States: b. Raleigh, N. C., 29 Dec. 1808; d. near Carter's Station, Tenn., 31 July 1875. In 1818 he was apprenticed to a tailor at Raleigh, in 1824–6 worked as a journeyman at Laurens Court House, S. C., and then removed to Greenville, Tenn., where also he worked at his trade. At that time the State of Tennessee was controlled by the landed proprietors, who formed an aristocratic class. Johnson made himself the leader of an opposition or workingman's party, in 1828–30 was an alderman of Greenville, and in 1830–3 its mayor. In 1834 he was a leading advocate of the new State constitution, by means of which the power of the greater landholders was reduced. He was elected to the State legislature in 1835 and again in 1839, as a Democrat of the Jacksonian type. A Democratic elector for the State in 1840, he stumped effectively for the Van Buren ticket, and gained considerable reputation as an orator. In 1840 he was elected to the State senate from the counties of Greene and Hawkins, and during his term urged that the basis of representation should be the white vote without consideration of slave-ownership. In 1843 he was chosen to Congress, to which he was four times re-elected. While in the House he supported the restoration to General Jackson of the fine imposed upon him for the imprisonment of a judge at New Orleans in 1815; the annexation of Texas; the homestead law, distasteful to the Southern slaveholding class; the compromise of 1850; and the presidential veto-power. He was opposed to disregard of economy in the expenditure of public moneys. In 1853 he was elected governor of Tennessee, and in 1855 re-elected after a bitter campaign. He sat in the United States Senate in 1857–62, and there opposed the grant for the construction of a Pacific railway and strongly attacked secession. His vigorous Union attitude rendered him so unpopular in the South that he was several times burned in effigy, and upon his return to Tennessee his life was endangered. Appointed military governor of the State, with rank of brigadier-general of volunteers, 4 March 1862, he displayed great prudence in the employment of his autocratic powers. On 6 June 1864 he was nominated Vice-President of the United States by the national Republican convention assembled at Baltimore, and, elected with Lincoln, entered on his office 4 March 1865. President Lincoln died by assassination 15 April, and Johnson became President. His policy toward the seceded States was, contrary to expectation, one of leniency. On 22 May he opened all Southern ports save four in Texas, to foreign commerce, and 29 May he proclaimed general amnesty to all except 14 specified classes. These and similar measures aroused the opposition of the majority of Republicans in Congress, and thenceforward differences between the executive and legislative branches of the government were constantly arising. Johnson established provisional governments, afterward disallowed by Congress, in seceded States, and Congress retaliated by passing over his veto of 27 March 1866 the civil rights act, admitting freedmen to full citizenship rights. In August 1866 he undertook a tour of the Northern States which became known as "swinging 'round the circle," and in the course of which he denounced Congress and advocated his own plan of reconstruction. Other bills, including one for the arrangement of the Southern States, with the exception of Tennessee, into military districts; and the tenure-of-office act, were passed over the President's veto. In August 1867 Johnson removed from office Stanton, secretary of war, and appointed Grant to the post; but in September following Congress refused to ratify the removal, Grant resigned, and Stanton resumed his former duties. On 21 Feb. 1868 Johnson dismissed Stanton and appointed Gen. Lorenzo Thomas secretary ad interim. Two unsuccessful attempts to impeach the President had already been made. On 24 February a resolution of impeachment was passed by the House and on 5 March the trial began. Eleven articles charged the President with high crimes and misdemeanors in connection with five various matters, most important of which were the removal of Stanton in disregard of the tenure-of-office act and the appointment of Thomas. The trial was presided over by Chief Justice Chase. On 16 May a test vote resulted in 35 for conviction, 19 against; and the requisite two thirds vote not having been obtained, the President was acquitted. The result is now generally approved. "The single vote by which Andrew Johnson escaped conviction," says Dunning, "marks the narrow margin by which the Presidential element in our system escaped destruction." In January 1875 he was chosen to the Senate, and 5 March took his seat in the extra session. He was sincere and able, and if Congress viewed his procedure as usurpation no less did he believe that of Congress to be unconstitutional. Consult: Dunning, 'Essays on the Civil War and Reconstruction' (1898); and Dewitt, 'The Impeachment and Trial of Andrew Johnson' (1903), a spirited defense. See also UNITED STATES — RECONSTRUCTION.

Johnson, Bradley Tyler, American lawyer: b. Frederick, Md., 29 Sept. 1829; d. 5 Oct. 1903.

He was graduated from Princeton in 1849, studied law at Harvard in 1850–1, entered practice at Frederick in 1851, became in that year State's attorney for Frederick County, was a delegate to the National Democratic Convention at Charleston and Baltimore in 1860, withdrew from the convention, and supported the Breckenridge and Lane ticket. At his own expense he organized a company for the Confederate service, in which he rose to be brigadier-general of cavalry (1864). Subsequent to the War he practised law at Richmond in 1865–79, at Baltimore in 1879–90; and was a member of the State senate of Virginia in 1875–90. His works include: 'Reports of Chase's Decisions' (1875); 'Memoir of J. E. Johnston' (1891); a 'Life of General Washington'; etc.

Johnson, Bushrod Rust, American soldier: b. Belmont County, Ohio, 7 Oct. 1817; d. Brighton, Ill., 11 Sept. 1880. He was graduated at West Point in 1840. He saw service in the Florida and Mexican wars, resigning his commission in 1847 to become professor in the Western Military Institution of Kentucky, at Georgetown. He entered the Confederate army as a brigadier-general at the commencement of the Civil War, and in 1864 became a major-general. He commanded a division under General Lee till the surrender at Appomattox. He subsequently became superintendent of the Military College in the University of Nashville, and chancellor of that institution.

Johnson, Cave, American politician: b. Robertson County, Tenn., 11 Jan. 1793; d. Clarksville, Tenn., 23 Nov. 1866. Admitted to the bar, he practised at Clarksville, in 1820 became a judge of the State circuit court, and was a Democratic representative in Congress in 1829–37 and again in 1839–45. In 1845 he was appointed postmaster-general, from which post he retired at the close of Polk's administration (1849). He was president of the Tennessee State bank in 1850–9, and was elected to the State senate as a Unionist in 1863, although unable to serve because of ill-health.

Johnson, Clifton, American author and illustrator: b. Hadley, Mass., 25 Jan. 1865. He obtained a secondary education, worked on a farm, was clerk in a book-shop and school-teacher, studied in the New York art-schools, published in 1892 'The New England Country,' an illustrated study of farm-folk, and later was much abroad obtaining notes and pictures for works on foreign life. Other volumes of which he is author and illustrator are: 'The Country School' (1893); 'The Farmer's Boy' (1894); 'What They Say in New England' (1896); 'Among English Hedge Rows' (1899); etc.

Johnson, David, American painter: b. New York May 1827. He was self-taught, excepting for the few lessons he received from Jasper F. Cropsey, and chose American landscape as his specialty. Among his works are: 'Echo Lake' (1869); 'Lake George' (1876); 'Greenwood Lake' (1878).

Johnson, E. Pauline, Canadian poetess: b. Chiefwood, Ont., 1862; the daughter of George Johnson, head chief of the Mohawk Indians, and of his English wife. She has written several striking poems on Indian subjects and has given public recitals from her works. 'The White Wampum' appeared in 1894.

Johnson, Eastman, American painter: b. Lowell, Maine, 29 July 1824; d. New York City 5 April 1906. He began his art studies at the Royal Academy, Düsseldorf (1849–51) and developed a distinct talent for genre. He afterward traveled in France, Italy, and Holland, and spent four years at The Hague. Among his pictures painted in Europe are the 'Savoyard,' and the 'Card Players,' in which he showed the influence of the Dutch school. He returned to the United States in 1856 and devoted himself for some years to the study of rustic and negro life and he painted some of the most popular pictures ever produced by a native painter; many of them have been engraved and chromolithographed. The best known are 'Old Kentucky Home'; 'Husking Bee'; and the 'Boyhood of Abraham Lincoln.' He also produced excellent likenesses of Grover Cleveland, Benjamin Harrison and other eminent men.

Johnson, Edward, American colonial historian: b. Herne Hill, Kent, England, about 1599; d. Woburn, Mass., 23 April 1672. He emigrated to America probably with Governor Winthrop in 1630. In 1632 he was engaged in trade at Merrimack, and was on the committee appointed to superintend the foundation of a new town and church at the place now called Woburn. In 1643 he was elected by the town of Woburn a member of the legislature of Massachusetts, in which he continued to sit till 1671, with the exception of 1648. In 1655 he was chosen speaker of the house. He was recorder of Woburn from the time of its incorporation till his death. In 1665 he was one of the members deputed to hold conference with the commissioners sent from England by Charles II. He wrote a 'History of New England from the English Planting in 1628 till 1652, or Wonder-Working Providence of Zion's Saviour' (1654).

Johnson, Edward, American soldier: b. Chesterfield County, Va., 16 April 1816; d. Richmond, Va., 22 Feb. 1873. Graduated from the United States Military Academy in 1838, he fought in the Florida wars, for his services in which he was brevetted captain, and subsequently in the Mexican War, being brevetted major for his conduct at Chapultepec. He received his captain's commission in 1851, but in 1861 resigned to enter the army of the Confederate States as colonel of the 12th Georgia volunteers. He was promoted brigadier-general in 1862 and major-general in 1863. At Gettysburg he commanded a division. He was captured with his entire force at Spottsylvania (12 May 1864) and retaken in the following December. Subsequent to the war he was a farmer in Chesterfield County, Va.

Johnson, Franklin, American Baptist clergyman and scholar: b. Frankfort, Ohio, 2 Nov. 1836. He was graduated from the Colgate Theological Seminary (Hamilton, N. Y.), in 1861, held pastorates in Michigan, New Jersey, and at Cambridge, Mass., in 1862–88, was co-editor of 'The Watchman' in 1876, and in 1890–2 president of Ottawa University. In 1892 he was appointed professor of history and homiletics in the University of Chicago. Among his writings, besides translations and an annotated edition of St. Matthew, are: 'Moses and Israel'; 'Heroes and Judges from the Lawgiver to the

King'; 'The New Psychic Studies in their Relation to Christian Thought.'

Johnson, Helen Kendrick, American author: b. Hamilton, N. Y., 4 Jan. 1843. She was the daughter of A. C. Kendrick (q.v.) and was married to Rossiter Johnson (q.v.) in 1869. Beside editing several compilations of verse she has published 'The Roddy Books,' popular juvenile tales (1874–6); 'Our Familiar Songs' (1881); 'Raleigh Westgate' (1889); 'Woman and the Republic' (1897). She has been an active member of the Association Opposed to the Extension of Suffrage to Women.

Johnson, Herschel Vespasian, American jurist and politician: b. Burke County, Ga., 8 Sept. 1812; d. Jefferson County, Ga., 16 Aug. 1880. He was graduated from the University of Georgia in 1834, studied law, practised there, from 1844 at Milledgeville, and in 1848 was appointed to the Senate of the United States to fill the seat of W. T. Colquitt, resigned. A strong advocate of Clay's compromise scheme, he identified himself with the Southern Unionists. In 1849–53 he was a judge of the Georgia superior court, in 1853–7 governor of the State. He was nominated by the northern Democracy in 1860 as vice-president on the presidential ticket with Douglas. Though opposed to secession, he followed his State, and in 1862 was elected to the Confederate Congress. Elected United States senator in 1866, he was refused his seat because of war disabilities. He was a judge of the Georgia superior court from 1873 until his death.

Johnson, Horace Chauncey, American artist: b. Oxford, Conn., 1 Feb. 1820. He was a pupil of A. H. Emmons at Hartford, and of the antique school of the National Academy, New York; studied also in Rome (1856–8); established his studio in Italy, and later at Waterbury, Conn. His works include: 'Roman Peasants on the Campagna'; 'Grape Gatherers of Gensano'; 'Italian Kitchen'; 'Azrael'; etc.

Johnson, Sir John, American colonial soldier: b. near Johnstown, N. Y., 5 Nov. 1742; d. Montreal 4 Jan. 1830. He was the son of Sir William Johnson (q.v.), was knighted in 1765 and succeeded to his father's estates and baronetcy in the Mohawk Valley in 1774. When the Revolution came on he escaped to Canada in 1776 with 700 loyalists. He organized the corps known as the Queen's Own American Regiment, of which he was commissioned colonel. In July 1777, he took part in the siege of Fort Stanwix (q.v.). He defeated General Herkimer in the latter's brilliant attempt to cause the besiegers to abandon their operations; but was himself subsequently defeated. During the next two years he continued active in northern and central New York, and the Indian massacres of Cherry Valley and Wyoming formed some of the most painful incidents of the war. He was, however, crushingly defeated at Newton 29 Aug. 1779, and retired to Montreal. His influence over the Indians had always been remarkable and the British government appointed him superintendent-general of Indian affairs in British North America, besides making him extensive land grants, to replace the Mohawk family estates which had been confiscated.

Johnson, Lionel Pigot, English poet: b. Broadstairs, Kent, March 1867; d. 9 Oct. 1902. He was educated at Winchester College, and Oxford University. He published 'Poems'; 'Ireland and Other Poems'; and 'The Act of Thomas Hardy'; and contributed to 'The Academy' and other literary journals. His verse though often obscure exhibited much command of metre and was full of promise.

Johnson, Oliver, American reformer and editor: b. Peacham, Vt., 27 Dec. 1809; d. Brooklyn, N. Y., 10 Dec. 1889. He became editor of 'The Christian Soldier' in 1831, and from that year to 1865 was engaged in the anti-slavery cause as a lecturer and editor. He was one of the founders of the New England Anti-Slavery Society in 1832. He was editor of the 'Independent' from 1865 to 1870; became editor of the 'Christian Union' in 1872; and published 'William Lloyd Garrison and his Times' (1880).

Johnson, Owen, American novelist: b. New York 27 Aug. 1878. He is a son of R. U. Johnson (q.v.) and was graduated from Yale in 1900. He has published 'Arrows of the Almighty' (1901).

Johnson, Reverdy, American jurist: b. Annapolis, Md., 21 May 1796; d. there 10 Feb. 1876. He was educated at St. John's College in that city, and at 17 began to study law. In 1815 he was admitted to the bar, in 1817 removed to Baltimore and subsequently devoted his time mainly to the arguing of cases before the United States Supreme Court. He reported seven volumes of the decisions of the Maryland court of appeals, known as 'Harris's and Johnson's Reports.' 1820. In 1821 he was elected a State senator, and at the expiration of his term in 1825 was re-elected for a second term. In 1845 he was chosen a United States senator, resigning in 1849 on being appointed attorney-general of the United States. On the succession of Mr. Fillmore, after the death of President Taylor, he resigned that office, and resumed in Baltimore the practice of the law. In 1861 he was a member of the peace commission, was United States senator 1863–8, and succeeding Charles Francis Adams as minister to England in 1868 negotiated the treaty for the adjustment of the Alabama claims, afterward rejected by the Senate.

Johnson, Richard Mentor, American statesman and soldier: b. Floyd's Station, near Louisville, Ky., 17 Oct. 1780; d. Frankfort, Ky., 19 Nov. 1850. He was educated at Transylvania University, and subsequently studied law and practised with success. He commenced his public career as a member of the Kentucky legislature, to which he was elected at 23, and in 1807 was returned to Congress, and remained a member of the House until 1819. He was a firm supporter of the administration of Madison, and upon the commencement of the War of 1812 raised a body of Kentucky mounted riflemen, whom he commanded, on the Canadian frontier. The decisive charge of his mounted volunteers mainly contributed to the brilliant victory gained over the British and Indians at the battle of the Thames, 5 Oct. 1813, and it was by his hand that the Indian leader Tecumseh is commonly supposed to have fallen. In 1819 he was elected to fill a vacancy in the United States senate, of which he continued a member until 1829, when he was again returned to the House of Representatives. He remained a member until his election by the Senate in March, 1837, as Vice-President of the United States.

He discharged the duties of presiding officer of the senate for four years, and in the Presidential election of 1840 was an unsuccessful candidate of the Democratic party for Vice-President. He thenceforth lived chiefly in retirement. He was, however, serving a term in the State legislature at the time of his death. In Congress his chief efforts were against the discontinuance of the Sunday mails, and in behalf of soldiers of the Revolution or of the War of 1812, who applied for pensions. He was the author of the law abolishing imprisonment for debt in Kentucky.

Johnson, Richard W., American military officer: b. near Smithland, Ky., 7 Feb. 1827; d. St. Paul, Minn., 21 April 1897. He was graduated at West Point in 1849, in 1861 became colonel of the 3d Kentucky cavalry, 11 October was appointed brigadier-general of volunteers, and later commanded a division at Murfreesboro, and with his division fought under Thomas at Chickamauga, (19–21 Sept. 1863). He commanded the 12th division of the Army of the Cumberland in the invasion of Georgia and a division of cavalry at Nashville, was brevetted brigadier-general, United States army, for his services (13 March 1865), and, having been mustered out of the volunteer service, became provost-marshal of the military division of the Tennessee. In 1867 he resigned from the service with rank of major-general, changed by act of Congress (1875) to brigadier. Among his writings were: 'Life of Gen. G. H. Thomas' (1881); and 'A Soldier's Reminiscences' (1886).

Johnson, Robert Underwood, American aditor and poet: b. Washington D. C., 12 Jan. 1853. He became associate editor of the 'Century Magazine' in 1881. His efforts as secretary of the American Copyright League in behalf of the establishment of international copyright greatly aided in obtaining the law of 1891. He edited, with C. C. Buel, the notable 'Battles and Leaders of the Civil War' (1887–8), and has published three volumes of verse: 'The Winter Hour and Other Poems' (1891); 'Songs of Liberty and Other Poems' (1897); and 'Poems' (1902).

Johnson, Rossiter, American author and editor: b. Rochester, N. Y., 27 Jan. 1840. He was graduated from the University of Rochester in 1863 and was associate editor of the Rochester *Democrat* 1864–8. From 1869 to 1872 he edited the Concord (N. H.) *Statesman;* and in 1873–7 was associated with George Ripley and Charles A. Dana in editing the American Cyclopedia, while in 1879–80 he aided Sydney Howard Gay in his 'History of the United States.' From 1883–1902 he was editor of the 'Annual Cyclopædia,' and since 1900 has been editor of the 'Universal Cyclopædia.' He edited the series of 'Little Classics' (8 vols. 1874–80), and was editor-in-chief of the 'World's Great Books' (50 vols. 1898–1901). His original works include 'Phaeton Rogers,' a novel of boy life (1881); 'A History of the French War ending in the Conquest of Canada' (1882); 'History of the War of 1812' (1882); 'Idler and Poet,' verse (1883); 'Short History of the War of Secession' (1888); 'The End of a Rainbow,' a story (1892); 'The Hero of Manila' (1899); 'Short History of the War with Spain' (1899); 'Morning Lights and Evening Shadows,' poems (1902); 'The Frankfort Boys' (1905); etc.

Johnson, Samuel, American college president, first president of King's College (now Columbia University): b. Guilford, Conn., 14 Oct. 1696; d. Stratford, Conn., 6 June 1772. He was graduated at Yale College in 1714, and two years later appointed tutor there. In 1870 he resigned to receive ordination as a Congregational minister, and settled at West Haven. He relinquished his charge in 1722 and soon after sailed for England, where he received Episcopal ordination in 1723. Shortly after he returned to America, bearing a commission as missionary of the Society for the Propagation of the Gospel in Foreign Parts, and settled in Stratford, Conn., as rector of an Episcopal church there. In 1743 he received the degree of D.D. from the University of Oxford. In 1746 he published 'A System of Morality,' and in 1752 a compend of logic and metaphysics, and another of ethics; the two latter were printed in Philadelphia by Franklin as text-books for the University of Pennsylvania. In 1755 he was offered the presidency of that university, but declined it. In 1753 he was invited to accept the presidency of the newly founded King's College in New York, in all the plans for which he had been consulted. He did so, but in 1763 resigned and returned to Stratford, where he resumed his parochial duties, revised his previous works, and published an 'English and a Hebrew Grammar' (1767). Consult Beardsley 'Life of Samuel Johnson, D.D.' (1876).

Johnson, Samuel, English man of letters: b. Lichfield, 18 Sept. (N. S.) 1709; d. London 13 Dec. 1784. He was the son of Michael Johnson, a learned bookseller, and his wife, Sarah Ford. The father was a Jacobitical, high church Tory, somewhat given to melancholy, and not methodical in habits. The son took after him in these particulars. Of the mother little is known. They had another son, Nathaniel, born in 1712, who died at 25. The elder Johnson was a man of some local importance, church warden, sheriff, and bailiff, but before his death in 1731 his business had declined until he was nearly bankrupt.

Samuel is said to have been a very precocious child, but his mental forwardness could not compensate for his bodily defects. His face was deeply marked by scrofula and one eye was permanently injured, Queen Anne's touch profiting him nothing, but leaving in his loyal memory a vague picture of a "lady in diamonds and a long black hood." He was first taught by a dame, later at the Lichfield school. Being lazy and lumbering he early exerted his powers of command upon his fellows by making three of his mates carry him to school. In 1726, he was sent to school at Stourbridge for a year. Then he remained for two years at home, where he did little except to read widely among his father's books. His talents impressed a neighboring gentleman, who offered to send him to Oxford. Johnson entered Pembroke College as a commoner 31 Oct. 1728, remained in continuous residence a little over a year, and returned for brief periods, until the autumn of 1731. He was wretchedly poor during his college residence, and he left without a degree because of

his father's business troubles. The stories of his haranguing students in a tattered gown and flinging away in a passion a pair of shoes left at his door are well known. His unusual learning seems to have impressed the college authorities from the beginning, and his Latin translation of Pope's 'Messiah,' printed in 1731 in a "miscellany," pleased that famous poet. But Johnson was too indolent and hypochrondriacal to profit greatly from the college routine, and the cutting short of his academic career is thus not specially to be regretted.

After his father's death he found himself obliged to earn his living by teaching school and acting as chaplain to a baronet, who did not treat him kindly. He soon gave up the place and removed to Birmingham, where he lived with an old schoolmate named Hector and became a bookseller's hack. The only fairly important work of these years was his translation, through the French, of the Portuguese Lobo's 'Voyage to Abyssinia,' which appeared in 1735. Johnson is said to have walked to Oxford to get a copy of the French version, which has never yet found its way back to the shelves of the Pembroke College library.

In 1735 he made a marriage which has afforded posterity a great deal of amusement. Among his acquaintances in Birmingham was a mercer named Henry Porter, who died in 1734, leaving a widow and three children. In a little less than a year Johnson married the widow, who was about twenty years his senior. Johnson declared that it was a love match on both sides, and his own constancy to her throughout her life and his devotion to her memory prove that for himself at least he did not exaggerate. Despite his uncouth appearance, his eccentricities, his visionary and morbid qualities which made some people think him insane, the widow is said to have recognized, that he was at bottom one of the most sensible of men. According to Garrick he showed no sense of the beautiful in choosing a fat, painted, and affected old woman. She showed no prudence in placing her small fortune under the control of a poor young man with apparently slim prospects. Yet as Johnson was nearsighted and could see but little of what shocked others in his wife — if indeed the report of Garrick was not purposely exaggerated — and as he undoubtedly made her a good husband, there seems to be little reason to waste sympathy on either party to the match.

After his marriage Johnson set up a boarding school near Lichfield. His peculiarities naturally prevented him from succeeding. He may have had only three pupils; but one of these, David Garrick, combines with the master himself to make the short-lived school a very famous one. Early in 1737 the two set out together to seek their fortunes in London, Mrs. Johnson being left in Lichfield. They had little money, and Johnson's chief baggage seems to have consisted of part of his tragedy 'Irene' and a few letters of introduction.

The literary adventurer spent his first months in London seeking employment from the booksellers. He lived prudently and seems to have been aided by Henry Hervey, a son of the Earl of Bristol. In the summer he returned to Lichfield and finished 'Irene;' in the autumn he removed permanently to London with his wife.

Macaulay in an excellent paragraph of his admirable essay on Johnson describes the desperate state of authors at the time. In 1736 the day of the patron was drawing to a close, but, although Pope had succeeded in making the public his patron, it was too early for other men to hope to rival him. Writers who under Queen Anne might have received money and political positions were now rather happy when they were sure of their meals. Booksellers kept them under by "sweat-shop" methods. Johnson took his place in the toiling ranks, but, because of his pride, suffered more than most of his brother hacks. His never polished manners deteriorated in cellar restaurants; he became a sloven in his dress and, as all the world knows, he never got over his acquired aversion to clean linen. Much of the brutality of manners for which he was afterward reproached is accounted for by the rough treatment to which he was subjected at this period of his career.

The details which Boswell was able to gather with regard to the early life of his hero are not very ample. After 'Irene' was refused by a manager, Johnson secured employment with Cave in 1738, revising for 'The Gentleman's Magazine' the parliamentary debates, which could be published only as if they had occurred in the Senate of Lilliput. From July 1741 to March 1744 he wrote the debates, making use of notes taken by others. They were often regarded as genuine, few readers knowing that the writer, to use his own words, had taken care that the Whig dogs should not have the best of it.

Meanwhile in 1738 Johnson had published through Dodsley his first important piece of work, the satire entitled 'London,' in which he imitated Juvenal's third satire as Boileau and Oldham had done before him. Being a strong, manly spirit and having his own sufferings and indignities to spur him on, he produced a poem which seemed so good to his contemporaries that the first edition was exhausted in a week. Pope inquired who the author was and endeavored to have him elected to the mastership of a school. The project failed and Johnson remained in London gathering the knowledge of writers and life that stood him in such good stead in his later criticism.

This knowledge was first displayed on a considerable scale in his life of Richard Savage (q. v.), which appeared in February, 1744. Johnson, who had been much thrown with Savage, took that curious personage far too seriously; but his small biography is not only valuable as an excellent description of the literary Bohemianism of the day, but is important as one of the first books of its kind to abandon a stiff and formal or a stately tone, and to present a life simply and vividly. When we praise Boswell as a biographer, we ought not to forget that his great subject gave him instructions which the Scotchman bettered.

Little is heard of Johnson for the next two or three years, but his fame must have grown, for in 1747 he was employed by a sort of booksellers' syndicate to prepare an English dictionary, this project superseding that of an edition of Shakespeare, which he contemplated in 1745. The dictionary was to be in two folio volumes for which he was to receive £1,575. The entire cost of preparing copy fell on him, however hence the bargain was not a profitable one to

the needy scholar except in so far as it enhanced his reputation. He issued a plan of his work dedicated to Lord Chesterfield; did a large amount of reading to secure quotations; employed six amanuenses to copy such citations as he had marked; supplied etymologies and definitions; and finally on 15 April 1755 stood forth to the world as "the great lexicographer." All things considered, it was a monument of scholarship despite its compiler's ignorance of the history of the language. Of its definitions, excellent as a rule, the humorous ones, such as that oats is a grain used for horses in England but for people in Scotland, are mainly remembered; but it should not be forgotten that Johnson not only far surpassed his predecessors, but also laid the foundations on which subsequent lexicographers have reared more imposing structures. The dictionary is also remembered as the occasion of Johnson's writing one of the most famous of all letters — that to Lord Chesterfield, who had neglected him for years but on the eve of the publication of the great work wrote flattering notices of it in the hope that it might be dedicated to him. Johnson's letter of 7 Feb. 1755 is remarkable not merely for the dignity with which he refused to be encumbered with help after he had safely reached the shore unassisted, but also for the touching pathos with which he referred to his disillusionment and his loneliness. His "Tetty," for whose sake he had labored so heroically, was not by his side to share his rewards. She had died in March 1752.

The completion of the "Dictionary" in eight years would have been sufficient work and glory for a more than ordinary man of letters; but between 1747 and 1755 Johnson added greatly to his reputation in other ways. In January 1749 the second of his celebrated satires appeared, 'The Vanity of Human Wishes,' based upon the tenth satire of Juvenal. It is better than the 'London,' indeed it is one of the best sententious pieces of moralizing in verse to be found in English literature. It brought Johnson only 15 guineas. He received nearly £300 in benefits and copyright for his tragedy 'Irene,' which Garrick produced in February 1749. Even Garrick's acting and Johnson's appearance in a box clad in a gold-laced hat and a gold-laced scarlet waistcoat could not save so undramatic a performance. It ran nine nights; the person who has read it nine times has probably never existed.

More important than his reappearance as a poet was his assumption of the rôle of periodical essayist. His famous semi-weekly imitation of 'The Spectator,' entitled 'The Rambler,' which ran from 20 March 1750 to 14 March 1752, was not specially successful as a journal, but when the numbers were gathered into volumes, which Johnson most carefully revised, the work became very popular. That it was the equal of 'The Spectator,' as the novelist Richardson, who wrote the only really popular number, and other contemporaries declared, nobody now believes. That it should have held its own against so formidable a rival, when so many other attempts had failed, is a clear proof that it had genuine merits. It certainly established Johnson's fame as a moralist, and, if we omit the papers in which he clumsily attempted to be entertaining as well as some of his specifically critical essays, we can still find in its pages more sound thought and feeling with regard to human life in its lights and shadows than can be discovered in the pages of most of the essayists we actually read. Johnson's contemporaries were also greatly impressed by his elaborate, balanced, Latinistic prose style. The effects of this both upon the prose of his period and upon his own reputation were injurious. Even to this day most people think of Dr. Johnson — he was not yet M.A., that degree coming to him from Oxford, partly in reward for 'The Rambler,' in time to be printed on the title page of the Dictionary — as a pompous affected writer who never used a short English word, if he could find a long Latin one to put in its place. 'The Rambler' and other works produced when he was about 40 give a basis of truth to this opinion; but we should remember that as he grew older and after he had had much practice as a racy talker, his style became simpler and stronger.

The last number of 'The Rambler' was written when Mrs. Johnson was dying. He mourned her loss sincerely through 32 years of widowerhood. He did not see her painted cheeks or hear her affected giggles; he saw only an ideal being whose death left him desolate. No one can read the numerous references to her in his 'Prayers and Meditations' (1785) without feeling a profound respect for the blinded man.

During the years between 1752 and 1759, that is between 'The Rambler' and 'Rasselas,' Johnson not only published the Dictionary, wrote essays for his friend Dr. Hawkesworth's 'The Adventurer' (1753–54), and edited and contributed to the 'Literary Magazine, or Universal Review' (1756–58), but also issued proposals for the edition of Shakespeare he had long contemplated (1756), and began a new series of essays, 'The Idler.' He lazily put off the Shakespeare until a taunt by the satirist, Charles Churchill, in 'The Ghost,' to the effect that he was cheating the subscribers who had paid in their money forced him to go to work on the promised edition, which finally appeared in 1765. Naturally, it was not a monument of scholarship, but it contained some sound criticism, and its preface has long been regarded as one of the most sensible introductions to the reading of Shakespeare that we possess. 'The Idler' ran in weekly numbers from 15 April 1758 to 5 April 1760 on Saturdays in Newberry's 'Universal Chronicle.' It was collected in two volumes in 1761 and in part deserved its title, for it was distinctly less ponderous than 'The Rambler.'

It is at this period that the Johnson who has impressed the world's imagination as a man begins clearly to emerge. He was still the old impecunious Johnson, for the year after the Dictionary appeared he was twice arrested for debt. But he was slowly improving his finances, and he was gathering around him friends who were better than riches. He had long delighted in tavern clubs where he met queer characters, such as the forger, Psalmanazar (q.v.). In 1749 he organized a club of his own at the King's Head, which included Bathurst, Hawkesworth, and his future biographer, Sir John Hawkins. Then he formed friendships — destined to become more famous because they figure so frequently in Boswell — with the accomplished Grecian Bennet Langton, with the

gay, fashionable Topham Beauclerk, with Sir Joshua Reynolds and Dr. Burney, and, a trifle later, with Goldsmith and Burke. An humbler circle of friends is still more picturesque — to wit, the unfortunates he received into his gloomy house after his wife died — blind Miss Anna Williams, good talker but peevish, Robert Levett, the self-educated physician of the poor, to whose memory Johnson consecrated one of the most pathetic of English elegies — and later, Mrs. Desmonlins and Miss Carmichael. These dependents, as was natural, quarreled among themselves and harassed their benefactor. Another inmate of his house, of whom we frequently hear, was his black servant, Francis Barber.

In January 1759 Johnson's old mother died at Lichfield. The story that he wrote 'Rasselas, Prince of Abyssinia,' in a week, to pay her funeral expenses is, as is usual, not altogether accurate. It seems to have been begun before her death, mainly in order to defray the cost of a visit to her. When published, it became the most popular of his writings, and it still has readers and ranks as a classic, although a ponderous one. It has little narrative interest, lacks the atmosphere of the East, presents us with personages rather than with persons, and makes them talk in an impossibly magniloquent style; yet, when all deductions are made, it remains not only a strong attack upon the fashionable shallow optimism of the day which Johnson detested, but also one of the most manly utterances on the evils of life and the courage needed to combat them that has ever been heard from an English moralist. In literary ability Johnson was inferior to Voltaire, whose witty 'Candide,' by a curious coincidence, attacked the optimists almost contemporaneously with 'Rasselas;' but in moral force the advantage was entirely on Johnson's side.

Three years after 'Rasselas' began its long life in numerous editions and translations, Johnson's own life was almost entirely changed. In July 1762, despite his famous uncomplimentary definition of "pension," he accepted one of £300 per annum. He was independent enough to be able to afford being slightly inconsistent, and he did not promise to support the Tory government in return for its favors. Pensioned or unpensioned he would have taken his reactionary position on American affairs, whether or not he would have written his unfortunate 'Taxation no Tyranny' (1775), just as naturally as he took part in exposing the Cock Lane Ghost (1762).

His pension gave Johnson full opportunity to indulge his constitutional sluggishness. He could afford to write only now and then, to lie in bed till the afternoon, to spend the evening at a tavern laying down the law to his hearers. Thanks partly to his genius for conversation and friendship, partly to his rooted dislike of solitude, he grew to be more and more of a club-man, as the word was then understood, and it was in this capacity rather than as a productive man of letters that he became the literary dictator of his time. As Macaulay remarks, between 1765 and 1775 Johnson published only what it would scarcely have taken him a week to write, if he had been working at his old rate of speed. Instead of writing he talked, and when he came forward again as an author, the vigorous English of his conversation got the better of the stately Latin of his pen. About the beginning of 1764 he became the chief figure of the famous club which for nearly 20 years held weekly or fortnightly meetings at the Turk's Head, Soho. Besides Johnson, its chief members were Reynolds, Burke, Goldsmith, Gibbon, Garrick, Sir William Jones, and, last but not least, James Boswell, whom Johnson caused to be elected early in 1773. Langton, Beauclerc, Bishop Percy, Fox, and others nearly or quite as distinguished, were also members. It is perhaps not so surprising that these men admitted Boswell at Johnson's solicitation as that Johnson should have tolerated the bibulous, gossiping little man, who hailed from a part of Great Britain for which the sturdy English moralist had always professed a great dislike. The matter can no more be settled by explanation than Johnson's infatuation with Mrs. Porter. Boswell, with all his faults, must have been amusing, and his devotion to his master doubtless touched that essentially kind though rough personage. At any rate, posterity, which owes so much to Boswell, has no occasion to criticize harshly either of the apparently ill-assorted friends. It is better to remember that, although several other members of the club wrote books that have stood the wear and tear of time more successfully than most of Johnson's writings have done — Burke, Goldsmith, and Gibbon, for example, and Boswell himself — the fact that Johnson dominated such men speaks volumes for his essential greatness as a man. Mere dictatorial rudeness and other qualities natural to an *Ursa Major*, as the poet Gray used to denominate him, are not sufficient to explain the phenomenon.

Boswell is not the only person who lives in literature because he was once associated with Johnson. Henry Thrale, the brewer, and his bright, gay wife are mainly remembered, because after 1764 Johnson passed much of his time at the brewery in Southwark and at their villa at Streatham, leaving his new house in Fleet street to be occupied in the main by the queer recipients of his bounty already mentioned. He now became somewhat more polished in his manners and enjoyed the society of such interesting women as Fanny Burney (Mme. D'Arblay, q. v.), Hannah More (q. v.), Mrs. Montagu, and Mrs. Carter. The literary lion in such company presents a picture very different from that of the adventurer wandering the streets with Savage. Boswell gives so many interesting pictures of the later Johnson that it is difficult to select the most striking. The interview with George III. was a great event in the life of so loyal a subject. It took place in February 1767. His softening down in the presence of that amusing radical, John Wilkes, showed him in a still happier light. His excursions, whether with Boswell or the Thrales, to the Hebrides (1773), to Wales (1774), and to France (1775) — to say nothing of visits to old friends at Oxford and elsewhere, had their share with time in mellowing his character and widening his outlook upon men and institutions. 'A Journey to the Western Isles,' the account he gave of his visit to Scotland with Boswell, upon which the latter wrote a more sprightly book, would have given far more offense to the Scotch if it had been written two decades earlier. It was published

in 1775, the year Oxford, following Dublin by 10 years, made him a doctor, and is a dignified and worthy book; but it is probably chiefly remembered because in it Johnson severely handled James Macpherson of Ossian fame, a fact which led to Macpherson's challenging him, and to Johnson's purchasing a stout stick, which he did not have occasion to use on his challenger.

Two years later — Easter Eve 1777 — a committee representing many of the best London booksellers called upon Johnson to ask him to furnish introductions to a proposed series of the works of the English poets since the Restoration. The project pleased him, he named a compensation far too low (200 guineas, subsequently increased by £200 by the booksellers), shook off his lethargy, and by 1781 had finished the most famous of his books, the 'Lives of the English Poets,' which appeared (collected) in 10 small volumes (1779, 1781). This latest work was, in literary merit, by far his best. He was in sympathy with most of the poets he had to treat, he had amassed through reading and gossip much information about them, he had mellowed with age, the common sense and sound morality, which are the best features of his criticism, had full chance to display themselves, and his style was no longer ponderous and unidiomatic. The life of Milton was marred by prejudice, religious and political, as well as by lack of appreciation of such a poem as 'Lycidas,' the life of Gray was unsympathetic and inadequate; but the chief lives, such as those of Cowley, Addison, Dryden, Swift, Pope, and Savage, left little to be desired, and many of the minor sketches were intelligent, to the point, and, not infrequently, humorous in a somewhat grim fashion. In short, the book well deserves the place it has secured as an 18th century classic.

After its publication Johnson aged rapidly, and what with the loss of friends (like Thrale in 1781, and Levett in 1782), and with his dread of death and his increasing infirmities of gout and asthma, the last three years of his life were very painful. A break with Mrs. Thrale in consequence of her attachment to the Italian Piozzi, whom she married in 1784, led to his going back to his house in Fleet street, to recriminations and bad temper trying both to him and to her, and finally to his last letter to her, which is pathetic in the extreme. In the summer of 1783 he had a paralytic stroke; recovering, he tried, more or less in vain, to forget his miseries in his clubs, old and new. He visited Oxford with Boswell; plans were formed to get him to Italy, but failed; and in November 1784 he entered upon his last illness. Physicians and friends served him with the utmost kindness, his fears of death subsided, and after bravely undergoing operations and giving many proofs of his unfeigned piety, he died peacefully on 13 Dec. 1784. Seven days later he was buried in Westminster Abbey.

Johnson's massive figure and disfigured face, his swaying backward and forward, his muttering prayers to himself, his touching all the posts he passed, his bad manners at table, his 25 and less cups of tea, his slovenliness, his near-sightedness — all his moral and physical peculiarities are known wherever Boswell is read. We do not so frequently recall his generosity in making advances after a quarrel, his love of children, his chivalry toward women, his loyalty to his friends, his charity to the poor, his hatred of tyranny in every form. We remember his prejudices and superstitions without recalling the fact that he inherited them in large measure. By insisting upon his eccentricities we tend to overlook his splendid triumph over bodily infirmities and social drawbacks that would have quelled a less resolute spirit. Johnson at bottom was of heroic mould — courageous, tender, large-minded, sound-hearted. His peculiarities make him picturesque; study of his character and his career reveals him to have been truly great as a man. As a man of letters he is also great, through his influence upon the literature of his period, through his services to lexicography, through the solid intelligence and morality of his essays and 'Rasselas,' through the sanity of his best criticism, and through the vitality of his biographical sketches. But as a writer of books that are judged solely on their intrinsic merits of style and substance Johnson can scarcely be termed great. His complete works have been but rarely reprinted in the past 80 years and are little read. As an essayist and letter-writer, and poet, he is not in the highest class; 'Rasselas' is found to be heavy reading by most people; the 'Lives of the Poets' are perused in their entirety by but few. Boswell does much more to preserve Johnson's fame than the great Doctor's own writings; but the value of these is easily underestimated, and Boswell's biography would not have been such a great book if Johnson had not been such a great man.

Bibliography.— The best edition of Boswell's 'Life of Samuel Johnson' is that by G. Birkbeck Hill (6 vols., 1887). Other editions of importance are those by Malone (6th edition of the work, 1811), Croker (11th edition, 1831; revised, 1835), Percy Fitzgerald (1874), Rev. Alexander Napier (1884). Other sources of information are the biography by Sir John Hawkins (1787), Arthur Murphy's 'Essay on the Life and Genius, etc.' (1792), Mrs. Piozzi's 'Anecdotes' (1786), and her 'Autobiography' (1861), the Diary of Mme. D'Arblay (1841, now edited anew by Austin Dobson), and, in general, books dealing with the chief men of the time, Goldsmith, Reynolds, Burke, etc. See also the short lives by Leslie Stephen ('English Men of Letter,' 1879), and Col. F. Grant ('Great Writers,' 1887). The chief critical essays are by M. Arnold, Birrell, Carlyle, Macaulay, and Leslie Stephen. Consult also Birkbeck Hill's 'Dr. Johnson and His Friends' (1878), and 'Johnsonian Miscellanies' (1897), and Whitwell Elwin's 'Some Eighteenth Century Men of Letters' (1902). Johnson's works were edited by Hawkins in 1787 in 11 volumes (to which two volumes edited by Stockdale were added later). Several editions by Arthur Murphy followed (1792, 1796, etc.), then two by Chalmers (1810, 1816), and finally in 1825 came the best, the Oxford edition in 11 volumes, edited by F. P. Walesby and containing the Parliamentary Debates. Johnson's 'Letters,' save those included in Boswell, were edited by Birkbeck Hill in 1892 (2 vols.). Reprints of separate works have been very numerous, of late chiefly for school use. The best editions of 'Rasselas' are those by Birkbeck Hill (1887), and O. F. Emerson (1895). The 'Lives of the

Poets' were edited by Peter Cuningham in 1854, by Mrs. Napier in 1890, and by Arthur Waugh in 1896; but these have been superseded by the monumental edition of Birkbeck Hill (3 vols., 1905). Matthew Arnold edited six of the lives in 1878.

WILLIAM P. TRENT,
Professor of English Literature, Columbia University.

Johnson, Samuel, American preacher and author: b. Salem, Mass., 10 Oct. 1822; d. North Andover 19 Feb. 1882. He was graduated from Harvard in 1842, and from the Harvard Divinity School in 1846. He joined no religious denomination, and save for one year with a Unitarian church in Dorchester, was not settled as a minister until 1853, when he established in Lynn, Mass., an independent society, with which he remained till 1870, then withdrew to complete studies of many years, the results of which appeared later in his publications. With Samuel Longfellow (q.v.) he compiled a 'Book of Hymns' (1846) and 'Hymns of the Spirit' (1864). Some of his own inspiring hymns in these books are now found in the collections of various denominations. His critical study 'The Worship of Jesus' (1868), written in accordance with his views of universal religion, is described by O. B. Frothingham as "perhaps the most penetrating and uplifting essay on that subject in any language." He printed notable essays on religion, reform, etc., in 'The Radical' and other periodicals. His great work 'Oriental Religions,' including 'India' (1872), 'China' (1877), and 'Persia' (1885) — the last containing an introduction and a critical estimate of Johnson by O. B. Frothingham — represents what Johnson himself calls his "purely humanistic point of view." His philosophy was highly transcendental; but being versed in many languages, he was acquainted with all schools, and with the results of history, literature, science, and criticism in every department. 'Oriental Religions,' in the task of writing which scholars have compared his competence, patience, and thoroughness with the same qualities in Darwin, has taken its place among the most learned and liberal contributions to the study of comparative religion and civilization. Prof. E. J. Eitel, the German Orientalist, wrote of "Johnson's pre-eminent merits as the historian of universal religion," and F. Max Müller paid him tribute as the finder of "a religion behind all religions." His 'Theodore Parker' (1890) is a profoundly spiritual interpretation of that preacher and reformer, whose work on the intellectual side was surpassed by Johnson's, while on the moral side, as in the anti-slavery conflict, they stood as equal comrades. A little volume of Johnson's hymns, with other poems, was published in 1899. Consult Longfellow, 'Lectures, Essays, and Sermons by Samuel Johnson, with a Memoir.' This volume contains some of Johnson's best papers, including brilliant lectures on 'Switzerland' and 'Florence,' the outgrowth of searching observations in Europe, 'Equal Opportunity for Woman,' 'Labor Parties and Labor Reform,' and an illuminative essay on 'Transcendentalism.'

Johnson, Samuel Frost, American painter: b. New York 1835. He received his art education in New York, Düsseldorf, Antwerp, and Paris, in which last place he was a pupil at the Ecole des Beaux Arts. He afterward went to Ecouen and worked under the direction of Edouard Frère, the celebrated painter of children. He produces genre, still life and portraits. Among his genre subjects may be mentioned 'Caught at It'; 'Study of an Interior'; 'Roasted Chestnuts'; 'Good Night'; and 'A Thirsty Party.'

Johnson, Samuel William, American chemist: b. Kingsboro, N. Y., 3 July 1830. He studied at Yale Scientific School and the Universities of Leipsic and Munich. In 1856 he became professor of analytical and agricultural chemistry in the Sheffield Scientific School of Yale and since 1896 professor emeritus. He has published 'Essays on Peat Muck and Commercial Manures' (1859); 'How Crops Feed' (1870); etc.

Johnson, Thomas, American statesman: b. St. Leonard's, Md., 1732; d. 1819. He studied law at Annapolis, was elected to the first Continental Congress (1774), was again sent to Congress in 1776, and in the latter year became brigadier-general of Maryland militia. In 1777 he was chosen governor of Maryland, remaining in office until the close of 1779. In 1780 he entered the provincial congress and the house of delegates, in 1781–7 was in the Continental Congress, in 1791 became an associate justice of the United States Supreme Court, and later declined the office of chief justice.

Johnson, Tom Loftin, American capitalist and politician: b. Georgetown, Ky., 18 July 1854. He was clerk in a street railway office (1869–75), and invented several street railway devices; became owner of a street railway in Indianapolis and later acquired large interests in Cleveland and other cities; he was also interested in the iron manufacture in Cleveland. He has been prominent in politics as a member of the Democratic party, and is known as an advocate of the single tax (q.v.), and public ownership of public utilities. Though opposed to the free coinage of silver, he supported Bryan in 1896 and 1900, and the State convention which he controlled unanimously endorsed the Kansas City platform. He was a member of Congress from 1891–5. In 1901 he was elected mayor of Cleveland, and was reelected in 1903 and 1905. In this position he has been an advocate of three cent street railway fares. In the fall of 1903 he was Democratic candidate for governor of Ohio, but was defeated by a large plurality.

Johnson, Virginia Wales, American novelist: b. Brooklyn, N. Y., 28 Dec. 1849. Since 1875 she has lived in Florence, Italy. Her publications include: 'Kettle Club Series' (1870); 'Travels of an American Owl' (1870); 'Joseph the Jew' (1873); 'A Sack of Gold' (1874); 'The Catskill Fairies' (1875); 'The Calderwood Secret' (1875); 'A Foreign Marriage' (1880); 'The Neptune Vase,' her finest work (1881); 'The Fainalls of Tipton' (1885); 'Tulip Place' (1886); 'Miss Nancy's Pilgrimage' (1887); 'The House of the Musician' (1887); and other fictions, and several descriptive works, such as 'Genoa, the Superb'; 'The Lily of the Arno'; 'Lake Como.'

Johnson, Walter Rogers, American chemist: b. Leominster, Mass., 21 June 1794; d. Washington, D. C., 26 April 1852. He was graduated from Harvard in 1818, taught for many years in Framingham, and Salem, Mass., and in

Philadelphia, and was professor of physics in the University of Pennsylvania, 1839–43. He was the first secretary of the Association for the Advancement of Science, and published 'Use of Anthracite' (1841); 'Report on Coals' (1844); 'Coal Trade of British America' (1850); etc.

Johnson, Sir William, British superintendent-general of Indian affairs in North America: b. Smithtown, County Meath, Ireland, 1715; d. near Johnstown, N. Y., 11 July 1774. His uncle, Sir Peter Warner, offered his nephew the management of his entire property in New York, if the latter would undertake its improvement and settlement. Johnson accepted the offer, and in 1738 established himself upon a tract of land on the south side of the Mohawk, about 25 miles from Schenectady, which Sir Peter had called Warrensburgh. In addition to the settling and improving of the country, he embarked in trade with the Indians, whom he always treated with perfect honesty and justice. He became a master of their language, speaking many of their dialects as perfectly as they did themselves, and was thoroughly acquainted with their beliefs and customs. He was adopted by the Mohawks as one of their own tribe, chosen a sachem, and named Wariaghejaghe, or Warraghiaghy, "he who has charge of affairs." In 1744 he was appointed colonel of the Six Nations, in 1746 commissioner of New York for Indian affairs. In 1750 he became a member of the provincial council. In 1754 he attended as one of the delegates from New York the congress of Albany, and also the great council held with the Indians on that occasion, at which they strongly urged his reappointment as their superintendent. At the council of Alexandria, 14 April 1755, he was sent for by Braddock and commissioned by him "sole superintendent of the affairs of the Six United Nations, their allies and dependents." He was also, pursuant to the determination of that council, created a major-general, and commander-in-chief of the provincial forces destined for the expedition against Crown Point. At the head of these forces, in September 1755, he defeated Baron Dieskau at Lake George. This victory saved the colony from the French, and Johnson received the thanks of parliament for his victory, was voted £5,000, and on 27 Nov. 1755, created a baronet of Great Britain. On his arrival at Lac St. Sacrement a few days before this battle, he gave to it the name of Lake George, "not only in honor of his majesty, but to assert his undoubted dominion here." In March 1756 he received from George II. a commission as "colonel, agent, and sole superintendent of the affairs of the Six Nations, and other northern Indians." He held this office for the rest of his life. In 1758 was present with Abercrombie at Ticonderoga. General Prideaux led the expedition against Fort Niagara in 1759. Johnson was second in command, and upon the death of Prideaux, before that fort, succeeded to the command in chief. With upward of 1,000 Indian allies he continued the siege with great vigor and cut to pieces the French army. He led the same Indian allies the following year in the Canadian expedition of Amherst, and was present at the capitulation of Montreal and the surrender of Canada to the British arms in 1760. The war was now at an end, and the king granted to Sir William for his services a tract of about 100,000 acres of land, north of the Mohawk. In 1764, the country being at peace, and the Indians perfectly contented, Sir William erected Johnson hall, a large wooden edifice still standing. The village of Johnstown, with stores, an inn, a court-house, and an Episcopal church, was soon laid out. In 1772 it became the shire town of Tryon County. Johnson lived in the style of an old English baron of former days, and exercised a liberal hospitality. In 1768 he concluded the treaty of Fort Stanwix. Consult the 'Life' by Stone (1865).

Johnson, William Henry, American historical novelist: b. Beaufort, S. C., 29 March 1845. He studied for the Episcopal ministry in the Theological Seminary of Virginia, served in the Confederate army during the Civil War, and in 1872 took orders in the Episcopal Church. In 1886 he withdrew from the Episcopal Church to enter the Unitarian, and was pastor for several years of a Unitarian church at Wilmington, Del. He has published 'The King's Henchman' (1898); 'King or Knave: Which Wins?' (1899); 'The World's Discoverers' (1900).

Johnson, William Samuel, American jurist: b. Stratford, Conn., 7 Oct. 1727; d. there 14 Nov. 1819. He was graduated from Yale in 1744, was admitted to the bar, practised in the New York and Connecticut courts, in 1761 and 1765 represented Stratford in the Connecticut general assembly, or lower house, and in the latter year was a Connecticut delegate to the Stamp-act congress at New York. In 1766 he became a member of the governor's council, or upper house of the Connecticut legislature, in 1766–71 was in England as special agent for the colony in defense of its title to land obtained from the Mohegan Indians, in 1771 re-entered the council, and for a time in 1772 was a judge of the superior court of the colony. After Lexington, he was a member of a committee sent to General Gage on the unsuccessful mission of inquiring into possible means of peace. Opposed to the Revolution, he remained in private life during its progress, but in 1784–7 was a member of the Continental Congress, in 1787–9 sat in the Connecticut assembly, in 1787–1800 was president of Columbia College, and from 1789 to 1791, when he resigned, was the first United States senator from Connecticut. His letters to the governors of Connecticut during his residence in Great Britain have been published in the 'Collections' of the Massachusetts Historical Society, 5th series, Vol. IX. (1885).

Johnson City, Tenn., city in Washington County, on the Southern railroad, 106 miles north of Knoxville. Its elevated location and picturesque mountain scenery make it a favorite summer resort for Southern people. Here is located the mountain branch of the National Soldiers' Home. The manufacturing interests include iron furnaces, rolling mills, machine shops, tanneries and brickmaking plants. The city was settled in 1870 and is governed under a charter of 1897, by a mayor and council elected biennially. Pop. (1890) 4,161; (1900) 4,645.

Johnson Grass. See Grasses in the United States.

Johnson's Island, Ohio, an island located at the mouth of Sandusky Bay, overlooking Lake Erie, about a mile long and a mile and a half wide. The island was used during the Civil War as a prison for captured Confederates. It

was an ideal spot for a prison post. No prisoner was ever known to escape from it. The grounds were enclosed within a fence 12 feet high, with a platform top, upon which sentinels paced to and fro day and night. To the north Lake Erie stretches away for 50 miles; on the east, separated by three miles of water, lies Sandusky, while west and south of the island are broad stretches of Sandusky Bay. The island was used almost exclusively as a prison for officers, the total number confined there from first to last aggregating over 15,000. The first prisoners were taken there in April 1862, and in September 1865 the last of them were sent to Fort Lafayette, and Johnson's Island was abandoned as a prison post. The men confined on Johnson's Island represented the flower of the chivalry of the South. They were largely professional men and planters, among them being many who were prominent in science, literature and art.

Johnston, jŏn-stŏn, **Albert Sidney,** American general: b. Mason County, Ky., 3 Feb. 1803; d. Shiloh, Miss., 6 April 1862. General Johnston had but a brief career in the Confederate army, and the first part of that career was one of great disaster and consequently of severe criticism; but he fell "on the field of glory" at Shiloh, and not a few endorse the opinion of President Davis that he was the greatest general whom the war produced. Descended from a long line of illustrious ancestors, he obtained his literary education at Transylvania University, and was graduated at West Point 30 June 1826, being number eight in a brilliant class of which Jefferson Davis was a member. He was brevetted second lieutenant in the 2d infantry, transferred to the 6th infantry in 1827, was regimental adjutant from 1828 to 1832, aid to General Atkinson a year, and acting assistant adjutant-general to Illinois volunteers during the Black Hawk War — in all of which positions he showed the qualities of an accomplished soldier. He resigned his commission in the United States army 31 May 1834, having determined to settle in Texas and cast in his fortunes with the "Lone Star" Republic.

The battle of San Jacinto was fought 21 April 1836, and soon after Johnston arrived in Texas and enlisted as a private soldier in the Texan army. His merit soon brought him promotion, and he was made adjutant-general of the Army of Texas, and not long after brigadier-general and chief commander of the army in the place of General Felix Houston. As a result of jealousy growing out of this promotion there was an unfortunate duel between Houston and Johnston, in which the latter was wounded. He continued in command of the Texan army until 1838, when he was made secretary of war of the Republic of Texas. In 1839 he led an expedition against the hostile Cherokee Indians, and in a battle on the Neches, defeated and routed them with great slaughter. He used all of his abilities and wide influence in bringing about the annexation of Texas to the United States, and promptly enlisted when the Mexican War broke out, being colonel of a regiment of Texas volunteers. He was distinguished in various battles, especially at Monterey, where he had three horses shot from under him, and was highly complimented by General Butler on whose staff he was serving.

On 31 Oct. 1849 he was appointed by President Taylor paymaster in the United States army, with the rank of major, and when the 2d cavalry regiment was formed he was appointed, 3 March 1855, its colonel on the recommendation of his old classmate and lifelong friend, Jefferson Davis, who was at that time the able and efficient secretary of war. In 1857 he was put in command of an expedition to Utah to force the Mormons to submit to the laws of the United States Government, and overcame great difficulties and showed such ability and tact in the delicate mission that he was made brevet brigadier-general. When the War between the States broke out General Johnston was in command of the department of the Pacific, but he very promptly resigned his commission, and with a small party made his way across the plains, passing through New Orleans and reached Richmond on 2 September, where he had a cordial reception and was made a full general, and assigned to the command of the department of Kentucky, whither he went at once, beginning the able and efficient discharge of his duties there.

It could not be published at the time that he had a force barely 20,000 to defend that long line against overwhelming numbers of the enemy, and he was severely criticised in the newspapers for not being more aggressive, and when Forts Henry and Donelson fell, and he was compelled to fall back and abandon to the enemy so large a section of Confederate territory that abuse and severest criticism were heaped upon him, he was denounced as incompetent and his removal from command was demanded. President Davis calmly said: "If Albert Sidney Johnston is not a general, then I have none to put in his place." He wrote his old friend a noble letter, and Johnston replied in the same spirit, concluding with this sentiment: "The test of merit in my profession, with the people, is success. *It is a hard rule, but I think it right.* If I join this corps to the forces of General Beauregard (I confess a hazardous experiment), then those who are now exclaiming against me will be without an argument." He alluded to his plan of uniting with Beauregard to strike Grant before Buell and Mitchel could join him, and in pursuance of which plan he marched from Corinth, Miss., on 3 April, intending to attack Grant at Pittsburg Landing, or Shiloh Church, twenty miles off, on 4 April. There was delay on the part of some of the troops so that the attack could not be made until the morning of the 6th, but with his 40,000 men Johnston attacked Grant's 50,000 with such impetuosity, skill, and dash, that the Federals were driven back at every point, were huddled together at Pittsburg Landing, and there seemed to be lacking at 2.30 P. M. only one more vigorous advance to annihilate Grant's army. But just at this moment the great commander who had just remarked to one of his staff: "The victory is ours. We shall soon water our horses in the Tennessee River," was struck by a minie ball in his leg, and bled to death in 15 minutes. In the confusion which followed, the advance was not made. Beauregard (who had been ill in his ambulance all day and did not appreciate the real situation) ordered the Confederate lines to fall back. Buell and Mitchel came up that night with 55,000 fresh troops, and thus the fruits of Johnston's great

victory were lost, and the next day the Confederates were compelled to fall back to Corinth.

No nobler eulogy could be pronounced on Albert Sidney Johnston than that of President Davis in a special message to the Confederate Congress, in which he said: "Without doing injustice to the living, it may safely be said that our loss is irreparable. Among the shining hosts of the great and good who now cluster around the banner of our country, there exists no purer spirit, no more heroic soul than that of the illustrious man whose death I join you in lamenting. In his death he has illustrated the character for which, through life, he was conspicuous — that of singleness of purpose and devotion to duty with his whole energies. Bent on obtaining the victory which he deemed essential to his country's cause, he rode on to the accomplishment of his object, forgetful of self, while his very life blood was fast ebbing away. His last breath cheered his comrades on to victory. The last sound he heard was their shout of victory. His last thought was his country, and long and deeply did his country mourn its loss."

It is scarcely extravagant to say that had Albert Sidney Johnston lived the victory at Shiloh would have been complete, the whole character of the campaign in the West would have been changed, and with Lee in Virginia and Johnston in the West, the result of the War might have been different. The monument to Albert Sidney Johnston in New Orleans is one of the most beautiful in the country; he is buried in Austin, the capital of his adopted State, and Texas proposes to honor herself by erecting to his memory a fitting monument.

J. Wm. Jones,
Author and Lecturer.

Johnston, Alexander, American historian: b. Brooklyn, L. I., 29 April 1849; d. Princeton, N. J., 21 July 1889. He was graduated from Rutgers College, N. J., in 1870, studied law and was admitted to the bar in 1876. He did not practise, however, and was professor of jurisprudence and political economy at Princeton University from 1883 till his death. He was the author of 'History of American Politics' (1879); 'Connecticut: a Study of a Commonwealth-Democracy' (1887); 'History of the United States for Schools' (1886); and 'The United States: its History and Constitution,' reprinted from the 'Encyclopædia Britannica' (1887).

Johnston, Alexander Keith, Scottish cartographer: b. Kirkhill, Edinburgh, Scotland, 28 Dec. 1804; d. 10 July 1871. His first important work, the 'National Atlas,' was published in 1843. At the suggestion of Humboldt, he visited Germany and gathered material for his 'Physical Atlas of Natural Phenomena' (1847–9), and his 'Royal Atlas of Geography' (1861) was one of the most beautiful and minutely accurate atlases ever published up to that time. His son of the same name (b. 1846; d. 28 June 1879) continued his father's enterprises.

Johnston, Gabriel, American colonial governor of North Carolina: b. Scotland 1699; d. 1752. Very little is known of his personal history. He was educated at the University of St. Andrew's, with a view to the medical profession, which he seems not to have practised. He was for a while professor of Oriental languages at St. Andrew's, and then removed to London, where he was engaged with Pulteney and Bolingbroke in writing for the 'Craftsman.' By the influence of the Earl of Wilmington he was appointed governor of North Carolina, and took the oath of office at Brunswick 2 Nov. 1734. He was the ablest and most successful of all the colonial governors, holding the reins of power up to the time of his death.

Johnston, Harriet Lane, American gentlewoman: b. Mercersburg, Pa., 1833; d. Narragansett Pier, R. I., 3 July 1903. She was the niece of James Buchanan, afterward President of the United States, and on the death of her mother, Buchanan's sister, in 1839, was brought up under the care of her uncle. When the latter was minister to Great Britain, the niece presided over the hospitalities of the legation in London, and during his occupancy of the White House was its mistress, receiving among other distinguished guests the Prince of Wales, now Edward VII. On the occasion of his coronation in 1902 she was among the specially invited guests in recognition of the courtesies extended to him at the White House so long before. In 1866 she was married to Henry Eliott Johnston of Baltimore.

Johnston, Sir Harry Hamilton, English traveler: b. London 12 June 1858. He was educated at King's College, London, and the Royal Academy of Arts, traveled in North Africa, 1879–80, and Portuguese West Africa, and the Kongo region, 1882–3. He commanded a scientific expedition to Mount Kilimanjaro in 1884 and has held various consular posts in Africa. He has published 'Essays on the Tunisian Question' (1880–1); 'The River Congo' (1884); 'Kilimanjaro' (1885); 'History of a Slave' (1889); 'Life of a Livingstone' (1891); 'British Central Africa' (1897); 'History of the Colonization of Africa by Alien Races' (1899); 'The Uganda Protectorate' (1902).

Johnston, Henry Phelps, American historical writer: b. 1842. He is professor of history in the College of the City of New York, and has published 'The Battle of Harlem Heights'; 'Loyalist History of the Revolution'; 'The Yorktown Campaign'; etc.

Johnston, James Steptoe, American Episcopal bishop: b. Church Hill, Miss., 9 June 1843. He was educated at the University of Virginia, served as 2d lieutenant in the Confederate cavalry during the Civil War, subsequently studied law and was admitted to the bar. After practising for a short time he took orders in the Episcopal Church in 1869 and after holding rectorships at Port Gibson, Miss., six years; Mount Sterling, Ky., four years; and Mobile, Ala., eight years, became bishop of western Texas in January 1888.

Johnston, John, American Indian agent: b. Ballyshannon, Ireland, March 1775; d. Washington, D. C., 19 April 1861. He came to Cumberland County, Pa., in 1786, obtained a post in the War Department, in 1792 went to the Ohio Valley, later became a United States factor at Fort Wayne, Ind., and at the beginning of the War of 1812 was appointed Indian agent for Ohio, with headquarters at Piqua. President Harrison appointed him agent to the Senecas, with headquarters at Upper Sandusky, and in that capacity negotiated with the Senecas the

treaty whereby they agreed to move westward across the Mississippi. He was president of the Historical and Philosophical Society of Ohio, and wrote: 'Present State of the Indian Tribes Inhabiting Ohio,' printed in 'Archæologia Americana' (transactions and collections of the American Antiquarian Society), Vol. I. (6 vols., 1820–74).

Johnston, Joseph Eggleston, American soldier: b. Cherry Grove, Va., 3 Feb. 1807; d. Washington, D. C., 21 March 1891. He was graduated at West Point in 1829; and served with distinction in the Black Hawk and Seminole wars. In the Mexican War he distinguished himself also and was brevetted major and colonel United States army for bravery at Cerro Gordo. He was promoted quartermaster-general of the army with the rank of brigadier-general in June 1860, but resigned his commission when Virginia seceded. He was then made major-general of Virginia volunteers and later full general in the Confederate service, taking an active part in the first battle of Bull Run, 21 July 1861, where he personally led a charge with the colors of the 4th Alabama regiment in his hands. At the battle of Fair Oaks, 31 May 1862, Johnston was severely wounded and was disabled for service for several months. In November he again reported for duty and was assigned to the Military Department of Tennessee. In the operations of Grant before Vicksburg he did everything possible to prevent the shutting up of General Pemberton in Vicksburg, telegraphing him May 2: "If Grant crosses, unite all your troops to beat him. Success will give back what was abandoned to win it." Although similar orders were repeatedly sent to Pemberton, they were disregarded; Pemberton allowed himself to be shut up in Vicksburg, and the siege and surrender on 4 July followed. In December of the same year he took command of Bragg's army at Dalton, Ga., and by the spring of 1864 brought it to a state of efficiency which it had not previously had, though it contained only 45,000 men against Sherman's 98,797. The campaign from Dalton to Atlanta, a distance of 100 miles, was a series of severe engagements without a general battle, Johnston's friends claiming "the retreat had been the masterpiece of Johnston's life, and one of the most skilful and successful that had ever been executed." On 17 July 1864 Johnston was superseded in this command by General Hood. In the early part of 1865 he was several times defeated by Sherman, to whom he surrendered at Durham Station, N. C., on 26 April, the terms of capitulation resembling those granted to Lee at Appomattox. After the war Johnston engaged in business, and was member of Congress 1876–8. He was United States Commissioner of Railways 1885–9, and the author of 'A Narrative of Military Operations During the Late War' (1874). Consult: Hughes, 'General Johnston' (1893).

Johnston, Mary, American novelist: b. Buchanan, Botefourt County, Va., 21 Nov. 1870. In 1898 she became suddenly famous through her 'Prisoners of Hope: a Tale of Colonial Virginia,' and her next book 'To Have and to Hold' (1900) was even more popular. She has since published 'Audrey' (1902).

Johnston, Richard Malcolm, American author: b. Powelton, Ga., 8 March 1822; d. Baltimore, Md., 23 Sept. 1898. He was graduated at Mercer University in 1841; was admitted to the bar in 1843; and began practice in Sparta, Ga., the same year. He was professor of literature in the University of Georgia in 1857–61 and served as colonel in the Confederate service during the Civil War. At its close he established a boys' boarding school at Sparta, which he removed in 1867 to Baltimore, and of which he was the head for many years. His publications include: 'Historical Sketch of English Literature'; 'Life of Alexander H. Stephens' (1883); 'Dukesborough Tales' (1883); 'Old Mark Langston'; 'Ogeechee Cross-Firings' (1889); 'Mr. Absalom Billingslea and Other Georgia Folk' (1887); 'Studies Literary and Social' (1891–2); 'The Primes and Their Neighbors'; 'Mr. Billy Downs and his Likes.' The usual theme of his longer as well as his shorter fictions is the life of the middle class Georgian in the ante-bellum period.

Johnston, Samuel, American lawyer and statesman, nephew of Gabriel Johnston (q.v.): b. Dundee, Scotland, 15 Dec. 1733; d. near Edenton, N. C., 18 Aug. 1816. His father, John, came to North Carolina in 1736, became surveyor-general, and acquired large landed estates. The son chose the profession of the law, and was clerk of the superior court in Chowan County for five years from 1767, and served there also as naval officer under the crown. Elected to the assembly in 1769 from the first he espoused the popular side, and in 1773 the assembly placed him on its standing committee of inquiry and correspondence, the organ by which it sought to co-operate with the other provinces. This was the first decisive step toward revolution taken by the legislature of North Carolina. He was an active member of the first two provincial congresses in this province. The 3d and 4th met at his summons, and he presided over the deliberations of both. In the 3d, August 1775, the political organization of the province was decided on, and the supreme executive authority was entrusted to a provincial council, of which he was made the chairman, and so virtually the governor of the province. In September 1775 he was chosen treasurer for the northern district of North Carolina. In 1781–2 he was a member of the Continental Congress. In 1787 he was elected governor of the State, and in 1788 presided over the convention which rejected the Federal Constitution, which, however, he supported with all his influence. He was United States senator 1789–93, and judge of the superior court 1800–03.

Johnston, William Preston, American educator: b. Louisville, Ky., 5 Jan. 1831; d. Lexington, Va., 16 July 1899. He was a son of A. S. Johnston (q.v.) and was graduated at Yale in 1852 and from the Louisville Law School in 1853. He served as colonel and aide-de-camp to Jefferson Davis in the Confederate army during the Civil War, and soon after its close became professor of history and literature at the Washington and Lee University, remaining there till 1877. In 1880 he became president of the Louisiana State University, and after its union with Tulane University, New Orleans, in 1884, was president of that institution till his death. His

publications include: 'Life of General Albert Sidney Johnston'; 'The Johnstons of Salisbury'; 'The Prototype of Hamlet'; and 'Seekers after God' (poem).

Johnstown, jŏnz'town, N. Y., city and county-seat of Fulton County, on Cayadutta Creek, and on the Fonda, J. & G. railroad, 44 miles northwest of Albany. In 1771, a few years after its settlement, it was named after its founder, Sir William Johnson, whose mansion, built here 10 years earlier, still stands almost as it was left by him. In 1808 Johnstown was incorporated as a village, and in 1895 it received a city charter. The court-house and jail, built by Sir William Johnson in 1772, occupy with Johnson Hall an interesting place in local history. The city has a public library building which was the gift of Andrew Carnegie. The industries of Johnstown include a variety of important manufactures, chief among which are those of gloves and mittens, knit goods of different kinds, leather, gelatin, lumber, grist-mill and machine-shop products, etc. The municipal government is well supported by public spirit, and the city's affairs are efficiently managed. The people elect the water board and the school board, and the waterworks are owned and operated by the city. Pop. (1890) 7,768; (1900) 10,130.

Johnstown, Pa., city, Cambria County; on the Conemaugh River, and on the Baltimore & O. and the Pennsylvania R.R.'s; about 80 miles east of Pittsburg. The Little Conemaugh River and Stony Creek unite at Johnstown and form the Conemaugh River. The area of the city is about five square miles, and the valley in which it is located is about 1,200 feet above sea-level. Johnstown was settled about 1790, was incorporated as a borough in 1831, and as a city in 1889. Its situation, in a coal and iron ore region, combined with its great water power, has made it an important manufacturing centre. Fire-clay and limestone are also found in the vicinity. Some of its industrial establishments are the Cambria Steel Company works, where about 16,000 men are employed, the Lorain Steel Company, iron and steel works, iron-plate mills, street-car rail factory, planing-mills, cement works, furniture factories, potteries, breweries, brick-yards, machine-shops, foundries, furnaces, wire works, leather, and woolen goods. Some of the noted public buildings are the Cambria Free Library, the Conemaugh Valley Memorial Hospital, several churches, the city hall, and the high school. The number and arrangement of the parks add to the beauty of the place. In Grand View Cemetery are the graves of 777 unidentified dead who perished in the "Johnstown Flood." This disastrous flood occurred on 31 May 1889, and was the result of the destruction of a dam across South Fork, a small branch of the Conemaugh River. Heavy rains had fallen and the mountain streams of the vicinity had become roaring torrents. The dam kept back the waters of Conemaugh Lake, about two and one half miles long, one and one half miles wide, and averaging over 50 feet in depth; in some places the water of the lake was 100 feet in depth. The direct distance from the city was about 12 miles, but along the river the distance was five or six miles longer. In a very short time after the dam had burst, the valley was flooded and Johnstown and several small villages were under water. The loss of lives was 2,205, and the loss of property was estimated to be about $10,000,000. Aid for the sufferers came from all parts of the country; and the city was soon rebuilt, and its industries re-established. Pop. (1890) 21,805; (1900) 35,936.

Joint, in anatomy, an articulation or connection between bones. Many of the immovable joints are so close in their union that the two bones practically become one, as in the dovetailed sutures of the skull. In the make-up of a movable joint there are the two bones, and covering the surface of each a layer of tissue of rubbery consistency called cartilage; binding the bones together are firm inelastic bands of tissue called ligaments. Over the surface of the cartilage and the inner surfaces of the ligaments there is a thin smooth layer of tissue, the synovial membrane, which is kept constantly moist with an oily fluid to prevent friction. Joints are classified according to the variety of motions they allow: the freest is the ball-and-socket joint, as seen in the hip and shoulder.

Diseases of Joints.— Joint-diseases are distinguished by names that indicate the principal structure involved and the causes of disease. Where the cause is a specific disorder, as tuberculosis, rheumatism, syphilis or gonorrhœa, the name of that particular malady is given to the inflammation. The only structure of a joint that is apt to be involved alone is the synovial membrane, and inflammation of this structure is called synovitis. Inflammation of all the joint-structures is called arthritis, and where the bone is the primary seat of the trouble, or is principally involved, the name osteo-arthritis is used.

Synovitis.— This condition results from injuries (sprains, bruises, and wounds), from overuse, acting as an injury, and from poisons circulating in the blood. The joint is painful, moves with greater pain, and may be red outside. Blood-serum is poured out, and the synovial sac is distended. (This condition constitutes "water on the knee.") The general symptoms and severity depend on the cause of the trouble. Absolute rest of the joint and pressure by a snug bandage hasten recovery. When such injuries are repeated, or when the inflammation is slight but persistent, painting with iodine tincture may be of value. When the condition of inflammation reaches the suppurative stage all the structures of the joint are involved, and the condition is considered under the term "arthritis."

Arthritis (non-specific).— This is due to the extension of disease of contiguous bone, or it may result from wounds or in the course of various diseases. The joint becomes swollen, red, very painful, and the general symptoms are severe. When the poison is sufficiently virulent, suppurative arthritis results, and the pus collects in the synovial sac. (See INFLAMMATION.) In this condition the joint becomes "boggy," and the poisoning of the entire system is so severe as to warrant the most radical measures for relief. Opening the joint and allowing the escape of the pus, with thorough cleansing, may be sufficient, or the limb may have to be sacrificed. See ARTHRITIS; ARTHRITIS DEFORMANS; GOUT; RHEUMATISM; SYPHILIS.

Knock-knee.— This is a deformity of the legs, consisting in the angular projection of the knee inward, and is sometimes called in-knee. It arises in children learning to walk who are affected with rickets (q.v.). The deformity is due to the faulty growth of the bones which enter into the joint. In early life, correction of it may be secured by splints and braces; but when the bones become less pliable, the femur, the tibia, or both may have to be severed by chiseling and the bones held in the normal line by plaster casts until union has taken place.

Charcot's Disease.— The peculiar form of arthritis thus named occurs in the course of locomotor ataxia, the knee-joint usually being the one affected. The joint swells painlessly, the structures are worn away, and the function of the joint is lost.

Injuries of Joints.— See DISLOCATION.

Sprains.— These are wrenches resulting in more or less stretching or laceration of ligaments, hemorrhage in and around the joint, and sometimes the displacement of tendons. The part usually swells at once, and movement causes severe pain. This injury may closely resemble a joint-fracture. Absolute rest of the joint must be insisted upon, as synovitis may follow. Alternating hot and cold applications, if started early, lessen the damage. The joint should then be snugly bandaged and kept so until swelling and tenderness disappear.

Wounds of Joints.— Injuries of this nature may cause damage directly to the structures or by infecting the joint and producing arthritis. Penetration into the synovial sac is indicated by an escape of the viscid fluid.

Floating Cartilages.— These are rarely seen except in the knee-joint, where they are ordinarily due to a small portion of cartilage being bitten off between the bones; this piece then floats around in the synovial sac, and causes trouble when the bones lock together on it. When this occurs, the patient falls to the ground because of the severe pain. The synovial membrane is injured, and is apt to be mildly inflamed. These bodies may sometimes be felt through the skin, and can be held, by holding the joint in the same position, until an opening is made; but ordinarily when the attacks become so frequent as to be unbearable the joint has to be opened and searched.

Joint or Knot Grass. See GRASSES IN THE UNITED STATES.

Joint-snake. See GLASS-SNAKE.

Joint Tenants, persons who hold or own lands jointly, by title created expressly by one and the same deed or will. It has been uniformly held by the courts that a unity of possession derived by several and distinct conveyances does not constitute a joint tenancy, but rather a tenancy in common. Joint tenants must have the same interest, derived from the same conveyance, commencing at one and the same time, and held by a united possession. The duration of the estates must be alike in both, and also the interest. Should one hold under the conveyance for a term of years, and the other for life, the possession even for a term of years would not be a joint tenancy. The estate must vest in each tenant at the same time. In the case of a will which gives one an interest to commence at a day named and another an interest to commence a year later, no joint tenancy is created thereby. Should one receive an interest absolute and another an interest for life, the relation of joint tenants would not be created. The doctrine of survivorship is the distinguishing incident of title by joint tenancy. In the event of the death of one of the joint tenants, the survivor is entitled to the whole property, and the full title immediately vests in him. This is not an incident of tenancy in common. Many of the States of the Union have abolished title by survivorship in joint tenancy by constitutional provisions or by express statute enactments. In other States acts have been passed abrogating the distinction between joint tenants and tenants in common; and inheritance by survivorship not being an incident of tenancy in common, such acts are construed by the courts as abolishing such inheritance. Such acts do not apply to existing joint tenancies, but only to such as may be created after the enactment.

Joint-worm, the larva of chalcid flies (see CHALCIS) which make galls near the "joints" of grass-plants, and thus are sometimes of great injury to cereal crops, especially wheat and barley. See WHEAT INSECT-PESTS.

Jointure, join'tūr, a settlement of lands and tenements made to a woman in consideration of marriage, as a substitute for dower. Originally it was a joint estate limited to both husband and wife as a joint tenancy and subjected to survivorship. The wife takes nothing under the settlement until after the death of the husband, unless special provisions are incorporated, which in reality modifies the effect of a regular jointure. In some settlements, denominated jointures, provisions are inserted to the effect that they are not to exclude enjoyment of dower; but such provisions are an innovation upon the established province of jointures. A good jointure must provide that it shall take effect, in possession and profit, immediately after the death of the husband; that it shall be for the life of the wife herself, and cannot be left in trust for her use and benefit. It should be provided that it is in settlement of all dower interest, in order to maintain its distinctive features of jointure. The settlement must be executed before marriage, as marriage constitutes the entire consideration for the jointure. Such an instrument properly executed before marriage is binding on the wife and a complete bar to dower in any dowable lands owned or conveyed by the husband during the marital relations. Without the intervention and assistance of legislative action, no other form of agreement is effectual to bar dower. It sometimes happens that the wife is deprived of her jointure by lawful acts to which she is not a party, as by the lands being taken for public purposes, or in some other manner equally legitimate. In such a case the settlement does not bar her claim against the husband's estate to the extent to which she is deprived of her jointure.

Joinville, Jean, zhŏń zhwän-vēl, SIEUR DE, French historian: b. Champagne 1224; d. 11 July 1317. He early entered the service of Thibaut, king of Navarre, and in 1248 raised a troop of 9 knights and 700 armed soldiers, and accompanied Louis IX. in his first crusade to

the Holy Land. He rose high in favor with Louis, shared his captivity, returned with him to France in 1254, and spent much of his time at court. His 'Histoire de St. Louis,' which is one of the most valuable specimens of early French prose, has been often reprinted.

Jokai, yō'kä-ĭ, **Maurus,** Hungarian novelist: b. Komorn 19 Feb. 1825; d. Budapest 5 May 1904. In 1846 he received his advocate's diploma, but never practised, and from a very early age devoted himself to literary work. In 1842 he produced a drama, 'The Jew Boy,' in 1846 his first novel, 'Work-days,' was published, and in 1847 he issued a collection of stories entitled 'Flowers of the Desert.' His 'Revolution and Battle Pictures' appeared in 1849, and after that he devoted himself with extraordinary energy to journalistic and literary work, producing in all more than 300 volumes. He was a member of the Hungarian parliament and the recognized leader of the Liberal opposition since the restoration of the constitution, and in 1897 was appointed a life member of the House of Magnates. He was a successful newspaper editor continuously from 1858 till his death, his last paper being the 'Nemzet' (Nation). He is best known by his numerous romances and novels. Among the latter are 'Transylvania's Golden Age' (1851); 'The Man with Two Horns' (1852); 'The Turks in Hungary' (1852); 'A Hungarian Nabob' (1854); 'Kárpáthy Zoltan' (1855); 'Political Fashions' (1861); 'The New Landlord' (1862); 'Dr. Dumany's Wife' (Eng. trans. 1891); 'In Love With the Czarina' (Eng. trans. 1894); 'The Nameless Castle' (Eng. trans. 1891); 'The Green Book' (Eng. trans. 1897); 'The Lion of Janina' (Eng. trans. 1897); 'The Poor Plutocrats' (Eng. trans. 1899); 'Debts of Honor' (Eng. trans. 1900); 'The Baron's Son' (Eng. trans. 1900); 'The Day of Wrath' (Eng. trans. 1900). His best plays are: 'King Kolomon' (1855); 'Manlius Sinister' (1856); 'Georg Dózsa' (1858); 'The Martyrs of Szigetvár' (1859); and 'Milton' (1878). His 'Political Poems' appeared in 1880. Consult Nevai, 'M. Jokai' (1894).

Joliet, jō'lĭ-ĕt, Fr. zhō-lē-ā, **Louis,** American explorer: b. Quebec 21 Sept. 1645; d. Canada May 1700. He was educated at the Jesuit College of Quebec, and subsequently engaged in the fur trade on the western frontier, thereby becoming familiar with the missionaries and tribes. He was selected by the governor Frontenac to ascertain the direction and mouth of the Mississippi, a few of whose affluents had already been visited by missionaries and traders. Starting with his companion, the illustrious Father Marquette (q.v.), and five other Frenchmen, from Green Bay in June 1673, he ascended the Fox River, and descended the Wisconsin to its confluence with the Mississippi, down which they sailed as far as the country of the Chickasaws, below the entrance of the Arkansas. Having ascertained with tolerable accuracy the general course of the stream, they returned to Green Bay, by the way of Illinois River, Chicago, and Lake Michigan, whence Joliet started alone for Quebec. The whole route traveled by them is estimated at 2,500 miles. He lost his journal and other papers in the rapids above Montreal, but wrote out from recollection a few pages of manuscript, which agree with the narrative of Marquette. In the same manner he prepared a map of the region explored. The French government inadequately rewarded him for his services with the Island of Anticosti at the mouth of the St. Lawrence, where he built a house and fort for his family, intending to embark in trade. He appears, however, to have been subsequently employed in the West. In 1691 his island was captured by a British fleet and his property destroyed. In 1697 the seignory of Joliet, Canada, was assigned to him. Joliet, the capital of Will County, Ill., is named after him. Consult: Parkman, 'La Salle' (1869); Winsor, 'Narrative and Critical History of America' (1884–7).

Joliet, jō'lĭ-ĕt, Ill., city, county-seat of Will County; on the Des Plaines River, and on the Chicago, R. I. & P., the Michigan C., the Atchison, T. & S. F., the Elgin, J. & E., the Lake Shore & E., and the Chicago & A. R.R.'s; about 30 miles southwest of Chicago. The first permanent settlement was made in 1831 and the city was chartered in 1859. The places was named in honor of Louis Joliet, a Canadian navigator and one of the party who with Marquette visited this place in 1673. The Illinois and Michigan Canal and the Joliet River supply the city with good water power. The city is situated in a rich agricultural region, and large limestone quarries are in the vicinity. Its chief manufacturing establishments are the American Steel and Wire Company works, the Illinois Steel Company factory, the American Tin Plate Company, machine-shops, agricultural implement works, foundry and furnace products, breweries, flour-mills, boot and shoe factories, and furniture factories. Some of the public institutions are the State penitentiary, Silver Cross and Saint Joseph's hospitals, Saint Mary and Saint Francis academies, and a public library which contains about 16,000 volumes. The Illinois Steel Company Athenæum, a club-house for workingmen, is a fine institution. The city owns and operates the waterworks. Pop. (1890) 23,264; (1900) 29,353.

Joliette, or **Industry Village,** Canada, town and county-seat of Joliette County, Quebec; on the L'Assomption River, at the junction of a branch of the Canadian Pacific with the Great Northern Ry. of Canada; 40 miles north of Montreal. It is an important market town, has fine water power, and has a good trade in lumber and farm products. It has large foundries, saw, paper, and grist mills, and manufactories of woolen goods, leather, boots and shoes, biscuit, agricultural implements, carriages, and tobacco and cigars. Limestone for building is quarried in the vicinity. It has two churches, a college, hospital, convent, orphan asylum, and mechanic's institute; an industrial school, banks, and weekly newspapers. The municipality controls the waterworks and electric light. Pop. (1901) 4,220, almost entirely French Canadian.

Jolly Balance, a spring balance devised by Prof. Philipp von Jolly, of the University of Munich, for determining the specific gravities of small objects. In its usual form it consists essentially of a long spiral spring of fine wire, to the lower end of which two pans are attached, one above the other. The lower pan is kept immersed in water, while the upper one remains in the air. The object whose specific gravity is to be determined is placed in the upper

pan first, and the extension of the spring due to the weight of the object in the air is noted. The specimen is then transferred to the lower pan (where it will be under water), and the extension of the spring under these new conditions is also noted. The specific gravity of the specimen is then obtained by dividing the extension of the spring when the object is in the air by the difference between the two extensions as observed for air and water, respectively. The extension of the spring is observed by means of a graduated scale engraved upon a mirror that is placed back of the spring, and parallel to it. In taking a reading, the eye is brought into such a position that the image of the pupil is seen in the mirror directly behind the image of the pointer at the lower end of the spring. In this way errors of parallax are avoided in the readings. The Jolly balance is chiefly used for the rapid determination of the specific gravities of minerals and similar objects, where great precision is not essential.

Jonah, jō'na, a Hebrew prophet: b. Gath-Hepher, Galilee. He flourished in the early years of Jeroboam II., king of Israel, who acceded to the throne 781 B.C. In 2 Kings xiv. 20 we are told that Jonah predicted to Jeroboam his victories over the Syrians. In the narrative of this so-called prophecy of Jonah we see the son of Amittai despatched on an errand of unique importance. He is to go to Nineveh to warn the inhabitants of the destruction of their city, which is to follow within 40 days. The Assyrians at that time were in a reduced condition, their power was broken, and they were inclined to heed the warning. A fast was proclaimed and the threatened judgment was thus averted. Chapter 1st of the book tells the story of Jonah's refusal to obey the command to go to Nineveh; his flight westward, his miraculous arrest, ending in his imprisonment in the belly of a large fish. Then follows a psalm of thanksgiving for deliverance from the fish. The 3d chapter relates to the preaching of Jonah and the repentance of the Ninevites followed by the reprieve of their city. Finally Jonah is rebuked for his anger at the sparing of Nineveh, by which his prophetic reputation ran the risk of being discredited. The book is in no proper sense a prophecy, but is intended to rebuke the haughty exclusiveness of Israel. The Jews were inclined to rejoice at the calamities of the heathen, and the present reprimand is all the more severe because the Assyrians had been and were afterward again to be the most powerful and dangerous foe to the peace of Palestine.

Jonah Crab, a crab of southern New England (*Cancer borealis*) related to the common edible species, but more robust, and with a thicker, harder shell. It is eaten locally.

Jo'nas, Benjamin Franklin, American lawyer and politician: b. Williamston, Ky., 19 July 1834. He was graduated from the law department of the University of Louisiana in 1855, and on the outbreak of the Civil War entered the Confederate army as private and rose to the rank of adjutant. In 1865 he was elected to the Louisiana legislature, to the State senate in 1872, and was then chosen city attorney of New Orleans. After a second term in the State legislature, he was elected to the United States Senate from Louisiana and served from 1879 to 1885. He was appointed by President Cleveland collector of the port of New Orleans (1885–9).

Jonas, yō'näs, **Justus** (originally JOBST KOCH), German religious reformer: b. Nordhausen, Saxony, 5 June 1493; d. Eisfeldt 9 Oct. 1555. He accompanied Luther to the diet at Worms, assisted him in translating the Old Testament, took part in the Marburg Conference as well as in drawing up the so-called articles of Torgau and was present at the Diet of Augsburg. He did good service to the cause of the Reformation not only by his preaching but by his vigorous translations into German of the Latin works of Luther and Melanchthon.

Jon'athan, son of Saul, king of Israel. He carried on the war against the Philistines for some time with victorious success, but in the battle of Gilboa (1033 B.C.) was slain. His friendship for David is one of the most beautiful incidents in Old Testament history, and the elegy or dirge composed by David on his death—'The Song of the Bow'—is in the highest strain of Hebrew poetry.

Jonathan. See BROTHER JONATHAN.

Jones, Alexander, American inventor and journalist: b. North Carolina about 1802; d. New York 25 Aug. 1863. He studied medicine in Philadelphia, entered practice in Mississippi, there became interested in cotton cultivation, and made important improvements in the cotton-gin. He invented also a street-sweeping machine. He became an agent of the Associated Press in 1850, and subsequently commercial reporter of the New York *Herald*. His published volumes are: 'Cuba in 1851' (1851); 'Historical Sketch of the Electric Telegraph' (1852); and 'The Cymri of '76' (1855).

Jones, Alfred Gilpin, Canadian statesman: b. Weymouth, Nova Scotia, September 1824; d. Halifax, 15 March 1906. After a secondary education, he entered mercantile life, opposed confederation in 1865, sat in the Dominion Parliament for Halifax in 1867–72 and again in 1874–8, was a member of the privy council, and in 1878 was minister of militia. In 1887–91 he was a third time in Parliament. In 1900 he was appointed Lieutenant-Governor of Nova Scotia. At first a Conservative, he later identified himself with the Liberals, and favored a trade-union with the United States.

Jones, Amanda Theodosia, American poet: b. East Bloomfield, Ontario County, N. Y., 19 Oct. 1835. Some of her war songs were very popular. She published: 'Ulah and Other Poems' (1860); 'Atlantis and Other Poems' (1866); 'A Prairie Idyl, and Other Poems' (1882).

Jones, Anson, last president of the Republic of Texas: b. Great Barrington, Mass., 20 Jan. 1798; d. Houston, Texas, 7 Jan. 1858. He commenced the study of medicine in Litchfield, Conn., in 1817, and in 1820 was licensed to practise. He established himself in 1833 in Brazoria, Texas, and upon the outbreak of the troubles between Texas and Mexico, became one of the earliest advocates of the severance of the two countries. In the succeeding war of independence he served as a private soldier, and as surgeon in the Texan army. In 1837–8 he

was a representative in the Texan congress from Brazoria County; in 1838 was sent as minister to Washington, where he endeavored, though unsuccessfully, to secure the annexation of Texas to the United States, and on his return to Texas took his seat in Congress as senator from Brazoria, and in 1841 was appointed by President Houston his secretary of state, which office he filled three years. In September 1844 he was elected President of Texas for three years from the ensuing December, and held that office until the annexation of Texas to the United States. He succeeded in maintaining a footing of equality in negotiations with England, France, and the United States; and by the intervention of the two former powers the government of Mexico was induced to acknowledge the independence of Texas.

Jones, Charles Colcock, Jr., American author: b. Savannah, Ga., 28 Oct. 1831; d. 19 July 1893. He was graduated at Princeton (1852), at Harvard Law School (1855), and was admitted to the bar in 1856. He served as colonel of artillery in the Confederate army during the War for the Union, and on the return of peace removed to New York, where he practised law. In 1877 he returned to Georgia and devoted his time to the study of the history and archæology of that State. He wrote: 'Negro Myths from the Georgia Coast, Told in the Vernacular' (1888); 'The History of Georgia' (1883).

Jones, David Phillips, American naval engineer: b. Philadelphia 1841; d. Pittsburg 30 Jan. 1903. He entered the navy in 1862, during the Civil War took part in the operations on the James (Va.) and the St. John's (Fla.), and was present at Bermuda Hundred, and in 1889 attained the grade of chief engineer. In 1874–9 he was instructor in steam engineering at the Naval Academy, Annapolis, and from 1889 to 1892, when he was retired, was on duty at the naval training-station at Newport, R. I. He was chief inspector of steel for the district at Pittsburg during the Spanish-American war.

Jones, Edward Franc, American soldier and manufacturer: b. Utica, N. Y., 3 June 1828. He was colonel of the 6th regiment of Massachusetts volunteers, which he led through Baltimore at the opening of the Civil War, and which was attacked by the mob. He was subsequently brevetted a brigadier-general of United States volunteers. He was a member of the Massachusetts Legislature in 1865, but removed to Binghamton, N. Y., the same year. He was lieutenant-governor of New York 1886–91, and originated the phrase, "He pays the freight." He published 'The Origin of the Flag'; etc.

Jones, Henry Arthur, English dramatist: b. Grandborough, Buckinghamshire, England, 28 Sept. 1851. After a secondary education, he took up writing as a means of livelihood, and in 1879 appeared as playwright with 'A Clerical Error,' performed by Wilson Barrett at the Court Theatre. He followed this by a series of comedies of modern life, clever in dialogue and stagecraft, which have been very popular, particularly with English audiences. They include: 'Silver King' (1882); 'Saints and Sinners' (1884); 'Middleman' (1889); 'Judah' (1890); 'The Dancing Girl' (1891); 'The Tempter' (1893); 'The Masqueraders' (1894); 'The Triumph of the Philistines' (1895); 'The Rogues' Comedy' (1896); 'The Liars' (1897); 'The Manœuvres of Jane' (1898); 'Carnac Sahib' (1899); 'The Princess' Nose' (1902); 'Chance, the Idol' (1902); 'Mrs. Dane's Defense' (1904).

Jones, Inigo, English architect: b. London July 1573; d. there 21 July 1652. He was the son of a clothworker and began life as a carpenter, but showing a taste for painting, William, earl of Pembroke, supplied him with the means of visiting Italy for the purpose of studying landscape painting. At Venice, the works of Palladio inspired him with a taste for architecture. He was appointed first architect to Christian IV., king of Denmark, but in 1605 he returned to his native country. After being employed for a time as a scenic and stage artist, he was appointed in 1610 surveyor of the works to Henry, Prince of Wales. After the death of the prince he again visited Italy, and extended his knowledge and improved his taste from the examination of the models of ancient and modern art. The banqueting house at Whitehall is a monument of his skill and science. At Winchester Cathedral he erected a screen in the style of classic antiquity. Like Wren he seems not to have duly appreciated the Pointed style of building. He built the front of Wilton House, in Wiltshire, for Philip, earl of Pembroke, and was much employed by the court and by many of the nobility and gentry. He also designed the scenery and decorations for masks — a species of dramatic entertainment fashionable in the early part of the 17th century. In these pieces the dialogues and songs were composed by Ben Jonson, who quarreled with Jones, and abused him in epigrams and satires. Being a Roman Catholic, and a partisan of royalty, he suffered in the civil war, and in 1646 was forced to pay a heavy fine as a malignant or cavalier. As an author he is known by a work on Stonehenge, composed by command of King James I., in which he undertook to prove that Stonehenge was erected by the Romans, and was a hypæthral temple dedicated to the god Cœlus. He was the reviver of classical architecture in England, but he blended Gothic elements with the Italian style. Among his works besides those mentioned are the Greenwich Hospital, the old London Exchange, and the portico of St. Paul's Church, and Earl Pembroke's house.

Jones, Jacob, American naval officer: b. near Smyrna, Del., March 1768; d. Philadelphia 3 Aug. 1850. He entered the United States navy in 1799 as a midshipman and while serving in the war with Tripoli, was captured in 1803 and held a prisoner for 18 months. In 1812 he became commander of the Wasp and with her captured the English brig Frolic 18 Oct. 1812, but on the following day encountered the English war vessel Poictiers, 74 guns, by which both the Wasp and its prize were taken. He was released on parole at Bermuda and for his victory over the Frolic was voted a gold medal by Congress, and $25,000 was granted to him and his crew in payment of the personal loss they had sustained. He subsequently commanded squadrons in the Mediterranean and the Pacific.

Jones, Jenkin Lloyd American Unitarian clergyman: b. Llandyssil, Cardiganshire, Wales, 14 Nov. 1843. He came to America with his

parents while an infant, served in a Wisconsin regiment during the Civil War, and was graduated from the Meadville (Pa.) Theological Seminary in 1870. He was pastor of All Souls Unitarian Church, Janesville, Wis., 1874–83; was secretary of the Western Unitarian Conference for nine years, and since 1883 has been pastor of All Souls Church, Chicago. He has been prominent among the more radical members of the Unitarian body, and has published: 'The Faith that Makes Faithful,' with W. C. Gannett (1886); 'Practical Piety' (1890); 'Word of the Spirit' (1897); 'Bits of Wayside Gospel' (1899); etc.

Jones, John, American surgeon: b. Jamaica, L. I., 1729; d. 1791. He studied medicine in Europe, and, returning to America, practised in New York, becoming professor of surgery in King's College, and, with Dr. Bard, founding the New York Hospital in 1771. After the occupation of New York by the English Forces in 1777 he removed to Philadelphia, there being one of the physicians of the Pennsylvania Hospital, and in 1787 vice-president of the College of Physicians. He was the friend and physician of both Washington and Franklin, attending the latter in his last illness. He published 'Plain Remarks upon Wounds and Fractures' (1775).

Jones, John Paul, the first of the great American sea fighters, and not the least splendid in the long line, was born John Paul — the name Jones being a subsequent assumption — on 6 July 1747 on the estate of Arbigland, in the parish of Kirkbean, in the County of Kircudbright, Scotland. His family was obscure, his circumstances narrow, his advantages meagre, his opportunities limited. At the age of 12 he became a sailor. Genius rose superior to adverse circumstances, however, and before he died he was one of the most accomplished officers who ever served the United States. The greatest men of America and France took pleasure in his society and were proud of his friendship.

He progressed rapidly in his chosen career. At 19 he was chief mate of a slaver, a legitimate occupation in his day, but one that filled him with disgust. At 21 he was captain of a trader. In 1773 he came to America, forsook the sea, and settled in Virginia.

He was still poor and obscure when on 7 Dec. 1775 he was appointed a lieutenant in the new Continental Navy, and was ordered to the Alfred, a small converted merchantman, Commodore Hopkins' flagship, on which, in the latter part of December, he had the honor of hoisting with his own hands the first naval flag of an American squadron. This was the famous yellow silk banner with a rattlesnake, and perhaps a pine tree, emblazoned upon it, with the significant legend, "Don't tread on me!"

Hopkins made an abortive expedition to New Providence, in which Jones had but one opportunity to distinguish himself. At the peril of his commission, when the regular pilots refused to do so, he volunteered to take the Alfred through a difficult and dangerous channel. Needless to say, he succeeded — he always succeeded!

His first independent command was the little brig-ship Providence, of 70 men and 12 4-pound guns. In the fall of 1775 he made a notable cruise in this vessel; he skirmished with, and escaped from, by seamanship and daring, two heavy frigates, the Solebay and the Milford; in four months he captured 16 vessels, 8 of which were sent in as prizes, 5 burned, 3 returned to certain poor fishermen; and he destroyed property aggregating $1,000,000.

Later, in command of the Alfred, with a short crew of 150 when he should have had 300, he made another brilliant cruise in which he burned several British transports, captured one storeship laden to the gunwales with priceless munitions of war and supplies, cut out three of the coal fleet from under the guns of the Flora frigate, and had another smart brush with the Milford.

He was commissioned captain in the navy on 10 Oct. 1776, and on 14 June 1777, in the same resolution that established the form of the American flag, he was ordered to the Ranger, a small ship-rigged corvette of 300 tons and 18 6-pounders. In her, at Portsmouth, N. H., on 4 July, he hoisted the first Stars and Stripes that ever flew from the peak of an American man-of-war. Sailing for European waters, he carried to France the official despatches announcing Burgoyne's surrender, which brought about the Franco-American alliance.

In Quiberon Bay, late on the evening of 14 Feb. 1778, in the Ranger, he received the first formal recognition ever given by a foreign fleet to the United States in a salute to the American flag. As it was after sunset when the salutes were exchanged, in order that there should be no mistake about it, the next morning, 15 February, Jones transferred his flag to the Independence, a small privateer, and deliberately sailed through La Motte Piquet's fleet of battleships, saluting and receiving salutes again.

In April 1778, still on the Ranger, he left Brest on a cruise in British waters, which took him around Ireland. During this cruise he made daring but abortive attempts to burn the shipping at Whitehaven, and to capture the Earl of Selkirk at Saint Mary's Isle. On the evening of 24 April, off Carrickfergus, he fought the British sloop-of-war Drake, of equal force and larger crew, to a standstill in an hour and five minutes. When the Drake struck her flag, her rigging, sails, and spars were cut to pieces. She had 42 killed and wounded — more than one fifth of her crew — and was completely helpless. The Ranger lost 2 killed and 6 wounded.

In 1779 Jones hoisted his flag on the Duc de Duras, a condemned East Indiaman, which would have been broken up had he not turned her into a makeshift frigate by mounting 40 guns in her batteries — 14 12-pounders, 20 nines, and 6 eighteens. This, in honor of Franklin, he renamed the Bon Homme Richard. Accompanied by the fine little American-built frigate Alliance, 32, commanded by Pierre Landais, an incompetent and unbalanced French naval officer in the American service, the French corvette Pallas, 30, Captain de Cottineau, with the brig Vengeance, 12, and the cutter Cerf, 16, Jones cruised around England and Scotland, taking many valuable prizes and striking terror all along the shore, in spite of constant mutiny and insubordination among the ships, officers, and men of his heterogeneous squadron.

On the evening of 23 September, off Flamborough Head, he fell in with the valuable Baltic convoy. He was accompanied at the time only by the Alliance and the Pallas. The Baltic convoy was protected by the Serapis and the Scarborough. The Serapis was a brand-new double-banked frigate of 800 tons, carrying 20 18-pounders, 20 nines, and 10 sixes. Inasmuch as the 18-pounders on the Richard burst and were abandoned after the first fire, the Serapis could and did discharge nearly twice as many pounds' weight of broadside as the Richard — say 300 pounds to 175. The Pallas grappled with the Scarborough — a more equal match — and Jones attacked the Serapis, which was not unwilling — quite the contrary — for the fight.

The battle was one of the most memorable and desperate ever fought upon the ocean. The Richard was riddled like a sieve. Her rotten sides were literally blown out to starboard and port by the heavy batteries of the Serapis. Jones had several hundred English prisoners on board. The master-at-arms released them, but with great readiness and presence of mind Jones, who was brilliantly supported by Richard Dale, his first lieutenant, sent them to the pumps while he continued to fight the English frigate, his own ship kept afloat by their efforts.

Captain Pearson, of the Serapis, was a brave man, but no match for the indomitable personality of the American commander. After several hours of such fighting as had scarcely been seen before on the narrow seas, he struck his flag. The Alliance, commanded by a jealous and incapable Frenchman, had contributed nothing to Jones' success. Indeed, she had twice deliberately poured her broadsides into the Richard in spite of frequent warning. The American vessel was so wrecked alow and aloft that she sank alongside, and Jones had to transfer the survivors of his crew to the English frigate. The aggregate of the two crews was nearly 700, of which about 350 were killed or wounded. The Scarborough was captured by the Pallas after a smart action.

Jones took his prizes into the Texel, when, after showing himself as vigorous and able in statecraft in maintaining American honor in diplomatic intrigues as he was at sea in battle, he was forced to turn over the Serapis and Scarborough to France.

The poverty of America did not permit Jones to get to sea in adequate ships thereafter, although he subsequently commanded successively the Alliance and the Ariel, a small sloop-of-war, in which he caused the British letter-of-marque Triumph to strike her flag after a brief action, from which she escaped by a clever ruse, he performed no other conspicuous service.

After the Revolution, he took service under Catherine of Russia, carefully reserving his American citizenship. In her service, in June and July 1788, he fought four brilliant actions in the Black Sea, in which he had to contend with the usual discouragement of indifferent personnel and wretched material, and in which he displayed all his old-time qualities, winning his usual successes, too.

Worn out in unrequited service, disgusted with Russian court intrigues of which he was the victim, resentful of the infamous Potemkin's brutal attempts at coercion, he asked leave of absence from Catherine's service and went to Paris, where in the companionship of his friends and in the society of the beautiful Aimée de Telison, the one woman he loved, he lived two years, and died of dropsy on 18 July 1792, at the age of 45.

Besides the memory of his battles, Paul Jones left a collection of immortal sayings, which are the heritage of the American navy and the admiration of brave men the world over.

"I do not wish to have command of any ship that does not sail fast, for I intend to go in harm's way!"

"I have ever looked out for the honor of the American flag."

"I can never renounce the glorious title of a citizen of the United States."

Last, but not least, the curt phrase which comes ringing through the centuries like a trumpet call to battle; the words with which he replied to the demand of the astonished Pearson, who saw the enemy's ship beaten to a pulp, and wondered why he did not yield:

"I have not yet begun to fight!"

Never in his long career did Jones have a decent ship or a respectable crew. His materials were always of the very poorest. His officers, with the exception of Richard Dale, were but little to boast of. What he accomplished he accomplished by the exercise of his own indomitable will, his serene courage, his matchless skill as a sailor, and his devotion to the cause he had espoused. After his death, among his papers, the following little memorandum of his services, written in his own hand, was found:

In 1775, J. Paul Jones armed and embarked in the first American ship of war. In the Revolution he had 23 battles and solemn rencontres by sea; made 7 descents in Britain and her colonies; took of her navy two ships of equal, and two of superior force, many store-ships, and others; constrained her to fortify her ports; suffer the Irish volunteers; desist from her cruel burnings in America, and exchange, as prisoners of war, the American citizens taken on the ocean, and cast into prisons of England, as "traitors, pirates, and felons!"

Paul Jones was accused of being a pirate. The charge was a long time dying, but it is to-day generally withdrawn. His status was clear and unequivocal. He was a regularly commissioned officer in the navy.

In person Jones was a small, slender, well-made man, about 5 feet 7 inches high. His complexion was dark, his features were regular, and his eyes black and brilliant. He had acquired a charming manner, especially with women, and not a little education and polish in his varied career. He wrote and spoke fluently, and, like Nelson, sometimes amused himself by making indifferent verse. His chief fault was his vanity. In morals he was rather above the custom of the time and the society in which he mingled. He had one child by Aimée de Telison, which died in infancy.

As a strategist, tactician, and fighter he stands high among naval captains. Louis XVI. conferred on him the Order of Military Merit and presented him with a magnificent sword; the Empress Catherine appointed him a rear admiral and created him a knight of Sainte Anne, and Congress formally thanked him and awarded him a gold medal for his services. He was accorded the honor of a public funeral by the French Assembly, and was buried in a Protestant cemetery at the corner of the Rue

de la Grange aux Belles and the Rue des Ecluses Saint Martin, in Paris. In the spring of 1905, through the efforts of Gen. Horace Porter, American ambassador to France, his remains were discovered and identified and brought to America in the armored cruiser Brooklyn, flagship of Rear Admiral Charles D. Sigsbee's accompanying squadron. They are interred at the United States Naval Academy at Annapolis, Md., awaiting the completion of a suitable resting place for them.

There is one mystery connected with Jones' life which has never been cleared up. No one knows why John Paul assumed the name Jones. There have been two attempts at explanation: one that he took it in testamentary succession to his brother, William Paul, who had taken the name Jones to inherit property from one William Jones, a Virginia planter. This is now disproved, and the prevailing theory is that the name was assumed by John Paul out of respect and affection for the Jones family of North Carolina, from whom he had received much kindness.

Consult: Brady, 'Commodore Paul Jones'; Buell, 'John Paul Jones, the Founder of the American Navy'; Hapgood, 'Paul Jones'; Laughton, 'Studies in Naval History'; etc.

CYRUS TOWNSEND BRADY.

Jones, John Percival, American politician: b. Herefordshire, England, 1830. He came to the United States in 1831, was educated in the schools of Cleveland, Ohio, in the early days of California gold-mining went to that State where he acquired mining interests, and in 1863–7 was a member of the State senate. In 1867 he removed to Nevada, where he became a proprietor and the superintendent of the "Crown Point" silver mine, through which he realized a fortune. He was elected to the United States Senate from Nevada in 1873, and this office he held by re-election until 1903. He was originally a Republican, was elected to the Senate as a "Silverite" in 1897, and from 1900 was a "Silver" Republican.

Jones, John William, American Baptist clergyman and author: b. Louisa, Va., 25 Sept. 1836. He was graduated from the University of Virginia in 1859 and from the Southern Baptist Theological Seminary, and during the Civil War served as private and then chaplain in the Confederate army. He was pastor of a Baptist church in Lexington, Va., 1865–71, and chaplain of Washington College during Lee's presidency, and since the last named date has been successively agent of various Southern institutions, chaplain of the University of Virginia, and pastor of several churches. Besides editing 14 volumes of the 'Southern Historical Papers' he has published 'Personal Reminiscences, Anecdotes and Letters of R. E. Lee' (1874); 'Christ in the Camp, or Religion in Lee's Army'; 'Memorial Volume of Jefferson Davis'; 'School History of the United States'; etc.

Jones, Joseph Stevens, American playwright: b. 1811; d. Boston, Mass., 30 Dec. 1877. After his graduation from the Harvard Medical School in 1843, he practised medicine for several years: but was subsequently proprietor and manager of the Tremont, Old National, and other theatres in Boston at various times. Among the nearly 200 plays of which he was the author may be named: 'Solon Shingle'; 'The Liberty Tree'; 'The Siege of Boston'; 'Moll Pitcher'; 'The Last Dollar'; 'The People's Lawyer'; 'Paul Revere'; 'The Silver Spoon.'

Jones, Leonard Augustus, American jurist: b. Templeton, Mass., 13 Jan. 1832. He was graduated from Harvard in 1855 and from Harvard Law School in 1858. He was admitted to the Suffolk bar in 1858 and since 1884 has been one of the editors of the 'American Law Review.' Among his many legal works are: 'Law of Mortgages and Real Property' (1878–94); 'Law of Mortgages of Personal Property' (1881–94); 'Law of Easements' (1898). He was appointed judge of the court of land registrations in 1898.

Jones, Owen, English architect: b. London 15 Feb. 1809; d. there 19 April 1874. In 1834 he traveled in Spain and studied the art monuments of Granada, after which he visited Egypt. On returning to England he published his great work on the Alhambra. In 1851 he undertook the decoration of the Crystal Palace at the first Universal Exhibition. He also furnished the various courts of different architecture, notably the "Alhambra Court." His researches and publications had a wonderful influence on the decorative art of England, especially his 'Grammar of Ornament,' in which he illustrated the decorative devices of all nations. He published 'Plans, Elevations, Sections and Details of the Alhambra' (1845).

Jones, Samuel M., American manufacturer and politician: b. 3 Aug. 1846 in Wales; d. Toledo, Ohio, 12 July 1904. He came to the United States with his parents when three years old; at 18 he was working in the oil-fields of Titusville, Pa. In 1893 he invented improved oil-well apparatus and set up the Acme Sucker Rod Factory in Toledo, Ohio. Here he introduced reforms in the condition of his employees, fixed a minimum wage, gave an eight-hour day, and introduced a system of profit-sharing; he also opened a pleasure ground adjoining the factory, known as "Golden Rule" Park. In 1897 he was nominated for mayor of Toledo by the Republican party and elected; but his subsequent advocacy of municipal ownership of public utilities and of the abolition of the system of private contract in doing city work alienated the support of his party. His administration was, however, very popular, and he was re-elected as independent candidate in 1899 and 1901. In 1900 he was non-partisan candidate by petition for governor of Ohio, but was defeated.

Jones, Samuel Porter, commonly known as SAM JONES, American Methodist revival preacher: b. Chambers County, Ala., 16 Oct. 1847; d. 15 Oct. 1906. He was admitted to the Georgia bar in 1869, but his drinking habits put an end to his career as a lawyer. Becoming converted in 1872 he was admitted to the ministry of the Methodist Church South, and afterwards devoted himself to evangelistic work, his marked eccentricities of speech and manner probably contributing somewhat to his popularity. He has published: 'Sermons and Sayings'; 'Music Hall Sermons'; 'Sam Jones' Own Book'; etc.

Jones, Thomas ap Catesby, American naval officer: b. Virginia 1787; d. 1858. Having entered the navy in 1805, he was employed in

police duty in the Gulf, saw service in the latter part of the War of 1812, and was unsuccessful in an attempt to prevent the passage of Vice-Admiral Cochrane's fleet across Lake Borgne. In 1826 he was sent to the Hawaiian Islands to settle the difficulties arising through the efforts of a local party to make the islands a British dependency. Upon the declaration of war between the United States and Mexico, he feared that the British man-of-war Dublin intended the annexation of California, and imprudently landed at Monterey and took possession. He was therefore removed temporarily from his command.

Jones, Sir **William,** English lawyer and Oriental scholar: b. London 28 Sept. 1746; d. Calcutta 27 April 1794. He was educated at Harrow and Oxford, and early acquired a reputation as a linguist, Hebrew, Persian, Arabic, and even Chinese, besides German, Italian, French, Spanish, and Portuguese, being among his acquisitions. In 1770 his translation (in French) of the life of Nadir Shah from the Persian appeared; in 1771 his grammar of the Persian language; in 1774 his 'Poeseos Asiaticæ Commentariorum Libri Sex,' and in 1781 his translation of the seven Arabic poems known as the 'Moallákat.' He had been called to the bar in 1774, and in 1783 was nominated judge in the supreme court of judicature, Bengal, and knighted. Here he did much for the furtherance of Oriental studies, being one of the first Europeans to study Sanskrit, founding the Royal Asiatic Society, in 1784 translating the Sakuntala, the Ordinances of Manu, besides tales, poems, extracts from the Vedas, etc. He also undertook a digest of the Hindu and Mohammedan laws, which he did not, however, live to complete.

Jonesboro, jōnz'bŭr-ō, Ark., city, county-seat of Craighead County; on the Kansas City, Ft. S. & M., the St. Louis S. W., and the Jonesboro L. E. R.R.'s; about 120 miles northeast of Little Rock. It was first settled in 1870, although some settlements had been made earlier on farms in the vicinity. It was incorporated in 1882. It is situated in an agricultural and lumbering region, and the railroad facilities make it the trade centre for quite an extent of country. The chief manufactures are flour, lumber, staves and headings, boxes, and wagons. In addition to the manufactures there is considerable trade in grain, live stock, and some dairy products. Pop. (1890) 2,065; (1900) 4,508.

Jonesboro, Ga., city, county-seat of Clayton County; on the Central of Georgia railroad; about 16 miles south of Atlanta. It is situated in a fertile agricultural region, but its nearness to Atlanta and lack of water power are hindrances to manufacturing. Its chief trade is in fertilizers, cotton, and farm products. At this point, August 1864, was fought a hotly contested battle with Gen. Howard of Sherman's army, in command of the Federal troops, and Gen. Hardee of Hood's army, in command of the Confederates. See Jonesboro, Battle of.

Jonesboro, Battle of, and Fall of Atlanta. After the battle of Ezra Church (q.v.), 28 July 1864, Gen. Sherman, unable fully to invest Atlanta, drew the Fourteenth corps and Schofield's Army of the Ohio from the left, and extended his lines on the right nearly to East Point, about six miles below Atlanta, the junction of the two railroads leading from the south, upon which the city and Hood's army depended for supplies. Hood made a corresponding movement to cover the roads, meeting Sherman's advance with strong, well-intrenched lines, and, 6 August, severely handling two of Schofield's brigades that had crossed Utoy Creek, killing and wounding over 300 men and taking two colors. To compel Sherman to relinquish his movement and raise the siege of Atlanta, Hood, 10 August, sent Wheeler with about 5,000 cavalry to operate upon his line of communication with Nashville. Wheeler moved promptly, struck and destroyed the railroad near Marietta, Calhoun, Adairsville, and Dalton, captured over 1,000 head of beef-cattle and other supplies, and, after demonstrating on Dalton and Resaca, was driven into East Tennessee. Sherman had issued an order, 16 August, for a general movement on the 18th upon the West Point and Macon railroads, for the purpose of forcing Hood from Atlanta, but hearing of Wheeler's raid, he suspended the order, and directed Gen. Kilpatrick, with 5,000 cavalry, to move on the night of the 18th against the West Point and Macon roads and destroy them completely. Kilpatrick started from near Sandtown, crossed the West Point road at Fairburn, and struck the Macon road a short distance north of Jonesboro, some 26 miles from Atlanta, where he encountered Ross' brigade of cavalry, which was driven through Jonesboro. But little of the railroad had been destroyed when Jackson's brigade of cavalry and an infantry brigade, coming up from the south, compelled Kilpatrick to retreat. Making a circuit, he again struck the railroad at Lovejoy's, about six miles south of Jonesboro, and encountered a Confederate force, through which he cut his way and reached Decatur, near Atlanta, on the 22d. As Sherman was satisfied that Kilpatrick had not greatly damaged the railroad, he renewed his order for the movement of the whole army. On the night of the 25th the siege of Atlanta was raised. The sick and wounded, spare artillery, and surplus transportation were sent back to the Chattahoochee bridge; Stanley's Fourth corps drew out from the left and moved to the right, closing up with the Fourteenth near Utoy, and the Twentieth corps fell back to an intrenched position covering the Chattahoochee bridge and the hospitals. On the night of the 26th the Army of the Tennessee (Gen. Howard) drew out, rapidly made a wide circuit, and came up on the right of the Army of the Cumberland, under Gen. Thomas, along Utoy Creek, facing south. The Army of the Ohio remained in position, now on the extreme left. On the 28th, making a general left wheel, pivoting on Schofield's army, both Thomas and Howard reached the West Point road extending from East Point to Red Oak and Fairburn, Schofield closing in upon the left of Thomas, but a short distance from the Confederate works covering the junction of the road at East Point. The next day was devoted to the railroad, of which nearly 13 miles was destroyed, and on the 30th the entire army moved eastward for the Macon railroad. Schofield, on the left, approached it near Rough and Ready, and presented a bold front toward East Point; Thomas, in the centre, reached Couch's, on the Fayetteville and Decatur road, with but little opposition; and Howard, on the right, driving before him the enemy's cavalry, saved the bridge

over Flint River after a sharp engagement, then, crossing part of his command, halted at night within half a mile of Jonesboro. On the morning of the 31st Howard, finding himself in the presence of a large force, disposed the Army of the Tennessee for battle and intrenched: Logan's Fifteenth corps on the left, Ransom's Sixteenth corps on the right, and Blair's Seventeenth corps in rear of Logan's left. When Sherman began his movement on the night of the 25th S. D. Lee's corps of Hood's army covered the railroad from near Atlanta to a place nearly a mile south of East Point. Hardee's corps was on Lee's left, while Hood held Atlanta with Stewart's corps and the Georgia militia. Hood had been deceived; he knew of Sherman's earlier movement, but misinterpreted it as preliminary to a retreat across the Chattahoochee; but when undeceived on the 30th, he ordered Hardee with his own corps and Lee's to move rapidly to Jonesboro and crush Howard on the morning of the 31st. Hardee, who was near Rough and Ready, four miles below East Point, began moving about 4 P.M., followed later by Lee, and at noon of the 31st both were in Howard's front. At 3 P.M. Hardee attacked with Lee's corps and part of his own, under Cleburne, with the expectation of driving Howard into the river, and for two hours the fighting was severe, but Hardee was repulsed. Lee, who, on the Confederate side, bore the brunt of the fight, says: "The attack was a feeble one and a failure, with a loss to my corps of about 1,300 men killed and wounded." Hardee's entire loss was about 1,700. The Union loss was 179 killed and wounded, almost entirely of Logan's corps.

When Sherman heard the noise of this battle he was with Thomas, who, with Schofield, had reached and was destroying the road from Rough and Ready southward. Thomas and Schofield were marched to the assistance of Howard, and Kilpatrick was sent down the western bank of the Flint to strike the road south of Jonesboro. Davis' Fourteenth corps joined Howard's left at noon of 1 September, relieving Blair, who was disposed to support Kilpatrick. Lee's corps had gone, but Hardee's was still in position and intrenched, covering Jonesboro on the north. At 4 P.M. Davis charged Hardee's works and, after a hard fight, carried parts of them, capturing Gen. Govan and the greater part of his brigade and two batteries of four guns each. Stanley and Schofield reached the field too late to take part in the engagement. During the night Hardee retreated to Lovejoy's station, and next morning Sherman started in pursuit. The Union loss 1 September was 223 killed, 946 wounded, and 105 missing. The Confederate loss is not fully known; of the three divisions engaged Cleburne's sustained a loss of 55 killed, 197 wounded, and 659 missing. There is no return of losses in the other two divisions.

The result of the battle of Jonesboro was the fall of Atlanta. Six hours before Hood heard of the result of Hardee's attack 31 August, he sent an order to Lee to return in the direction of Atlanta, to make a movement on Sherman's flank, or to cover the evacuation of the city. Lee received the order at midnight, and was halted next morning about six miles from Atlanta. Meanwhile Hood had heard of the result of Hardee's attack; its "failure necessitated the evacuation of Atlanta." Lee was ordered to join Hardee, which he did on the 2d, and at 5 P.M. of the 1st Hood marched out of the city with Stewart's corps on the McDonough road; the Georgia militia was sent to Covington, and at night the rear-guard blew up some abandoned ammunition-trains. Slocum's Twentieth corps entered the city on the morning of the 2d. Sherman received the news on the 4th, and, turning his back on the Confederates at Lovejoy's, marched his army to East Point and Atlanta.

The campaign for Atlanta, which began 6 May 1864, was marked by brilliant flanking movements, on both sides, by almost uninterrupted skirmishing, growing at times to the dimensions of a battle, and by many heavy engagements, most of them of a desperate character. The Union losses in the entire campaign were 4,423 killed, 22,822 wounded, and 4,442 missing, a grand aggregate of 31,687. The Confederate losses were 3,044 killed and 18,952 wounded. Add to this the number of prisoners captured, 12,938, makes a grand aggregate of 34,979. Consult: 'Official Records,' Vol. XXXVIII.; Cox, 'Atlanta'; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; 'Life of Gen. George H. Thomas'; Bowman, 'Sherman and his Campaigns'; Sherman, 'Personal Memoirs,' Vol. II.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Jonesville, jōnz'vĭl, Va., the scene of a Civil War action. On 1 Jan. 1864 Major Beeres, who had been operating with a battalion of the 16th Illinois cavalry and a battery, near Cumberland Gap, attacked and drove a small Confederate cavalry force from Jonesville and occupied the place. On the morning of the 3d he was attacked by Gen. W. E. Jones' cavalry brigade and, after a spirited resistance, continuing nearly the entire day, in which he lost 10 killed and over 40 wounded, was finally surrounded and obliged to surrender. The Confederates reported that he surrendered 383 officers and men, 45 of whom were wounded, 3 pieces of artillery, and 27 wagons. The Confederate loss was about 30 killed and wounded. Consult 'Official Records,' Vol. XXXII.

E. A. CARMAN.

Jonge, yŏng'e, **Johannes Cornelius de**, Dutch historian: b. Zierikzee, 9 March 1793; d. Zeeland, 11 June 1853. He was educated at Leyden and in 1831 succeeded Van Wijn, whose assistant he had been, as keeper of the Dutch archives. The most important of his historical works are: 'Verhanderling over dem oorsprong der Hoeksche en Kabeljaauwsche twisten' (1817); 'Het derde Staat in de Statenvergaderingen' (1824); and 'Geschiedenis van het Nederlandsche Zeewezen' (1833–48, 2d ed. 1858). He also published a biography of Van Wijn in 1832.

Jonkoping, yŏn'chö-pĭng, Sweden, a town located at the southern end of Lake Wetter, about 170 miles southwest of Stockholm. The town has a beautiful situation in a valley between Lake Wetter and two smaller lakes known as the Rocksjö and Munksjö, and is backed by pine-clad hills. The chief buildings are the Church of Saint Christina, the supreme court, the town hall, barracks, theatre, and school. The manufacturing industries of the town are of considerable importance; the larg-

est single industry is match-making, the safety-matches made here being used throughout the world. There are also manufactures of machinery and arms, perfumes, cigars, snuff, paper, and wood-pulp, etc. The maritime trade was greatly increased by the completion of the Göta Canal in 1832, connecting the Baltic and North seas (Göteborg with Stockholm), thus making Jönköping a seaport. The town's history dates back to legendary times; it is named in history in the early part of the 13th century; and in 1284 received its town charter. In 1357, 1439, and 1599 parliament met here; in 1448 occurred the conference of the Swedish and Danish plenipotentiaries; in 1612 the town was destroyed by order of Gustavus Adolphus to prevent it from falling into the hands of the Danes, but was soon afterward rebuilt; and in 1809 a peace treaty was signed here between Denmark and Sweden. Pop. 23,143.

Jonquil, jŏn'kwĭl. See NARCISSUS.

Jonson, Ben or **Benjamin,** English poet and dramatist, contemporary and friend of Shakespeare: b. 1573; d. 6 Aug. 1637. According to his conversations with Drummond, his father was a gentleman, who lost his estate under Queen Mary and then turned minister. Benjamin was born after his father's death, and his mother afterwards married a bricklayer, an occupation in which Ben Jonson was engaged for some time, and with which he was frequently taunted by his enemies. He was educated at Westminster School under the instruction of William Camden, whose scholarship and friendship he afterwards praised in the highest terms. He proceeded to Cambridge but remained there for only a short time, later receiving the degree of Master of Arts from both Universities "by their favour, not his studies." After his return to London, he seems to have worked for a time at his father's trade, then to have served as a soldier in the Low Countries, after which he returned to England, married, and by 1595, became an actor and playwright.

In 1598, his famous comedy 'Every Man in His Humour' was acted by the Lord Chamberlain's servants (Shakespeare's company). This play marks the full beginning of his dramatic career; it is the first of his long series of humoristic comedies, and is the first outcome of his life-long effort to infuse into the drama critical consciousness and painstaking art. In the same year Jonson quarreled with a well known actor, Gabriel Spenser, and killed him in a duel on 22 Sept. Jonson escaped serious penalty by pleading benefit of clergy; and in the following year his 'Every Man Out of His Humour' was acted before the queen. Jonson's quarrelsome temper was apparently little abated by his recent imprisonment, for his 'Cynthia's Revels,' acted 1600, satirized Marston and Dekker, and 'The Poetaster,' 1601, provoked by retorts actual or intended, continued the attack in unmistakable terms. Dekker retorted in the same year with his 'Satiromastix, or the Untrussing of the Humourous Poet.' But this "war of the theatres" shortly subsided.

The accession of James I. in 1603 brought a great improvement in Jonson's circumstances through the patronage of the court, exhibited in various employments, honors, and eventually a pension. Henceforth he counted among his friends and patrons the most distinguished men of the time, and he was able to devote his prodigious energies to scholarship and poetry without leaning too heavily upon the stage for pecuniary aid. His immediate access to royal favor seems to have been maintained by his success in writing masks. These musical and spectacular entertainments assumed an elaborate form at the court of James, and Jonson at once became the chief literary purveyor to this fashion, a position which he maintained until his quarrels with Inigo Jones and the supersedence of the literary by the scenic elements of these shows put an end to his employment. The first half of the reign of James was also the time of Jonson's dramatic masterpieces. His tragedies, 'Sejanus' and 'Catiline' were acted in 1603 and 1611, and the greatest of his comedies came in the same period, 'Volpone,' 1605, 'The Silent Woman,' 1609, 'The Alchemist,' 1610, and 'Bartholomew Fair,' 1614. During the same years, Jonson was maintaining many friendships with scholars and poets, with Camden, Selden, and Bacon, with Chapman, Beaumont, Fletcher, and Shakespeare; and he was becoming the recognized chief of the wits whose gatherings have made the Mermaid Tavern famous in literature.

Jonson's life, however, was by no means free from vicissitude. In 1605 he was imprisoned along with Marston and Chapman on account of a passage reflecting on the Scotch in 'Eastward Hoe,' a play on which they had collaborated. He had become a Roman Catholic in 1598, but after twelve years returned again to the Protestant faith. In 1613 he was in France as tutor of the son of Sir Walter Raleigh; and in 1618 he made a pedestrian expedition to Scotland. Here he was received with honors and banquets, and entertained for several weeks by the poet, William Drummond, at his seat, Hawthornden. Drummond's notes of his conversations with Jonson furnish us with most interesting and valuable records of Jonson's character and opinions, but it must be remembered that Jonson was talking with great freedom and with no idea of being reported, and that the reports were doubtless colored by the temper and prejudices of the reporter. Some of Jonson's weaknesses as well as his host's sourness of temper, are to be found in Drummond's well-known postscript: "He is a great lover and praiser of himself; a contemner and scorner of others; given rather to lose a friend than a jest; jealous of every word and action of those about him (especially after drink, which is one of the elements in which he liveth); . . . . he is passionately kynde and angry; careless either to gain or keep; vindictive, but, if he be well answered, at himself."

From 1616 to 1625 Jonson wrote no plays for the public stage but he wrote numerous masks and remained in high favor at court. After the death of James he seems to have fallen on unprosperous days; his occupation as a writer of masks ceased, and he turned again to the stage. His 'Staple of News' was acted in 1625, and 'The New Inn' 1629, the latter proving an utter failure. He had suffered an irreparable loss in the burning of his library which included many manuscripts of his incompleted works as well as a notable collection of books

in which he had a scholar's pride. Want and disease added to his troubles, and we have many appeals for aid addressed by him to his noble patrons. Fortunately these met with response, and King Charles increased his annuity. The few plays and entertainments composed at this time give evidence of his failing powers; and give force to the conjecture that the beautiful pastoral drama, 'The Sad Shepherd,' left unfinished at his death, must have been written at a much earlier date. In old age and sickness, however, Jonson held his place at the head of English men of letters. 'The Mermaid' had given place to 'The Devil Tavern,' and the old friends to a set of young disciples who sealed themselves "of the tribe of Ben." But his literary dictatorship was recognized outside of this intimate circle, and contemporary literature abounds in tributes of respect and admiration. The most famous of these is the brief epitaph carved on the stone that marks his grave in Westminster Abbey: "O rare Ben Jonson."

Jonson's character is better known to us than that of any of his literary contemporaries. Combative, arrogant, opinionated, outspoken, and generous, he drank deeply, swore freely, learned his Latin thoroughly, wrote his plays carefully, went to prison for his friends, and fought every fight to the finish. His failings were due to excess not weakness; his virtues were full-grown; whatever he did, he did vigorously, ponderously perhaps, but always wholeheartedly. To scholarship, to criticism, to poetry and the drama, he brought this vehement positiveness and this whole-hearted laboriousness. His personality is stamped on all his work, but in the enjoyment of some of its salient manifestations, one must not lose sight of the range and power and fineness of his literary achievement as a scholar, a critic, a translator, and a lyric poet as well as a dramatist, nor the great importance of his forty years of activity in the development of the drama and the history of literature. His non-dramatic work includes an 'English Grammar,' 'Discoveries,' a prose tract treating among other matters of literary and dramatic criticism, 'The Forest,' a collection of his epigrams and other poetry, and 'Underwoods,' another collection of minor poems and translations. His dramatic work comprises masks, tragedies, and comedies, three forms that Jonson kept distinct.

His influence upon the drama was in large part that of a critic and a reformer. He began his important work at a time when, through the efforts of Shakespeare, Marlowe, Lyly, and others, the popular drama had already attained eminence as a form of literature; and Jonson was ardent to advance and secure this eminence. In the preceding drama he saw much that was crude and absurd, and from the start he urged an abandonment of the incongruities of the chronicle plays and the romantic comedies, and the adoption of fixed rules and more regular models. In the reliance of the dramatists upon the applause of unlettered audiences, he saw a menace to the highest development of the drama; hence he constantly advocated the appeal to the taste of the more judicious through an elevated purpose and a conscientious art. Recognizing that the English drama had already attained greatness under conditions so different from those of antiquity that they forbade the rigid application of the precedents of the classic drama, he nevertheless believed that improvement could be secured by intelligent adoption of classic rules and models. He insisted therefore upon the discrimination between tragedy and comedy and the recognition of the purpose and function of each species according to the precepts of Aristotle, protesting pedantically enough, not only against the incongruities of the old histories but also against such combinations of comedy and mask as Shakespeare's 'Tempest.' A more coherent construction and the application of the unities of time and place, so far as the English stage would permit, were other articles of his theory which he supported by precept and practice. Still farther, he contended that characterization should not depend on an impossible plot or a hap-hazard collocation of heroism, sentiment, and nonsense, but upon a careful representation of certain types as illustrative of human motive, such as the tyrant or the conspirator in tragedy, or the braggart soldier, the gull, or the cheat in comedy. In opposition to the extravagant romanticism that had prevailed up to 1600, Jonson stood for a comedy that should attempt the realistic portrayal of manners. In dramatic criticism and practice Jonson was consequently at most points on the other side from Shakespeare, though he bore splendid testimony to his appreciation of Shakespeare's friendship and genius.

His masks and entertainments, so famous in their day, have little interest now, except as they illustrate the curious literary fashion, or as they exhibit Jonson's charming lyrics. Of the 34 complete, some of the most notable are, 'Hymenæi,' 'The Mask of Queens,' 'The Penates,' and 'The Metamorphosed Gypsies.' His two tragedies, 'Sejanus' and 'Catiline,' are thoroughgoing attempts to present a scholarly and accurate view of history, a penetrating study of historical characters, and to retain as much as possible of classical decorum while conforming in the main to the form of tragedy established by his great Elizabethan predecessors. But his genius found its best field in comedies. Though modeled on the comedies of Plautus and Terence, they fulfil his promise to show an image of his own times, its fads and follies, or "humours"; and though their plots are constructed overelaborately, their artificiality is redeemed by an abundance of humor. The 'Alchemist' with its extraordinarily skilful structure, and 'Bartholomew Fair' with its broad and lively presentation of the London of the day are perhaps the greatest English masterpieces of the strict comedy of manners. Jonson's example turned comedy for a while from romantic to realistic, and satirical themes and treatment; and the influence was potent at least into the 18th century. In humor and the delineation of character, Jonson ranks first of English dramatists after Shakespeare.

His plays, excluding masks, are 'Every Man in His Humour,' 'Every Man Out of His Humour,' 'Cynthia's Revels,' 'The Poetaster,' 'Sejanus,' 'Volpone,' 'Epicæne,' 'The Alchemist,' 'Catiline,' 'Bartholomew Fair,' 'The Devil Is An Ass,' 'The Staple of News,' 'The

New Inn,' 'The Magnetic Lady,' 'A Tale of a Tub,' 'The Case is Altered' (unavowed by Jonson and perhaps an early play), 'The Sad Shepherd' (incomplete), 'The Fall of Mortimer' (a fragment). See DRAMA; ELIZABETHAN LITERATURE—DRAMA.

Bibliography.—Jonson edited a folio of his works which appeared in 1616; a second folio in 1640. The standard edition is that of Gifford, 1816 (9 vols., frequently reprinted). The separate plays have often been reprinted, and recently with extended introductions and notes in 'Yale Studies in English.' For criticism consult Swinburne's 'Study of Ben Jonson'; Fleay, 'A Biographical Chronicle of the English Drama'; E. Koeppel, 'Quellen-studien zu den Dramen Ben Jonson's,' etc. (Leipsic 1895; Woodbridge, 'Studies in Jonson's Comedy'; Ward, 'History of Dramatic Literature' (vol. II.).

ASHLEY H. THORNDIKE,
Professor of English, Columbia University.

Jop'lin, Mo., city and one of the county-seats of Jasper County, in the southwestern portion of the State. It is the metropolis of the richest zinc and lead mining camp in the world and the largest city in Jasper County or southwest Missouri. The county of Jasper, in which it is located, is the richest county in the State of Missouri in surplus products, having produced during the year ending June 1904 a surplus of all products amounting to about $15,000,000, which was about four times the surplus product of any other county in the State of Missouri, except one, and was more than double the surplus produced by that county. The larger portion of this surplus was derived from the zinc and lead mines in and around the city of Joplin. Joplin is only six miles from the eastern line of the State of Kansas and about ten miles north of the Indian Territory. It was first settled in 1870 by native American citizens, and was organized as a city in 1873. The city government is composed of a mayor and city council, who are alternately elected annually; the mayor being elected every two years. There are four railroads entering Joplin at the present time as follows: Missouri Pacific; St. Louis & San Francisco; Missouri Kansas & Texas, and the Kansas City Southern; the Arkansas, Missouri & Kansas Ry. is now under construction and is expected to be in operation during 1905. There are six banks, four of which are State banks, and the other two national banks, all having a combined capital of $400,000, with deposits amounting to $2,500,000 annually. The chief business of the city is zinc and lead mining. There are a number of large foundries and other industries supported by the zinc and lead industry. Joplin has a very fine system of public schools, consisting of a high school and 14 other graded schools. It has a Carnegie public library (cost about $50,000); a United States government building (cost $150,000); a county circuit court-house, a Y. M. C. A. building, and a public hospital, and is well supplied with churches. Pop. (1900) 26,023; (1904 est.) 30,000.

HORACE MERRITT.

Jop'pa. See JAFFA.

Jo'ram, or **Jehoram,** name of two Hebrew kings, one of Israel (851-842 B.C.) and the other of Judah (848-844 B.C.). (1) JEHORAM king of Israel was the second son of Ahab, and succeeded his brother Ahaziah. He revived the worship of Jehovah, and repressed the worship of Baal. He joined with the king of Judah in a war with the Moabites. In his reign Benhadad king of Damascus invaded Israel, and besieged Samaria, but retreated to meet a hostile invasion in his own country. In a battle with Hazan king of Syria Jehoram was wounded and retired to Jezreel, where he was slain by Jehu whom Elisha had anointed king over Israel.

(2) JORAM king of Judah was the son and successor of Jehosaphat and for four years from 848 B.C. had a luckless reign. The Edomites revolted in the land and Libna joined them, while Bedouin tribes of Arabia sacked Jerusalem and carried off the wives and son of the king, who died horribly of an intestinal disease, as had been foretold by the prophet Elisha.

Jordaens, Jacob, yä'kōb yōr'däns, Flemish painter: b. Antwerp 19 May 1593; d. there 18 Oct. 1679. From his early boyhood in 1607 he was the pupil of Van Noort, whose daughter he afterward married, and in 1615 was made master in the Guild of St. Luke at Antwerp. He was the most eminent painter of the Flemish school next to Rubens. The most renowned among his religious pictures are 'The Last Supper' in the Antwerp Museum; and 'The Martyrdom of St. Apollonia' in the church of the Augustines, Antwerp.

Jordan, Camille, French politician: b. Lyons 11 Jan. 1771; d. Paris 19 May 1821. He was a pupil of the Oratorians at Lyons and when still young became imbued with Royalist principles, later developing into an active opponent of the French Revolution. When only 20 years of age he published a pamphlet satirizing the Constitutional Church, entitled 'Histoire de la conversion d'une dame parisienne.' When Lyons fell in October 1793, Jordan was proscribed by the Directory for his participation in the insurrection and fled to Switzerland, subsequently passing six months in England. In 1796 he returned to France and in 1797 was sent by Lyons to the Council of Five Hundred. In the revolution of 4 Sept. 1797 Jordan escaped to Basel and later went to Germany. In 1800 he returned and in 1802 exposed the schemes of Bonaparte in a pamphlet 'Vrai Sens du Vote National pour le Consulat à Vie.' From that time till 1814 he devoted his time in retirement to literature but at the Restoration was made a councillor of state by Louis XVIII. and from 1816 till his death represented Ain in the chamber of deputies. Besides the above mentioned works he wrote 'Lettre à M. Lamourette' (1791); 'La Loi et la Religion Vengées' (1792); 'Adresse à ses Commettants sur la Révolution du 4 Septembre 1797' (1797); 'Sur les Troubles de Lyon' (1818); 'La Session de 1817' (1818).

Jordan, jôr'dan, **Conrad N.,** American financier: b. New York 20 April 1830; d. there 26 Feb. 1903. He entered a printing office, but soon exchanged this for a banking establishment, was cashier of a New York bank in 1864-80, and in 1880-4 was treasurer of the New York, Ontario, and Western railroad. In 1885-7 he was treasurer of the United States, and introduced in the accounts of the treasury a revised

DAVID STARR JORDAN,

PRESIDENT LELAND STANFORD JUNIOR UNIVERSITY.

SCENE ON THE JORDAN RIVER.

form of debt and cash statements. He was an organizer of the Western National Bank of New York and for a time its president. In 1893 at the recommendation of all important New York banks, he was appointed assistant United States treasurer in New York, and this post he held until his death.

Jordan, David Starr, American college president and naturalist: b. Gainesville, N. Y., 19 Jan. 1851. He was graduated from Cornell University in 1872 and was instructor in botany there 1871–2. He was professor of natural history at Lombard University, Ill., 1872–3, and taught the same subject in the Indianapolis High School, 1874–5. From 1875 to 1879 he was professor of biology at Butler University, Indianapolis; professor of zoology at Indiana University 1879–85, and president of the last named institution, 1885–91. Since 1891 he has been president of Leland Stanford Junior University. Beside innumerable scientific monographs and reports, among which may be named 'Synopsis of the Fishes of North America' with C. H. Gilbert (1882); enlarged in 1896 with title 'Check List of the Fishes and Fish-Like Vertebrates of North and Middle America'; and 'Report of Fur Seal Investigations'; he has published 'Science Sketches' (1896); 'Footnotes to Evolution' (1898); 'Imperial Democracy' (1899); etc. He was president of the California Academy of Sciences 1896–8 and 1901–3, and has been commissioner in charge of the United States Fish Commission investigations in the Pacific Ocean from 1901, and of the salmon investigations for Alaska from 1903.

Jordan, Elizabeth Garver, American journalist: b. Milwaukee, Wis., 9 May 1867. She is editor of 'Harper's Bazaar' and has published 'Tales of the City Room' (1898).

Jordan, Jules, American composer: b. Willimantic, Conn., 10 Nov. 1850. He is the author of several cantatas, including 'Barbara Frietchie' and 'Wind Swept Wheat'; and many sacred and secular songs.

Jordan, Thomas, American soldier: b. Luray, Va., 30 Sept. 1819; d. New York 27 Nov. 1895. He was graduated from West Point in 1840; and distinguishing himself in the Mexican War, was promoted captain in March 1847. He was stationed on the Pacific coast in 1856–60, during which time he introduced steam navigation above the Dalles, on the Columbia River. He served in the Confederate army during the Civil War and was promoted brigadier-general for gallantry at the battle of Shiloh. In 1869 he went to Cuba, where he was made chief of the general staff of the insurgent army and soon afterward commander-in-chief of the revolutionists, winning a battle at Guarmaro, in January 1870. In the following year he resigned and settled in New York, where he became editor of 'The Financial and Mining Record.' He published 'Campaigns of Lieutenant-General Forrest' (with J. B. Pryor, 1868).

Jordan, William George, American journalist: b. New York 6 March 1864. He was graduated at the College of the City of New York; and became managing editor of the 'Ladies' Home Journal' in 1897, and was editor of 'The Saturday Evening Post' in 1898–9. He has published 'Mental Training by Analysis, Law and Analogy'; 'Mental Training a Remedy for Education'; 'The Kingship of Self Control'; and 'The Majesty of Calmness.'

Jordan, the largest river of Palestine, and one of the most celebrated in the world. It rises from three main sources at the foot of Hermon, and these upper streams unite in Lake Huleh, the ancient Waters of Merom. From this point it sinks with a rapid current in a narrow rocky bed below the level of the sea, and falls after a course of 9 miles into the Lake of Galilee. Shortly after leaving the south end of this lake it enters a broad valley called by the Arabs Ghôr, and in the Bible "the plain"; and continuing a singularly crooked course of about 65 miles direct distance, or 200 including windings, falls into the north end of the Dead Sea, having received the Zerka or Jabbok and numerous smaller affluents. The Ghôr expands at Bethlehem and Jericho into a wide plain, but elsewhere is from three to five miles across. The upper part of the valley of the Jordan is hilly, arid, and barren, but it becomes more level and fertile as it approaches the Zerka. The river is muddy and full of small fish. In the dry season it is shallow, with an average width of from 30 to 50 yards. At its mouth it is about 180 yards broad and about 3 feet deep. It is subject to great inundations during the winter season. The valley of the Jordan forms one of the most remarkable depressions in the world, the Dead Sea being 1,312 feet below sea-level, and the total fall of the river being about 2,300 feet.

Consult: 'Official Report' (Washington, 1852); 'Survey of Western Palestine' (London, 1859); Smith, 'Historical Geography of the Holy Land'; Molyneux (in the 'Journal' of the Royal Geographic Society 1848); Lynch, 'Narrative of the United States Expedition to the River Jordan and the Dead Sea' (1849); McGregor, 'Rob Roy on the Jordan' (1870); Costello, 'Gospel Story'; Macmillan, 'Guide to Palestine and Egypt'; Thomas, 'Two Years in Palestine.'

Jorullo, hō-rool'yō, a volcano of Mexico in the State of Michoacan, 160 miles southwest of Mexico, and 80 miles from the Pacific. The district had continued undisturbed from the discovery of the New World when, in June 1759, earthquakes occurred, followed 29 September by one more violent. On the line of a chasm which was made, six volcanic cones were formed, the loftiest, Jorullo, 1,600 feet above the plain. The total height of the volcano above the sea is 4,265 feet. It shows but few signs of activity at present.

Joseffy, yō-sĕf'ĭ, **Rafael,** Hungarian-American pianist: b. Miskolcz, Hungary, 1853. He was a pupil of Moscheles at the Leipsic Conservatory and of Tausig at Berlin, won distinction in a concert tour of Holland and Germany, and later appeared with large success throughout Europe and the United States. For several years he was a professor in the National Conservatory at New York, where he resided from about 1880. As a virtuoso he evinces great facility and technical finish, and won particular recognition through his interpretations of Chopin. His compositions include: 'Ungarisches Album' (6 works for pianoforte); 'Die Mühle' (op. 23); a 'Marche Turque'; and 'Conzert-Studien nach Chopin.'

Joseph, Saint, the husband of Mary the mother of Jesus Christ, was a descendant of the

house of David, born at Bethlehem, but resident at Nazareth, where he practised the trade of a carpenter. Tradition and art represent him as an old man at the time of Christ's birth and he is said to have died before the beginning of Christ's public ministry. His day in the Roman Catholic calendar is 19 March.

Joseph, a son of the patriarch Jacob by his favorite wife Rachel. His father's preference for him and his own relation of dreams which predicted his future exaltation above those of his household drew upon him the envy of his brothers, who sold him to Ishmaelitish and Midianite slave-dealers, by whom he was sold to Potiphar, a captain of the guard in Egypt. The story of his condemnation to prison on the false accusation of Potiphar's wife, of his release and subsequent elevation to the position of vice-regent of Egypt and the final settlement there of his father and brothers is related in the Book of Genesis. Authorities still differ as to the period in Egyptian history to which Joseph's life belongs, but the majority agree in placing it under the Hyksos or shepherd kings.

Joseph of Arimathæa, member of the Jewish Sanhedrim, who believed in Jesus, but had not the courage to make profession of faith. He was born in Rathaim, a city of Benjamin, near Lydda. After the crucifixion he went to Pilate, begged the body of Jesus, wound it in fine linen and buried it in his own new tomb. According to tradition he came as apostle to Glastonbury, England. His day is 17 March in the Roman Catholic calendar, and 31 July in the Greek Church.

Joseph I., emperor of Germany: b. Vienna 26 July 1678; d. 17 April 1711. He succeeded his father, Leopold I., and was employed for nearly the whole of his reign in war. With England and Holland he continued the war against France, to seat the Archduke Charles on the throne of Spain. The great victories gained by the allies under Marlborough in the Low Countries, and Prince Eugene on the Rhine, made the reign of Joseph especially noteworthy. He was equally triumphant in Italy and Hungary; in the latter kingdom driving the revolted Bagotski from the country, and forcing him to seek safety in Turkey; while in the Italian peninsula, great cities from Mantua to Genoa were laid under heavy contributions.

Joseph II., German emperor, son of Francis I. and Maria Theresa: b. Vienna 13 March 1741; d. there 20 Feb. 1790. He was elected king of the Romans in 1764, and on the death of his father, 1765, German emperor. His mother declared him co-regent in the hereditary states of the house of Austria, and gave him the command of the army; but the real authority remained in her hands. In the earlier part of his reign he employed his time in traveling and becoming acquainted with his states. In 1780 Joseph came into the possession of full dominion over his hereditary states. He allowed a greater freedom of the press, put an end to the connection between Rome and the religious orders, diminished the pensions, placed the Jews on a better footing, abolished bondage, suppressed all nunneries, and many monasteries, particularly those of the purely contemplative orders. All branches of the government, public education, the police, and the peasantry, were reformed. By a new code of laws capital punishments were abolished. On 9 Feb. 1788 he declared war against the Turks. By the defeat at Lugos (20 Sept. 1788) the army was obliged to retreat, but in the following year fortune favored the Austrian arms, and Belgrade surrendered. With the tax law, introduced in November 1789, nobility and peasantry showed themselves equally dissatisfied, and the signal was given for open rebellion. The Netherlands declared themselves independent, and expelled the imperial forces from all the provinces, and Luxemburg alone remained in the possession of the imperial troops. The Hungarians also rebelled, and demanded the restoration of their ancient rights and constitution. Joseph, in January, 1790, declared all the acts of his government in that country revoked, even to the edict of toleration (22 June, 1781). Joseph was a man of considerable ability, but arbitrary and despotic. Whatever his own reflections or his knowledge of other countries showed to be useful, he wished to introduce. But he did not sufficiently consider that he had to do with men who would not see things in the same light as himself; and that long habit rendered it difficult to change, at once, usages sanctified by time Being a freethinker he often grossly overrode the rights of the Church. Consult Gross-Hoffinger, 'Lebens- und Regierungs-Geschichte Josephs II.' (1835–7); Brunner, 'Joseph II.' (1885); Schlitter, 'Pius VI. und Joseph II.' (1894).

Josephine (Fr. zhō-zĕ-fēn), empress of the French: b. Trois Islets, Martinique, 24 June 1763; d. Malmaison, near Paris, 29 May 1814. She was the daughter of Lieutenant Tascher de la Pagerie, and was married in 1779 to Vicomte Alexandre Beauharnais, by whom she had two children, Eugène and Hortense. In 1794 her husband, who had been commander of the army of the Rhine, was executed by order of the Convention. She herself had a narrow escape, having been included in the list of proscription. After the fall of Robespierre she paid a visit to Napoleon to thank him for restoring the sword of her husband, and so pleased him that he soon after married her (1796). When Napoleon became emperor in 1804 she was crowned with him. But the fact that the union was childless stood in the way of Napoleon's ambition to become the founder of a dynasty, and accordingly in 1809 Josephine was divorced, retiring to her seat of Malmaison, with the title of empress-queen-dowager and an annual grant of two million francs. Consult: Aubenas, 'Histoire de l'Impératrice Josephine' (1859); Welschinger, 'Le Divorce de Napoléon I.' (1889); Ober, 'Josephine, Empress of the French' (1901).

Josephus, jō-sē'fus, **Flavius** (Jewish name, JOSEPH BEN MATTHIAS), Jewish historian: b. Jerusalem 37 A.D.; d. about 95 A.D. He was carefully educated and in 64 A.D. he made a journey to Rome. On his return he found his countrymen preparing to throw off the Roman yoke, and having tried in vain to persuade them of the hopelessness of such a struggle, accepted the post of defending the province of Galilee, and actually held the fortified town of Jotapata against the whole Roman army for 47 days. He was captured at the fall of the city, was afterward present in the Roman army at the destruction of Jerusalem (70 A.D.), and went with Titus to Rome, where, assuming the family name

of his patron, Flavius, he lived in learned leisure. Here he wrote (in Greek) 'The History of the Jewish War' and 'The Antiquities of the Jews,' giving a history of the Jews from the earliest times to the reign of Nero.

Josh Billings. See SHAW, HENRY WHEELER.

Joshua, the leader of the Israelites after the death of Moses. He was the son of Nun, of the tribe of Ephraim, and upon him fell the task of conducting the people over the Jordan, and commanding their armies in battle against the heathen they were ordained to dispossess. He succeeded in ravaging a large portion of Palestine, and dividing it among the people. He died at the age of 110 and was buried at Timnath-Serah, in Mount Ephraim.

Joshua, Book of, a historical book of the Old Testament, sometimes classified as the last division of a Hexateuch, and containing an account of Joshua's leadership in Israel from the death of Moses until his own death. While it has many resemblances in style and arrangement to the Pentateuch, or first five books of Moses, it must have been early separated from them, if ever it was included in the same series, for the Samaritans, though they have had the Pentateuch since the 8th century before Christ, have never acknowledged the Book of Joshua. The contents of the book may be divided into three parts: the conquest of Canaan; the partition of the land among the 12 tribes; and the parting address made by Joshua to the assembled people. The first part is a narrative of the manner in which Joshua prepared to cross the Jordan at the head of the Israelites. The miraculous passage of the Jordan is accomplished, circumcision is performed, and the Passover observed on the soil of the Promised Land. Jericho and Ai are captured; the covenant confirmed at Ebal and Gerizim; the Gibeonites secure a treaty of peace through guile. The decisive battle of Bethhoron ends in the rout of the leagued kings. The second part is topographical and statistical, gives a general view of the land, with some account of its apportionment, and the setting aside of the Cities of Refuge. The third and concluding section is in the style of Deuteronomy. The people are exhorted to remain faithful to Jehovah, to eschew idolatry, and at Shechem, to which place the bones of Joseph had been brought, the covenant is renewed. The death and burial of Joshua and Eleazar make up a narrative which closes the book.

Josiah, king of Judah. He succeeded his father Amon (638 B.C.). He is said in the Scriptures to have done "that which was right in the sight of the Lord." He took an active part in the reform of temple worship, and in the abolition of idolatry throughout the land, and commenced the restoration of the temple, during the progress of which the high-priest Hilkiah discovered the book of the law, that is, the book of Deuteronomy. In his 30th year he marched out against Pharaoh Necho, king of Egypt, who was on his way to attack the kingdom of Assyria. Josiah was slain in the battle at Megiddo where he had attempted to check the northward march of the Egyptians.

Josiah Allen's Wife. See HOLLEY, MARIETTA.

Joss, the penates of the Chinese; every family has its joss. A temple is called a joss house. The joss is an idol, usually of wood and decorated in colors, mostly in gold and red. There are three large joss houses in San Francisco, one in Chicago and two in New York. A Chinese upon entering the presence of a joss falls upon his knees, and touches his forehead thrice upon the floor, as a preliminary of worshipping the joss. See CHINESE; IDOLATRY; IMAGE WORSHIP.

Jo'tham, king of Israel and Judah, who succeeded (735 B.C.) Uzziah, his father. He ascended the throne at the age of 25 and reigned 16 years.

Joubert, yow'bĕrt, **Petrus Jacobus,** Boer military officer: b. Cape Colony 1831; d. Pretoria 27 March 1900. After an elementary education he settled as a farmer in the Wakkerstroom district of the Transvaal, about 1863 was elected for that district to the Volksraad, and in 1870 became attorney-general of the South African Republic. During the visit of President Burgers to Europe in 1874 he was acting president. In 1880 he became commander-in-chief of the Boer forces at the outbreak of the war with England, and three times defeated the British, at Laing's Nek, Ingogo, and Majuba Hill, the last battle (27 Feb. 1881) deciding the war in favor of the Boers. He was again acting president during the absence of President Kruger in Europe in 1883–4. He twice unsuccessfully contested the presidency with Kruger, the vote being 7,881 to 7,009 in 1893 and 12,858 to 2,001 in 1898. In the second Boer war also he was commandant-general, and directed the campaign in northern Natal which resulted in a succession of disasters for the British. He became ill early in 1900, however, and was obliged to withdraw from active service. He was the ablest of the Boer military leaders.

Jouett, jow'ĕt, **James Edward,** American naval officer: b. Lexington, Ky., 27 Feb. 1828; d. Sandy Spring, Md., 1 Oct. 1902. He entered the navy in 1841, served during the Mexican War, was graduated from the United States Naval Academy in 1847, in 1861 with a detachment of marines entered Galveston harbor and destroyed the Confederate war-vessel Royal Yacht, and for his services was appointed to the command of the United States steamship Montgomery. As lieutenant-commander, he was prominent in Farragut's entrance of Mobile Bay (August 1864), and in 1885, when in command of the North Atlantic squadron he opened the transit across the Isthmus of Panama, closed by the rebels. He was promoted rear-admiral in 1886, subsequently president of the Board of Inspection and Survey, and in 1890 was retired.

Jouffroy d'Abbans, Claude François Dorothée, klōd frăn-swä dō-ro-tā zhoo-frwä däb-bäñ, MARQUIS DE, French inventor: b. Franche-Comte 30 Sept. 1751; d. Paris 1832. He is claimed by the French as the inventor of steam navigation. He served in the army, and in 1783 succeeded in propelling a small paddle-wheel steamboat up the Rhone at Lyons — the connection between piston and paddle-wheel axle being rack-and-pinion.

Joule, James Prescott, English physicist: b. Salford, Lancashire, 24 Dec. 1818; d. Sale, Cheshire, 11 Oct. 1889. He was chiefly his own educator, but received special instruction in

physics from John Dalton (q.v.). While associated in business with his father, a brewer, he early developed an enthusiasm for original scientific research, and described in the 'Annals of Electricity' (January 1838) an electromagnetic engine he had invented. While it was afterward found that this invention was impracticable as a substitute for the steam-engine, the further investigation to which it led brought to light many important facts concerning the laws of heat, its electrical and mechanical nature and evolution, chemical affinity as related to heat, etc. The mechanical equivalent of heat (see HEAT) was first ascertained by Joule, who also, in 1847, announced the doctrine of the correlation and conservation of energy, in a paper read at Manchester which failed at the time to impress men of science, as did also an address of like import before the British Association, but which was taken up by William Thomson (Lord Kelvin), by whom its momentous significance was brought home to the scientific world. No principle of science is now more fully established than Joule's law for determining the energy developed by an electric current in overcoming the resistance of a circuit, a law which he verified by experiment. He received the highest honors of scientific bodies and universities, and in 1873 was made president of the British Asociation for the Advancement of Science. His writings are to be found mainly in the proceedings of scientific societies and in English periodicals, but in 1885 and 1887 appeared, in two volumes, his 'Scientific Papers.'

Journalism. Journalism is a comprehensive term which signifies the business of producing a public journal. In a general way it is applied to the vocation of making newspapers. Broadly speaking it is both a business and a profession, though the name of journalist as commonly understood is limited to those who are engaged on the editorial or news or literary side of the production rather than on the business side. While editor and journalist are not strictly synonymous — the former meaning the head of a paper or a department and the latter any literary worker on a newspaper — they are often used as convertible terms.

In a large sense the subject involves the functions of journalism as collector and purveyor of news and as leader and exponent of public opinion; the ethics of journalism in its various fields of political, religious, literary, social and commercial aim and representation; the relations of the counting room to the editorial department: the training and qualifications of the journalist; in short, the mission, methods, responsibilities and obligations of journalism. All of these general phases are deeply affected by the physical conditions of the business. Within the last twenty-five years these conditions have been practically revolutionized. In the mechanical facilities of production, in the cheapening of white paper and in the instrumentalities of news collection there has been an extraordinary advance. This great change in the material factors has wrought a corresponding change in the scope and character of journalism. Not only as a business enterprise but as a public influence it takes on new aspects.

The remarkable development of later years touches every side of the material production of a newspaper. The old, limited, slow-moving printing press has been transformed into the ingenious and gigantic quadruple or octuple which converts the plain white roll into complete, folded papers, at the rate of thirty to forty thousand an hour. The number of pages may be determined at will, even at the last moment before going to press, thus responding to the exigencies of the news; and the application of the half tone and of color at undiminished speed permits pictorial effects. Simultaneously with this improvement in the printing press has come the linotype which substitutes machine type setting for hand composition. A third vital advance has been the perfection of the process of making paper out of wood-pulp which has vastly increased the supply and greatly decreased the cost of white paper.

These radical changes in the elemental business factors have largely modified the conditions of journalism. They have opened the way to unlimited production and have enormously cheapened the cost of the single copy. Penny and two-cent papers have become the prevailing rule. Immense circulations have thus been rendered possible, and where twenty-five years ago the edition even of the most widely read papers was comparatively limited, not a few now issue scores and even hundreds of thousands of copies a day. At the same time the initial cost of the newspaper plant with its expensive machinery and the magnitude of the daily transactions require a far larger outlay than in the earlier time and the business has come to be one demanding much greater capital.

All of these circumstances have inevitably and powerfully moulded the course and character of journalism. They have given increased importance to its business side, and have tended to make business considerations in the publication still more dominant. The effect has been two-fold and somewhat contradictory. The great capabilities of the business with the reduced cost of telegraphing have stimulated and quickened journalistic enterprise and have broadened the range of the journalistic field. The scope of journalism has been enlarged and in many cases its standard has been elevated. Within a sphere, perhaps too limited, the best and worthiest effort is accepted as the best business. But, on the other hand, the competition for great circulations has bred sensationalism and a pandering to the taste for personal and piquant matters. There is an eager and feverish struggle for the unusual, the dramatic and the spectacular, a constant straining for effect, a lavishness of "scareheads" and garish pictures, a studied and persistent search for objects of criticism and attack. The appetite for the effervescent grows by what it feeds on, and must be met by new excitation. This rivalry of explosive and paroxysmal journalism is carried on with too little sense of responsibility and verification, and while the notable manifestations are exceptional, and it would not be just to say that the infection has extended through journalism, it is nevertheless true that its injurious influence is widely perceptible.

In one important and conspicuous respect the development of journalism as a business has palpably improved its character. It has produced a greater degree of independence than

ever distinguished it before. In the earlier days political and official advertising might be a large item in the income of a newspaper. Its monetary value gave it potency in controlling editorial policy. But in the expansion of the business under modern conditions official patronage is unimportant compared with general commercial advertising, and its relative decline in value has greatly reduced its power of influencing newspaper expression. The favor of the public is far more advantageous than that of the party manager. It brings popular circulation and consequently business advertising, and there is less concern about the crumbs that fall from the official table. Even party journalism has greatly advanced in independence. While standing as the recognized exponents of party principles and policies the important party papers have become much more free in their judgment of men, methods and measures. A more critical standard is applied and a more rigorous public accountability is enforced under which there has been a visible improvement in general civic administration.

Under the same influences distinctive independent journalism has increased. It professes to have no connection with any party and disclaims a representative party position. Its theory is that it addresses itself not to party sentiment but to independent public judgment, and its claim for support is based on its journalistic quality without regard to political association. It is the extraordinary advance of newspaper-making as a business that has rendered independent journalism on a large scale possible. A quarter of a century ago it would have been difficult to name more than two or three important examples in the United States. Now there are many conspicuous and successful papers which are thus classed, and even more significant of the change in journalism is the greater independence of the party journals already referred to. Indeed, in essential independence, which consists of free judgment and candid expression on public questions, the line of demarcation between the better class of party papers and the professedly independent papers is scarcely perceptible and it would be hard to distinguish between them.

There has been a signal advance in other directions. Against the false and meretricious tendencies to sensationalism which have been indicated must be placed a higher and broader treatment of all the varied interests of life. In news collection the journalism of to-day is as much ahead of that of 25 years ago as the railroad express is ahead of the stage coach. It spares no expense, reaches everywhere, sends its correspondents to all parts of the world, employs the best experts and specialists, caters equally to the lover of literature and the lover of sports, keeps pace with scientific discovery and development, rivals the best periodicals in commanding the most famous writers and artists, makes its own special missions of public service, reports all business, social, educational, philanthropic and religious movements, and, in short, treats whatever concerns mankind as within its boundless domain. Its range, enterprise and comprehensiveness are a constant marvel. With all its faults the breadth, fullness and accuracy which are combined with so much celerity of action attest a thoroughness of organization and extent of resources never before equalled.

There are marked differences, however, in its development in different lands. Continental journalism in Europe is of a type quite distinct from English journalism, and that again is unlike American. In Paris the news is not the conspicuous feature of the newspapers. It holds a subordinate place and is limited in its quantity. Literary and dramatic criticism and political discussion command the first rank, and the feuilleton is a popular and important part. Literary excellence with a flavor of characteristic French wit is the dominant trait. The Parisian type with variations, generally soberer and heavier, is the prevailing continental model. English journalism is weightier and more enterprising in news. It covers the field of international politics and war with special thoroughness. It lacks the variety and vivacity of American newspapers, but within its chosen and more limited range it is more complete. Its reports of parliamentary proceedings and of important political, social and scientific meetings are copious and intelligent, and its discussions are distinguished by sobriety and information.

In life, spirit, minuteness of news gleaning, emphasis of display, and preponderance of personal flavor American journalism far outstrips all others. It does not surpass, oftentimes does not equal, British journalism in the presentation of great events, but in the multiplicity of its news of all sorts not only from its own country, but from all the world, there is no approach to it elsewhere. Its dominant tone is a light and airy freedom. There is a manifest tendency even on the part of the most respectable newspapers to avoid being heavy. The general aim is to be breezy, pungent and picturesque, and this often leads to the flippancy which is remarked in American papers. Perhaps the public taste which is thus indicated and cultivated will serve to explain in part why there are no serious and masterful weekly journals of literary and political discussion in the United States like the 'Spectator' and the 'Saturday Review,' and why even the monthly periodicals run chiefly to fiction and light matter. There are excellent trade journals of a high grade, showing a demand for the searching and careful treatment of special interests, but outside of these immediate respresentatives of the stupendous material enterprises of the land, the trend is towards the lighter vein.

Somewhat analogous is the explanation of the fact that journalism has grown more impersonal in its sources and impress. It is no longer distinguished by the great overshadowing personalities which marked it a generation ago. No editorial chief puts his individual stamp on a paper as Horace Greeley did, with his controversial power, his moral earnestness and his incisive force, which seemed to make the whole paper breathe his spirit and speak his voice. There are no successors to Raymond, Bennett, Weed, Bowles, and Dana. Henry Watterson is perhaps the only survivor of the old school of journalists. The difference is due, however, not so much to the lack of men as to the change of conditions. In its immeasurably wider range and larger demands the great journal of to-day is the product of no single mind, but of a vast organization and of a whole galaxy of stars. The elder journalism was largely political

pamphleteering. The later journalism is the complete mirror of daily life, and no individual throws so great a shadow across its comprehensive face.

It is a question much mooted whether journalism has declined in influence. It never was as universally read as now; it never was so much a common practice to read several newspapers; and whether in this multiplicity of reading and frequent contrariety of representation as serious an impression is made as when the appeal was more earnest and less divided may well be doubted. The editorial page has not actually fallen off in interest and importance; on the contrary, it is all in all better written, more varied and more instructive than when it had more of a polemic character. But in the broad development and great advance of the news departments the editorial page has receded in relative importance, and the drift to the light treatment of topics has tended to detract from its distinct and superior position. The greater absorption of the public mind in multiplied interests operates in the same direction. In the stress of modern business life and in the variety of diversions the body of readers have less time to follow public discussion. If it be true, as it often is, that the favorite journal does the thinking for its readers on current questions, it is equally true that many of the questions take less hold than when life was more simple and feeling more tense. When the press is in substantial accord on any public matter, except where party tradition rules, it generally carries the public judgment, and united expression makes it invincible; but when there is a discord of journalistic voices little heed is apt to be paid to any. The power of the press in its aggregate force, in the sweep of its activities and in a certain apprehension of its publicity, has steadily augmented; but at the same time the impression that it is too intrusive, too little restrained, too little governed by a just sense of responsibility, has grown and has impaired the influence it would otherwise exert.

It remains true, however, and probably grows more true with the decadence of other influences, that the press is the most effective force in protecting the moral and social well-being of the community. It is the belief of many observers that under our modern conditions the weight of mere authority is declining. In the intense strife and eagerness of the times the efficacy of the old standards in enforcing true principles and restraining wrongdoing grows weaker. With this advance of individual assertion and independence the power of public opinion is becoming the surest defence of social and business morality. The blaze of publicity gives a protection which nothing else furnishes. In the financial and social world there is a wide margin along the shadowy and undefined line between law and lawlessness, between ethical duty and questionable interest, where the search-light of exposure is the only security. Much would be done under cover of darkness which fears the light. Despite a freedom which often degenerates into license the press is thus recognized not only as the most effective safeguard against political and administrative debauchery but as the best bulwark against that social and business misconduct which becomes a public offence.

The relation of the counting-room to the editorial department involves both the business and the ethics of journalism. The business side cannot be disregarded. In its ultimate purpose it is a commercial proposition. Newspapers are published to make money. The counting-room considers both income and outgo. It adjusts expenditures to receipts. It properly studies to augment revenue in every legitimate way. But while newspapers are business enterprises they are such with recognized limitations and obligations. They are not simply business undertakings but public representatives, and the former object, while consistent with the latter, is subordinate to it. The foundation of the newspaper is the confidence of the public. It is the history of yesterday and the interpreter and teacher of to-day. In the very nature of the relation it assumes distinct obligations. It is bound to give the news and to treat public questions in absolute good faith. The counting-room is warranted in doing business in every way compatible with the fulfillment of that duty, but in all legitimate journalism it is a fundamental rule that editorial opinion and news publication must be beyond the reach of any questionable influence. The editorial department must be entirely free from commercialism. Public confidence and moral power depend on full faith that editorial and news conduct is honest, fearless and upright. The publication of a newspaper, like any other enterprise, is founded on business principles; its sphere or field of operations, whether general, political, literary or other, is chosen; the relation of counting room and editorial room in organizing and maintaining it on a sound business basis is of the most intimate character; but when the general lines of the enterprise are determined, the independence and integrity of the editorial management and fidelity to its declared aim as a public representative within its chosen sphere are absolutely indispensable. This rule lies at the foundation of the whole ethical code of journalism.

The question of the training and qualifications of the journalist has assumed new interest and importance both through the general growth of the profession and through special movements for its advancement. Schools or chairs of journalism have been established in a few instances and in a limited way, and the munificent endowment by Mr. Pulitzer of a College of Journalism in Columbia University — the first large and distinct project of the kind — has presented the proposition in a practical and definite form. There are two systems of thought on the subject. The first holds that the best and most efficient school of journalism is the newspaper office. It believes that the true journalist is born, not made; that knack, aptitude, native talent, the sense of news and proportion lie at the foundation of success; and that the most useful training is that of actual experience. It does not dispute that broad education and culture are essential to the journalist, and recognizes that particular studies, like history, political economy, the fundamentals of law, social science, and kindred matters, may be followed with special advantage. But it urges that these may be gathered from the general college course, and that the college or university has no distinctive professional knowledge to teach journalists in the special sense that it has to teach lawyers or physicians. The technical-

ities of the newspaper art — a suitable style, phonography, proof reading, the treatment of news and the like — are best acquired in practice, and the rest is the quickest and surest application of knowledge which is power, and of instinct or intuition which in dealing with public intelligence and currents is no less power, to the activities of the world.

The other system of opinion is represented in the scheme and scope of Mr. Pulitzer's College of Journalism. It is based on the theory that the journalist can be prepared for his vocation, like the lawyer, by a special course of study adapted to its requirements. Its aim and its tendency are to elevate and dignify the profession, and to establish a higher standard both of obligation and of performance. It seeks to teach not merely the technical necessities in newspaper-making but the true ideals of public service to which the newspaper should be dedicated, and the wide range of knowledge with which the journalist should be equipped. This includes style, ethics, law, literature, history, sociology, statistics, and particularly the principles and methods of journalism. It embraces an examination and comparison of existing newspapers by experts, an exposition of the functions of editor, correspondent and reporter, and the production of an experimental journal under the necessary limitations with its practical application of the instruction. In its main features this plan is an enlargement of the ordinary academic course directed to a particular end, and it is claimed that the establishment of such a college with liberal endowment would not only provide a large body of trained journalists but would set a standard for the profession.

On the whole, notwithstanding the faults of the "new journalism," the position of the press in the public estimate is increasing. One evidence of this truth is the more liberal character of libel legislation. In some States the greater license has prompted efforts at more restrictive measures, but the general trend of legislation has been toward reasonable liberality with just accountability. The prevailing movement has been to provide reparation for any wrong or injury that may be done, to assure just restitution for actual damages, but not to permit punitive damages or trammel the free expression of opinion. Journalism is advancing and is acquiring a higher position and recognition as a distinct profession. With the enlightened spirit of the age and with the marvellous agencies of instant and united expression the power of public opinion steadily grows, and the journalist is its medium and prophet. See AMERICAN NEWSPAPERS; PERIODICAL LITERATURE.

CHARLES EMORY SMITH,
Editor 'The Press,' Philadelphia

Journalism, School of, a college of journalism, endowed by a gift of $2,000,000 by Joseph Pulitzer, editor and proprietor of the New York *World*, to Columbia University, New York, in 1903. With the advance of civilization and general culture and intelligence the demands upon the journalists of the present day are constantly becoming greater, and this college is the recognition of the importance and place of journalism as a profession, and a practical endeavor to equip those who adopt it, by a course of thorough instruction for its exacting and laborious duties. Mr. Pulitzer considers the creation and rendering effective of public opinion (see PUBLIC OPINION, POWER OF) a task of which the press alone is capable of successfully accomplishing. The College of Journalism will therefore be a means to an end — to raise the character and standing of journalism, to increase its power and prestige, and to attract to the profession men of the highest capacity and the loftiest ideals, who, because of special training, will advance the professional to a higher standard of thought and action. This school is the first institution of the kind in the world. See JOURNALISM.

Joveite, jōv'īt, is a nitro-substitution explosive used in blasting, and as charges for high-explosive shells, which was invented by J. E. Blomen, Washington, D. C. It consists of nitro-naphthalenes 6 to 8 per cent, nitro-phenols, 16 to 30 per cent, and nitrate of soda 64 to 76 per cent. It is made by melting the nitro-naphthalenes in a steam-jacketed kettle, adding the nitro-phenols and continuing the heating until they are melted, and then stirring into this liquid mixture the solid nitrate of soda in a finely ground and perfectly dry condition until each of the solid particles of the nitrate is coated and impregnated with the liquid. On cooling, the particles of the nitrate are protected from deliquescence by the coating of scarcely soluble nitro-substitution compounds, while on explosion, the nitrate causes the reaction to be most complete. For blasting purposes this explosive is used in a granulated condition, but in loading armor-piercing projectiles it is poured into the shell while in the plastic condition and on cooling sets to a hard mass which completely fills the cavity except for a canal in the centre where the fuse is placed. For blasting purposes the explosive is fired by means of a mercuric fulminate detonator, but the charges in shells are fired by means of gunpowder fuses. In tests of the explosive by the United States navy, made at Indian Head, Md., in 1897, a 10-inch Carpenter armor-piercing shell containing 8.25 pounds of joveite, fired with a velocity of 1,860 foot-seconds at a Harveyized nickel-steel armor plate, 14.5 inches thick, passed completely through the plate and burst on the other side. See EXPLOSIVES.

Jovianus, jō-vĭ-ā-nŭs, **Flavius Claudius,** Roman emperor: d. Dadastana, Bithynia, 17 Feb. 364 A.D. He was originally captain of the household troops of the emperor Julian, whom he accompanied in the disastrous campaign against the Persians in which Julian lost his life (363 A.D.). After Julian's death he was proclaimed emperor by the troops, but could only extricate his army by ceding to the Persian monarch the five provinces beyond the Tigris. He was succeeded by Valentinianus I.

Jovellanos, hō-vĕl-yā'nōs, **Gaspar Melchior de,** Spanish statesman and writer: b. Gijon, Spain, 5 Jan. 1744; d. Vega, Spain, 27 Nov. 1811. He was educated at the universities of Oviedo, Avila, and Alcalá, became in 1770 a member of the Royal Academy, in 1778 chief justice of the criminal court at Madrid, and in 1780 a member of the council of state. Subsequently he was for a time minister of justice, but in 1801, through the agency of his enemy, Don Manuel Godoy (q.v.), was imprisoned at Majorca. Released at the French invasion (1808),

he joined the patriots, and became a member of the supreme junta. His writings are various, including treatises on political economy, a dissertation on English architecture, a 'Memoir on Law Applied to Agriculture,' the tragedy 'El Pelayo,' and 'El Delincuente Honrado' ('The Honorable Delinquent'), a comedy.

Jow'ett, Benjamin, English scholar and educator: b. Camberwell, London, 1817; d. Oxford 1 Oct. 1893. He studied at Oxford, was ordained in 1842, and became regius professor of Greek in 1855. In 1855 he published a notable commentary on the Epistles of St. Paul. In 1860 he contributed an essay 'On the Interpretation of Scripture' to the celebrated volume 'Essays and Reviews,' for which he was tried on a charge of heresy before the chancellor's court, but was acquitted. In 1870 he became master of Balliol College, and in 1871 published his most important work, a translation of the 'Dialogues of Plato,' of which a fifth edition was issued in 1892. He subsequently published translations of Thucydides (1881) and the 'Politics' of Aristotle (1885). He was vice-chancellor of the university in 1882–6.

Joy, Charles Arad, American chemist: b. Ludlowville, N. Y., 1823. He was educated at Union College and the Harvard Law School, and after a few years spent as professor of chemistry at Union, became in 1857 professor of chemistry at Columbia, where he remained for 20 years. In 1866 he became president of the Lyceum of Natural History and was long one of the editorial staff of the 'Scientific American.'

Joy, George William, English painter: b. Dublin, Ireland, 1844. He was educated at Harrow, and studied art at Kensington, at the Royal Academy, and under Charles Jalabert and Bonnat, at Paris. He has won gold medals at Paris, Munich and Berlin. His principal pictures are 'Domenica'; 'Chess Players'; 'Laodamia'; 'Young Nelson's First Farewell'; 'Wellington at Angers'; 'Prince Charlie and Flora Macdonald'; 'The Death of General Gordon'; 'Princess Alice of Albany' (for Queen Victoria); 'Reverie' (for the New Zealand Government); 'Truth' (German Government); 'Joan of Arc' (bought by French Government); 'Lear and Cordelia'; etc.

Joy, Thomas, American colonist: b. Norfolk, England, 1610; d. Boston 1678. Upon emigrating to America in 1635 he established himself in Boston as an architect and builder, and in 1657 erected the Townhouse of Boston, the earliest civic structure of any note in New England. In 1646 for his share in the 'Child Memorial,' protesting against both the civil and ecclesiastical government of the Bay Colony, he was fined and imprisoned.

Joyce, Robert Dwyer, Irish poet and physician: b. in County Limerick, September 1836; d. Dublin 23 Oct. 1883. In 1866 he came to the United States and practised medicine for several years in Boston, Mass., contributing during that period to the 'Pilot' and other Irish journals. He published 'Ballads, Romances, and Songs' (1872); 'Deirdré,' a much admired epic poem, which appeared anonymously as one of the 'No Name Series' (1876); Legends of the Wars in Ireland' (1868); 'Fireside Stories of Ireland' (1871); 'Blanid,' a poem (1879); 'The Squire of Castleton'; etc.

Joyeuse Entrée, zhwä-yèz ŏn-trā, the name given to the important privileges of the estates of Brabant and Limburg, with Antwerp, which the dukes were obliged to swear to maintain before they were allowed to enter the ducal residence, from which circumstance the name was taken. The most important of these privileges was that the people were released from an allegiance whenever the duke should attempt to violate their rights. So important were these privileges considered that many women went to Brabant to be confined there, that their children might enjoy the rights of a citizen of Brabant.

Joynes, Edward Southey, American educator: b. Accomac County, Va., 2 March 1834. He was educated at the University of Virginia and at Berlin, in 1858 was appointed professor of Greek at William and Mary College, in 1866–75 was professor of modern languages at Washington College (now Washington and Lee University, Lexington, Va.), and subsequently held chairs in Vanderbilt University and the University of Tennessee. In 1882 he became professor of modern languages in South Carolina College (Columbia). He published text-books of French and German, most important of which is the 'Joynes-Meissner German Grammar' (1887).

Juan Fernandez, joo'an fĕr-nän'dēz (Sp. hoo-än' fĕr-nän'dĕth), so called from the name of its discoverer, also sometimes Más-á-Tierra, an island in the South Pacific Ocean, about 350 miles west of the coast of Chile, to which it belongs. It is 12½ miles long and 5 miles broad at the broadest part, mountainous, and of rugged aspect. Parts of it are fertile, producing various kinds of timber, peaches, figs, grapes, cherries, etc. There are excellent fish. The island is inhabited by a few settlers, whose chief occupation is the providing of fresh vegetables, water, and wood for the whaling or other vessels that call here. Defoe is said to have founded his 'Robinson Crusoe' on the history of the solitary residence here for over four years (1704–9) of a Scotch sailor, Alexander Selkirk.

Juan de Fuca, joo'an dĕ fū'ka (Sp. hoo-än' dā foo'kä), **Strait of,** an ocean passage between the State of Washington and Vancouver Island. It connects the Pacific with the Strait of Georgia on the north and Puget Sound on the south. It is 100 miles long and about 15 miles wide. It contains several islands, some of which were at one time in dispute between the United States and Great Britain.

Juarez, Benito Pablo, bā-nē'tō päb'lō hoo-ä'rĕth, Mexican statesman: b. San Pueblo Guelatao, Oajaca, 21 March 1806; d. Mexico 18 July 1872. He was admitted to the bar in 1834; became a judge of the civil court in 1842; in 1847–52 was governor of the state of Oajaca, in which post he greatly improved provincial conditions; and after a period of exile (1853–5) joined the revolutionists under Alvarez, by whom he was later made minister of justice and ecclesiastical affairs. In 1855 he was appointed provisional governor of Oajaca by Comonfort, the successor of Alvarez, and in 1857 elected constitutional governor. He was made secretary of the interior and chief justice in the latter

year (the office of chief justice being by the constitution the equivalent of a vice-presidency), and when Comonfort was driven from power (1858), duly succeeded to the presidency, was recognized by the Mexican states and the United States, but was opposed by the conservatives in a long civil war, and did not enter Mexico City until 11 Jan. 1861. In March he was elected president for a four-years' term. The bankrupt government published a decree suspending for two years the payment on the foreign debt, and an alliance of intervention was at once entered into by England, Spain, and France. On Juarez' agreement to protect the interests of foreign debtors, the English and Spanish troops evacuated the country, but France proceeded to a war of conquest. Juarez was driven to the extreme north and Maximilian assumed imperial power. Upon the interference of the United States, however, the French troops were withdrawn in 1867, and in the same year Maximilian was executed and Juarez elected president. He was re-elected in 1871. His vigorous and liberal policy was of great benefit to the nation, and he has sometimes been called the "Mexican Washington." Consult Baz, 'Vida de Benito Juarez' (1874); and the 'Life' by Burke (1894).

Juarez Celman, Miguel, mē-gĕl′ hoo-ā′rĕth sāl-mān′, Argentine statesman: b. Cordoba, Argentina, 29 Sept. 1844. He was graduated from the University of Cordoba in 1870 and after holding several political posts became governor of his province of Cordoba, and in 1884 a senator in the national Congress. In 1886 he was chosen president and the speculation rife during his administration, as well as the inflation of the currency and the magnitude of the public works undertaken at this time, induced a financial panic in 1890. The Celman administration was held responsible for this disaster and the president himself charged with having amassed a fortune from sums known to have been taken from the treasury. The cabinet resigned, but revolt broke out in Buenos Ayres 26 July 1890, and fighting in the streets continued for several days. On 6 August, however, the president resigned and the vice-president, Pellegrini, assumed his duties for the remainder of the term.

Juba (joo'bä) **Islands.** See DUNDAS ISLANDS.

Juba River, in eastern Africa, a large stream which flows into the Indian Ocean at about lat. 0° 5′ S. Its mouth marks the north boundary of the coast placed under British control by the agreement with Germany in 1890. The river has been explored to beyond lat. 3° N., and Cecchi identifies the Umo as its upper waters; so that it probably takes its rise in the same mountains as the feeders of the Nile.

Jubal, joo'bal, or **Jabal,** son of Lamech and Adah. According to Genesis iv. 21, the inventor of the reed-flute and harp or lyre, and the father, or predecessor, of all them who play upon such instruments, that is, the discoverer of musical science.

Ju'bilee, an observance among the Jews which recurred every fiftieth year; the land was to rest, as in sabbatical years; land and houses in the open country and in unwalled villages reverted to their original owners or the heirs of such; all slaves were to go free. The law as a whole was distinctly theocratic; it vindicated the absolutism of Jehovah; it meant that Hebrews were the servants of Him, and could not therefore continue to be the slaves of their fellow men; the land belonged to Him, and was only lent to the Hebrew tribes and families, who could not therefore be driven out by any human arrangement.

In the Roman Catholic Church a Jubilee occurs every twenty-fifth year in which the Pope proclaims a remission, from Christmas to Christmas, of the penal consequences of sin, on condition of repentance, restitution and the performance of certain pious works. The first Roman Catholic Jubilee was given in 1300.

Juch, yook, **Emma Johanna Antonia,** American opera singer: b. Vienna 4 July 1863. She came with her parents to the United States when an infant and was educated in the public schools of New York. She studied singing under Murio-Celli for three years, making her concert début in Chickering Hall, New York, and her operatic début as Felina in 'Mignon' in London 1881. She sang for three seasons in the Mapleson opera company, and under the management of Theodore Thomas in the United States sang the part of Elsa in 'Lohengrin' on alternate nights with Nilsson. She was the prima donna of the American Opera Company for three seasons, and has sung in the Emma Juch English Opera Company and other organizations. She was married in 1894 to Francis L. Wellman of New York.

DEPARTMENT OF JUDAISM.

1. Judaism — Its History and Principles. Judaism is the religion of the Hebrew people and of that portion of the same to-day known as Jews.[1] A religion which has been active in the world for so many centuries has naturally undergone modification as to details from age to age, both by growth from within and by adoption from without; but in essentials, Judaism has been characteristically staunch to its principles from its earliest days. The object of this article is to outline, historically and concisely, the essentials, and briefly to mention the successive secondary points of accretion and modification. There are five ages of development to be distinguished.

I. The Patriarchal Age.— Judaism's fundamental conception is its earliest:— the spiritual nature of the Deity and His consequent elevation above all human forms, methods and attributes. Though not clearly expressed in Genesis, this seems to be at bottom the lesson taught by the first Hebrew, Abraham, who, in the land of Canaan whither the divine call had summoned him from his home in Mesopotamia, built altars to the Living God and "called upon His name." These altars, built without images, taught the first principle of the spirituality of God, not to be represented by stock or stone. What Genesis omits, Jewish legend as recorded in Talmud and Midrash, abundantly supplies, in the shape of tradition — no doubt with sufficient substratum of truth — as to how Abraham came to the conception of an invisible spiritual God, and how he preached his first convictions of the new truth by vigorous assault upon the idols of his father, an image-carver, and his neighbors. Most scholars see in the abortive "sacrifice of Isaac" (Gen. xxii.) also an object-lesson of protest against the prevalent Canaanitish practice of human sacrifices, and especially of sacrifices of children. For the rest, we have, beyond the institution of Circumcision (Gen. xvii, 9) as protest, and possibly as physical aid against the current temptations to the immoralities which formed essential features of Canaanite idolatry, no trace of any code of observance connected with this early form of Judaism; no regulations as to ceremonies or food-laws (compare Gen. xviii. 8 in contradiction to Ex. xxiii. 19), unless indeed the Noachide prohibition of blood (Gen. ix. 4) is to be understood as current among this branch of Noah's descendants.

II. The Formative National Age.—With the advent of Moses and the contact with a much more highly developed religious culture, that of the Egyptians, a more elaborate Judaism came into being. A definite central shrine as a visible mark of God's presence among men (Ex. xxv, 8), but still without any central image or idol; and above all, the direct and formal acceptance by the Hebrews of a mission of enlightenment to the nations on behalf of "the Holy God," *i. e.* the Pure, (Ex. xix. 5, 6) prepared the way for the adoption of a somewhat complex religious ritual — cast in the universally prevailing form of animal sacrifices and burnt offerings — together with a system of fasts, feasts and holydays, food-laws and health-laws, regulations political and agricultural, the whole forming a body of legislation, set down in the later books of the Pentateuch, admirably suited both to Israel's formative desert-sojourn and to the promised period of re-occupancy of the land of Canaan, the old home of the patriarchs. Of fundamental principles we note in Moses' age, the Eternity of God (Ehyeh asher Ehyeh "I shall be what I am," Ex. iii. 14); the Unity of God, in contraversion of the multitudinous, circumscribed, and mutually antagonistic gods of Canaan and Egypt; the duty of uprooting the foul idolators and idolatries of the land of Canaan (Ex. xxiii. 24, 33; Deut. vii. 1, 6); the fact of the divine revelation of religious and ethical fundamentals (Deut. v. 22); the duty of serving God by acts of love and obedience to His revealed will (Deut. x. 12) and of training children in this practice (Deut. xi. 19); love of the neighbor — the "Golden Ethic" — (Lev. xix. 18); love of the foreigner, "for strangers were ye in the land of Egypt" (Ex. xxii. 21, Lev. xix. 34, Deut. x. 19); etc.

III. The Age of National Independence.— In spite of the loving warnings and wise safeguards of the Mosaic legislation, the Hebrews when restored to the occupancy of Canaan, did not remain faithful to their local mission, but, to a greater or less degree, fraternized with heathen nations to the extent of adopting their idolatrous ways and principles. The prophets urged to higher conceptions, but not always successfully: a superficial ceremonialism seems to have been the highest point attained by the yet uncultured people. "To obey is better than sacrifice, and to harken than the fat of rams!" (1 Sam. xv. 22) was Samuel's reproof to Saul. It was not until David ascended the throne and brought to the national ceremonialism the element of reverential, spiritual elevation that Judaism at all approached the higher plane to which Moses inspired it. An elaborate central worship was planned and prepared for by David, with accessories of music and psalmody, and found its grand culmination in the stately Temple of Solomon (B.C.E. 1018). But although the lofty religious spirit of David and the other psalmists found expression in this elaborate public ritual and exerted due influence over the popular mind, it needed all the energy

[1] The Jews known to civilization today are the descendants of only the smaller kingdom of Judah, which consisted of the two tribes of Judah and Banjamin (with a sprinkling of priests and Levites of the tribe of Levi) and which, in the year 586 B. C. E. was transported to Babylon by Nebuchadnezzar and allowed to return to Palestine by Cyrus, king of Persia in 536. The members of the larger kingdom of Israel — the Ten Tribes — were deported in the year 720 by Salmanassar, king of Assyria, to unknown regions in the interior of Asia, and have since disappeared from history.

and devotion of the prophets during the reigns of Solomon's successors in the twin-kingdoms into which the Hebrews then divided, to maintain these lofty ideals. The golden age of a spiritually exalted Judaism was surely reached when its preachers held up as the religion's highest teachings God's desire that men should be just and merciful, upright and generous, in preference to being ceremonially observant and ostentatiously pious (Isa. i. 12-17, Hos. v. 14, 15, 24; Micah vi. 6-9); God's willingness to extend forgiveness to repentant sinners (Isa. lv. 7; Jer. iii. 22; iv. 1, 2; Ezek. xviii. 21-32; Hos. xiv. 2); God's exalted spiritual nature, above all picture or comparison (Isa. xl. 18-25); the ineffable superiority of His thoughts and His ways to men's thoughts and ways (Isa. lv. 8, 9); and His intimate, interested knowledge and supervision of men's deeds (Ps. xciv. 7-11; Jer. xx. 12, xxiii. 24).

Political independence of other nations, however, might have had the evil result of suggesting that Israel's religion was the exclusive prerogative of Israel's people. Against this narrow conception, too, the prophets contended, with their teachings of the Fatherhood of God unto all men (Isa. xlv. 22-24; Jer. x. 6, 7; Zech. xiv. 9, 16; Mal. ii. 10) and with the description of a glorious epoch to come when "many nations should go up to the mountain of the Lord, to the house of the God of Jacob, to learn of His ways and to walk in His paths" (Micah iv. 1, 2). The strongest opposition to the growth and maintenance of all such ideals centered in the political ambitions of the people, and their frequent approximations — for political reasons fundamentally — to the paganism of one or other of their powerful neighbor-states; so that the history of the Hebrews under their own kings is a record of continual relapses into idolatry and heathen immorality, together with revulsions, now and again, back to purer Judaism. The most enduring and prominent contribution to Judaism traceable to this age of religious storm-and-stress is the belief in the coming of a Messiah ("anointed one, king"), who was to be a descendant of the royal house of David and, as earthly monarch over a re-united Israel, would restore the pure worship of the spiritual One God of their fathers (Isa. xi. 1-10).

IV. The Age of Exile and Oppression.— When the above-mentioned political ambitions of the sister-kindoms culminated in the destruction of both (Israel in 720 and Judah in 586), the population of the smaller one, Judah, deported to the plains of Babylon, found there leisure and inclination for a closer and more devoted attention to their religion, which resulted in the growth of a minute formalism of observance and petty precept, substantiated and elaborated upon the foundation of the Mosaic law. Its multitudinous details are collected in the Talmud (see JUDAISM — THE TALMUD), and for many generations after the Jews' return to Palestine (536), the rabbis and sages of this epoch, both in Palestine and among those remaining in Babylonia, impressed their extremist piety upon the people; not altogether, however, without protest. Not that the lofty ideals of the prophets were ignored; to the contrary, they were treasured and still further developed in many a noble dictum and many a shining example. But the popular sentiment threw itself by preference into the religion of ceremonial and observance, and when, after a brief period of independence under the Asmoneans, the Jews succumbed to the military might of Rome in 70 C. E., this ceremonial bent proved the chief source of spiritualizing strength to teachers and people alike in the ensuing centuries of exile and oppression. A most elaborate accumulation of ritual observance grew up in their new homes, in north Africa, Spain, France, Germany and Poland, codified from time to time by such Talmudical experts as Isaac of Fez, usually called "Alfazi" (died at Lucena, 1103); Moses Maimonides, lived in Spain and Egypt, 1135–1204; Jacob ben Asher, died in Spain, before 1340, author of the 'Arba Turim' ('Four Rows'); Joseph Karo, lived in Spain and Turkey (1588–1575), author of the Shulchan Aruch ('Arranged Table'). Obedience to these voluminous codes of ceremonial law constitutes today the chief difference between Jews of the "Orthodox" and "Reform" wings of modern Judaism, the former accepting, the latter rejecting, their binding force.

But while ceremonial formalism absorbed the religious thought and activities of the masses of the people in all their foreign homes, the growing culture of the ages appealed forcibly to the superior intellects of the Jews, especially in such countries as Spain (both Moorish and Christian), southern France, Italy, etc., and deep philosophical expositions became numerous (see JUDAISM — JEWISH PHILOSOPHICAL WRITERS). Their chief aim was still to maintain and fortify the doctrines of that spiritual sole God whom Abraham and Moses taught, not so much now in contravention of heathenism as in protest against the doctrines of the Christian Church. Perhaps as complete a presentation as is possible of Judaic tenets in this age may be found in the 'Credo' drawn up by Maimonides, thirteen articles of belief, which today are printed in the Orthodox Hebrew prayerbook, both in a prose version (they were written originally in Arabic), and in a metrical form composed by Daniel ben Judah Dayyan in 1404, the "Yigdal." The modern school of Reform-Judaism adopts these in the main, likewise including the Yigdal in its ritual (see Union Prayerbook, compiled by the Central Conference of American Rabbis, Cincinnati 1894, vol. I. p. 162–3; vol. II. pp. 120–121). They include the unity, omniscience and incorporeality of God, the truth of the prophecy of Moses and the prophets, future reward and punishment, the coming of Messiah, immortality of the soul.

V. The Modern Age.— The divergences between the two wings of modern Judaism, the "Orthodox" and the "Reform," rarely trench upon fundamental principles, but are mainly concerned with the observance or non-observance of precepts and practises that have added themselves in the course of time and in various countries of sojourn, to the ritual features of the religion. The only serious approach to a fundamental difference is concerned rather with the political side of the religion, namely, the belief in a personal Messiah to come, a factor originating, as shown above, in the age when impending loss of national independence

and the stress of national politics, stirred the hope in superior minds for restoration of a Davidic kingship, with God's law of mercy and justice, coupled with complete reverence, more potently in sway than ever before. Reform Judaism deems that restored Jewish nationality in Palestine is by no means an essential feature of the Messianic age of universal peace and righteousness, and therefore looks coldly today upon such nationalistic endeavors as Zionism (see JUDAISM — ZIONISM). It does not seem attracted even to the Jewish Territorial Organization (familiarly called the Ito, from its initials), originating in 1905, having fo its object the establishment of a Jewish state outside of Palestine. It agrees with Orthodoxy in refusing to make propaganda for the dissemination of Jewish principles other than by the passive policy of example and their inherent truth. In religious practice it rejects the minutiæ of ceremonial observance, household and synagogal. Reform Judaism is represented today in the matter of seminary-instruction in America, by the Hebrew Union College at Cincinnati; in Germany by the Jewish Theological Seminary at Breslau, by the Hochschule (now Lehranstalt) für die Wissenschaft des Judenthums, at Berlin, and in Austria-Hungary by the Landes-Rabbiner Schule at Buda-Pest. Orthodox Judaism counts, among others, the following seminaries: the Paris Seminaire Israelite de France, the London Jews' College, the Berlin Rabbinical Seminary, the New York Jewish Theological Seminary.

FREDERICK DE SOLA MENDES,
Rabbi and Author, West End Synagogue, New York City.

2. Judaism—Jewish History. *I. Pre-Exilic Times.*— Although the title "Jew" is not known until Israel's return from the Exile, 536 B.C. (Ezr. 4:12), Jewish history precedes the Exile by 2,000 years. The progenitor was Abraham, who, hailing from Ur of the Chaldees, is known, not as a "Jew," but as a "Hebrew" (Gen. 14:13). As patriarch of his tribe, he was succeeded by his son Isaac; Isaac, in turn, by Jacob, surnamed "Israel," and Israel by his 12 sons, who, after the slavery of their descendants in Egypt, became the heads of 12 tribes, known collectively as "Israel" or "the Children of Israel" (Ex. 1:1). Among the 12 tribes, neither Levi, who was destined for the service of God, nor Joseph, who was supplanted by his two sons, Ephraim and Menasseh, is represented. With the conclusion of Egyptian servitude, the Children of Israel were formed into a nation by Moses, their liberator. Moses led Israel, by a circuitous route, through the desert, towards Canaan. Forty years were consumed in making that journey, during which time, Israel's appointment as "a kingdom of priests and a holy nation" with the establishment of a theocracy as highest aim, was made known; religious tenets, ethical precepts, hygienic laws, and social principles were promulgated; a tabernacle, with an elaborate sacrificial cult, was established; countless hardships were endured; frequent rebellions were instituted, and numerous battles were fought.

Upon his death, Moses was succeeded by Joshua, a warrior chieftain, who, crossing the River Jordan, and vanquishing many of the native tribes, divided Canaan, by lot, among the tribes, and set up the tabernacle at Shiloh. The natives who were not vanquished, proved sources of annoyance to the invading Israelites, and often made certain portions of Israel tributary to them. This condition called for the "Judges" who, by means of battle, succeeded in regaining for the Israelites their independence. Of these there are 15 most celebrated, among whom are Deborah, Gideon, Samson, and Samuel, also the first of the prophets, a class of men whose principal aim was to keep Israel free from the contaminating heathen influences of the natives, and loyal to the higher worship of the one God. It was in Samuel's days, about the middle of the 11th century B.C., that democratic Israel became a monarchy. Saul was made king. His throne did not pass over to his son, but to David, who had proved victor in many battles against the harassing Philistines. Upon the close of David's life, replete with warfare, his son, Solomon, who became the architect of a powerful kingdom, succeeded him. He beautified Jerusalem, the capital, built the first Temple, constructed palaces, extended commerce, and made many alliances with foreign nations. Although his was a golden age, it was in his time that idolatry was introduced into Israel. Upon his death (977 B.C.) a revolt broke out. Solomon had taxed the people heavily, to further his many expensive ventures. The people wanted the taxes decreased. Rehaboam, his son and successor, refused to listen to the clamors of the people. Ten tribes seceded and formed an independent kingdom, called the "Kingdom of Israel," leaving to Rehaboam only Judah and Benjamin, termed the "Kingdom of Judah." Israel had 19 and Judah 20 kings. Jeraboam, the first king of Israel, desirous of weaning the tribes of their attachment to Jerusalem, the common sanctuary, introduced the calf worship in Dan and Bethel. Israel, through the example of its kings, went from bad to worse, until, in 719 B.C., Samaria, Israel's capital, was destroyed, and the people constituting the 10 tribes were deported to Assyria by Shalmanezer IV., to become lost forever. Judah, too, entered upon the downward path. With the exception of occasional and temporary reforms under Asa (954), Hezekiah (720), and Josiah (627), Judah was idolatrous, always reflecting the fetichism of surrounding nations. The exhortations of such prophets as Elijah, Elisha, Jonah, Amos, Joel, Hosea, Zechariah, Micah, Isaiah, Zephaniah, Jeremiah, and others, were of no more avail with Judah than with Israel, so that in 586 B.C., Jerusalem was razed to the ground, the Temple destroyed and the people taken captives to Babylonia by Nebuchadnezzar.

II. From Exile to Dispersion.— The captivity lasted 70 years. Many of the Judeans hoped for a return to their land, and for a resurrected commonwealth. They met with encouragement at the hands of the prophets Ezekiel, the Babylonian Isaiah, and Haggai. In 538 B.C., Cyrus, King of Persia, taking Babylonia, permitted the Jews to return to Jerusalem, in order to rebuild it, and erect a temple. Only a part took advantage of the privilege to join the first pilgrims, under Zerubabel. The building of the temple was interrupted, as a result of the charges brought against the Jews by the Samaritans, Assyrian settlers of Samaria. However, in 516 B.C., the Temple was completed. In 459, Ezra, a scribe well versed in the law, who was, in course of time, followed by Nehemiah, came to Jerusalem. Nehemiah regenerated Judah physically, and Ezra culturally. Ezra was responsible for the formation of the Great Assembly, the study of the law, the rejuvenation of the literary genius, and the beginnings of the Synagogal service. With the invasion of Alexander the Great into Asia (332 B.C.), Jews came into contact with Greek thought, which did not leave them altogether unaffected. Judah had become tributary to Egypt, whither the Greek civilization was transplanted, and two parties, Hellenists and Hassidim arose; the Hellenists admitting philosophy as man's guide, and the Hassidim recognizing only the law of Moses (Torah).

While these two parties were in dispute, Syria gained control of Palestine, and, in course of time, aimed at the destruction of Israel, the confiscation of the Temple, and the destruction of Israel's faith, under Antiochus Epiphanes (168 B.C.). Thus came into existence the Maccabees. They took up arms against Syria, regained the Temple, and eventually won for the Jews national independence, so that when Judah allied itself with Rome (140 B.C.), it once more had a king in John Hyrcan (135 B.C.). It was at this time that Biblical literature, which had begun to thrive with the return of the Exile from Babylonia, flowered most luxuriantly. However, Jewish independence was not to endure very long. The Jews were divided by parties (see JEWISH SECTS), such as the Pharisees, Sadducees, and Essenes. The Idumaeans were converted to Judaism. One of their number, Herod I., obtained control of the Jewish State, and was proclaimed King by the Roman Senate (37 B.C.). In their political and religious hostilities, Rome was called in to act as arbiter, and assumed the dictatorship. Rome, the friend, soon turned enemy. It tried to get possession of Jerusalem, and succeeded in its undertaking under Titus (70 A.D.). After a long siege, the city was burned, the Temple destroyed, and thousands of Jews were carried away captives to Rome.

III. From Exile to Close of Oriental Schools. —Many foresaw the doom of the Holy City. The law of Israel had grown to be more than the Bible, and Israel's life was no longer thought to be dependent upon the possession of Palestine. An attempt was therefore made to save the law and life. Rabbi Johanan ben Saccai requested of Rome — and the request was granted — to be allowed to remove from Jerusalem to Jabneh, in order to establish there a school, whose purpose would be to keep intact the teachings which had grown up in the earlier schools of Palestine. Thousands of pupils followed the teacher, and soon the Synhedrin, the religious court of the Jews, was transplanted thither. Although Rome permitted Johanan to found a school in Jabneh, Rome did not look with favor on Israel's new lease on life. It interdicted the study of the law, the secret of Jewish preservation, and seconded its interdictions by persecutions and massacres, among which the death of the 10 martyrs, participants of the Bar-Cochba revolution, during the reign of the Emperor Hadrian, was undoubtedly one of the most bloody (135 A.D.). Unable to enjoy rest and peace on Palestinean soil, the Jews soon found their way to ever friendly Babylonia, where many of their brethren sojourned. The Rabbis, who had been forbidden to erect schools in the Holy Land, established them in Babylonia. It was in the very midst of the constantly shifting centre of Jewish gravity and the uninterrupted stream of persecution, that Rabbi Jehudah, a Palestinean rabbi (190), deemed it necessary to collect, in permanent, systematic form, all the civil, criminal, religious, and ethical principles which the new surroundings had brought into existence, calling the name of this collection «Mishnah,» which was studied and explained in all schools, so that with it as a foundation, two works were eventually produced, the Palestinean Talmud (375) and the Babylonian Talmud (550); the two Talmuds containing the discussions of the schools on the teachings of the Mishnah. (See TALMUD.) Residence in Palestine was made more and more impossible for Jews. In Palestine, beginning with the Council of Nice (325), Jews were exposed eventually to the hostilities of the Church, as well as to those of imperial Rome; whereas on the other hand, they were granted fair treatment in Neo-Persian Babylonia. In Babylonia they had a political head in the «Exilarch» and religious authorities in the «Gaons» of the academies. It was in these schools that the Bible was given its present canonical form, that the vocalization of the Hebrew text of the scriptures was fixed, that the many Midrashim were created, that additions were made to the prayer book, and that numerous ceremonies were established.

That the positions of honor held out to the Jews of Babylonia, filled the more prominent among them with ambition, goes without saying. Anan ben David (761) expected to be promoted to the Exilarchate, but was disappointed. Incensed by his disappointment, and later imprisoned for having himself proclaimed anti-Exilarch, he, as soon as released, assumed the aggressive toward the prevailing Jewish thought current of Babylonia, instituting a movement called «Karaism.» (See JUDAISM — THE KARAITES.) In justice it must be confessed that the movement was beneficial as well as detrimental to the Jews of those times, for it helped to check their imagination which had often run riot in their understanding of scriptures. Rabbinism was recast, and in its recast form, found an ardent champion in Saadia ben Joseph (892–942) who, though a native of Fayum in upper Egypt, attained to the Gaonate of Sora, because of his Biblical, Talmudical, and grammatical knowledge, and his religio-philosophical genius. As long as the school of

Sora had at its head a man like Saadia, the wrangles between the Jewish scholars of Babylonia, and the growing Mohammedan antagonism to Jews and Judaism, both disintegrating influences of the Babylonian academic life, did not make themselves markedly felt; but when once Saadia was no more, the decline of the schools of the East was inevitable. To prevent the closing of the schools, four scholars (948) Shemarya ben Elchanon, Chusiel, Nathan ben Isaac Cohen, and Moses ben Chanoch, were despatched to scattered Jewry, to collect funds for the maintenance of Sora. They embarked on the same vessel, which was captured by a Spanish-Arabic admiral, and thus became separated forever; Shemarya going to Alexandria, Chushiel to Cyrene, Nathan to Narbonne, and Moses to Cordova. Thus was the last hope of Babylonian Jewry defeated, and the Jews began to make history in European countries.

IV. From Close of Oriental Schools to Close of 16th Century.— Although Jewish history now takes us into European countries, Jews lived in Europe long before the middle of the 10th century. Already in the earliest centuries of the Common Era, Jews, who soon grew into fair-sized communities, contributing to the prosperity of the various governments, were found in all countries, in consequence of the Jewish dispersion. Welcomed upon their arrival wheresoever they settled, they did not anywhere continue to live long in the enjoyment of peace. Europe made suffering the badge of all their race. They were misunderstood and misrepresented; they were regarded unbelievers and infidels. Not only during the Crusades did they suffer, as for instance in Rouen, Treves, Speyer, Worms, Cologne, Ratisbon, Prague (1096), in South Germany and France (1147), in Toledo (1212), in Anjou and Poiton (1236), but also in times and amid conditions which held out peace to others. Time and time again, edicts restricting them, were unjustly promulgated, as, for example, by Pope Gregory VII. (1078), by the government of France (1198), by the Council of Avignon (1209), by Pope Innocent III., instituting the "Jew Badge" (1215), by the Council of Zamora (1313), by Juan II. (1412), by the Council of Basle (1434), by Eugenius IV. (1442), by Paul IV. (1555), and in Russia in 1881 and still later. Time and again they were crowded into Ghettos, as for example in Rome, Prague, Frankfort, and the Russian Pale. Time and again their literature, especially the Talmud, because not understood, was either unjustly burned, as for instance in Paris (1242), in Cremona (1559), or publicly attacked, as by the Dominicans (1507), or forbidden to be studied, as by Pope Benedict XIII. (1415). Time and again the Jews were unjustly accused of the use of Christian blood for ritualistic purposes, as in Blois (1171), all over Germany (1283), in South Germany (1431), in the case of Simon of Trent (1475), which brought a Jewish persecution in its train in Ratisbon, in Damascus (1840), and in Tiszla Eszla, Hungary (1882). Time and again they were unjustly imprisoned, as in England by King John (1210), and again in 1278. Time and time again they were unjustly banished from their homes, as from Granada (1066), from France (1254), from England (1290), a second time from France (1306), and a third time (1394), from Cologne (1426), from Spain (1492), from Portugal (1497), from Prague (1561), from the Papal States (1569), from Italian Principalities (1597), and from Worms (1615). Time and again they were unjustly persecuted and massacred by the thousands, as in London (1189), in Germany all the way from the Rhine to Vienna (1190), and again in Germany in 1298 and frequently thereafter, in France (1321), all over Europe on account of the "Black Death" (1348), in Spain (from 1391 to 1492), in Silesia and Poland (1453), in Portugal (1530), again in Poland (1648), and in Germany, Austria and Russia as late as our times, on account of anti-Semitic agitations.

That all of this suffering stunted the Jews physically is self-evident, and that it, to a certain extent, prevented the broadest spiritual unfolding, in accordance with the higher light of their religious genius, is therefore not surprising. The spiritual offspring of persecution was that mysticism known as the Cabala (see JUDAISM — THE CABALA), and the belief in such pseudo-Messiahs as Serene (720), David Alroy (1160), Abraham Abulafia (1279), Asher Lemmlein (1502), David Reubeni and Solomon Molko (1558), Isaac Luria (1569), Sabbatai Zevi (1665) and others. However, barring these vagaries, the Jews developed a phenomenal intellectual activity, not merely along religious, but along all lines of thought.

With the arrival of Moses ben Chanoch in Cordova (945) the Jews took an active part in the development of far-famed Andalusia. Apart from the celebrated Spanish seats of learning they helped to create, they also cultivated a many-sided specific Jewish literature. Versed as the Spanish Jews became in Arabic lore, and acquainted as they were with the work done by the Moors in Arabic philology, they soon began to apply the science of philology to Hebrew grammar and lexicography. Biblical criticism found in them champions. Philosophy and poetry were cultivated among them by famous men. Simultaneous with the Jews in Spain, those of France also were intellectually active. The Jews of Italy, too, were bound to grow likewise. In Germany and Poland, the specific literature produced by the Jews covered, for the most part, the ritual, Biblical interpretation, and legal codes.

V. From Settlement of Jews in Holland Until the Present Time.— Although the flowering of Spanish-Jewish life, which came to an end in the reign of Ferdinand and Isabella of Spain, through the intrigues of their chief inquisitor, Torquemada, in 1492, was noticeable in Italy and Turkey in consequence of the welcome these countries extended to the hapless fugitives, that flowering was most apparent in Holland. Holland had become the most ardent champion of the broadest liberty, from the time that it threw off the yoke of Philip II. of Spain. Thither, therefore, countless Jews, more particularly the Marranos, who were obliged to profess Christianity outwardly, and practice Judaism only secretly, found their way, and soon made of Amsterdam a second Cordova. Being unchecked and unhampered by restrictions of any kind, it was only natural that the Jews of Holland became, in due course of time, exponents of a comparative rationalism in religion, to the extremes of which, as preached by Benedict Spinoza, the Amsterdam Rabbinate, Saul

Levi Morteira, Isaac Aboab, and Menasseh ben Israel, objected. The Jews of Holland contributed no little in defining the trend of Jewish history; and yet however otherwise valuable their contribution to the happier and higher life of the Jews may have been, one event, for the occurrence of which Menasseh ben Israel is responsible, stands out in bold relief. That event is the readmission of Jews into England under Cromwell (1655), they having been forbidden to dwell there for several centuries. The rationalism of Holland Jewry may not have influenced Jewry immediately all over Europe, but it worked with telling subtlety, and effected sure results, the moment the Jews began to be treated with more justice than they had been previously accorded. Now a pseudo-Messiah like Berachyah may have deluded the people; now an enemy like Eisenmenger (1700) may have misrepresented them; and now Chassidism (an unnatural piety) may have claimed to be the ideal conduct for the Jew, as was the case at the time of Israel Baalshem (1750), the founder of the movement; still, it was a question of only a short time, how soon the bars hemming the Jews in from without, and the bolts hemming them in from within, would be broken.

The year 1729 witnessed the birth of Moses Mendelssohn (q. v.) in Dessau, Germany. Having gone from his native town to cultured Berlin, having learned the sciences, philosophy, and ethics, and having become acquainted with Lessing (q. v.), whose 'Nathan the Wise' he became, he attempted to explain the Jew and his faith to the Jew himself and to the world, so as to prove the Jew's right to the privileges of citizenship. The first attempt he made in this direction was to translate the Pentateuch (1778) and other Biblical books into German for the Jews, in order to wean them of the jargon, which translation was soon followed by his 'Jerusalem' and 'Morgenstunden.' He was called upon to answer not only attacks made upon his people by non-Jews, but also those made upon him by his own people, to whom the jargon had become a sacred tongue and the narrow Ghetto life the natural Jewish life. Unwelcome as his good offices were in many quarters, they soon began to tell without and within Jewry, in France, Batavia, Westphalia, Hamburg, and Mecklenburg. (See JUDAISM, A CENTURY OF EMANCIPATION.) In the meantime, Jews were permitted to enter German gymnasia and universities. Leopold Zunz and Isaac Markus Jost availed themselves of the opportunity, with others, built on the foundation laid by Mendelssohn, and hence are the fathers of the movement which is known as the "Science of Judaism," and has made itself felt all over the world, more especially Europe and America. Although these men and their followers worked unceasingly to place the Jew, his faith, and ideals before the world in their true light, prejudice and persecution against the Jews still continued to live. The year 1819 witnessed persecutions whose tocsin was the shout "Hep-Hep" (Hierosolyma est perdita, *i. e.* "Jerusalem is destroyed"). The Jew's rights had to be won by incessant fighting. The emancipation of the Jews of German States, won in 1848, required the constant defense of a Gabriel Riesser, Ferdinand Lasalle, Eduard Lasker, and Karl Marx in Germany, of an Isaac Adolphe Crémieux in France, of a Moses Montefiore in England, of an Alliance Israelite Universelle in the Orient, and of a Union of American Hebrew Congregations, with Isaac M. Wise as creator, in the United States. To-day the Jews live in almost all parts of the world. They number about 9,000,000, the greater part being in Russia, and 1,000,000 in the United States. Wheresoever sufficiently numerous, they worship in large and stately synagogues. Their mode of worship varies in degree of ceremonialism, ritualism, and the language of prayer, though the Hebrew is heard in all synagogues. In every country they have one or more theological seminaries, the first of the modern type having been founded at Breslau in 1854. A movement which has, in recent years, become prominent on account of Russian persecutions, but has been variously interpreted by its several factions, is "Zionism," which primarily aimed to establish, for persecuted Jews, a legally assured home in Palestine. As a humanitarian movement, if feasible, it appeals to all Jews. As a national movement it has opponents as emphatic in their opposition, as are its champions emphatic in their propaganda. Though the Jew is justly called the "Wandering Jew," he is not any the less justly termed, because of his life, despite persecutions and massacre, the "Eternal Jew."

3. Judaism—The Hebrew Language. *Origin and Name.*— Hebrew is the language of the ancient Hebrew nation. It is a Semitic language, that is to say, one of the great group of languages spoken in antiquity, and to a great extent in modern times also, in Southwestern Asia and contiguous regions by the nations descended, according to the account given in Gen. x. 21–31, from Shem, the son of Noah.[1] The Semitic tongues are divided into four great divisions or branches, the South Semitic or Arabic, the Middle Semitic or Canaanitic, the North Semitic or Aramaic and the East Semitic or Assyrio-Babylonian. The Hebrew belongs to the second or Canaanitic branch and has, as its sister dialects, the Canaanitic tongues, the Phoenician of the coast-cities and the Punic of Carthage and its colonies. The name Hebrew language does not appear to have been its original designation. In Isaiah xix. 18, it is called "the language of Canaan" and in II Kings xviii. 28, Isaiah xxxvi. 11 and 13 and Neh. xiii. 24 it is called 'Judaean' or 'Jewish.'[2] In the Talmud it is called 'the language of the sanctuary' (Sanh. 21 b. et-alia). By modern writers it is called "the language of Eber" or "Hebrew."[3]

Old Testament Hebrew.— With the exception of parts of Daniel, Ezra and one verse in Jeremiah, Cap. x. vii., the entire Old Testament is written in Hebrew. Considering the long period of time over which the composition of the Biblical books extends one would naturally expect great variation in their linguistic and grammatical forms. As a matter of fact there is a most surprising uniformity and homogeneity. The Hebrew of the earliest is practically identical with that of the latest books. The probable reason of this is that in the Biblical writings we have the literary idiom, which is fixed, as distinguished from the spoken language, which undoubtedly varied greatly in different times and regions. The fact that the Biblical books were revered as sacred also undoubtedly contributed to this uniformity of diction. However, a progressive variation, due to historic influences, is clearly discernible also in the Biblical Hebrew. The language tends constantly to become Aramaized. The earlier writings are purest in their language, the later writings contain many Aramaic nouns, verbs and terms of expression. Such books as Ecclesiastes and the Song of Songs are closely approximate in their language to the Mishnah Hebrew. Job shows a strong Arabic influence.

Other Sources of Hebrew.— Outside of the Bible the ancient Hebrew is only preserved in some few inscriptions. These are chiefly the celebrated Mesa stone, an inscription found in 1880 near the Pool of Siloam at Jerusalem and the coins of the Maccabean princes and of the revolts against Vespasian and Hadrian.

Grammatical Structure.— The Hebrew, in its grammatical structure, exhibits in general the characteristics of the Semitic family of languages, which differs greatly from the Indo-Germanic, its most prominent neighbor. Its most striking characteristic is its root-system. All the parts of speech are derived from roots or word-stems which are almost invariably triliteral. Modifications, such as conjugation in verbs and declension in nouns, are indicated generally by internal or vowel changes. The verb has but two tenses, the uses of which vary in accordance with peculiar rules. The noun has only two genders, masculine and feminine and no direct method of indicating case relations for which purpose pronominal prefixes are usually employed. Possessive pronouns and pronominal objects of the verbs are indicated by suffixes. Compound nouns are almost unknown, except in proper nouns. The syntax is extremely simple and direct co-ordination of clauses, without periodic construction, is the rule. These facts would seem to indicate poverty and lack of development in Hebraic expression. But it rather indicates directness of grasp of ideas which are presented with the picturesque clearness of word-photography, rather than in the vagueness of involved relationships. This is strikingly exemplified by the Vav conversive or consecutive, as it is termed by modern grammarians. This peculiar usage of the conjunction, unknown in the other Semitic tongues, enables the Hebrew to picture the sequence of events, past or future, with a clearness and directness of connection impossible in other languages. Another example of the realistic directness of Hebrew speech is the fact that in it the so-called *ratio obliqua* or indirect discourse is unknown. All quotations are made in the very words of the speaker.

Relation to Indo-European.— The Hebrew grammar shows, as has been stated, no evidence of relation to the Indo-European tongues.[4] Lexicographically there is much more agreement. A great number of Hebrew word-stems agree in sound with Indo-European terms of the same sense. But these are largely confined to onomatapoetic words or to such whose similarity may be explained as merely fortuitous. They do not establish any historical or generic relation which is inconceivable without agreement in grammatical structure.

Loan-Words.— The Hebrew, even in its purest state, contains numerous loan-words, derived from the languages of the peoples with whom the Hebrews came into contact. Examples of such are: from the Egyptian, *Yeor*, "the Nile"; from the Persian, *Pardes*, "a park"; *Darkemon*, "a daric"; from the Hindustani or Malabari, *Tukkim*, "peacocks," *Kof*, "an ape." In the later stages of the language these foreign terms increase greatly in number. The Mishnah Hebrew, for instance, contains several hundred terms derived from the Greek and Latin. Conversely, Hebrew loan-words are found in Greek and Latin, notably the former, as for example χρύσος, gold, Heb. Harnz. Many of these terms occur in early Greek writ-

1 The Canaanites and Phoenicians are stated in this chapter to have descended from Ham. Their language, however, undoubtedly belongs to the stock now designated as Semitic.

2 This may signify either the speech of the tribe of Judah or of the whole nation which afterwards was thus called.

3 The term Εβραϊστί Hebrew is used in the New Testament to designate the Aramaic vernacular of Palestine rather than the true Hebrew.

4 An exception must be made in the case of the German causative verbs, produced by modification of the original vowel of the verb, e. g. *schwimmen*, to float, *schwemmen*, to cause to float, *sinken*, to sink, *senken*, to cause to sink. This is exactly in the manner of the Semitic tongues and is a peculiar phenomenon.

ings, thus showing contact of the two peoples at a much earlier date than it is known historically to have occurred. These Semitic terms in the classic tongues may, however, have been introduced by the Phœnicians in their commercial expeditions and not be due to direct contact with the Hebrews.

Mishnah Hebrew.— It is a somewhat general, but erroneous, supposition that during the Babylonian exile the Jews entirely unlearned the colloquial use of the Hebrew, and that the Hebrew of the Mishnah is an artificial tongue, the product of the schools. As a matter of fact the Hebrew continued to be a living language throughout the period of the second temple, though limited to narrowing circles of the people. Because of its being chiefly represented in the Mishnah and other Halachic works, the language of the second Jewish commonwealth is known as Mishnah or Mishnaic Hebrew. It differs greatly from the Biblical Hebrew, but these differences are only sufficient to stamp it as a different dialect, not a different tongue. The main differences are as follows: the Mishnaic Hebrew contains a much greater number of foreign terms than the Bible language, its syntax is considerably modified by Aramaic influence, the feminine future or imperfect plural forms and the Vav conversive have disappeared, the plural ending ם = *im* has become ן = *in*, the suffix ם = *am* is changed to ן = *an*, the participles are more extensively used, the particle shel = frequently preceded by the possessive suffix is often employed as a substitute for the construct state, prepositions and conjunctions are more numerous and are used differently than in the Biblical Hebrew and many new terms have been coined from existing Hebrew roots. In all this the influence of the schools was no doubt very potent. In the liturgy the language used is much closer to the Biblical model.

The Neo-Hebraic.— With the destruction of the second temple and the scattering of the Jews throughout the world influences disruptive of the Hebrew increased greatly in intensity. As a medium of spoken intercourse it almost ceased to exist, but as a literary medium it has been cultivated and used continuously up to the present day. This later form of the language is known as Neo-Hebraic or New Hebrew. It is not a uniform language but differs greatly according to the capacity of the writer and the nature of the subject treated, in some compositions being almost classic in beauty and correctness, while in others it degenerates into a mixed and corrupt jargon. At present the Hebrew is experiencing considerable of a Renaissance, principally in Russia and Palestine. Works on all possible subjects are written in it and a systematic effort is made to qualify it for all the purposes of a modern tongue by the introduction of new terms, coined mainly from the old Hebrew roots, for all modern concepts. Efforts are also made to rehabilitate it as a medium of spoken intercourse by the formation of societies whose members are pledged to speak only Hebrew with each other. In Palestine, where not only historic sentiment but the existence of diverse Jewish elements side by side have made the revival of the Hebrew not only desirable but necessary, these efforts have been most successful and the Hebrew has become again to a great extent the spoken language of the Hebrew people.

Professor of Bible and Rabbinical Codes, Jewish Theological Seminary, New York.

4. Judaism—Jewish Literature. *The Hebrew National Literature to 70 A. D.*— The former belief that in patriarchal times Israel could have had no literature, is now disproven. The code of Hammurabi has established the fact that already in the age of Abraham, the art of writing was known, and records of events kept. Still, the oldest remains of Hebrew literature, are only found in fragments of ancient songs, and in parables, such as the war-song of Lemeh (Genesis iv. 23–24), and the Song of the Well, (Numbers xxi, 17–20). Collections of such songs existed, and are alluded to under the title of 'Book of the Wars of the Lord' (Numbers xxi, 14), and 'Book of the Righteous' (Joshua x, 13; 2 Sam. i, 18). At a later period, codifications of laws were begun, and still later, recollections of the history of the past, naturally overgrown with legends, were written down. It is impossible to give their date or that of the compilation in which they have been brought down to us. The nature of such investigations will always lead only to negative results with some degree of certainty. As to the positive inferences, drawn from these results, differences are bound to exist, especially as religious prejudice enters largely into this controversy.

It may be laid down as a generally accepted opinion, that the entire Pentateuch, as we have it, cannot have been written by Moses, and that the oldest part is the so-called book of the covenant (Ex. xxi–xxiv). Then follows the Jehovistic code, named so, because in it the name of God is given as Jehovah (or rather Jahveh). Then followed the Elohistic code, named from the employment of the word Elohim, for God. After that came the compilation of Deuteronomy, and finally, the Priestly code, chiefly found in Leviticus. This arrangement does not exclude the fact that some older passages are found in the younger codes, and that some of the older codes contain additions from the

hands of the last compiler, who, naturally, lived after the priestly code had been written. The date of these books is always hypothetical. Still, it may be considered as the prevalent opinion, that the Jehovistic code comes from the 9th century, because it contains references to the sacred places of Bethel, which presupposes an author, who lived in the Kingdom of Israel. The Elohistic code may be dated from the 8th century. In the period, characterized by the revival of religious sentiment, under King Josiah, the book of Deuteronomy was discovered, according to the testimony of the Bible. It is therefore, to be dated from about 600. The ideals evolved during the exile, when the past of Israel was gilded with reminiscences, and the ideal of a strictly uniform ritual and an organized hierarchy were formed, were laid down in the priestly code during the 6th century, but the final adoption of the Pentateuch, with its attempts to fill some lacunæ and to harmonize some discrepancies, did not take place until about 400.

Prophetic literature began with Hosea and Isaiah, during the 8th century. Micah, Nahum, Zephaniah and Jeremiah followed during the succeeding century. Again here, the dating is difficult. One of the clearest facts is a reference to King Cyrus of Persia (Isaiah xlv, 1), which indicates, beyond a doubt, that the prophet who wrote the passage, was a contemporary with this Persian king, and therefore, lived nearly two centuries after Isaiah, who lived at the time of Ahaz. Chapter 66, which denounces the rebuilding of the Temple as something heathenish, is of still later origin.

The Babylonian exile, naturally stimulated literature in various ways, and still more so, the return of the exiles, to whom Cyrus gave permission to settle again in the land of their fathers (538). Of this time, we possess the prophesies of Haggai and Malachi, and the beautiful idyl of Ruth, with its clearly indicated polemic against Ezra's prohibition of intermarriage with the heathen. The book of Jonah, although, as the language would seem to indicate, of very late origin, clearly presents a universalistic tendency which is the opposite of the strongly nationalistic ideas expressed by Ezra and Nehemiah. From the same period, we must date a large number of the Psalms, which form the hymn book of the congregation of Israel. Here again, the dating is exceedingly difficult, as a great many of the psalms have no clear historical references. Others, such as Psalm 51, show that they have been interpolated by later hands, as the whole Psalm denounces sacrificial worship, while the last two verses pray for the restoration of the sacrifices. Some again, as Psalm 74, speaking of the destruction of the synagogues, clearly point to the time of Antiochus Epiphanes (175). Quite a number of the biblical books cannot be dated at all, except in so far as the linguistic reasons will give a vague indication of their origin. Such is the case with Canticles, Ecclesiastes, and Job, in reference to which various scholars differ widely, and only agree that Canticles and Ecclesiastes cannot have been written by Solomon, and that Job, which the Talmud places in the days of Moses, is of much later origin.

A clear indication of the origin, even to the month, is given in the book of Daniel. Here, in apocalyptic form, the world's history, as far as it affected the Jews, is reviewed, from the days of Alexander the Great to the death of Antiochus Epiphanes (164). It is evident that the author wrote under the impression produced by this important event, which he expected would inaugurate the kingdom of Heaven. Less certain, although very likely, is the assumption, that the Book of Esther was written at the same period, because its author starts from the same point of view, presenting Israel's deliverance from a cruel persecution, although his idea is just the opposite of that of his supposed contemporary. Daniel pleads for a religious solidification, and the author of Esther for an amalgamation with the non-Jewish world. It is very difficult to say when the Bible, as such, was formed into a canon. It is probable that this never took place, but that the various books, and fragments of such were collected as a library of ancient Hebrew literature, and only later on considered as divinely inspired. The collection may have taken place in the first century B.C., and the belief that these books were written under special divine guidance was more and more crystallized a century later.

The conquest of the Orient by Alexander the Great had a far-reaching influence on the spiritual life of the Jews. Through the medium of Greek, which now was generally adopted in the Orient, the Jews became acquainted with an entirely different realm of thought. This widened their horizon, and stimulated their pride, because, while the Greeks looked down upon them as barbarians, they were zealous to show that whatever was good in Greek thought was borrowed from the Jews. They conceived for the first time an idea of secular literature. There is only one book in the Hebrew bible, which could be definitely classed as secular, and this is the book of Canticles, almost certainly modeled after the Idyls of the Greek Theocritus.

The influence of Greek thought on the Jews is manifested in the so-called Septuagint, a translation of the Bible, which, according to the legend, was undertaken by 72 Jewish scholars, designated by the High Priest, upon the request of the Egyptian King, Ptolemy II. (283–87). This translation became very popular among the Jews outside of Palestine, and in some instances, superseded the Greek original, as was also the case with the book of Sirach, written in Hebrew, about 180, and translated 50 years later by the author's grandson, into Greek. The Hebrew text was entirely lost until 1896, when remnants were discovered in the garret of an old synagogue. The book of Sirach is an imitation of the biblical book of Proverbs. So is the Wisdom of Solomon, and a great many authors tried their hands at writing books after biblical patterns, and at interpolating the existing Hebrew books of the Bible. These books form the collection of Apocrypha, which means, hidden books, or, books excluded from the canon of holy writ. Some were devoted to contemporary history, as is the case with the first and second books of the Maccabees, written most probably in the first century B. C. Others were amplifications of existing biblical books, as is the case with the fourth book of Ezra, or the Book of Jubilees, and the Book of Enoch. Finally, a great number were apologetic, prompted by a desire to show to the Greek-speaking world the superiority of Jewish thought and life. To this class belong the third and fourth

book of the Maccabees; the latter the work of the historian Josephus.

The desire to prove that Judaism was the only true philosophy, and tended to elevate man to the highest attainable level, prompted the writing of quite a number of Jewish books. The most prominent authors of this type are Philo of Alexandria, and his younger contemporary, Josephus Flavius of Palestine. Both wrote historical and philosophical works. Josephus is known to us as a classic historian, and is especially valuable for the history of his own time and the century preceding his days, for which he is the only complete source extant. In his book against Apion, he defends Judaism against charges preferred by a Greek author. Similar is the work of Philo, the most classic representative of the Jewish Alexandrian school, on whose work, Christian ideas are, to some extent, based. Besides theological writers, we find among the Jews a number of authors, who, prompted by the Greek classics, tried to present Jewish ideas in the poetical form, borrowed from the Greeks. The most prominent are Ezekiel, who wrote a dream based on the Exodus, and another Philo, who wrote an epic on Jerusalem. Another peculiar feature of this welding of the Jewish and Greek spirits is presented in the Sibyline oracles. Here Jewish authors adopted the mythical idea of a Sibyl, who in remotest antiquity had predicted events of later times, by putting into the mouth of the Sibyl the glorification of Israel, and the prediction of its final triumph. Christian authors have partly interpolated some of these Jewish works, and partly imitated them, making the Sibyl predict the coming of Christianity as the final solution of the world's problems.

II.— Talmudic Period.— The Maccabean revolt (165 B. C.) was undertaken by a small band of people, determined to die rather than give up their ancestral religion. When the victory was obtained, their utmost care was devoted to the preservation and the development of the visible symbol of their religion, the Law of God. Thus the Scribes, who are traced back to Ezra, became the undisputed spiritual leaders of Israel. It was one of their number who composed the 119th Psalm, arranged so that eight acrostics are devoted to every one of the 22 letters of the Hebrew alphabet, praising in 176 verses, the one all-important topic of the devotion to God's statutes, commandments, laws, ordinances, and testimonies. This devotion to the law became still stronger after the destruction of the Temple of Jerusalem (70 A. D.). The law now was the one bond which united the scattered people of Israel. The study of the law was undertaken first with a practical end in view. It was the endeavor of the Scribes to clarify all possible details, and to answer all the questions which emergency might bring before the observant Jew. This habit of going into the minutiæ of the law, whose infiniteness was a matter in which the pious scholars prided themselves, led to the habit of developing the law, for the law's sake. The most unlikely, and even impossible, consequences were discussed in the schools, because it was meritorious to devote one's life to the expounding of God's will, laid down in his Thorah. Over these hair-splitting decisions, the rabbis did not forget the spiritualizing ideas, which were the real object of their Alexandrian co-religionists.

There were two principal methods of studying the word of God. The first, looking upon the law and its practice, is called Halachah, literally, the Walk, meaning the practice. The second method is called Hagadah, preaching, and is devoted to the finding of edifying thoughts in the Bible. For a long time these studies were confined to the schoolroom, the teacher expounding the law to his pupils as he had learned it from his teachers, or as he saw fit to present it. The mass of these laws grew. Originally, some made brief notes of their lessons, called Meggillath Setarim "secret scroll," or named after the teacher in whose school the notes were taken, as Mishnah of Rabbi Akiba, of Rabbi Meir, of Rabbi Nathan. The name Mishnah became then the technical term for a collection of rabbinical laws. The word means, the Second Law, or, more properly, although not literally, a compendium of the Law. According to reliable tradition, the first one to compile these scattered laws into one code, and to arrange them according to the subject-matter, was Judah Hanasi, head of the school of Tiberias, 200. His compendium of what may be called, partly rabbinical law, and partly Mosaic Law, in rabbinical conception, was called Mishnah, and forms the textbook of the Jewish law, comprising the ritual, as well as the civil laws, and the penal code. The Dogma is almost entirely missing.

Judah Hanasi's first effort, stimulated others into imitation. Other codes were compiled, either following the example of the Mishnah, and arranging the text according to subject matter, or taking the Pentateuch as text, and commenting upon its laws, showing the rabbinical interpretation. A work belonging to the first class is the Tosefta (literally, addition), and to the latter class belongs the Mekilta (literally, methods, namely of scriptural interpretation), a rabbinical commentary on Exodus, Sifra (The Book), a rabbinical commentary on Leviticus, Sifre (The Books), a commentary on Numbers and Deuteronomy. Legal discussions continued even after the Mishnah had been recognized as the authorized code of laws. The disciples and successors of Judah Hanasi continued to discuss the text of the Mishnah in the same way in which the text of the Bible had been treated by their predecessors. These glosses soon greatly exceeded the text in volume, and they were called Gemara (completion). Together with the Mishnah, the Gemara formed one book, called the Talmud. (See TALMUD). With the growing influence of Christianity, the condition of the Jews in Palestine became more and more unfavorable, and a great many emigrated to the more congenial Parthian kingdom in Mesopotamia, which, from the time of the Exile, had had Jewish settlements; and so two schools were formed, one being in Palestine, notably in Tiberias, and the other in Southern Mesopotamia. Both schools used the same Mishnah as a textbook, but the glosses naturally differed, although there was a considerable interchange of ideas owing to the fact that some noted Palestine scholar would settle in Babylonia, or some promising Babylonian student, went to Palestine to continue his studies. Thus two Gemaras were compiled, one, containing the glosses of the Palestinian rabbis, called the Talmud of Jerusalem, and the other containing the glosses of the Babylonian rabbis, called the

Talmud of Babylon. The former was closed about 350, and the latter about 500. These dates, however, are not accurate, just as the tradition that Judah Hanasi compiled the Mishnah is not accurate when taken literally. All of these codes have been handled freely, and some of them have been interpolated by authors as late as the 8th century.

The fundamental conception of the Jewish student was that everything worth knowing was contained in the Bible, and notably in the Pentateuch, and so they looked to the Bible, and especially to the Pentateuch, for a confirmation of their conceptions. The controversies with Christianity, which especially affected the Jews in Palestine, produced quite a literature of homiletical explanations of the Bible. This is called the Midrash (literally, investigation). While the Midrash originally applies to both Halachah and Hagadah, it is more specifically understood with regard to the latter. The expositions of the Scripture delivered by various prominent teachers were collected, and so a vast number of Midrashim were compiled, the oldest of which is the Genesis Rabba, about 600. This literature was still more subject to arbitrary interpolations and additions, because the subject always disappeared behind the object, which was to teach the fear of the Lord. Who had first made a certain statement, and in what form he had made it, was from this point of view of no consequence.

The 6th and the beginning of the 7th century were sad times for the Jews, both of Palestine and of Babylonia. Their co-religionists, living outside of these two countries, scattered all over the northern coast of Africa, over Italy, France, and Spain, and perhaps, already over Germany, were numerically so insignificant that their spiritual life left no traces behind. The conquest of the Orient by the Mohammedans brought new impulses to the Jews. First of all the schools of Babylon were revived, and devoted themselves to talmudical literature, to the composition of a liturgy, and by and by, also to a more systematic study of theology, resulting in works on Biblical exegesis, on Hebrew grammar, on philosophy, and finally, on theosophy. The spiritual leaders of this age were the men who presided over the schools of Babylon, and were called Gaon, and therefore this period, extending from 630 to 1040, is called the period of the Geonim.

Their most important object was to codify the law, and to make their decisions in individual cases as accessible as possible. So a number of codes were composed, either arranged according to subject-matter, like the Halachoth Gedoloth of Simeon Kahira (700), or arranged according to the lessons from the Pentateuch, like the Sheeltot of Ahai. Furthermore, the authority of the famous scholars of Babylon was appealed to in difficult cases that came up for decision, in doctrinal questions, or very often for the interpretation of important talmudic passages. A copy of the replies was preserved, and as years passed by, compilations of these replies were made, and served, as in our day, the decisions of the supreme courts. These decisions were written partly in the Jewish-Aramaic dialect of those days and partly in Arabic, which, since the rise of Islam, had superseded the former dialect spoken by the Jews. Another literary activity was that which was devoted to liturgical needs. The synagogue was strictly congregational, but the desire for unity on the one hand, and the impossibility of having properly qualified congregational leaders in every small congregation on the other, created a need for a uniform liturgy. Amram (800), the Gaon of Sura, was appealed to, and compiled such an order of services. This official liturgy, however, was soon supplemented by what might be called hymns, and is technically called by a word taken from the Greek, "Piyut." The authors of such Piyuts are called "Payetanim." They amplified the service by dwelling on certain favorite themes, such as the sacrifice of Isaac, or by a poetical paraphrase of the official liturgy. Their activity lasted from 800 to 1200, although occasional attempts at this kind of poetry extend down to our times. Their most prominent representative is Eleazar Hakalir. They employed both rhyme and acrostic, but owing to far-fetched allusions their style is obscure and the poetical value of their productions meager.

In 760 a serious schism took place. Political conditions, combined with sectional strife and the growing propensity for the hair-splitting methods of rabbinical legislation, created a sect which rejected every authority but the Bible. The leader of this movement was Anan ben David, and his followers called themselves, Bene Mikra ("Sons of the Scripture"), or Karaites. (See JUDAISM — THE KARAITES.) This movement produced quite an extensive polemical literature, and led to a deepening of exegetical studies as also to various attempts at presenting the theological conceptions of Judaism in a clear and concise form, while the doctrinal part of theology had formerly been altogether neglected out of preference for the law. The most important defender of the Karaitic doctrine is Salmon ben Jeroham, and on the side of the Rabbanites, as they were then called, Saadia, the Gaon of Sura (892–942). The latter translated the Bible into Arabic, wrote Arabic commentaries on Biblical books, and besides his activity in other directions, is noteworthy as a pioneer in what is called the Philosophy of Religion, but ought more properly to be termed, apologetics. He wrote a book in Arabic on Judaism, 'Dogma and Philosophy.' From this time on, a decline in the spiritual life of the Babylonian Jews is noticeable. At the end of the 10th, and in the beginning of the 11th century, only the names of Sherira, and his son, Haii, are prominent as rabbinical authors. Both occupied the position of Gaon of Pumbeditha, in Babylonia. The former, especially, is noteworthy for his compilation of the history of rabbinical law, which was undertaken for apologetic purposes, in order to prove that the rabbinical law had come down in uninterrupted tradition from the days of Moses. With this decline in Babylonia, new centers of spiritual life appeared in other countries. In Morocco, Isaac Israeli (850–950) appears, whose medical treatises, written in Arabic, are considered important contributions to the medical literature of his day. He also wrote Biblical commentaries, and he was the first to present the idea that some of the passages of the Pentateuch were written after Moses' time. In the 10th century, we meet the first Jewish author known by name in Europe. He is Sabattai Donolo, who wrote on astronomy and on Cabala. Cabala,

literally tradition, is the Jewish theosophy, which, while obscure in its origin, seems to go back to Neo-Platonic Philosophy, and received its first systematic presentation in the Sefer Yezirah ('Book of Creation'), written, most likely about 850. (See JUDAISM—THE CABALA.) Before Donolo, however, there were some Jewish authors in Italy, whom we do not know by name. One of them wrote the Josippon, a Hebrew abstract of the works of Josephus. Another wrote a homiletical compilation, called the Chapters of Rabbi Eliezer, and ascribed to Eliezer ben Hyrkanos, who flourished about 100 in Palestine, but really written by a Roman Jew, about 840.

The classic period of Jewish literature in mediæval times began in the 10th century in Spain. There, under the favorable condition produced by Arabic dominion, some Jews became powerful factors at the courts of the Caliphs, and, like their Arabic countrymen, employed their wealth and their influence for the patronage of literature. Such Maecenases were Hasdai ibn Shaprut (950), and Samuel Hanagid (1050). Under their influence, a systematic study of Hebrew grammar began. The names of the most important authors on this subject are Dunash ibn Labrat, Menahem ben Saruk (10th century); who were succeeded by Ibn Ganah and Judah Hajug. Ibn Ganah wrote the first Hebrew dictionary. With such attempts, naturally, exegesis went hand in hand, and penetration into the laws of the language developed a finer taste for Hebrew style, and a better conception of the art of poetry than that which the former Payetanim possessed. Of the numerous exegetes of this period, Abraham ibn Esra (1092–1167) deserves to be mentioned. He not only employed his knowledge of grammar and the principle that the Bible must be explained from the point of view of the context, but he also claimed that the rabbinical interpretation of scripture was not infallible, and finally, he pointed out a number of passages in the Pentateuch which could not have been written by Moses. So he became the father of biblical criticism. Of the Hebrew poets of this age, two deserve very prominent mention, Solomon ibn Gabirol (1022–1070) and Judah Halevi (1080–1141). Both handled the Hebrew language not merely for the purposes of religious poetry, but for secular poetry, as well, and with a mastery which makes them classics, not merely of Jewish, but of the world's literature. Judah Halevi's Ode on Zion, has been translated into various modern languages. During this period, the Philosophy of Religion, if we may employ this traditional term, developed to its highest perfection. (See JUDAISM — JEWISH PHILOSOPHICAL WRITERS.) The first to write on this topic in Spain, was Bahya ibn Pakuda (11th century), whose work, 'Duties of the Heart' emphasizes the necessity of an inner religion, as contrasted with the idea of strict ritual observance. A very popular work is the 'Kusari' of Judah Halevi. The most important development of this class of literature is the 'Guide for the Perplexed,' by Moses ben Maimon (1135–1204), written like the above-mentioned works in Arabic. Like them, it was translated into Hebrew, in the course of the 12th century. While this literary activity shows a somewhat secular tendency, also evident in works on astronomy, medicine, science, etc., talmudic studies were not neglected. Maimonides wrote a code of the Jewish law, including even the sacrificial cult, and the constitutional law for Israel's kingdom, dogma and ethics, under the title, 'Mishneh Torah.' He had been preceded by Isaac Alfasi (1013–1103), a native of Fez, who lived, during the latter part of his life in Spain. Alfasi made an abstract of the Talmud, in order to facilitate legal decisions, and this work became a very popular code of Jewish laws. . .d was often commented upon.

Jewish literature developed in France, somewhat later than in Spain. There were chiefly two centers, one in the south, the Provence, and one in the east, the Champagne. The oldest name of any prominence is that of Gershom, surnamed, "The Light of the Diaspora." He wrote talmudic commentaries, and a number of decisions and hymns. In the latter part of his life he moved to Mayence, where he established a new center of Jewish spiritual activity. He died in 1028. To the school founded by him belongs the most popular of all mediæval authors, Solomon ben Isaac of Troyes, called "Rashi," abbreviated from the initials of his name, Rabbi Shelomoh Izhaki (1040–1105). He compiled the first complete commentary on the Babylonian Talmud, which from his time on was studied alongside of the text, and is printed with all talmudic editions. He further wrote commentaries on almost all books of the Bible, and his commentary on the Pentateuch, giving in simple, precise language the talmudic interpretations of the law and the best rabbinical homilies is the most popular work of mediæval Jewish literature, being used to-day in numerous schools and study circles. His disciples, among whom members of his own family, especially his two grandsons, Samuel and Jacob ben Meir, were most prominent, continued his work in commenting on the Talmud, and laid down their work in glosses, called Tosafot (additions). In Germany, where studies began with the 11th century, attention was almost exclusively given to the Talmud, besides which only religious poetry was cultivated, lacking, however, the true inspiration of the Spanish school.

With the death of Maimonides a marked decline occurred. With a few exceptions, exegesis degenerates into blind adherence to rabbinical authorities, philosophy becomes more and more fanciful homiletics, or gives way to theosophy, and poetry becomes punning on biblical and talmudic phrases. Exceptions are found in the cases of Joseph Kimhi, and his two sons, Moses and David (1150–1230), and Moses ben Nahman (1200–1270) whose commentary on the Pentateuch, though as a rule very sound, shows very often leanings towards fanciful mysticism. Notable, in this period, is the work of the family of Ibn Tibbon, four generations of which were engaged in the translation of Arabic works into Hebrew, and so, along with others, among whom may be mentioned Jacob Anatoli of the 13th century, helped to preserve the treasures of Greek literature, which they translated from Arabic into Latin. Among those who worked along the lines of Saadia for the harmonization of religion and science, mention must be made of Hasdai Crescas, author of 'The Light of the Lord', Levi ben Gershom, author of 'The Wars of the Lord' (14th century), and finally, Joseph

Albo (1400–1440), whose work 'Ikkarim' ('The Fundaments of Faith'), is altogether dependent on Maimonides. While this decline is noticeable in the best parts of Jewish literature, there is, on the other hand, a great activity in mystic literature. The most important work of this kind is the Zohar ('Brightness'). It is a theosophical explanation of the Pentateuch, which gives itself as the work of Simeon ben Johai, a rabbi of the 2d century, but is now generally believed to have been written by a Spanish author, Moses de Leon, about 1280. The fabrications of works of this kind, attributed to the authorities of the Talmud, and even to patriarchs, became as frequent in these days as it had been in the first Christian century, when the book of Enoch, and the Sibylline oracles were composed. The German Jews of those days confined their activity exclusively to Talmudic literature, and even in this line were frequently devoting themselves to the minutest details of ritual practice. A very prominent author of this day, and the founder of an important school, was Meir of Rothenburg, who is otherwise well known in Jewish history as a martyr, who spent seven years in prison, because he refused to allow his congregation to pay the ransom, for the exaction of which King Rudolf had imprisoned him (1286). Exceptions are found in Italy, where most noteworthy are the poets, Kalonymos ben Kalonymos, and Immanuel of Rome, the latter a friend and contemporary of Dante. Another exception are some polemical works against Christianity, amongst which mention may be made of the Nizahon, by Lipman of Muehlhausen (14th century).

III. From the Reformation to Moses Mendelssohn.— The expulsion of the Jews from Spain (1492) had an unfavorable influence on Jewish literature. The Jew, driven to the Orient and to Poland, and even expelled from all centers of culture in western Europe, became more and more spiritually isolated. On the other hand, however, rabbinical literature was more widely studied, owing to the assistance of the printing press. Talmudic studies flourished largely in the Orient and in Poland. The most important production of this time is the popular code of the law, the 'Schulhan Aruk,' by Joseph Caro (1488–1575), written in Safed, and edited with annotations by Moses Isserles (1520–1572), of Cracow. Annotations to the code of the law formed the most popular literary occupation for the rabbis of the 17th and 18th centuries. While the belief in the rabbinical authority became more and more almost absolute, indications of a development in the opposite direction begin to appear. Elijah Levita (1469–1549), a German who lived in Italy, and devoted his activity to grammar, made an important step in critical archæology by his discovery that the vowel points were not invented before the 7th century. He was followed by Azariah dei Rossi (1511–1578), who, in his work 'Meor Enayim' proved that the authority of the Talmud could not be maintained in questions of history and astronomy. His work brought forth a number of apologies of rabbinical literature, notably, the 'Beer Hagolah', of Loew ben Bezalel, Rabbi of Prague (1530–1609). Similar apologies were prompted either by the attacks of Christianity, or by skepticism within the Jewish fold. To the former class belong the 'Consolations' of Samuel Usque (1553), and to the latter, the 'Nomologia' of Immanuel Aboab (1625). An indication of a sounder development of Jewish literature, although prompted by apologetic methods, were the chronicles, becoming more and more numerous from the beginning of the 16th century. The most prominent of these are, 'The Sceptre of Judah', by Solomon ibn Verga, 'The Chain of Tradition', by Gedaliah ibn Yahia, and the 'Valley of Weeping', by Joseph Hakohen, all of the 16th century. The influence of this development is offset by the growth of cabalistic literature, which penetrates into every branch of religious practice, and degenerates into the compilation of senseless phrases. The comparatively soundest representative of this class is Isaiah Horwitz (1550–1630), whose book 'The Two Tablets of the Covenant', intended to give a system of Cabala, became very popular. The type of utter degeneracy is represented by Hayim Vital, whose exposition of the doctrine of the transmigration of the soul, and of similar Cabalistic doctrines, is partly childish, and partly unintelligible. At the same time, however, Cabala was attacked severely by Leon Modena, of Venice (1571–1648), who also wrote a defense of rabbinical Judaism, against the attacks of freethinkers, of whom, Uriel Acosta is the most prominent type. Apologetic works were further written by the Amsterdam Rabbi, Manasseh ben Israel (1600–1655), who is famous in history owing to his audience with Oliver Cromwell, which resulted in the re-admission of the Jews to England, after nearly 400 years of exile. Still, the most untiring activity of the Jews was devoted to dialectical explanations of the Talmud, and to the exposition of the ritual law. A great exception is the case of Moses Hayim Luzzatto (1707–1747) of Padua, whose allegorical dramas, written in Hebrew, and patterned after Italian masters, rank with the best Hebrew poetry of medæval times. Another exceptional position may be claimed for Jacob Emden (1696–1776) who, while a strict believer in rabbinical authority, wrote a work, proving that the Zohar, as we possess it, was the work of a Spanish Jew.

IV. From Moses Mendelssohn to the Present Day.— Religious toleration, partly the result of actual conditions as they developed after the Thirty Years' War, and partly the result of the philosophical teachings of Locke, and his disciples, the English Deists, and the French encyclopedists, influenced the condition of the Jews very favorably. Admitted to higher occupations, and to the universities, the number of those who devoted themselves to secular learning began to increase considerably in the 18th century. This movement to rescue the Jews from their mental isolation, received its strongest impetus from Moses Mendelssohn (1729–1786), whose translation of the Pentateuch into pure literary German changed the hitherto one-sided education of the Jewish youth. His example was followed by a number of his friends, who, like him, translated the biblical books and the prayer books into pure literary German, and wrote biblical commentaries, which, by their clear Hebrew, and by their embodiment of modern methods and ideas, broadened the intellectual horizon of the Jewish student. Together with this

movement there was a revival of Hebrew poetry, notably due to Hartwig Wessely (1725–1805), which helped to develop a literary art, almost forgotten since the beginning of the 16th century. A prominent factor was 'Hameassef' (1783–1810), a Hebrew periodical, edited by friends of Mendelssohn. Through the medium of these works, the Jews became acquainted with secular literature, and very soon a generation arose that received a secular education equal to that of their Christian neighbors, which could not but influence the development of Jewish literature. This branch, is inaptly called, "The Science of Judaism." It is a systematic presentation of Jewish literature and history. The founder was Leopold Zunz (1794–1886), whose 'Gottesdienstliche Vortraege' was the first, and is still unsurpassed in its scientific presentation of homiletical literature. Of his numerous other works, special mention must be made of his 'Synagogale Poesie' another pioneer work, presenting a history of liturgical literature and especially of liturgical poetry. His work was taken up by some Polish scholars, who, possessing a vast acquaintance with Jewish literature, lacked systematic training, and living in a land where secular studies were considered heresy, had received the first ray of light from some men who had come, under Mendelssohn's influence, to Berlin. The leaders were Nahman Krochmal (1785–1840), and Solomon Loeb Rapoport (1790–1867). The latter presented for the first time, biographies of mediæval Jewish authors in scientific form. The attack of this movement by fanatics, prompted some fine satirical works in Hebrew, notably, 'The Revealer of Secrets,' by Joseph Perl (1773–1838), patterned after the 'Epistolæ obscurorum,' and a travesty on the Jewish mystics; also 'The Observer,' by Isaac Erter (1792–1851).

These two currents of literature, namely, the investigation of the history and literature of the Jews on the one hand, and the poetical representation of modern ideas in good Hebrew, on the other, characterize the literary activity of the Jews in the 19th century. The work of Zunz was continued by various authors, notably Zechariah Frankel (1801–1875), who was head of the Breslau Seminary, and stimulated many authors into similar activity. Abraham Geiger (1808–1874) the leader of the liberal movement in religious matters, has also contributed to the elucidation of Jewish history. An attempt to present history in a more popular form was first made by Isaac Marcus Jost (1793–1860). The most popular work of this kind was written by Heinrich Graetz (1817–1891), whose work has gone through several editions, and been translated into various languages. More strictly scientific is the work of Moritz Steinschneider, born 1816. Of the numerous scholars who worked on individual topics of Jewish history and literature, mention may be made of Isaac H. Weiss (1815–1905), Meyer Kayserling (1829–1905), David Kaufmann (1852–1899). Jewish poetry and fiction was chiefly cultivated in Russia, where, through the efforts of Isaac Baer Lewinsohn (1789–1860), modern ideas were cultivated. A marvellous art in the use of Biblical Hebrew for novels was exhibited by Abraham Mapu (1808–1867), who first attempted to write novels from biblical times, and later on used the biblical language with unprecedented skill in writing a novel from the life of the Russian Jews of his day. Poetry, especially of the satirical sort, is best represented by Leon Gordon (1831–1892), while in novels from contemporary Jewish life, Perez Smolensky (1842–1884), ranks foremost.

Some words must be said about the development of literature in Yiddish, which is a German, freely mixed with Hebrew, and in Eastern Europe, also with Slavic. Originally devoted merely to practical religious purposes, such as translation of prayer books, for the edification and religious instruction of women, in the latter half of the 19th century it began to be used for higher literary purposes, in poems, novels, and dramas. As a poet, Simeon Frug may be considered as the foremost representative; among the novelists, S. J. Abramowitz, Solomon Rabbinowitz, and J. S. Peretz, some of whose works may justly claim a place in the world's literature. Among the dramatists, Jacob Gordin is noteworthy for his bold treatment of sociological and economical questions, although the plots of his plays are mostly adaptations from the classics of other languages.

In this connection a new branch of literature has to be mentioned, which, akin to the idyl, is peculiarly Jewish. It is the so-called ghetto novel, cultivated first in the German language by Aaron Bernstein (1812–1884), in his two novels, 'Voegele der Magid,' and 'Mendl Gibbor,' presented life in a provincial town of Eastern Germany in the period of transition from Ghetto to modern culture. Leopold Kompert (1822–1886), wrote stories from Bohemian Ghettos which are masterpieces of their kind. Life in the over-crowded Ghetto districts of Eastern Galicia, with its squalor and superstition on the one hand, and its ardent desire for knowledge, and its beautiful family life on the other, were masterfully presented by Leopold von Sacher-Masoch (1835–95), and Karl Emil Franzos (1848–1904). Israel Zangwill, born 1864, presented the life of the Russian Jews in London. Sketches from Jewish life in Moravia, were written by Martha Wolfenstein (1871–1906), in her 'Idyls of the Gass.'

A development of the 19th century is Jewish periodical literature, although its beginnings reach back to 1674, when a periodical in Judeo-Spanish was first published in Amsterdam. These periodicals are mostly weekly, when devoted to religious interests. The oldest of them is the 'Allgemeine Zeitung des Judenthums,' now of Berlin, founded in 1837 at Leipsic. It was followed by the 'Archives Israélites' of Paris, in 1840, the 'Jewish Chronicle' of London, in 1841, and the 'American Israélite' of Cincinnati, in 1854. Such papers appear in at least fifteen languages, in all parts of the globe. Dailies in Hebrew and Yiddish are devoted to general news, but give particular attention to Jewish affairs. They appear in Warsaw, Wilna, Saint Petersburg and New York. The oldest is 'Hazefirah,' founded in 1862 as a weekly, edited as a daily since 1886, and suspended by order of the government in 1905. Some monthlies and quarterlies are de-

voted to scientific and literary purposes; the most prominent are 'Monatsschrift fuer Geschichte und Wissenschaft des Judenthums' (1851), 'Revue des Etudes Juives' (1880), and the 'Jewish Quarterly Review' (1880). To this class belong numerous year-books, published in various languages, and appearing more or less regularly.

In spite of these modern tendencies, which occupied the attention of Jewish authors during the 19th century, Talmudic studies of the old type were not entirely neglected. They are, however, mostly confined to the East of Europe, and the Orient. The most prominent rabbinical author in the beginning of the 19th century was Moses Schreiber (Sofer), Rabbi of Presburg (1762–1839). In the Orient, the most prolific authors of rabbinical works of the 19th century are Hayim David Hazan (1790–1876), Rabbi of Jerusalem, Hayim Palagi, Rabbi of Smyrna (1782–1868), and finally, Hayim Hezekiah Medini, of Hebron (1832–1904). Of the Jews of Europe, the most prominent rank amongst the Talmudic authors in the latter part of the 19th century, was held by Isaac Elhanan Spektor (1810–1896), Rabbi of Kovno.

Such in brief, is the historical outline of a literature extending over more than three thousand years and over all parts of the globe.

5. Judaism—Jewish Philosophical Writers.—The philosophic spirit in its proper sense appeared among the Jews at the time of their contact with Greek culture, which began with the conquest of the Semitic Orient by Alexander the Great. Its first definite traces are to be discerned in the skepticism which pervades Job and Ecclesiastes, books which in their present form belong, therefore, to a period subsequent to the last quarter of the 4th century B. C. In the former work, the skepticism is more or less veiled and proceeds no further than to express a doubt as to the wise workings of Providence. In the latter composition, the skeptical spirit is more pronounced and amounts to a practical denial of divine justice. Results of a more positive character, however, appear in the system of Philo Judæus (b. in Alexandria about 20 B. C.; d. after 40 A. D.). In his many works, of which the chief are in the form of commentaries to the Pentateuch, he strives to reconcile the traditional tenets of Judaism with the eclectic school of Greek philosophy. While recognizing the Old Testament as divine and authoritative, he makes full use of allegory, to adapt Jewish conceptions to current Greek wisdom. The corner-stone of his system is formed by his doctrine of the Logos or "Word" as the active agency associated with God in his creative powers. He identifies the Logos with the "divine wisdom," so strongly personified, notably in the book of Proverbs, as to become not merely an attribute, but an element of the divine. Philo is influenced throughout by Plato's doctrine of ideas, and while leaving little permanent impress on Jewish, he profoundly influenced Christian theology. The conception of the "word" in the Gospel of John is the most striking trace of the Philonic doctrine, and so enthusiastic were the early Christians over Philo's teachings that some of them saw in him a Christian. Philo's philosophy plays also a prominent part in the writings of the church fathers, and it is chiefly due to them that his works were preserved.

Saadia.— One of the earliest and most distinguished Jewish philosophers dates from the 9th century when the intellectual centre was still in the East, although there were already indications of its transfer to Northern Africa and Spain. The rise of Islam, followed by conflicts among its adherents as to the interpretation of the Koran, had given a fresh stimulus to philosophic thought which had its influence likewise upon the Jews. The rise of the Karaite sect (see JUDAISM—THE KARAITES) at the end of the 8th century is to be directly ascribed to this influence. For a time it seemed as though the disintegration of Rabbinical Judaism was at hand when the tide was stemmed by a profound thinker and prolific writer — Saadia ben Joseph, born in Dilaz in upper Egypt in 892 and who died at Sura 942. Equally versed in the Talmudic and Islamic theology, Saadia attempted to reconcile the teachings of Jewish orthodoxy with the current philosophy as developed chiefly by the Islamic rationalists known as the Motazilites (or Separatists). His main work written in Arabic 'Book of Faith and Doctrines' was completed in 933 and may be said to mark the first systematic compend of Jewish philosophy. Differing from Philo in making Biblical doctrines his starting-point, his entire efforts were devoted to demonstrating that where the current philosophy or rationalism was in contradiction to the Old Testament, the philosophy must be wrong and the Old Testament right. The aim of the book is clearly set forth in the introduction as intended to put an end to the prevailing confusion, and to rescue those immersed in the sea of doubt and error. Recognizing as sources of knowledge the testimony of the senses, reason, and logic, he declares that a fourth source — revelation, as comprised in the Old Testament, is superior to them all, because through revealed knowledge, the means is found to control the correctness of the teachings deduced from the other sources. In his chief philosophic work Saadia includes discussions of the creation of the world, of the attributes of the Creator, the theory of revelation, the beliefs based upon divine justice, the doctrine of the soul, of the resurrection of the dead and of the Messianic belief, concluding with a summary of ethical precepts.

Beginning in each main subdivision with the teachings of the law and the prophets on the subject, he contrasts these teachings with the speculations of the philosophers and shows wherein the errors of the latter consist. He betrays Aristotelian influences and at times,

especially in his discussion of the problems of creation, follows very closely the model of the more rationalistic Islamic theologians. Accepting the philosophic doctrine of a *creatio ex nihilo*, he proves its correctness from the use of the word "bara" in Gen. i, 1, which he declares means creating something out of nothing. The doctrine of a creator as set forth through revelation in the Old Testament is confirmed by reason which declares that creation implies a creator. Passing on to the more precise determination of the attributes of the Creator, he polemicizes against the dualistic tenets of Zoroastrianism, and against the trinitarian doctrine of Christianity in his endeavor to justify the conception of God as a unit. The divine laws as laid down in the Pentateuch supplemented by oral tradition, are, according to Saadia, given in order to enable men to attain to the highest degree of blessedness; and while recognizing in the divine laws given to Israel two classes, (a) those suggested by reason and (b) those due to revelation, he shows by examples how the latter may likewise be explained by pure reason. Perhaps the most original feature in Saadia's philosophy is the manner in which he endeavors to reconcile the doctrine of the freedom of the human will with the belief in the omniscience and omnipotence of God. He solves the problem by declaring that God could control the human will, but deliberately gave men freedom, so that he might bear the responsibility for his acts. Suffering and trials are sent by God to man in order to bring him by spiritual discipline nearer to perfection. He criticizes the various theories proposed by philosophers and others as to the nature of the soul and declares it to be a fine substance created by God, and placed in the human body during its stay on earth. After its life on earth another existence is in store for the soul, but only after the number of the souls to be created has reached an end, when all souls are again united to their bodies. In this combination of the doctrine of immortality with the resurrection of the body, Saadia betrays the influence of Islamic theologians who postulated this doctrine on the basis of the pictures of Paradise drawn in the Koran. Saadia's messianic beliefs accord with those indicated in the Talmud, pointing to the appearance of the Messiah as a preliminary to the resurrection of the dead. In the world to come, the good and pious will receive their recompense for their acts and sufferings in this world. The influence of Saadia on his age was profound. Through his philosophy in conjunction with his polemical writings against the Karaites, the new sect received a blow from which it never recovered. Jewish orthodoxy once more won the day, and it was not until the days of Maimonides that the soundness of Saadia's system was questioned.

Ibn Gabirol.— Passing by some minor writers like Bachya ben Joseph ibn Pakuda who flourished at Saragossa in the first half of the 11th century and who largely on the basis of Saadia's religious philosophy developed a system of Jewish ethics in a work known as 'The Guide to the Duties of the Heart' that represents a combination of Jewish doctrines with certain phases of Islamic mysticism, we reach in Solomon Ibn Gabirol (b. in Malaga about 1021; d. in Valencia about 1058) a thinker of the first magnitude, whose chief work written in Arabic is 'The Fountain of Life.' Though its aim is to reconcile the monotheistic doctrines of Judaism with the philosophy of Neo-Platonism which Gabirol espoused in opposition to the prevailing Aristotelianism, its basis is essentially philosophical rather than theological. Nor does the author lay any special stress upon his Jewish beliefs, as a consequence of which the influence that he exerted upon the scholasticism of mediæval Christianity was far greater than upon Jewish theology. The work consists of five treatises dealing respectively (1) with matter and form, (2) the substance underlying the corporeality of the world, (3) proofs of the existence of intermediaries between God and the physical world, (4) proofs that these intermediaries known as "simple" or "intelligible" substances are composed of matter and form, and (5) a treatise on universal matter and universal form. According to Gabirol's system, everything that exists is embraced under these three categories: (1) God, which is the first substance, (2) the world which is matter and form, and (3) will as intermediary between the two. Whether Gabirol connected with God divine attributes apart from an existence pure and simple is a question in regard to which opinions differ. The best authorities, however, incline to the view that Gabirol was an opponent of ascribing attributes to God as ingredient parts of his Being. Gabirol's chief model among the Greek Neo-Platonists is Plotinus, though he knew this author through secondary sources only. In an ethical treatise entitled 'The Improvement of the Moral Qualities' composed in 1045, he is even bolder than in his philosophic work, inasmuch as he attempts to formulate principles of ethics without reference to religious belief or doctrines. A comparison between Philo and Gabirol naturally suggests itself. Both revert to Plato as the natural source of their inspiration. Philo adapted Judaism to the Platonic doctrines whereas Gabirol a thousand years later revised Neo-Platonism and adapted Judaism, so far as it entered into his thoughts, to this system. Like Philo, Gabirol's influence was profound on Christian theology and under the Europeanized form of his name, Avicebron, his writings translated into Latin helped to mould the thought of such philosophers as Albertus Magnus, Thomas Aquinas, Duns Scotus, and Giordano Bruno. Ibn Gabirol was also a poet of the first rank, whose liturgical compositions in Hebrew give evidence that his philosophy, though so apparently independent of Jewish doctrines had not weaned him from Jewish orthodoxy. In this combination of poet and philosopher, he suggests comparison with Judah (or Jehudah) Halevi — the next important writer to engage our attention.

Judah Halevi was born in Toledo towards the end of the 11th century, dying some time after 1140 during a journey to the Orient. He is more famous for his exquisite Hebrew poems — both lyric and religious — than for his philosophy. The tone, form and imagination of the poet color his views of life far more so than in the case of Ibn Gabirol. Hence, in his philosophic treatise written in Arabic, but gen-

erally known by the title of the Hebrew translation as 'The Book of Cuzari'— he takes his stand upon revealed religion, which to him is superior and more trustworthy than any human speculation. He does not even attempt like Saadia to reconcile religion with philosophy, but devotes himself mainly to showing the superiority of Judaism among the religions claiming to be revealed. The discussion of the tenets of Judaism and the proof for their truth is given in the form of a dialogue between a Jew and the pagan king of Chazars — hence its title — who after discussing religion with a philosopher, a Christian and a Mohammedan, turns to the Jew for a statement of his beliefs. Naturally Judah Halevi cannot escape dealing with the current philosophical doctrines, and while claiming to draw his views exclusively from the teachings of the Old Testament, introduces distinctively Aristotelian notions, as well as certain views held by Islamic theologians. God is for him the first cause who creates the world out of "nothing." He divides the attributes of God, without any distinction between essential and non-essential, into three classes — active, relative, and negative. While not regarding God as a corporeal Being he is not prepared to reject all the anthropomorphisms in the Old Testament as purely symbolical. According to him, the immortality of the soul, the resurrection of the dead and the doctrine of rewards and punishment are all taught in the Old Testament and constitute essential features in Judaism. An entire division of the book is devoted to a refutation of the Karaites, an exposition of the basis and development of oral tradition as exemplified in the Talmud, while the fifth and last division is taken up with polemics against the current systems including the Aristotelian cosmology and the Epicurean doctrine of Fatalism which was also accepted by the orthodox Islamic theologians. His attempt to reconcile the freedom of the human will with the omniscience of God follows largely on the lines laid down by Saadia.

Maimonides.— The greatest of all Jewish philosophers in whom their philosophical activity reached its zenith was Moses ben Maimon, generally known as Maimonides (b. in Cordova 30 March 1135; d. at Cairo, 13 December 1204). His two main works are (1) the codification of the Talmudic regulations systematically arranged into 14 groups. This elaborate treatise, to which he gave the title 'Mishneh Torah' or 'The Second Law' and which was written in Hebrew, is a profound monument to the author's learning, ingenuity, and skill. It marked an epoch not only in Talmudic studies, but in the history of Judaism, and although intended to uphold and strengthen the authority of the Talmud, in reality led in the course of time to an anti-Talmudic movement, which after many vicissitudes contributed to the decline of Rabbinical authority in Judaism and eventually to its overthrow in all of western Europe and in America. The orthodoxy displayed by Maimonides in his code is in striking contrast to the freedom and boldness of his philosophical and theological views in his great philosophical work, completed in 1187, written in Arabic and known as the 'Guide of the Perplexed.' Upon this work his claim to immortal fame rests. Its principal aim may be summed up as an attempt to bring about the reconciliation between the prevailing modification of the Aristotelian philosophy and Judaism. Maimonides purposed to do for Judaism what Alfarabi, Avicenna (or Ibn Sina) did for Islam — to adapt it to the teachings of Aristotle, as these teachings were understood and interpreted in his days. Starting from the thesis that there can be no contradiction between truths revealed by God and truths discerned by the human mind, which is a power derived from God, Maimonides explains the apparent conflict between science and religion, as due to a misunderstanding of the anthropomorphisms in the Old Testament. Holding more strictly than any of his predecessors to the doctrine of the incorporeality of God, and going to the length of declaring every one who denied this dogma to be an idolater, he is obliged to fall back in accounting for anthropomorphic descriptions of God in the Bible on the old Philonic principle of the twofold meaning — an external or superficial one and an internal or allegorical one. By the same method he disposes of the attempt to predicate positive attributes into five classes, (1) those that include all the essential properties of an object, (2) those that include only a part of the essential properties, (3) those indicating a quality, (4) those indicating the relation of one object to another, (5) those referring to the actions of an object. He rejects all but the last because they either rest upon the erroneous assumption that God can be defined or because they contradict the fundamental view of the absoluteness of God. Attributes referring to God's actions may be admitted because they do not assume the co-existence with him of anything else. Maimonides, accordingly, interprets the names given to God in the Old Testament as indicative of His activity. While accepting the principle of *creatio ex nihilo*, because it can be supported by better arguments than the doctrine of the eternity of matter, he admits that no positive proof can be given for the former and criticizes sharply the seven arguments in support of the doctrine given by the Islamic theologians. In a series of 26 propositions he establishes the doctrines of the existence, unity, and incorporeality of God as the primal cause. He accepts the Aristotelian view of a number of heavenly spheres, each endowed with an intellect and possessing a soul, but instead of regarding these spheres and intelligences as co-existing with the primal cause, Maimonides maintains that they were created by the will of God. With the help of his allegorical method of interpreting Biblical passages, he proceeds to show that the account of creation in the Book of Genesis is in accord with the views of Aristotle. He takes the first word of Genesis as the term for "Intelligences" which constitutes the first work of God, as proclaiming the *creatio ex nihilo*. Adam's sin, and even the three sons of Adam are accorded a purely allegorical interpretation, so that in this way everything falls into line with the Aristotelian system. When he comes to prophecy, which in accord with the philosophers he regards as a natural quality that may be granted to any man whose physical, mental, and moral qualities are in perfect condition, he

extends the allegorical method to the interpretation of the prophetic visions, notably those of Ezekiel. Evil, according to Maimonides, has no positive existence, and consistently all such evils as are in the Old Testament ascribed to God as the direct cause are interpreted allegorically. His solution of the apparent contradiction between God's omniscience and the freedom of the human will possesses at least one original feature in the emphasis that he lays upon God's knowledge as essentially one of possibilities, and that the knowledge of the realization of one of several possibilities does not affect the nature of the "possible." This being admitted, man has a free choice among several possibilities. The last part of the 'Guide' is devoted to an exposition of Maimonides' system of ethics which is based upon the Pentateuchal laws These laws bear either directly or indirectly upon morality as the means to attain the highest happiness which in the case of men as superior to the animal world and as the end and purpose of creation must consist in a moral and intellectual perfection. In accordance with this basic principle he proceeds to the interpretation of the Pentateuchal precepts and from them deduces precepts for the regulation of man's life. His philosophy though intended as a justification of Judaism was not so regarded by those whose philosophical interests were subsidiary to their religious zeal. There was much in the 'Guide' that appeared rationalistic to more simple-minded believers — more particularly his views of prophecy and miracles, both of which he accounted for as due to perfectly natural processes. His lack of positiveness with regard to the doctrine of the *creatio ex nihilo* also aroused offense, and it was not long before a controversy arose that grew in bitterness between the adherents and opponents of Maimonides in France and Spain, and which threatened at one time to create a break in Jewry. The influence of Maimonides' 'Guide' extended, however, far beyond the limits of Judaism. Through a Latin translation it made its way to Christian scholastics and it was instrumental, like Gabirol's 'Fountain,' in shaping the thoughts of men like Albertus Magnus, Duns Scotus and numerous others, while within the pale of Judaism its traces may be discerned in Spinoza's system and down to the 18th century in men like Moses Mendelssohn and Solomon Maimon.

Gersonides.— Half a century after Maimonides we encounter in Levi ben Gerson known as Gersonides (b. 1288; d. 1344) and in Latin as Leo Hebræus, a philosopher who struck out into new paths, diverging somewhat from those of Maimonides. He was remarkable for the wide scope of his attainments, embracing logic, metaphysics, mathematics and medicine. As a philosopher his fame rests upon his work 'The Wars of God,' which is devoted chiefly to a discussion of those questions which Maimonides left in a vague state or in which he opposed Aristotelian principles. Gersonides clings more closely to Aristotle than any other Jewish philosopher, and thus represents the climax of Aristotelian influence in Jewish theology. If Maimonides is dependent upon Ibn Sina's interpretation of Aristotle, Gersonides may be said to represent the adaptation of Ibn Roshd's (or Averroes') exposition of the Aristotelian system to Judaism and which involved a more radical departure from orthodoxy. In a conflict between reason and religion, he does not hesitate to give the preference to reason. He ranges himself on the side of the scholastic realists and follows the arguments of the latter in maintaining that the intellect inasmuch as it consists of conceived ideas having a real existence may survive after the body decays. In opposition to Maimonides, he claims that certain attributes, such as knowledge, can be predicated of God but that divine knowledge is not to be placed on a par with human knowledge in any such particular. Through the wide divergence between the two, he opens the way for the maintenance of the doctrine of the freedom of the human will in the face of God's omniscience. Perhaps the most original part of his philosophy is his view of creation, assuming as he does that from eternity there existed inert and undetermined matter, devoid of form to which God at the proper time bestowed form, life, and motion. He thus occupies a middle position between those who accepted the eternity of matter and those who admitted the *creatio ex nihilo.*

Crescas.— The revolt against Aristotelianism came in the following century, the chief representatives of the movement being Chasdai ben Abraham (or ben Jehuda) Crescas (1340–1410) and his pupil Joseph Albo (1380–1435). In his work 'The Light of God,' Crescas boldly makes front against the subjection of Jewish theology to the tenets of the Aristotelians, whether of the Avicenna-Maimonides or of the Averroes-Gersonides type. He criticizes the 26 Aristotelian propositions adopted by Maimonides as the basis of his doctrine of the First Cause, and endeavors to show that through Revelation alone can the belief in the unity of God be established. Against Maimonides he assumes that attributes can be assigned to God without involving oneself in contradictions. As the six fundamental doctrines of Judaism he sets up the omniscience, omnipotence and providence of God, prophecy, freedom of the will and recognition of a purpose in creation. As the purpose of God's creation of the world he assumes the happiness of man's soul, though admitting that this happiness is not fully realized until after death when the soul enters into higher realms of existence. The soul is independent of knowledge and man's highest perfection is reached not through knowledge but through love of God's law and obedience to it.

Joseph Albo.— Crescas' pupil Joseph Albo develops the themes of his master still further. In his 'Principles' he plants himself even more securely on the basis of revelation, maintaining that the Mosaic law as the outcome of revelation establishes the claim of Judaism for all times as the only true religion. Instead of six, he sets up three principles as fundamental to this true religion, (1) the existence of God, (2) revelation and (3) rewards for the observance of God's laws and punishment for disobedience. Albo may be called the philosopher of Jewish orthodoxy par excellence, and the only feature of this orthodoxy that is perhaps not accentuated with its full force is the Messianic doctrine which is obscured by that of divine retribution. Such was the popularity of Albo's work that it eclipsed the glory of

Maimonides. The philosophical movement among the Jews thus issues, as among the Mohammedans, in the triumph of orthodoxy. With the breaking of the bond between the prevailing Aristotelian systems and Judaism, a distinctive religious philosophy among the Jews, for the time being at least, comes to an end. Instead, we have, as the next step in the realm of speculation, the tendency towards mysticism, which became more marked as the ages passed on, until in the 16th century it successfully stifled all efforts at independent speculation. The dark period of persecution which the Jews encountered, leading in Spain to their expulsion at the end of the 15th century, and to their more or less complete isolation from the life around them by the establishment of ghettos, either voluntary or enforced, in Italy, France, Germany, Poland, Russia, and even Holland, was also a factor in bringing the philosophical movement among them to a temporary close. Thus thrown upon their own resources, the study and interpretation of the Talmud, without reference to extraneous currents of thought, furnished by the side of absorption in cabalistic lore the outlet for their intellectual energies. (See JUDAISM — THE CABALA.)

Spinoza.— In a measure Baruch Spinoza (1632–1677) is to be regarded as a representative of Jewish philosophy because of the influence exerted upon him in his youthful training by Maimonides, Gersonides, and Crescas, but his thought turning into the new direction given to philosophical speculation by the movement that dates from Descartes he developed a system in which Judaism as a revealed religion had no part. The breaking away from scholasticism opened up new aspects, and Spinoza takes his place in the general history of philosophy rather than in the religious philosophy of Judaism, and this despite the fact that there are features in his system which can be directly traced to some of the Jewish philosophers of the Middle Ages. Thus it is generally agreed that Spinoza's attitude towards the problem of determinism was derived from Crescas, as likewise the emphasis he lays upon the love of God, rather than knowledge as the highest human quality. From Maimonides he appears to obtain the view that Time arose in Creation and not the reverse. His attitude towards the question of divine attributes also points to the influence of Jewish philosophers. His break, however, with the prevailing form of Judaism was so complete, as illustrated not merely by his excommunication but by his departure from the accepted doctrine of the Pentateuchal Laws as a special dispensation for the Jews derived directly from the divine source through Moses, as to place him outside of the rank of Jewish philosophers. His system, however, furnishes a link between Jewish theology and the currents of the later philosophical systems like those of Leibnitz and Wolff (built up largely under the influence of Spinoza, though with an endeavor to escape from his conclusions), so that when towards the end of the 18th century, the Jews once more began to take their place within the world's activities, the influence of Spinoza on specifically Jewish thought also began to make itself felt. Moses Mendelssohn, the mediator between Judaism and the external world, though a follower of Wolff's system, yet derives some of his views from Spinoza, and Solomon Maimon one of the ablest of the early exponents of the Kantian philosophy passed through a period of domination of Spinozastic philosophy. Indeed from a certain point of view, Spinoza's pantheism may be regarded as the last word of Jewish religious philosophy, though it involves the discarding of the specific doctrine of the divine authority of the Old Testament. In a certain sense, Spinoza is the last Jewish philosopher. (See SPINOZA.)

The attitude of Mendelssohn and Maimon toward the systems prevailing in their days is typical of modern Judaism, the exponents of which are swayed, as are the exponents of Christianity, by the currents of thought arising on the basis of scientific investigations outside of the domain of religious belief — either accepting the modern attitude towards the problems of existence, or endeavoring to confront it. Whether conditions will ever arise that will again lead to a distinctively Jewish philosophy is more than doubtful. The present tendency throughout the more intelligent religious world to seek the essence of religion in the heart and soul of man and to lay the main emphasis of the religious life upon conduct rather than upon speculation is unfavorable to the creation of such conditions, either in Judaism or in Christianity.

6. Judaism—The Jew in Art, Science, and Literature. It is a task of much difficulty to describe the influence which the Jews in all ages have exercised on art, science, and literature; for a period of more than 3,000 years will have to be considered, while the Jews have not only shared all the great developments of humanity's intellectual life, but have blended therewith the views which are at the basis of their own individuality. The culture of the Jews is bound up with that of antiquity, with Christianity's origin and development, all important movements of the Middle Ages, all grades of development and tendencies of the modern era. While it takes part in the intellectual life of the past and present, whose struggles and sorrows it shares, it becomes a complement of universal culture, but with an organism which aids in its turn the recognition of the universal.

ART.— It is conceivable how a people of such positive monotheistic belief should have only slightly cultivated art. Such cultivation belonged rather to a race which had received the surname of Japhet, or beauty in the genealogical record of Noah, thus symbolizing its mission. It was, however, the mission of the Hebrews to know God and spread this knowledge throughout the world. The older Talmudists assigned to Hellas the cultivation of beauty, to Judæa that of religious truth. In fact certain lines of art were condemned by the Hebrews, because they led to idolatry, to imitating and deifying nature, which in the Jewish religion was secondary to God, as the world's creator. Poetry, however, chiefly the lyric, and music were zealously cultivated — in these fields they equalled the most important achievements of other races in antiquity or surpassed them in many respects. Unquestionably the Jew's capacity for music is an old inheritance of his race. Architecture, too, with its side-lines, was familiar to the Hebrews, judging from their temples, gardens, pleasure grounds. The plastic arts and painting were not cultivated from religious motives, not from any want of taste or capacity. The mimic art, for a similar reason, was adopted at a late period, but with great success. The dance had been early developed into an art, and with musical accompaniment. Upon the whole, however, the nurture and development of art was neither the task nor the strength of old Israel, which lacked all the conditions to its growth. The period of national prosperity under Solomon and his successors, the most favorable time for such artistic achievements, occurred at too early a stage in the intellectual development of the race, and when this gradually reached its maturity art found little sunshine.

In the Middle Ages.— A similar condition occurred in the Middle Ages, but to a greater degree. Persecution, leading to incessant wandering from city to city, and land to land, prevented any growth of art, even in countries where the Jews enjoyed comparative rest for some centuries. In Spain, of all lands, where they dwelt in free competition with the Arabs, shared joyously the pleasures of life, hardened themselves in knightly exercises, sang and danced, spoke the vernacular like a mother tongue, and participated in intellectual progress, the religious prohibition against idolatry was carried out by the rabbis to the extremest limit. Islam, with its fanatic hostility to plastic art, was a worthy model; not only the representations of the Deity, but that of living beings, man and animal, was not allowed. Yet we hear in Spain of a famous Jewish portrait painter, whose name is unknown; and in Titian's days, on the border lines of the 15th and 16th centuries, we learn of an Italian portrait painter and illustrator, Mose dal Castellazzo, who attained high fame in art-loving Venice and then elsewhere in Italy.

Art in the Synagogue.— One form of art was cultivated by the Jews in the Middle Ages — the ecclesiastical. If the synagogue interior was usually free from any decoration, there were exceptions, when this was permitted, if rabbinical authorities assented. One of the most eminent sages in the 15th century allowed painting of forms of animals and plants in the synagogue on the ground that there was no likelihood of the Jew becoming an idolator. Hence we find in the synagogue windows painted glass and on the walls birds and plants. In some MSS. of prayer books and ritual works the illustration is a real adornment — an art that attained great development in the later Middle Ages. The goldsmith's art and silver embroidery employed in the decoration of the scrolls of the law, the curtains, coverings, little bells, goblets, lamps, and other objects used in the synagogue, reached high perfection in the ghetto.

In the Modern Era.— As the Jews, first in Germany, in the second half of the 18th century, again participated in the nation's intellectual activity, they devoted their attention to every branch of art. Hardly half a century after their emancipation, they number in Germany prominent painters who rank among the ablest in their profession, like Eduard Bendemann, one of the leaders in the older historical school; Philipp Veit, one of the most brilliant representatives of ecclesiastical art; Eduard Magnus, Julius Muhr, Moritz Oppenheim, whose 'Pictures from the Old Jewish Family Life' have acquired fame; Solomon Hart, the first Jewish Academician in England. In our day Jewish painters are prominent in every land. To mention the most eminent, let us recall the Hollander Josef Israels, the English Academician S. J. Solomon, the Austrian portrait-painter Leopold Horowitz, the French historical painter Eugene Vichel, the genre artist Friedrich Friedländer, the Belgian painter Carl Jacoby, with names like Herman Junker, Max Kahn, Louis Neustätter, Felix Possart, Toby Rosenthal,— one of the few American genre painters with a reputation in Europe — the great Swedish painter Geskel Salomon, Nathaniel Sichel, Isidor Kaufmann, Philipp Aarons, Henry Baron, M. Verner, David Bles—the dozen of Dutch painters — Karl Heinrich Bloch, Felix Borchardt, Lajos Bruck, Friedrich Kraus, the Polish historical painter Alexander Lesser, the French idyl painter Emile Lévy, Leopold Pollack, Felix Heinrich, and Karl Schlesinger, Gustav Wertheimer, Jules Worms, F. Hirszenberg, Philipp Làszlo, Samuel Hirschfelder, Herman Struck, Isaac Snowman, the American Henry Mosler, Geo. D. M. Peixotto, Ernest Peixotto, M. A. Woolf. In the modern movement, Max Liebermann, Lesser Ury, and Louis

Corinth are among the leaders. Strange to say, Russia has expelled the most painters. In copper and steel engraving, as in etching, the Jews furnish three of the first masters of this art — Friedrich Fränkel, Louis Jacoby, and Henryk Redlich. In America Louis Loeb, Henry Wolf, and Jacques Reich have acquired high rank. In sculpture one can mention as pre-eminent the Russian Marcus Antokolski, then the American M. J. Ezekiel and Ephraim Keyser, the French Antoni Adam Solomon, E. Soldi, Em. Hanneaux, L. Astruc; the Hungarian Max Klein, the Belgian Charles Samuel, the German Louis Sussman Hellborn, the Russian Leopold Bernstamm, Henrik Glycenstein, Charles Günzburg. In architecture may be mentioned, in Europe, Max Fleischer, Georg J. Hitzig, W. Stiassny, Richard Wolffenstein, Ludwig Levi, Frederick Marcks, Adolf Wolff, Siegmund Taussig; the American Dankmar Adler, Arnold W. Brunner, Henry Fernbach, Edgar M. Lazarus, S. B. Eisendrath. As medalists and engravers few names surpass in excellence A. Abrahamson, Salomon Bucher, Jacques Karl, and Leopold Wiener.

Music.— Through all the stages of his history, music was always close to the Jew. In antiquity it accompanied the Temple service, in the Middle Ages it comforted the home, and in the modern era it was to reach high development. The long list of composers, musical artists, and directors, is opened by the Englishman, John Barnett, and there follow Sir Julius Benedict, Myerbeer, Felix Mendelssohn-Bartholdy, J. F. Halévy, George Bizet, Anton Rubenstein, Jacques Offenbach, Ignatz Brüll, Karl Goldmark, Frederic Cowen, Ferd. David, Friedrich Gernsheim, Ferd. Hiller, Eduard Lassen, Ignatz Moscheles, Moritz Moszkowski, Siegfried Ochs, Julius Schulhoff, Jules Cohen, Josef Dessauer, Baron A. Franchetti, Ferd. Gumbert, Adalbert von Goldschmidt, Leopold Auer, H. W. Ernst, J. Joachim, E. Reményi, H. Wieniawski, H. and A. Grünfeld, David Popper, H. Herz, M. Rosenthal, Karl Taussig, Karl Heymann, M. J. Gusikow, L. Damrosch, S. Sulzer, Herman Levi, Gustav Mahler, Julius Stern, L. Lewandowski, and the artistes Clotilde Kleeberg, Sophie Jaffe, Ilona Eibenschütz, Berthe Marx, Fannie Bloomfield-Zeisler, the American pianist.

The Stage.— In dramatic art the achievements of the Jew have been conspicuous. Among actors, singers, theatrical directors, managers, in every civilized land, there is a lengthy list of Jewish names. To mention the most prominent, as operatic and concert singers, there are Leopold Demuth, Georg Henschel, Paul Kalisch, Leopold Landau, Nikolaus Rothmühl, Julius Lieban, Heinrich Sontheim, John Braham, Jose Lederer, Pauline Lucca, the sisters Grisi, Lola Beeth, Juditha Pasta, Caroline Gompertz, Rosa Olitzka. Among famous actors and actresses are Rachel Felix and Sarah Bernhardt, Adolf von Sonnenthal, E. Worms, S. Berr, L. Barnay, Anton Ascher, Bogumil Dawison, Ludwig Dessoir, Siegwart Friedmann, Alfred Hertz, Maximilian Ludwig, Gustav Kadelburg, Ernest von Possart, Emrich Robert, Moritz Rott, Emil Thomas. In America, the names of Aaron J., Jonas B., and Moses J. Phillips, Mordecai Noah, Emanuel and S. B. H. Judah occur in the early history of the American stage as playwrights and actors, and in more recent days the Wallacks, Madeline Henriques, both of Jewish origin, David Warfield, H. Conried, Jacob Adler.

Science.— "Knowledge and understanding" were ever regarded in Israel as the highest palladium from the earliest ages of its national history to the present day. The priest was the community's teacher and physician as well. In later times, when the different sciences were separated from each other more and more, the rabbis of the Talmudic era not only recommended such avocations to the faithful, but zealously devoted themselves to such pursuits. Many Talmudic teachers were physicians, astronomers, mathematicians, jurists. In the Talmud principles of geometry are stated, which agree with the modern rules. Its computation of the calendar rested upon the finest astronomical observations. The number of bones in the human body is given exactly as in modern anatomy. In the Middle Ages the Encyclopedia of the Sciences included chiefly three disciplines — astronomy, which was connected with mathematics and geometry, medicine, and philosophy. In all these fields the Jews have accomplished much, in some degree they have been pioneers, particularly in Spain and North Africa, where they could develop unchecked. The foundation of mediæval mathematics — the 'Almagest,' of Ptolemy, and of mediæval botany — the 'Plant Lore' of Dioscorides, Jews brought to Europe. It was Abraham b. Chija who wrote the first tex-book of geometry that Europe could boast of; it was a Jew who brought to Europe the Arabic-Indian numbers; a Jew whose observations on the inclination of the earth's axis cleared the way for the immortal astronomer who, as he arranged his system of the world, had to have translated into Latin the Arabic writings of that Jew, Jacob ibn Machir. A French Jew furnished an approximation for incommensurable numbers; a Spanish Jew was the first to apply decimal fractions in the extraction of the square root. As Jewish astronomers, among the Arabs, are mentioned Maschallah, Sahl el Taberi, Sind ben Ali, Ibn Simaweih, etc., through whom the Arabs already in the 8th century became acquainted with Indian medicine and astronomy, before the Greek sciences had been introduced. Natural philosophy and medicine, mathematics and astronomy, formed often the transition from the *halakha* to the *hagada*, and knowledge of these sciences could not therefore have been unknown to the teachers of the law.

Medicine.— Jews have performed the most important service in the department of medicine. Masergeweih (683) translated from the Syrian into Arabic the 'Pandects' of the Presbyter Aaron, a valuable medical work of antiquity. Nearly all the works of the Greeks and Arabs, the Syrians and Indians, the Nestorians and Christians, were brought to Europe by Jews and thus rescued from oblivion. These very writings were then, mostly by Jews, again translated into Arabic. More than 200 such translations have been restored by modern bibliography out of the dust of libraries. Their activity was precious for the history of the sciences in the Middle Ages. Entire families like the Tibbon and the Kalonymos occupied themselves in such work. It is stated that Jews were the first teachers of medicine at the first European high schools of Salerno and Montpelier. Whether this is a fact or not, it is in every case proved, what the history of medicine illustrates, that the labors of the Jews in this field

during the first half of the Middle Ages belong to the greatest achievements in that science, which without such activity could hardly be thought of as existing. In those days, too, Jews were body-physicians of popes and emperors, of sultans and notabilities in many countries.

Present Day Medical Scientists.— To-day this tendency has been naturally strengthened, with the result that in all lands Jews are among the most eminent physicians and medical investigators. We need mention only the names of Ludwig Traube, Herman Senator, August Hirsch, Jacob Henle, Eduard Henoch, Albert Neisser, Robert Remak, Julius Pagel, Karl Störk, Emil Zuckerhandl, Johann Schnitzler, Adolf Politzer, Paul Ehrlich, Julius Cohnheim, Wilhelm Ebstein, H. Zeissl, Jac. Fischel, August Wasserman, Ludwig Mauthner, Karl Weigert, Victor Birch-Hirschfeld, John Lebert, Heinrich Jacobson, Julius Wolf, Jacob Gottstein, in Germany; Germain Sée, Georges Hayman, Siegmund Rosenstein and Jacob Stokvis, in Holland; Sir Felix Semon, in London; G. Valentin and Moritz Schiff, in Switzerland; Gottlieb Cluge, in Belgium; Max Mandelstamm, Josef Bertenson, in Russia; Elias Cohen-Pasha, in Turkey. In the United States it would be no exaggeration to say that 50 names and more could be cited of Jewish physicians and medical experts who are leaders in their profession in every city and included in college faculties. It was Dr. Simon Flexner, who was chosen director of the Rockefeller Institute of Preventive Medicine. Of German physiologists we might mention among the authorities Julius Bernstein, Herman and Ymanuel Munk, Nathan Zuntz, Isidor Rosenthal.

Natural Sciences.— In the natural sciences, Jews number distinguished names in the varied lines of research. The most famous botanists are Ferdinand Cohn, N. Pringsheim, Julius Sachs. Among the eminent chemists are Victor Meyer, whose discoveries were remarkable, Adolf Pinner, Rafael Meldola, Karl Liebermann, Oscar Liebreich, Georg Lunge, H. G. Magnus. As geologists, mineralogists, and palæologists, one may include Emil Cohen, Angelo Heilprin. In physics a name of international prominence is Heinrich Hertz, famous for his discoveries in electricity and magnetism, with F. J. Pisko, P. T. Ries, who was the first Jewish academician in Germany, and Arthur Schuster in England. As zoologists, we can refer to Mendelssohn's contemporary, M. E. Bloch, to Emil Selenka, H. Gabriel, E. Ladenburg, G. Lehfeld, Leo Graetz.

Mathematics.— For centuries Jews have studied mathematics. Their sagacity, gift of combination, power of thought, have won signal success. The rabbis of the Talmud had mathematical ability. In the Middle Ages the science of mathematics was preparation for philosophy. In this field Jews were intermediaries and translators, as well as independent authors. They were employed in editing the Alfonsine Tables — the chief being Isaac Ibn Sid, with Judah b. Salomo Cohen, and Samuel Levi. One of the leading mediæval Biblical commentators, Abraham Ibn Ezra, was regarded by the Catholic Middle Ages as patron of mathematics. In later centuries Jews displayed similar interest in that science, and to-day they number leaders in the line. For instance, we may mention Leopold Kronecker, Felix Klein, Immanuel Fuchs, S. Spitzer, W. Königsberger, Meyer Hirsch, Georg and Moritz Cantor, Oscar Minkowski, J. Rosanes, G. Schönfliess, S. Weingarten, Ch. Slonimski, Herman Schapiro, Maurice Levi, J. J. Sylvester. In astronomy can be included Wilhelm Beer, Wilhelm Goldschmidt, Adolf Hirsch, Robert Rubenson, E. Schwarzschild, Prof. Harold Jacoby, of Columbia University.

Travel and Exploration.— To turn from traversing the skies with the telescope to traversing the earth in the interests of scientific research, we find a large number of Jewish travelers who have penetrated distant lands. From the legendary Eldad-ha-Dani of the 9th century, Benjamin of Tudela, and Petachia of Regensburg down to the men who shared the sea-journeys of the Portuguese, the Spaniards, and the Italians, and accompanied Columbus, and Vasco de Gama, to our time, a lengthy list could be given. In recent times can be mentioned J. J. Benjamin, Jacob Saphir, J. Halevy, while among explorers are Emin Pasha, Emil Bessel, Oscar Neumann, Eduard Glaser, Herman Vambéry, Edouard Foá, Adolph Strauss, W. G. Palgrave (of Jewish descent), and in America Angelo Heilprin, and Franz Boas, who is associated with Arctic research. In this connection may be recalled the labors of Jews in engineering, science, and invention, etc., with Jos. Hirsch, Maurice Levy, J. Bachman for France, E. Herman, and G. Schlesinger for Germany, Mendes Cohen, Emil Berliner, Elias E. Ries, Albert Edward Woolf, E. Zalinski for the United States. Here, too, may be included prominent names in numismatics, statistics, and economics. In the latter branch Profs. E. R. A. Seligman and J. H. Hollander are authorities in the United States; A. Raffalovicz in Russia; L. Luzzatti, Leone Wollenberg in Italy; as statisticians, Maurice Block is pre-eminent in France, Josef Körösi in Hungary, while Leone Levi did useful work in England. Here belong the founders of modern Socialism — David Ricardo, Karl Marx, Ferdinand Lassalle, E. Bernstein, with J. Jastrow, Max Hirsch, Edgar Loening, E. Warschauer, Ludwig Hamburger. As numismatists we can refer to Julius Friedländer, Wilhelm Löwy, A. Merzbacher, Leopold Hamburger, M. A. Levy.

Law.— Biblical and Talmudic legislation shows clearly that the Jews from olden days showed special inclination toward law and its interpretation. Coworkers in the compilation of the Pandects, they furnish distinguished jurists, judges, and lawyers. In France they can point to Adolphe Cremieux, August Bédarrides, A. Lyon-Caen; in England to Sir George Jessel, Sir George Lewis, Jacob Waley; in Holland to the Asser family, Goudsmit, Gódefroi; in Germany and Austro-Hungary, to Eduard Gans, Levin Goldschmidt, Paul Laband, Karl Grünhut, Herman Staub, Heinrich Harburger, Heinrich Wiener, H. Friedeberg, H. Makower, Eduard von Simson, Wolfgang Wessely, David Rubi, Ferd. Frensdorf, Julius Unger, Max Neuda, H. Dernburg, J. Glaser; in America they include a number of State and city judges.

Philosophy.— Recent writers call the Jews "the people of philosophy," and in fact to reflect on the highest questions of life has ever been their custom. Philosophy was regarded among them as one of the weightiest sciences —

both during the Middle Ages and to-day. We have to thank the Jews for the diffusion in Europe of Neo-Platonism, for being intermediaries between the Arab and Christian philosophy, for the basis of Scholasticism, the popularizing of Greek philosophy in Europe, and the birth of a new conception of the universe. In the construction of this new-world philosophy, above all else in spreading the systems of Kant, Hegel, and Schopenhauer, Jews have taken a conspicuous part. Among the Alexandrian philosophers Philo is pre-eminent, Solomon Ibn Gabirol opened a new path for Platonism, and was Scholasticism's pioneer, Moses Maimonides raised Aristotelianism to speculative heights. (See JEWISH PHILOSOPHICAL WRITERS.) Baruch Spinoza was influenced by him and later investigators, who were more inclined to mysticism. Jews were associated with the achievements of the Renaissance and Humanism, because they were teachers of the leaders of those movements. It was Moses Mendelssohn who popularized philosophy. Markus Herz and Salomon Maimon, Lazarus Bendavid, were enthusiastic supporters of Kant, whose most important representative in the new philosophy is Prof. Hermann Cohen of Marburg. The founders of the school of folk-psychology, Moritz Lazarus and H. Steinthal, champion Herbart's philosophy. Hegel's best followers were Eduard Gans and Julius Braniss; Schopenhauer's most ardent disciples, Julius Frauenstädt, D. Asher, Moritz Venetianer. In addition belong to philosophy Ludwig Stein, H. Bergson, Adolph Lasson, S. L. Steinheim, Adolphe Franck, S. Alexander.

Philology.— In the line of language, too, the Jews have labored with zeal. They count among the foremost workers in philology, as well as in literary history and bibliography. A brief summary of names will be sufficient proof — such as G. Ascoli, Jules Oppert, Jacob Bernays, Theodor Gompertz, Michele Amari, Theodor Benfey, M. Breal, James and Arséne Darmesteter, Jos. and Hartwig Derenbourg, H. Weil, W. Freund, Julius Fürst, Lazarus Geiger, Theodor Goldstücker, Ignatz Goldziher, J. Halévy, Wilhelm Bacher, H. Hirschfeld, S. Landauer, Gustav Weill, A. Harkavy, Salomon Munk, Adolf Mussafia, Daniel Sanders, S. Benedetti, L. Kellner, I. Gollanz, and in the United States, Marcus Jastrow, Alexander Kohut, M. Bloomfield, and a number of younger scholars who have done so much to arouse interest in Semitic studies at American universities, such as Morris Jastrow, and Richard Gottheil.

History.— In the Middle Ages history was neglected — they had no time to write their history, for before their old sufferings were narrated, new trials were to be endured. A few chronicles alone survive, with some Memor. Books. From the historian Josephus, of the 1st century, to our time, Judaism has produced no eminent historian of the outside world. With so much more zeal have Jews in more recent years devoted themselves to this department, men like Philipp Jaffé, Martin Philippson, Max Büdinger, Harry Bresslau, Samuel Sugenheim, Alfred Stern, Adolf Beer, Ernst Bernheim, Jacob Caro, Heinrich Friedjung, Salomon and Theodor Reinach, Julius Schwarz, Cesare d'Ancona, Alfred Przibram, E. Szanto. Samuel Romanelli is the historian of Venice, and Robert Davidson of Florence. Charles Gross, of Harvard, is an authority on early English history, as is Felix Liebermann on English law. In the history of the Jews in its varied departments Jewish scholars have naturally displayed particular ability — one need only mention names like Graetz, Zunz, Jost, Steinschneider, Geiger, Kayserling, Güdemann, A. Berliner. In the closely-allied branch of archeology, Charles Waldstein is a pre-eminent name, with B. Berenson in art criticism.

Literature.— In its earliest historical period Israel gave to humanity its best achievement in literature — the Bible, which with prophets and psalmists, despite the latest discoveries and researches, remains without a peer in the entire stretch of the world's literature. Since the close of the Canon until to-day the Bible has furnished a wealth of inspiration to the poets and writers of every race. The greatest poets in the world have been impelled by its words; it has exerted a distinct influence on the literary genius of every European literature, and how much plastic art is its debtor is far from being appreciated.

In the Early and Middle Ages.— The first translation of a book into another language was the Greek translation of the Bible — the Septuagint. This leads us to the participation of Jews in Greek literature. Of Philo, who has already been mentioned, it was said in Alexandria that he wrote as fine Greek as the divine Plato. Then lived, too, the first Jewish dramatist, Ezekiel; then a long line of philosophers, poets, historians, the author of the Sibylline books, and many other writers in Greek. In the Middle Ages the Jews familiarized themselves with Arabic literature, under whose influence the new Hebrew poetry in Spain developed. What Arab and Jew united in those centuries accomplished is not to be overlooked. They rescued the treasures of classical antiquity from oblivion and preserved them for posterity; they enriched the arts and sciences and truly promoted the intellectual growth of humanity. Jews appear, too, among the Arab poets, like Abraham Ibn Sahl, who is praised by them as one of the most graceful singers of love, Ibn el Mudawwer, Kasmune, etc. The Indian and Greek world of fable was communicated to Europe by Jews. During the entire Middle Ages, when the old literary treasures were practically lost, they preserved almost the only knowledge of those romances, stories, and fables which were to enter modern literature by a roundabout way through Arabia and Spain from the world of the ancients and the pictured pomp of India. They took a prominent part in those stories from the Orient, which still serve as material for our narrative literature. Later, too, when the Mohammedans were driven from Spain, the Jews displayed a lively interest in the development of the Arabic literature and language. A Moorish Israelite, Ibn Alfange, wrote the first 'Chronicle of the Cid'; another the first Spanish romance; a third — the baptized Petrus Alphonsus — the first story in Oriental manner, 'Disciplina Clericalis'; a fourth was the first Castilian troubadour, Santob de Carrion; and a fifth, Rodrigo de Cota, is credited with the authorship of the first Spanish drama (Celestina). In the Spanish songbooks of the 15th century can be found

many poems of baptized Jews. At the same era Jews were familiar with French literature. From the glosses of Rashi, the famous Biblical commentator, the old French language has been partly reconstructed; and Rashi's contemporaries, who through Nicolas of Lyra directly influenced Luther, already knew German and utilized that language. At the very period when the Jews in Germany were persecuted in the cruelest fashion, there lived a Jewish minnesinger, Süsskind von Trimberg; a Jew shared in the authorship of Percival. Their epics and elaborations of romantic legends aid to-day in interpreting old German literature.

In Modern Times.— When through Lessing and Mendelssohn the Jews in literature, at least, were emancipated, they devoted themselves to authorship with special zeal. Jewesses, like Henriette Herz, Rahel Varnhagen von Ense, Dorothea Veit, founded the Berlin salon and gave distinct impetus to Romanticism. Moses Mendelssohn was not only a philosopher, but one of the first authors in the era of rationalism. Heine is unquestionably the greatest German lyric poet after Goethe, Ludwig Börne the first German critic after Lessing. Berthold Auerbach founded the school of village tales; Fanny Lewald that of the woman's social romance. Jews have taken marked interest in all later literary movements. One may mention in this field the German authors, Karl Beck, Michael Beer, Theodor Creizenach, L. A. Frankl, Leopold Kompert, Karl Emil Franzos, E. Kulke, Moritz Hartmann, L. Kalisch, S. Kapper, Hieronymus Lorm, S. H. Mosenthal, Max Ring, Ludwig Robert, J. Rodenberg, August Silberstein, M. G. Saphir, H. Stieglitz, Daniel Spitzer, J. V. Weilen, L. Wihl, O. L. B. Wolff, Wilhelm Wolfsohn; and of later writers Theodor Herzl, L. Hevesy, A. L'Arronge, F. Lubliner, Fritz Mauthner, Oscar Blumenthal, Max Bernstein, J. J. David, L. Fulda, Max Nordan, Georg Hirschfeld, Felix Holländer, L. Jacobowski, J. Löwenberg, A. Schnitzler, J. Wassermann, Ernst Rosmer, Henriette Ottenheimer, Lina Morgenstern, Betty Paoli, Jenny Hirsch. In the history of literature Ludwig Geiger, Richard M. Meyer, Gustav and Otto Hirschfeld, Otto Pniower, Max Hermann, Eduard Engel, Max von Waldberg, E. Wolff can be mentioned.

In France Jews contribute to all branches of poetry — in dramatic composition may be included Catulle Mendes, Abraham Dreyfus, Ernest Blum, Leon Halévy, A. d'Ennery, A. Valabrègue, and as lyric poet León Gozlan, Gustav Cahn, Eugène Manuel, Louis Ratisbonne. In England Sir Philip Magnus has written extensively on Education, Joseph Jacobs is an authority on folk-lore, Sidney Lee is a leading Shakespeare scholar, Emanuel Deutsch was the first to tell the English world what the Talmud really was, B. L. Farjeon was a voluminous novelist, while I. Zangwill is prominent in various lines. In Italy one may point to Alessandro d'Ancona, David Levi, Tullo Masserani, Erminia Fuá; in Denmark to Henrik Hertz, M. Goldschmidt, Georg and Eduard Brandes, Silvia Benet; in Sweden to O. Levertin, and Sophie Elkan; in Holland to Isaac d'Acosta of the past, and H. Heijermans of the present; in Russia to S. Frug, S. Nadson, N. Minsky; in Roumania to Ronetti Roman, the greatest poet of our day, and to H. Tiktin, the greatest philologist; in Hungary to Ludwig Doczi, Josef Kiss, Adolph Agai, A. Nemény; all writers of distinction. In the United States Isaac Harby, Mordecai M. Noah are names of the past; with Emma Lazarus admittedly the leading poet and essayist, and among present-day story-writers I. K. Friedman, Ezra S. Brudno, Emma Wolf, Miriam Michaelson, Martha Wolfenstein, Mary Moss, Lee C. Harby. Prof. L. Wiener has written on the history of Yiddish literature, Oscar S. Straus on 'The Origin of the Republican Form of Government,' and 'Roger Williams.' Prof. Winkler has edited a number of German classics. In journalism Jews have undoubtedly attained prominence, as names like L. Sonnemann, Dernburg, and Bernstein in Germany, Brody in Hungary, Lawson and Lucien Wolf in England; Pulitzer, Ochs, Rosewater, De Young in America, amply prove.

We have given merely a survey, necessarily incomplete, of Jewish activity in art, science, and literature, in all ages and among all nations. It has been shown, however, with sufficient clearness that they have always striven with ardent enthusiasm for ideal aims, and with marked energy, despite unfavorable conditions, have taken an active interest in all the developments of the world's intellectual life.

Author of 'Jewish Literature and Other Essays.'

7. Judaism — The Talmud, a code or digest of Jewish laws and opinions. The Talmud is in reality a combination of two entirely separate works — the Mishna being the text, and the Gemara its commentary. The name signifies "study," and has come to be applied to the combined text and commentary, although it refers properly to the Gemara alone. There are two recensions of the Gemara, one called the Palestinian Talmud, originating in Palestine, the other Babylonian, in Babylon. They differ both in language and contents. There are only slight variations in their respective Mishnas.

The Mishna.— The word Mishna has been differently interpreted, according to its etymology, either as "second" or as "doctrine," oral teaching. It is a codification of the oral or unwritten law, based upon the written law of the Torah or Pentateuch, and was compiled during the era of the second Temple, and completed at the end of the second Christian century. As in course of time the oral law became unwieldy in bulk and hard to be remembered,

owing to its lack of order and arrangement, Hillel, who presided over the Sanhedrin in Herod's days, made the first attempt to systematize the immense mass of material by arranging it in six divisions, which were accepted by later revisers. Rabbi Akiba, who participated in the Bar Cochba revolt, went a step further by employing a more correct method of division. His disciple, Rabbi Meir, continued the work of revision, or, rather, collation, of old-time usages and teachings. Toward the end of the 2d century, R. Judah, the Prince, called "Rabbi," a descendant of the wise Hillel, strove to complete the work of his predecessors, sifted anew the mass of traditional ordinances, and became, by his intellectual vigor and freedom, the real compiler of the Mishna. In his later years he subjected the work to further revision, although some additions after his death were made by others. Whether Rabbi wrote the Mishna or merely transmitted it orally to his disciples is not definitely known, and has long been a moot point among scholars, with the probability in favor of his having written the work.

Divisions of the Mishna.— The Mishna is divided into six chief sections, called Sedarim or Orders: (1) Zeraim, seeds or products of the field, containing the ritual laws respecting agriculture. (2) Moed, Festival, referring to laws of the Sabbath and festivals. (3) Nashim, Women, including rules about marriage and divorce. (4) Nezikin, Damages, a large section of the civil and criminal law. (5) Kodashim, Sacred Things, discussing the laws of sacrifice and the Temple service. (6) Teharoth, Purification, treating of regulations as to things clean and unclean. Each Order is divided into Masechtoth, or treatises, which are 63 in all in the Mishna. Each treatise is subdivided into chapters or Perakim, and each chapter or perek into paragraphs, each of which is called Mishna or halakhah, law principle. The arrangement of the Orders is fixed, although the sequence of treatises, chapters and paragraphs is more open to question.

Contents of the Treatises of the Mishna.— The best way to describe the subject matter of the Mishna is to give a list of the various treatises and their contents. These are as follows, according to the six Orders: I. (1) Berakhoth, benedictions, treating of liturgical rules. (2) Peah, corner, about the corners and gleanings of the field. (3) Demai, uncertain, about corn bought from those suspected of not having given tithes. (4) Khilayim, mixtures, about the prohibited mixtures in plants, animals, and garments. (5) Shebiith, the Sabbatic year. (6) Terumoth, heave offerings for the priests. (7) Maaseroth, tithes to be given to the Levites. (8) Maaser Sheni, the second tithe, according to Deut. xiv. 22–26. (9) Challa, the dough, to be given to the priests, as ordered in Num. xv. 20–21. (10) Orla, treating of the fruits of the tree during its first four years, as commanded in Lev. xix. 23–25. (11) Biccurim, or first fruits. The contents of Order II.: (1) Sabbath, giving an account of labors prohibited on that day. (2) Erubin, combinations, continuing the subject of the preceding treatise and referring to the Sabbath boundary. (3) Pesachim, relating to the laws of Passover and the paschal lamb. (4) Shekalim, the law of the half-shekel temple tax. (5) Yoma, of the day of Atonement. (6) Sukkah, of the laws concerning the Feast of Tabernacles. (7) Betsah, of the work permitted or prohibited on the festivals. (8) Rosh Hashonah, of the feast of the New Year. (9) Taanith, as to the public feasts. (10) Megilla, the scroll, about the reading of the book of Esther on the feast of Purim. (11) Moed Katan, minor feasts, referring to the intermediate days of the festivals of Passover and the Feast of Tabernacles. (12) Chagiga, feast offerings, referring to the private offerings on the three pilgrim festivals. Order III.: (1) Jebamoth, sisters-in-law, about levirate marriage. (2) Khetuboth, marriage contracts, of dower and marriage settlements. (3) Nedarim, as to vows and their annulment. 4) Nazir, of the laws concerning Nazarite. (5) Sotah, about the woman suspected of infidelity, according to Num. v. 12–31. (6) Gittin, the laws of divorce. (7) Kiddushin, of betrothals. Order IV.: (1) Baba Kama, of damages and injuries. (2) Baba Metsia, of laws concerning found property, buying and selling, lending, hiring and renting. (3) Baba Bathra, of real estate, trade and hereditary succession. (4) Sanhedrin, of courts, their procedure, and capital punishment. (5) Maccoth, stripes, referring chiefly to false witness, and its penalties. (6) Shebuoth, oaths, about the various kinds of oaths, private and public. (7) Eduyoth, testimonies, laws and decisions collected from the testimonies of famous teachers. (8) Abodah Sara, idolatry, of idols and their worshippers. (3 Aboth, a collection of ethical sentences from the fathers or Mishna teachers. (10) Horayoth, decisions, as to the effect of erroneous decision by a religious authority, according to Lev. iv. 5. Order V.: (1) Sebachim, sacrifices, of animal sacrifices and the mode of offering. (2) Menachoth, meat-offerings, about meat and drink offerings. (3) Chullin, of the methods of slaughtering animals for food and of the dietary laws. (4) Bekhoroth, of the laws concerning the first-born. (5) Arakhin, values, as to how things or persons dedicated by vow are legally appraised to be redeemed. (6) Temurah, exchange, of the laws about dedicated things which have been exchanged, according to Lev. xxvii. 10–27. (7) Kherithoth, excisions, of the sins subject to the penalty of excision and their expiation. (8) Meila, trespass, concerning the sins of profaning sacred things. (8) Tamid, the daily sacrifice, a description of the temple service connected with the daily morning and evening sacrifice. (10) Middoth, measurements, giving chiefly the measurements and description of the temple courts, gates, and halls. (11) Kinnim, birds' nests, an account of the sacrifices which consist of fowls, the offering of the poor. Order VI.: (1) Khelim, as to how domestic vessels become unclean ritually. (2) Ohaloth, tents, as to how tents and houses become ritually unclean. (3) Negaim, of laws as to leprosy of men, garments, and houses. (4) Parah, the heifer, treats of the red heifer and its ashes as a purifying agent. (5) Teharoth, purification. (6) Mikvaoth, wells, how wells and reservoirs are fit to be used for ritual purification. The remaining six treatises concern various kinds of ritual uncleanness.

The Mishna Rabbis.— The men who are mentioned as authorities in the Mishna are

among the most notable names in Jewish history for about five and a half centuries from the era of the scribes to the death of Rabbi (210). They include the scribes or Soferim, who succeeded Ezra, and continued for about two centuries, the teachers who headed the Sanhedrin in pairs from the Maccabean struggle until the period of Hillel and Shamai, and finally the disciples of the two latter and their successors. These were called Tanaim teachers, whose opinions extend over fully two centuries, and whose disputations reveal marked intellectual keenness. Another class of rabbis received the name of Amoraim, speakers or expounders, whose labors were carried on in the schools of Tiberias, Sepphoris, and Cæsarea in Palestine, and in Nahardea, Sura, and Pumbaditha in Babylonia. Their province was to explain the terse Mishna phrases, examine into their sources, reconcile apparent contradictions, and apply the traditional principles to new cases. The Palestinian Amoraim were titled rabbis, the Babylonian rab or mar. They date from the death of Judah the Prince to the end of the 5th century, which marks the compilation of the Babylonian Talmud. They number several hundreds, while their predecessors, the Tanaim, amounted to about 120.

The Gemara.— The name Gemara, which means completion or doctrine, and which has come to be used interchangeably with Talmud, is practically a commentary on the Mishna, although some of its elements may be older. It embraces the discussions and interpretations of the Amoraim, but contains in addition a vast bulk of matter often unconnected with the Mishna text and touching upon law, history, ethics, and homiletics. The Palestinian Talmud, the work of the schools and schoolmen of Palestine, was more distinctly national, being composed on Jewish soil, and was completed about 370, although a later date is claimed by some. The Babylonian Talmud was finished about a century later. If rabbis like Jochanan, Rab, and Samuel were pioneers in the work, others gave the finishing touches, men like Rabba (270–330), Abayi (280–338) and Rava (299–352), while Ashi (352–427) and Rabina (died 499) are associated with its actual compilation. The Palestinian Gemara in its present form extends only over 39 out of the 63 treatises of the Mishna, thus indicating a probable loss of many treatises. The deficiency may partly be due to persecutions which abruptly closed the schools in Palestine, and partly to the fact that the Palestinian Gemara hardly received the favor and attention which commentators have given to the Babylonian. It is stated that Ashi devoted 30 years to the task of compilation and then revised the entire work. His Gemara covers only 37 of the treatises of the Mishna.

The Two Gemaras Compared.— The Gemaras differ in language, style, and method. The Mishna is in new Hebrew, which was developed during the era of the second Temple. While the popular language was Aramaic, the ancient Hebrew was retained for the liturgy and legal forms. Contemporary languages had their influence on it, and the Aramaic, Greek, and Latin were drawn upon and modified by the Hebrew idiom. In regard to the Palestinian Gemara, the language is the West Aramaic, which was current in Palestine in the age of the Amoraim. The language of the Babylonian is a blend of Hebrew, East Aramaic, and Persian, with other dialects whose decipherment is often attended with much difficulty. Of the main elements of the Gemara the halakhah or abstract law element, and the hagadah or legend, the former is more fully represented in the Palestinian, while the latter is more at home in the Babylonian edition. In size the Palestinian is about one third of the Babylonian, and only in modern times has aroused the attention of Jewish scholars. The study of the Babylonian Talmud, however, flourished in North Africa and thence passed to Spain, France, Germany, and Poland, and was ever a subject of interest and devotion. It gave rise to a vast library of rabbinical literature. Not the least curious incident connected with the spread of this study is that the four messengers sent by the schools of Babylonia in their days of decline to collect funds from their richer brethren in other lands, were taken captive by the Spanish pirates and sold in different slave-markets. All were redeemed by their co-religionists, and they became the heads of the community at Cairo, Kairwan in Africa, Cordova, and possibly in Narbonne. Among names eminent in the diffusion of Talmudic learning from the East to the West after the era of Sherira Gaon, his son Hai Gaon, and Samuel bar Hophni, were Gershom ben Judah of Metz, Isaac of Troyes, Jacob ben Yakar of Worms, Nathan ben Jechiel of Rome, Isaac ben Judah of Mayence, and the famous Rashi, his sons-in-law and disciples. After the expulsion of the Jews from England (1290) and France (1306), Poland became a favored home for them, and a seat of Talmudic learning whose glory has not yet been extinguished, although in other lands such lore is less cultivated. Of recent years, however, a fresh impulse has been given to Talmudic studies both in Europe and the United States.

The Talmud in History.— The history of the Talmud is essentially a history of the religious and intellectual development of the Jews, which has been elsewhere treated. A spiritual Temple rose among the Israelites when the Temple at Jerusalem had been destroyed by the Romans. The Talmud's history, however, is an important theme, and a brief glance at the varying fortunes of this volume will show the continuous persecution which it has received, like the Jew himself. It was proscribed by state and church, mutilated by the official censor, condemned by councils, burnt by popes and kings. Earlier centuries show a scattering fire of fulminations against it, from the era of Justinian, but the Middle Ages were persistent in such incidents of violence. In 1240 the Jews of France were compelled to surrender their copies of the Talmud and the work was put on trial, the result of which was that it was ordered to be burnt. Twenty-four carloads of the Talmud and similar writings were seized by Saint Louis and publicly burnt in Paris in June, 1242. The anniversary was held as a fast, and elegies were written on the event. Barcelona had a four days' trial of the Talmud on 20 July 1263. In 1264 Clement IX. issued a bull of confiscation, and subjected the Talmud to examination by the Franciscans and Dominicans, who expunged what they deemed abusive and blasphemous. Tortosa, Aragon, witnessed a public trial of the

Talmud, which lasted from February 1413 until 12 Nov. 1414, and had 68 sessions. Pope Benedict XIII. presided, condemned the work to the flames and prohibited its further study. His bull of 11 clauses issued 11 May 1415 never came into effect, for he was deposed by the Council of Constance. The hue and cry against the Talmud in the beginning of the 16th century was to have a marked influence on the Reformation and to pave the way for a Hebrew renaissance. On 19 Aug. 1509 the Emperor Maximilian gave Pfefferkorn full power over the Talmud and similar works; but when he demanded their surrender the Jews of Frankfort appealed to the Archbishop of Mayence, who temporarily checked the Dominicans. Reuchlin, the head of the Humanists, was asked to describe the character of the Talmud, and by him it was vindicated. Hutten and the author of 'Epistolæ Obscurorum Virorum,' lampooned Hoogstraten and the Dominicans. The Talmud gained new adherents, including Erasmus and Franz von Sickingen. The universities were appealed to for their opinion, and the University of Paris condemned the Talmud. Finally the subject was brought before the Lateran Council and the Dominicans were compelled to pay the costs of their suit against Reuchlin, while Leo X. permitted the Talmud to be printed by Daniel Bomberg at Venice. It was in the very year of the *editio princeps* of the Talmud (1520) that Luther at Wittenberg burnt the Pope's bull. On 12 Aug. 1553 Pope Julius III. signed the decree laid before him by the Inquisition-General, condemning to confiscation and the flames throughout Italy all copies of the Talmud and Hebrew books. Paul IV. continued hostile, but Pius IV. modified somewhat the harsh laws of his immediate predecessors. His bull (24 March 1564), in accordance with the decision of the Council of Trent, allowed the Talmud to be printed provided its name were omitted and it had been submitted before publication to the censor. The mutilations of the Talmud in accordance with the whim of an ignorant censor were often very curious; that the word heathen can refer to a non-Christian, and that the Rome of the early rabbis was not the Rome of the papacy, did not dawn upon the intelligence of the learned inquisitors. A brighter day was now to follow, with the Hebrew renaissance. In Holland, England, and Switzerland, Talmudic studies attracted a host of scholars, and the Buxtorfs, L'Empereur, Sheringam, Selden, Surenhuys, were among those who strove to popularize rabbinical lore, and who were to be succeeded by a host of learned men down to our own day — translators and interpreters in varied fashion. It is true, the Talmud was now and then subjected to condemnation; as recently as 1757, a large number of copies were burnt in Poland by fanatics. Germany, too, during the wave of anti-Semitism, revived old-time accusations. But the Talmud has survived the storm, and Christian scholars like Franz Delitzsch, August Wünsche, H. L. Strack, and W. H. Lowe, have joined with a host of Jewish scholars in its vindication and interpretation. After all its vicissitudes, it seems to have found rest as a distinct addition to the world's culture. Pope Clement's proposal in 1307 to found Talmudical chairs at the universities has been adopted to some extent in Europe and America.

Talmud Manuscripts, Editions, and Translations.— It is not to be expected that many manuscripts of the Talmud have been preserved after its experiences during the Middle Ages. The bonfire at Cremona in 1559, in which 12,000 volumes of the Talmud were burned, was only one of such incidents. The only known complete manuscript of the Babylonian Talmud, 1369, is in the Royal Library of Munich. Codices of single portions are preserved in the Vatican Library, and in the libraries at Oxford, Paris, Leyden, and other cities of Europe. Columbia University has secured from South Arabia a collection of manuscripts containing four treatises, which date from 1548. The University Library of Cambridge, England, has a fragment of the Talmud Pesachim, from the 8th or 9th century, edited in 1879, with an autotype facsimile, by W. H. Lowe. Manuscripts of the Mishna or portions of it are found in a few libraries abroad. The only manuscript of the Palestinian Talmud of any importance is to be found in Leyden. As to printed editions of the Mishna, the first appeared (1492) in Naples, and has since been followed by numerous others. In Venice (1520–3) appeared the first edition of the Babylonian Talmud by Daniel Bomberg in 12 folio volumes, and it has been followed by many editions in Venice, Basel, Amsterdam, Berlin, Warsaw, Vienna, etc. Only four complete editions of the Palestinian have appeared, Bomberg's Venice edition of 1523–4 being the first. Several parts, however, have been issued with commentaries. The Mishna has been translated into Latin and German, and partially into English. Translations of single treatises of the Babylonian Talmud have appeared in Latin, German, French, and English. At present complete translations of the work are being attempted in Berlin and New York. Special monographs have appeared on the medicine of the Talmud, its mathematics, its botany, zoology, astronomy, civil and criminal law, its legends, its archæology, meteorology, coins and weights, chronology and calendar, its customs, ethics and psychology, its exegesis, geography, and history, linguistics, education, its superstitions and philosophy, its poetry and proverbs,— an extensive list that proves how comprehensive is the work, and how many-sided the old-time sages who fought and wrought, until the fabric was finished. Out of its mines the workmen are still bringing fresh gems to light, and its deep lying strata furnish an inexhaustible field for research in almost every department of human knowledge.

The Talmud's Influence.— On the Jewish people the influence of the Talmud has been remarkable, not only by maintaining the religious idea among them, but by promoting their solidarity. Its development illustrates the buoyancy of Judaism, and the ease with which at a time of national overthrow and dispersion a fundamental reform could be instituted. It was a daring design, when so much of the Mosaic law had lost its application, to infuse new life into the religious code and provide for continuous intellectual development. The soldiers who defended Jerusalem became scholars whose labors were to be more successful in the field of progress and thought. The Talmud, too, was a popular institution — it was no ex-

clusive possession of the few. All could become sages if they had the brain and soul-power. In its disputations, a purer atmosphere was breathed that made the dark ages impossible,— it was tonic and preservative as well. Hence Jews could be scientists, physicians, poets, philosophers in goodly number, because their intellects had been Talmud-fed, and they had no craving for the riotousness and immorality that prevailed among their contemporaries. The rabbi, too, was no idle ecclesiastic, but a resolute worker, now a saddler, now a weaver, now a carpenter, now a dyer, for the study of the law was held to be most meritorious when combined with some manual employment. Hence the helpful and ennobling domestic life, in ages when family vices, not virtues, were exemplified alike in court, palace, and hovel. On the other hand, it must frankly be stated, that the exclusive study of the Talmud was often narrowing and repressive, with an unhappy influence on Jewish growth. It produced in such instances an intellectual Ghetto, utterly foreign to the spirit of representative sages, dwarfing the Jewish soul and its ambitions. When scholars become scholiasts, and broad students fatuous schoolmen, like the mediæval champions who argued as to how many angels could stand on the point of a needle, mental decay is inevitable. Hence the study of the Talmud degenerated at times into useless dialectic, which met the severe rebuke of clear-thinking rabbis, but held sway over many minds, and particularly in lands where the Jew knew no vernacular but a mongrel jargon of his own, and had no rights or privileges as a citizen, being merely a serf or underling, to be told to "move on!" with every fresh outbreak of the mob, — a veritable Ahasuerus of the popular imagination, ever wandering. No wonder that under such conditions he found solace in his Talmud and built his mountains of syllogism on very unsubstantial basis. It was Moses Mendelssohn who broke away from the intellectual Ghetto of his coreligionists and paved the way for their emancipation from the exclusive Talmudic atmosphere. They were to be citizens of the world hereafter, and civil and religious liberty became their possession. The Talmud was to be cherished, but not made an idol of, to be venerated, but not worshipped. It was a work to be studied, but not regarded as an infallible authority. It was to be analyzed, dissected, subjected to criticism as the work of men. Bible, Mishna, Gemara, with ritual codes and commentaries, were but steps in the progressive development of Judaism whose sages are restricted to no age and clime, but are continuous as God's revelation. One can thus understand how the Talmud supplies ammunition to all schools in modern Jewry, whether right, left, or centre; progressive or conservative, advocates of orthodoxy or reform.

Faults of the Talmud.— While claiming high rank for the Talmud among the works that have influenced millions of people, it is not necessary to glorify it out of all proportion and assert its absolute perfection. There are faults in this encyclopedia, which records the opinions of a thousand disputants of different climes, conditions, and eras, their after-dinner talk, as it were, and their more serious utterances. These faults are given as four-fold by the Jewish historian Graetz (History, II. p. 633, Am. Ed.). The Talmud contains much that is immaterial and frivolous, it reflects the superstitions and views of its Persian birthplace, with their magic, incantations, miraculous cures, demoniacal medicine and mystic dreams — all opposed to the spirit of Judaism. Then, too, it contains occasional instances of harsh judgments and decrees against other nations and religions; and finally, it seems to favor an incorrect exposition of Scripture, accepting as it does, often tasteless interpretations. What Graetz asserts is not to be denied; yet these defects are not organic. The Talmud is not one book but a collection of books; is not by one author, but by a thousand authors; is the work not of one age, but seven centuries. What wonder, then, that there are faults in such a composite creation, which Graetz compares to a literary Herculaneum and Pompeii, comprising the sublime and the common, the great and the small, the grave and the ridiculous, the altar and the ashes, things Jewish and heathenish side by side. The expressions of uncharitableness, often nothing but the utterances of ill-humor and righteous indignation of some single teacher, preserved by over-faithful pupils, are more than counterbalanced by the breadth and humanity that often illuminate the Talmud; and by its recognition of genuine religion as something higher than race or creed. One must also consider that the rabbis never enjoyed security for any prolonged period. The Roman, the Greek, the Persian and the rest, were ever "baiting" them, and persecutions were constant. If their utterances were human and expressed their agony and passion in times of bitter distress, the spirit of broad humanity was never wholly absent from their complaints. It was a sage of the Mishna who said: "A heathen who occupies himself with the law of God stands in the same rank as the high priest."

Commentaries on the Talmud.— The first to write a commentary on the Mishna was Maimonides (12th century), originally in Arabic. Manuscripts of this work are in the Bodleian, and have been translated into Hebrew by some scholars of the 13th century. R. Tanchum of Jerusalem followed Maimonides by writing a lexicon of the Mishna in Arabic. This has never been published, but manuscript copies exist in the Bodleian. A large number of commentaries have appeared upon the Mishna in whole or in part, usually clear and simple in aim, concise and exact in expression. As commentator on almost the whole of the Talmud, Rashi of Troyes (1040–1105) is most eminent, and his very clear and systematic exposition appears in every edition of the Babylonian Talmud. The supplements and additions to Rashi's commentary were written by his relatives and pupils. A collection of notes and discussions called Tosafoth, additions, appears in all Talmud editions, whose authors called "Tosafists," lived in France and Germany during the 12th and 13th centuries. Three of the more important later commentators whose expositions are printed in many Talmud editions are Solomon Luria (16th century), Samuel Edels (d. 1631), and Meir Lublin (d. 1616).

Helps to Talmudic Study.— These consist of lexicons from the oldest, the Aruch of. R. Nathan ben Jechiel of Rome, of the 11th century, recently revised and enlarged by Kohut as the

'Aruch Completum,' to Fisher's revised and enlarged edition of Buxtorf, Levy's 'Dictionary of the Talmuds and Midrashim' (in German), and Jastrow's ''Dictinary of the Talmud' etc. (London and New York, 1886–1903), an admirable and scholarly work. Then must be mentioned grammars, like Luzzatto's and Levias', which aid in the study of th idiom of the Babylonian Talmud, chrestomathies for beginners, and more elaborate introductory works and treatises from Samuel Hanagid's fragment (11th century) and Maimonides' introduction, translated into German by Pinner, to modern authors like Brüll, Frankel, and pre-eminently J. H. Weiss. There are other works of reference, but the best help is the living teacher, who is obiciously the most trustworthy pilot through the "sea of the Talmud."

Bibliography.— Mielziner, 'Introduction to the Talmud'; Deutsch and Darmesteter, 'Essays' (Jewish Pubication Society of America); Schechter, 'Studies in Judaism'; Isaacs, 'Stories from the Rabbis'; Graetz, 'History, Vol. II.'; DeSola and Raphall's 'Eighteen Tractates from the Mishua.' An exhaustive bibliography in English, German, and Franch is given in Mielziner's work.

ABRAM S. ISAACS,
Professor of Semitic Languages, New York University.

8. Judaism — Masorah or Massorah, is the name given to the body of critical notes on the external form of the Hebrew-Aramaic text of the Old Testament. The name is taken from Ezek. xx, 37, and means originally 'fetter,' the fixation of the text having been correctly looked upon as a fetter on its exposition. In later times the word assumed the meaning of "tradition." This body of notes represents the literary labors of a long line of scholars, very few of whom are known by name, who flourished during a period of about seventeen centuries — from about 300 B. C. to the invention of printing. They were mostly copyists or professional scribes, or teachers of the Bible, and their notes were the outcome of a close application to their professional work.

Object and Method — The chief object of the masoretic notes was to serve as a guide to the copyists and enable them to produce a faultless Bible-text. They were written on the margins of private Bible-codices or between the lines, and collected in a body before or after such codices, or finally compiled in special independent works. In Bible-scrolls designed for public use at the synagogue no notes were permitted in accordance with the injunction of Deut. iv, 2. The amount of masoretic notes differs greatly, depending on the amount of space at the copyist's disposal, on the size of the script used, the price of the writing material and of the scribe's labor and on the fanciful shape he gave to his glosses, which were sometimes written so as to form ornamental decorations to the book.

The independent works are arranged topically in numbered groups or rubrics, the interlinear and marginal notes, however, follow the order of the text, forming a kind of running annotation. Presumably in the course of time, a certain technique was worked out with regard to the distribution of masoretic material. Certain matter was designed preferably for the intercolumnal and outside perpendicular margins; other matter for the upper and lower margins, etc. The former is known as the Inner or Small Masorah, the latter, as the Outer or Large Masorah; the glosses surrounding the initial word of a book, usually written on a separate line, are called the Initial Masorah. The term Large Masorah is also applied to the lexically arranged notes at the end of the printed Bible, usually called Masoretic Concordance or Final Masorah.

The Small Masorah consists of brief notes with reference to marginal readings, to statistics, showing how many times a particular form occurs in Scripture, to full and defective spelling, and to abnormally written letters. The Large Masorah is more copious in its notes. The Final Masorah comprises all the longer rubrics for which space could not be found in the margin of the text.

The old Hebrew text was in all probability written in continuous script, without any break, and some of its words were abbreviated. The masorites divided the text into words, books, sections, paragraphs, verses and clauses (probably in the chronological order here enumerated), the various divisions being indicated by spaces. They fixed the orthography, pronunciation and cantillation, and introduced the square characters, or modern Hebrew script. To indicate various teachings, legal or popular, religious, or mystical, they formed some letters in some words in an abnormal way; some are larger, other smaller than the rest, some have their strokes or bars curved, others have them drawn out in a scroll, still others have scroll-like and semi-circular attachments, or a broken stroke. Most of these graphic peculiarities are of a late date and their vogue was short-lived; the printed Masorah either ignored them, or did not know them; and some of the terms referring to such peculiarities were already misunderstood by specialists in the 14th century. More of a purely calligraphical origin are the tittles or apices on certain letters of alphabet.

There are four words having one of their letters suspended above the line. One of them the *n* in the name of Manasse (Judges xviii, 30) is due to a correction of the original Moses, out of reverence for the latter. The origin of the other three (Ps. lxxx, 14; Job xxxviii, 13, 15) is doubtful. In the opinion of some, they are mistakes for large letters; according to others, they are later insertions of originally omitted weak consonants.

Nine passages in the Bible are preceded and followed by signs usually called "inverted Nuns," because they look like the letter N in the Hebrew alphabet. These signs are probably of text-critical importance. Their real significance is, however, unknown.

In 15 passages some words are stigmatised, as a sign of deletion. At a later period, a marginal reading takes the place of a stigma. The marginal reading are of a threefold character: (1) words to be read for those written in the text; (2) words to be read for those not written or omitted in the text; (3) words written, but not to be read. The origin of these variants is manifold. Some represent various readings in ancient manuscripts; others arose from the necessity of replacing erroneous expressions by correct ones, difficult, irregular, provincial and

archaic, by simpler, current and appropriate; or cacophonous by euphonious expressions. Some of them may have been designed to call attention to some mystic meaning or homiletical lesson supposed to be embodied in the text. Finally, and this at a later date, they represent variant readings found in Talmudic literature.

In traditional literature the observation is found that in some passages, the number of which varies in the different sources as 7, 11, 13, 15 or 18, the Bible contains expressions other than the context would lead one to expect. To the question why this is so, the earliest sources answer: "the Bible uses euphemism." The later sources, however, explain this by the assertion that the men of the Great Synagogue, *i. e.* the scholars of pre-Maccabean times, had made corrections in the text. Modern investigators are inclined to attribute these pecularities to the authors or redactors of the Biblical books themselves, the latter shrinking from putting in writing a thought which some of the readers might expect them to express. The assertion about the corrections made by the scribes is probably due to the tradition which ascribes the redaction of several books of Scripture to the Great Synagogue.

Textual Correction.— There are, however, phenomena in the Biblical text which lead one to assume that at some time textual corrections had been made. These corrections may be classified under the following heads: (1) Removal of unseemly expressions used in reference to God; *e. g.* the substitution of the verb 'to bless' for 'to curse' in certain passages. (2) Safeguarding of the Tetragrammaton; *e. g.* the substitution of Elohim for Yhwh in certain passages. Under this head some have counted such phenomena as the variants of the divine names in proper names; *e. g.* Joahaz for Jehoahaz. (3) Removal of application of the names of false gods to Yhwh; *e. g.* the change of the name Ishbaal to Ishbosheth; or, according to another opinion, from Ishbosheth to Ishbaal. (4) Safeguarding the unity of divine worship at Jerusalem. Here belongs the change of the city of "Righteousness" (Isaiah xix. 18) to that of "Destruction".

A large portion of the Masorah is given to statistical data: how many letters, words, verses, sections and chapters there are in each book and in all of them together; which is the middle letter, word or verse in each book; how many words begin with a certain letter, or combination of letters; how many times a particular form of word occurs in the Bible, etc. This feature probably has its origin in the early copyists counting the letters of the text to have a basis for calculating the charge to be made for their labor.

Beside the labors of fixing and guarding the purity of the text, the masorites put the world of scholars under the greatest obligation by inventing and introducing in the 6th century systems of vocalization and accentuation, embodying the pronunciation as handed down in the schools of their time, and their understanding of the textual connection. A great deal of our grammatical knowledge of the Hebrew language is based on their vocalization.

History and Development.—The history of the Masorah may be divided into three periods: (1) creative period, from its beginning to the introduction of vowel-signs; (2) reproductive period, from the introduction of vowel-signs to the printing of the Masorah in 1425; (3) critical period, from 1425 to the present day. The cultivation of masoretic studies both took its rise and had its culmination in Palestine. Still, it had already in the 2d Christian century its workers in Babylonia. In the course of time differences of spelling and pronunciation developed not only between the schools of Palestine and Babylonia, but in the various seats of learning in each country. In Babylonia the school of Sura differed from that of Nehardea; similar differences existed in the schools of Palestine, where the chief seat of learning in later times was Tiberias. These differences must have become accentuated with the introduction of graphic signs for pronunciation and cantillation; and every locality, following the tradition of its school, had a standard codex embodying its readings. The Biblical text accepted by us, its vocalization and accentuation, the Masorah in its contents and language, as well as the regulations with reference to writing of Biblical books, all are of Palestinian origin. Fragments of text and Masorah originating in Babylonia have but recently been discovered.

In this period living tradition ceased, and the masorites in preparing their codices usually followed the one school or the other, examining, however, standard codices of other schools and noting their differences. In the first half of the 10th century Aaron ben Moses Ben-Asher of Tiberias and Ben-Naphtali, heads of two rival masoretical schools, each wrote a standard copy of the Bible, embodying the traditions of their respective schools. Both of them were descendants of distinguished families of masorites. Ben-Asher's codex became recognized as the standard text of the Bible. Notwithstanding this, for reasons unknown, neither the printed text, nor any manuscript which has come down to us, is based entirely on Ben-Asher; they are all eclectic. The two rival authorities, Ben-Asher and Ben-Naphtali, practically brought the Masorah to a close. Very few additions were made by the later masorites, styled in the 13th and 14th centuries *Nakdanim*, who revised the works of the copyists, added the vowels and accents and frequently the Masorah. Considerable influence on the development and spread of masoretic literature was exercised during the three first centuries of the second millenium by the Franco-German school of *Tosaphists*, or Talmudic annotators.

Jacob ben Hayyim ibn Adonijah, having collated a vast number of manuscripts, systematized his material and arranged the Masorah in the second Bomberg edition of the Bible (Venice 1424–1425). Besides introducing the Masorah into the margin, he compiled at the close of his Bible a concordance of masoretic glosses for which he could find no room in a marginal form, and added an elaborate introduction — the first treatise on the Masorah ever written. In spite of its numerous errors, this excellent work has generally been acknowledged as the "textus receptus". Next to Ibn Adonijah the critical study has been most advanced by Elijah Levita, who published his famous 'Massoret ha-massoret' in 1538. The 'Tiberias' of the elder Bux-

terf (1620) made Levita's researches accessible to Christian students. Levita compiled likewise a vast masoretic concordance which still lies in the National Library of Paris unpublished. Other prominent workers in this field in the times of the Renaissance were Rabbi Meir ben Todros ha-Levi, Menahem di Lonzano, and Jedidiah Solomon of Norzi. In modern times, to mention only the most prominent names, were W. Heidenheim, S. Pinsker, S. Frensdorff, S. Baer and C. D. Ginsburg.

In imitation of the Masorah to the Hebrew text, a similar work exists to the text of the Aramaic version, known as Targum Onkelos. Its date is probably about 900.

Bibliography.—On the name: W. Bacher, 'Jewish Quarterly Review', iii. 785; C. Levias, in 'Hebrew Union College Annual' for 1904. On the Masora: Ibn Adonijah, 'Introduction' (ed. Ginsburg, London 1865); Levita, 'Massoret ha-massoret' (ed. Ginsburg, ib. 1867); H. L. Strack, 'Prolegomena Critica' (Leipsic, 1873); I. Harris, 'Rise and Development of the Massorah' ('Jewish Quarterly Review,' I. 128 ff.); C. D. Ginsburg, 'Introduction to the Hebrew Bible' (London 1897); W. Bacher, 'Die Masorah' (in Winter & Wuensche, 'Juedische Literatur,' II. 121–132).

Formerly Professor of Hebrew Union College.

9. Judaism—The Cabala Cabala designates the mystic lore of the Jews and the practises based thereon. The name is etymologically related to a Hebrew verb meaning to receive and which is technically used to denote the reception and transmission of divine revelation. Its application to theosophic speculation and theurgic art indicates the belief that the doctrines and practises comprising the Cabala were imparted through divine revelation, saints such as, among others, the Patriarchs being regarded as the chosen recipients of the divine unfolding.

The twofold character of the Cabala as speculative and experimental is expressed in the distinction of the one as Cabala Iyunit — reflective Cabala, and of the other as Cabala Maasit—active or theurgic Cabala. Historically considered, the Cabala antedates by many centuries the works devoted to the exposition of its theories and the inculcation of its practises. Indications are plentiful in both the Apocrypha and the Pseudo-epigrapha, notably in the Enoch books and the Testaments of various Biblical heroes, pointing to the acceptance and currency of Cabalistic concepts at the time these extra-canonical books were composed. Babylonian mythological elements, as well as Zoroastrian theological conceits were among the extraneous influences that gave fertile impulse to cabalistic speculation. Greek philosophy, especially as developed in the Stoic and Neo-Platonic systems of Alexandria, must also be credited with having stimulated its development. Jewish, of the late pre-Christian, and Christian Gnosticism of the early Christian centuries, may be looked upon as its predecessor. The absolutely transcendental character of Jewish monotheism could not but lay near to reflective minds the fundamental problems, basic to all Jewish mysticism, how the sublime extra and supra-mundane Deity could be the Creator of the existing world and could be regarded as being in contact with it as its ruler and guide, and more especially how man could rise into communion with God. The Biblical account of the Creation known as the Ma'aseh Bereshit (literally the work of the beginning) and the description of the divine chariot in the first chapter of Ezekiel termed the Ma'aseh Merkabah (literally the work of the chariot) were held in early Talmudic records to hide esoteric knowledge within the reach of the chosen few who of mature age and proper degree of wisdom might venture to unravel their occult suggestions. The allegorical method of interpreting scriptural contexts, in vogue among the preachers of Haggadists of the synagogue, stood the elect searchers for the contents of divine revelation transmitted in these two chapters in good stead. By amplifying it, they arrived at the deeper meaning of Genesis i. and Ezekiel i., designated by them as the "secrets" and the "hidden things" of the Torah or the Law. But care was had not to divulge publicly the truth thus found. It was zealously reserved exclusively for the "wise" and "worthy." Concepts that recur as basic to later theosophic speculations are attributed to some of these Talmudic wise men; for instance, the view that fire, water, and air existed before creation, these three producing light, darkness, and wisdom respectively, the world being a combination of these six elements, or that creation in reality is a process of condensation, God contracting Himself or His garment of light to make room for the world resulting from this operation. The Pantheistic designation of the Godhead as the "Place" the Mākôm (Greek Topos) of the universe credited to some Talmudic doctors is another indication of the prevalence of mystic speculation in the Talmudic schools, as is also the personification of God's "Justice" and "Mercy," of frequent recurrence in Talmudical parlance. Another evidence to the same effect is the tendency characteristic of a number of Talmudical observations to represent God's activity by ten hypostases or Sephirot, viz: wisdom, insight, cognition, power, strength, immutability, justice, righteousness, love, and mercy. Sometimes, as in Philo, wisdom is named as the totality of these ten potentialities. But most significant in this connection is the occurrence in Talmudic theology of Metatron, an angelic mediator between the transcendental Deity and Creation. He is the Demiurgos, the instrument through which the supra-mundane God acts. Again the soul is often described as pre-existent. The pious are credited with the power while living to ascend to God. During such ascension they learn the secrets of the Beyond. Furthermore the "mystery of sex" and of "marriage," which is one of the main pre-occupations of the later (literary) Cabala, as well as the doctrine of emanation, is met with in the Pseudo-epigrapha as in Talmudic passages.

Cabalistic speculation and practise presented in the Talmudic documents in detached glosses proceeded to become more systematic in what is known as the Geonic period (from about 500–900 or 1000 A.D.). Jewish mysticism developed a literature of its own, which, however, has been preserved only in fragmentary form. From what is known of the contents of this literature, it is certain that theosophy and cos-

mogony were central in its speculative interests, while theurgic practise, the art of producing by mystic words and names certain effects, was another department of its pre-occupation. In theosophy, the nature and personality of Metatron; the dimensions of God, or those of this mediator, presented the principal theme for discussion. A work entitled "Shiur Kômāh," the proportions of the (divine) stature," is devoted to the latter. Descriptions of the celestial halls or Hekalôt and of the visits and experiences of saints and ascetics that made the "ascension" furnish the matter of other treatises. To cosmogonic mysticism belong works treating of the "six days of Creation," the story of the conflict between God and Primal Water, or between the "Masculine" and "Feminine" Waters, descriptions of Paradise and the lower world. As for theurgic art, these fragmentary remnants of mystic literature present expositions of the power vested in such as know the names of angels, or of the prophylactic virtue of the knowledge and the use of mystic names.

The most important work by far is the famous Sephēr Yezirāh, the book of the Creation. Its date is in doubt. Certain it is that before the beginning of the second Christian millenium it had come to be regarded as one of the most important books calling for and receiving commentation at the hands of the most learned. According to this book, the fundamentals of all being are Sephîrôt or potentialities. These mediate between God and Creation. They comprehend first three emanations, one direct from God, and the other mediate, viz: (1) Spirit or air (Hebrew Ruach), from which came (2) water, which in turn was condensed into (3) fire. To these are added six dimensions, three to the right and three to the left. The tenth element is the Spirit of God. All ten are eternal, the first three being, however, pre-existent. They are the substance of all that is, the form being supplied by the 22 letters of the Hebrew alphabet. Between substance and form is a contrast. Creation consists in resolving this contrast. God is the solvent. Through Him as the solvent, existence, *i. e.*, combination of form and substance, takes on reality.

The Neo-Platonic and Pythagorean character of the book's theorizing is evident. To some sectaries, the affirmations of the treatise seemed too strongly anthropomorphic. They therefore posited between God and universe a mediator, the "Prince of the World," to whom they imputed all acts of creation and to him they referred the corporeal descriptions of God found in the Bible.

Among the systems that to a certain degree were impregnated with Cabalistic Pantheism, and in turn exercised a determinating influence on the further evolution of Jewish mysticism, that of Ibn Gabirol holds a prominent place, as his philosophy seemed to confirm the theory of God's immanence, underlying the central theory of the Cabala, that of successive emanation.

Subsequently the Cabala differentiated into that of the German Jews, and that of the Jews of Spain and Provence. Among these Eleazar of Worms and Abraham Abulafia deserve mention as exponents of the doctrine. They held that God was too exalted to be cognized by human intellect. But between the Unknowable God and man searching for God was God's Kābôd or Glory, created by God out of His own primal fire. This "Glory" has shape and dimension. It is seated on a Throne in the east but screened by a curtain open alone in the west. To this Kābôd the descriptive adjectives of the Bible refer. Four worlds are in existence: (1) That of this "glory;" (2) that of the angels; (3) that of the animal soul; (4) that of the intellectual soul. This German mysticism on its practical side was a reaction against the dominancy of Talmudic scholarship as the sole measure of piety. It substituted for study prayer, which it viewed as a mystic progress toward God. It reveled in states of ecstacy, as a protest against the barren rationalism and unstirred sobriety of the schools' dialects. Fasting, asceticism, and meditation were resorted to to bring on the coveted ecstatic states, or recourse was had to the mystic names of angels and the deity.

The Cabala of the Provence traced its origin to a revelation by the prophet Elijah to Jacob ha-Nazir, who in turn initiated Abraham, son of David of Posquières, whose son (Isaac the blind) again transmitted the doctrines to his followers. This invoking of the prophet Elijah shows that the mystics of Spain and the Provence regarded their doctrines as of divine authority. That it had came to them from afar—from Babylon by way of Greece and Greek philosophy — is now the theory of the competent scholars. The more important expositions are comprised in the following works: (1) 'Masseket Azilut' or treatise on emanation; (2) 'Bahir,' in which a new classification of the Sephirot is given and the doctrine of continuous emanation is advanced; (3) Azriel's book, written "to present Cabala to philosophers with a view of making it acceptable to them;" (4) a number of pseudo-epigraphic books of the second half of the 13th century, based on the foregoing; (5) the *one* publication commonly regarded as the Bible of the Cabala, the 'Zohar' (Splendor, based on Dan. xii:3), written in the form of a commentary on the Pentateuch and introduced as R. Simon ben Yochai's production. Analysis demonstrates that the Zohar is "an aggregate of heterogeneous parts." The compilation probably is not older than the beginning of the 14th century. It received its present form largely at the hands of Moses de Leon. Later Cabalists, either exponents or opponents of the Zohar, were Joseph ben Abraham, Ibn Wakar, Moses Botarel, Isaac Arama, Isaac Abravanel, Abraham Saba, Isaac Luria, Moses Zacuto, and others. The Cabala found readiest acceptance among the Jews in Turkey and in Poland. The pseudo-messianism of Shabbatai Zewi (1665) rested to a certain extent on Cabalistic expectations, asceticisms, keeping vigils at frequent intervals, performing baptismal ablutions, doing penance, having marked the practises of the adherents of the later Cabalistic teachers, who regarded these acts as preparatory to leading pure lives and expressive of love for man, virtues that were hoped to usher in the coming of the promised Redeemer.

The Cabala of the Jews was not without influence on the thoughts of Christian scholars,

among them, Raymond Lulli (1225–1315), Pico di Mirandola (1463–1494), Reuchlin, Heinrich, Cornelius Agrippa (1487–1535), Zorzi 1460–1540), and others. It is not too much to say that Cabalistic speculation recurs in the theology of some of the noted precursors of the Reformation, and had a share in the development of the Evangelical Church's dogmatics.

In brief, the main contentions of the Cabala are these: (1) God is unknowable in His own essence. He is the Eñ-sôf, limitless, infinite. He is the Hidden of All Hidden. He is the "negative" as far as He is cognizable by man. He is the first primal of all primals, the ulterior principle. Only as far as He has deigned to change His absoluteness into relativity, by permitting creation to take on existence, is He cognizable in measure as creation reveals Him. Between Him and creation, through irradiation or condensation of His primal light, He placed a mediator, Metatron, or the Prince of the World, or the Merkaba or Chariot: to this, sometimes denoted as the first Sephirāh, refer all anthropomorphisms of scriptural description of the Godhead. The Infinite has no attributes. But the Mediator has. He is the "Superior Man," the "Celestial Man," "Wisdom." This primal man or being is the creator and governor of the world. He is endowed with corporeality.

In God, will and thought and action are identical and synchronous — instantaneous. In Him transition from resolution to execution presupposes no change in essence. This divine will is the Rāzôn Kadmoñ, the uncreated eternal will. It is the first principle or sephirāh. God, however, concentrates himself. This "mystery of the divine concentration" (Sôd Zimzum) results in rendering visible that part of Himself which is the world. This act is similar to making a rent in a vessel, through which the contents are exposed to view. Through God's self-concentration, however, room is made for the visible world. For it limited vacancy is produced in which the divine ray of light is implanted as the germ of progressive creation. The Infinite has thus himself willed His partial finiteness. The Cause of all Causes has produced the ten Sephiroth. He is the Crown, the Light that is Infinite. In Him there is neither form nor substance. But He made a little vessel, the letter Yod. It is "wisdom;" then created He the sea, which is reason. This sea He divided into seven streams, for which He made seven vessels: (1) Greatness; (2) power; (3) beauty; (4) victory; (5) highness; (6) foundation; (7) Shekinah or government. Some of these Sephirot are constructive, others—the first three — are elemental. Some mystics regard these 10 as identical — representing only various aspects of the Divine Infinite — but others hold them to be tools of the Creator, superior beings totally different from Him. In the Sephirot two natures inhere: (1) That through which all change occurs, *i. e.* the "vessel;" (2) that which is unchangeable, *i. e.* the "Light" or the Power.

(2) Man. Man is the highest creature. His body is built according to the mysteries of wisdom. But he is more than body. He is threefold, soul,—animal soul (Nēphesh), moral soul (Ruach), intelligent soul (Neshāmāh). This third soul emanates from "Wisdom," the second from "Beauty," the third from "Dominion, or Kingdom." The soul is pre-existent. After dissolution of the temporary union of body and triune soul, the intelligent soul ascends to God, the moral soul enters Eden, the animal abides peacefully on earth. This is the destiny of the righteous. If stained by sin, the soul has to undergo punitory trials. Hence the Cabala accepts the doctrine of the transmigration of the soul. Only those souls that have fully developed their power may return to God or enter Eden; others will have to serve their period of probation, sometimes two souls being "inter-impregnated," merged into one, so as to help each other in the performance of the allotted task.

Man should love and fear God. Love is the secret of unity with God. In the degree man loves God he rises to higher intimacy with God. Life in the beyond is life which vouchsafes deeper contemplation of the divine reality. Evil is the contrary of the God-like, the "left side." Evil is finite. Evil man mistakes semblance for substance. He separates himself from God. The Cabala to a certain extent teaches the sinlessness of original man whose fall brought sin and evil into creation.

Man, however, is not eternally lost. He may rise to the centre of divine light through penitence.

The Cabala has induced a more spiritual conception of religion and emphasized its ethical implications more strongly than legal ritualism could vitalize. On the other hand it encouraged the belief in magic, in demons, and opened the door to many grotesque and even noxious superstitions. Its adepts came to put faith in signs and constellations, and otherwise naturalized in Judaism many conceits and customs of non-Jewish origin and significance.

Professor Rabbinical Literature and Philosophy, The University of Chicago.

10. Judaism—The Karaites. A Jewish sect which took its rise in Southern Mesopotamia in the second half of the 8th century and which has persisted to the present day. Several causes have contributed to its origin and continuance, some purely personal, others depending upon a difference of view in regard to some of the essential features of Rabbinical Judaism.

Origin.— The development of what is known as Rabbinical Judaism, which commenced after the destruction of the second Hebrew commonwealth, has not been as one-sided as is popularly imagined. In addition to the written law, the basis of all religious and all civil development, an unwritten law had naturally grown up which by its interpretation of the written law fitted that law to the changing times and to different needs. In this manner a large mass of traditions interpreting and enlarging the law has come into being. This mass is known as the oral law, and it gradu-

ally acquired a sanction and a sanctity second only to that of the canon. This oral law was not necessarily rigid; for as long as the schools maintained their vigor a natural and healthy development took place. Custom, however, came to the aid of the oral law and in a natural process was itself then regarded as law. The development, however, was not homogeneous. There were at all times within the Jewish polity freer spirits who rebelled against the trammels which a fixed interpretation of the Biblical laws naturally induced. They imagined that by basing themselves wholly upon the word of Scripture they would free themselves, forgetting that they were running the risk of worshipping the letter instead of the spirit which manifested itself in the development of the oral law. From time to time sects (see JEWISH SECTS) arose, having as their principal object the negation of the official tradition. Of such a kind were the Samaritans, though their opposition to the Jews was more political than religious, and in a large measure the Sadducees. To such sects the Karaites belong; but they represent the only sect that has had a long and important existence and against which Rabbinical Judaism had continually to be on the alert.

Anan and the Early Karaites.— The sect was thus to a certain extent the outcome of the opposition to the official oral law. A personal element entered into this opposition. The founder of the sect was a certain Anan ben David, said by some to have been a descendant of Bostanai, a celebrated head of the captivity. His followers and certain Mohammedan writers assert that he himself was an exilarch; this is undoubtedly a falsehood. His uncle, however, did occupy that position; and when he died in 760 Anan had a certain right to expect the appointment. A younger brother, Josiah by name, was preferred. Whatever may have been the reason for this preferment, Anan resented it and out of pique had himself proclaimed exilarch in 767. This appeared to the Abbasid caliph al-Mansur as treason, seeing that the regular exilarch had been confirmed by himself. Anan was imprisoned, and only released by heavy bribes given to the officials. He then started out to build up a following of his own. His immediate followers, who must be clearly distinguished from later Karaites, were called Ananites. This was no difficult matter at that period and in those regions. The Mohammedan world itself was in a ferment, due largely to the pretensions raised by the various followers of Ali. Numerous Mohammedan sects raised their heads, and their example cannot have been lost upon the Jews living in their neighborhood. The influence of Mohammedan thought upon the Jews was great at all times; and it cannot be doubted that this influence was strongly exerted in the formation of Karaism. The central doctrine of Anan's philosophical or theological rebellion was his denial that the oral law was divine. According to him all portions of the Bible are of equal value. One must delve deep into it in order to take out its secret and its hidden meaning. No fixed rules are to govern this study; each individual must find out for himself what is the law. To a greater or less degree similar controversies were raging in the Mohammedan world. The Shiites in a measure denounced tradition (Sunnah) as much as Anan did; and even among the orthodox the question as to the right of individual speculation occasioned bitter controversies. The founder of one of the four chief Mohammedan legal systems, Abu Hanifah, was the one who upheld this doctrine of the right of individual speculation; and it cannot be merely a chance circumstance that he lived in the same place and at the same time as did Anan. In fact it is said that he was imprisoned together with Anan. Undoubtedly the two systems have their basal thought in common.

Spurred on by the example in the Mohammedan world, the Karaites held that they were not a new sect, that they represented true Judaism, and that it is necessary to return to the purity in belief and practice of Moses and the Prophets, just as Mohammed insisted that he simply reintroduced the old religion of Abraham. The Rabbinites he held were following the cission introduced by Jeroboam. The Sadducees had, it was further held, found out a part of the truth; but Anan was the first to reveal it in its entirety. The connection with the Sadducees seems undoubted, in spite of the fact that the later Karaites rejected the connection, because the Sadducees did not believe in the resurrection. This is seen in their adoption of certain Biblical interpretations which are only to be found among the Sadducees or in the early *Halakah* which was superseded by that which became canonical: *e. g.* the meaning of the expression "on the morrow after the Sabbath" (Lev. xxii, 11), as the time for commencing to wave a sheaf of the first fruits; the real meaning of the lex talionis (Deut. xix, 21) and the use of the flesh of an animal that was diseased before it was slaughtered. The older Halakah not only forbade one to kindle a light on the Sabbath day but even to allow it to burn — an interpretation followed by the Sadducees, the Samaritans, and the Falashas. The early Karaites seem even to have had Sadduceean writings in their possession which are now lost, the authenticity of which not even their great opponent Saadiah contested. Anan was an eclectic, and evidently tried to gather into his fold all manner of doctrine that was in any way opposed to the Rabbinical interpretation. Thus he introduced the prohibition of eating meat or drinking wine during the exile of the Jews from the Holy Land; a theory upheld by two minor sects, the followers of Abu Isa of Ispahan (685 to 705), and of Yugdan, a pupil of Abu Isa. But despite his opposition to the Rabbinites, Anan followed their teachings in many things. He himself was a good Talmudist and he took over nearly all the rules of Biblical interpretation upon which the Talmudists based their system. He was by nature something of an ascetic, and consequently was apt to follow in all cases the more stringent rather than the more lenient view in questions of prac-

tice. In fact, he may be said to have developed a tradition and a Talmud of his own. His immediate followers, who called themselves "Mourners for Zion," went to live in Jerusalem, where they gradually died out and were of very little influence upon the development even of their own sect.

Development.— In the 10th and 11th centuries Karaism took on quite a large following. It spread notably in Babylonia, Persia, Syria, Palestine, and Egypt. It found a second home in Constantinople, and from here spread into Europe and certain parts of the Mediterranean litteral. We hear of Karaites in Salonica, and, what is of more importance, in Spain itself. One reason for this extension was undoubtedly the *point d'eppui* that Karaism gave to all those who, for one reason or another, were dissatisfied with Rabbinism. A more important reason was the supineness of the Jewish authorities in Babylon who were the nominal or spiritual heads of all the Jewish communities, but who were fast losing the direction of their affairs and prominence in scholarship. In a most surprising manner these Babylonian authorities misjudged the possible effects of the new schism. Even though proselytes were made out of their own ranks, they must have persuaded themselves that the new movement could be killed by silence. The Gaon Natronai bar Hilai (ca. 857–867) is the first one to busy himself with the new doctrine. In Spain it was otherwise. A Castilian Jew, Cid al-Taras, in 1054, journeyed to Jesrualem, where he became a convert to the new school. He returned and commenced to spread Karaism among the Spanish Jews. There grew up communities in Carrion, Burgos, Toledo, and Talavera, etc. The Rabbinites, however, were up in arms, and even secured the aid of the secular arm. Both the religious and the civil power weighed heavily upon the Karaites. At the end of the 11th century, then again under Alfonso VIII (1126–1156), and a third time under Alfonso IX (1158–1214), they suffered persecution and the schism was nipped in the bud.

But without making use of secular weapons, a young scholar in Fostat (Old Cairo), Egypt, set out in a scientific way to demolish the foundations upon which Karaism was built up. Had it not been for Saadiah ben Joseph (892–942), the heresy might have made great inroads into the Jewish body politic. Not only as a young man in Egypt, but later as Gaon at Sura, he devoted some of his best energies to refuting the works of Anan and to writing anti-Karaitic tracts. The refutation may be said to have been complete; for he set at rest any fear that the heresy might become dangerous to the real unity of Judaism.

The polemics of Saadia naturally called forth replies on the part of the Karaites and produced the flower of Karaite literature. Karaite scholars were forced to defend their theological position, their peculiar interpretation of the Bible, and their knowledge of the Hebrew language. The chief Karaite writers of this period were: the polemicist and Bible commentator, Solomon ben Jeruham (940); David ben Abraham al Fazi (950), the author of a Hebrew dictionary; Jacob al-Kirkisani (938), author of a commentary on the Pentateuch; David ben Boaz (ca. 910), author of a commentary on the Pentateuch and a work on the principles of religion; Japhet ben Ali (ca. 1000), their most prolific commentator, and Sahl ben Masliah (ca. 980), the author of a work on the Biblical laws.

Further History.— In the next period Constantinople becomes the center. Its most important Karaite scholar was undoubtedly Judah Hadassi (1149), the author of the Eshkol ha-Kofer, an encyclopedic work in rhymed prose, giving a whole system of Karaite theology and treating of the most varied subjects. After him lived Aaron ben Joseph, the elder (1300), a native of the Crimea, who is known not only as a distinguished Bible commentator, but as the compiler of the prayer book still used by the Karaites, and to which he contributed some notable poems of his own. Aaron ben Elijah, the younger (1300–1369), wrote the most philosophic treatise (Gan Eden) of any Karaite, as well as a commentary on the Pentateuch which is still very much in honor among his fellow believers. He had studied thoroughly the writings of Maimonides, and he did his best to raise up Karaism out of the morass into which it had fallen through the heavy onslaughts of Saadia. To these must be added Elijah ben Moses Bashyazi, the systematizer of Karaite canon law (1420–1490), his brother-in-law, Caleb Afendopulo (end of the 15th century), liturgical poet and writer of homiletic and theological works, and Moses ben Elijah Bashyazi (1544–1572), a writer on theology. At the present day there are from 50 to 60 families in Constantinople concentrated in the district Hasskeui. Upon several occasions the Karaites procured Firmans from the Porte recognizing themselves as a religious body apart from the other Jews and with their own chief rabbi. In 1900 these Firmans were confirmed by an Irade.

The Karaites had come into Egypt not long after the foundation of their sect. That they had made considerable progress there is seen from the fact that Saadia commenced his polemical writings in Fostat before 928, and that he had a number of direct opponents in the city. It was here also that lived the only important poet produced by the Karaites — Moses Dar'i who wrote in the style of the Judæo-Arabian poets of Spain. In Cairo, the Karaites, as elsewhere, kept themselves apart from the rest of the Jews. They had their own organization, at the head of which was a Nagid, who, however, was under the general jurisdiction of the Rabbinite Nagid. They had their own synagogues, first in Fostat and then in Cairo itself. They acquired a considerable amount of wealth there, being largely engaged in the goldsmith trade, while a number occupied positions of eminence chiefly as physicians. In the year 1313, when Abraham Maimonides was chief of the Egyptian Jews, a number of Karaites were converted to Rabbinism. At

the present day about 400 families live in Cairo mostly in a separate street back of the old Jewish quarter.

In Russia.— Under the Tartar rulers of Southern Russia Karaite Jews had emigrated during the 12th century into the Crimea and into Lithuania. From here they even penetrated into Galicia, and a Karaite community exists to-day there in the city of Halitsch. A portion of the city of Troki was given over to them; and here Isaac ben Abraham Troki composed, in 1593, his polemic, Hizzuk Emunah, directed against the Christian interpretation of Old Testament Messianic passages. It was especially in the Crimea that they flourished and evidenced some attempt at a revival of their literature; Simhah Isaac Lutski (1750) wrote a bibliography of Karaite writers, while Isaac ben Solomon, at the beginning of the 19th century, composed a work upon the doctrines of his sect. Their chief settlements here were in Chufut-Kale, Goslov (Eupatoria), Kaffa (Theodosia), Yenikele, and Sulchat. In contradistinction to the other Jews in the Russian Empire they have always been treated well by the government. In 1796 Catherine II relieved them of one-half of the poll tax, and from 1827 to 1874 they were entirely freed from service in the army. As late as 1905 the Karaites in Moscow were permitted to keep their synagogue open, a privilege not granted to other Jews. In the Russian Empire there are at present 43 Karaite communities, all under the leadership of an energetic Haham Pampuloff. They are, however, yearly decreasing in number; as they have until recently refused to intermarry with other Jews. The attempt was recently made to have the government grant complete civil rights to all Rabbinite Jews who married Karaite girls upon condition that they formally renounce the Talmud. It was in the Crimea also that a Karaite archæologist, Abraham Firkovich, made his celebrated collection of Karaite antiquities and manuscripts, after having traveled over a great portion of the Hither East for that especial purpose. Unfortunately, despite the excellency of this collection which is now deposited in the Imperial Library at St. Petersburg, he forged the dates on gravestones and upon manuscripts in order to prove the great antiquity of Karaite settlements in the Crimea and the disassociation of the ancestors of the present Karaites from the events that preceded the death of Jesus. At times, the Karaites in Russia have not scrupled at aiding the Russian government against the other Jews of the empire. At the present day there are about 10,000 Karaites in Russia, about 2,000 in Cairo, 20 or 25 in Jerusalem, and another thousand scattered in various places.

Dogmas and Customs — The religious dogmas of later Karaism have been formulated by Judah Hadassi as follows: 1. *Creatio ex nihilo;* 2. The existence of a Creator; 3. God is an absolute unity and incorporeal; 4. Moses and the other prophets were sent by God; 5. God has given to us the Torah, which is true and complete in every respect and not wanting the addition of the oral law; 6. The Torah must be studied by every Jew in the original language; 7. The Holy Temple was a place elected by God for his manifestation; 8. Resurrection of the dead; 9. Reward and punishment after death; 10. The coming of the Messiah, the Son of David. In other observances the Karaites differ in several particulars from the Rabbinites. Their synagogues are more thoroughly Oriental and have the appearance of Mohammedan mosques. Their prayers are largely made up of selections from the Bible, and of hymns composed by Aaron ben Elijah. Before entering the synagogue they remove their shoes. They do not wear phylacteries nor celebrate the festival of Hanukkah. They observe the Sabbath rest with great strictness; though in some places fire and light are now permitted on that day. Pentecost is celebrated on the day after the Sabbath; and the 10th of Ab is observed as the anniversary of the destruction of the temple. The prohibitive degrees of marriage have been greatly extended.

It should also be said that during its early development Karaism reacted favorably upon Jewish learning in the East. The Rabbinite Jews were forced to meet their opponents upon their own ground. Karaite exegesis led the Rabbinite Jews to a deeper study of the Bible and of the Hebrew language. The philosophic presentment of their theology necessitated an equally philosophic presentment on the part of the Rabbinites, and the rivalry they engendered was useful in turning the other Jews to a closer and more scientific examination of their own position.

Professor Semitic Languages, Columbia University.

11. **Judaism—Anti-Semitism.**—A term which has received a special signification of its own as the situation of the Jews in Germany, France, Russia, and elsewhere, in recent decades, has become more or less acute, means opposition to the Jews and their religion for various reasons. Such enmity, springing from many causes, has been a persistent factor in history from the era of the Pharoahs. Its manifestations assume dif-

ferent forms according to local or national conditions — from the crassest prejudice due to ignorance to more intense odium due to envy, and often arousing long-continued persecutions or popular outbreaks. While it is unjust to call every criticism of the Jews and Judaism as anti-Semitic—racial and religious peculiarities afford a fair field for the critic or investigator, who is not always to be termed an enemy because he discerns flaws or weaknesses — Anti-Semitism is wholly unfriendly, usually unjust, exaggerates minor defects into fundamental vices, employs faulty generalizations, and is careless how it arouses to strife and bloodshed, so keen and ruthless in pursuit of its quarry. History and literature abound in antipathies to nation and sect, from which, in Europe, Roman Catholic and Protestant, Methodist and Quaker alike have suffered, and which have crystallized themselves in words like barbarian and heathen, mummery and jesuitical. Anti-Semitism, however, in its intense and most characteristic form, is more than an antipathy — it is a relentless hunt to the death, which denying social and political equality to the Jew, would brand him as outcast and alien, strip Judaism of every distinguishing excellence, revive for the Jew an exclusive Ghetto or banish him from civilized climes. And this is done in the name of society, religion, and the state. What strength there must be in Judaism to awaken such antagonism! And how superficial the culture that countenances such enmity!

Origin and History.— The word Anti-Semitism owes its origin and present meaning to the ethnical differentiation of the Jews as Semites from the Aryan or Indo-European. Ethnology is made to prove that the racial traits of the Jews as Semites render them inferior and that they are legitimate objects of aversion. The theory as well as the present unfriendly signification of the term are of recent date, appearing in Germany about 1880, when the movement against the Jew and Judaism began to gain headway and spread elsewhere, as the era of persecution assumed a deadly phase in Russia. Decades earlier the word Semitism had been employed in a purely academic sense by philologists, but soon the theory of Semitic inferiority was to be asserted first by Lassen (1800–76), who ascribed to the Semite rather unflattering traits, such as intellectual sharpness, exclusiveness, and selfishness, in marked contrast to "the harmony of psychical forces which distinguishes the Aryan." It was reserved for Ernest Renan (1823–92) to emphasize still more strongly Semitic inferiority: he went so far as to assert that "science and philosophy were foreign" to the Semites. But if this opinion was not sufficient, he added in his 'Studies of Religious History' various other generalizations — a line in which he was quite proficient — to the effect that the Semites did not comprehend civilization in the modern sense; they were intolerant as the logical result of being monotheists, bequeathing their bigotry to the Aryans, who were naturally broader, while the Jews can attribute the hatred which has been extended to them for so many centuries to their glowing anticipation of future triumph. There can be little doubt that Renan's views had marked influence upon the growth of a hostile anti-Semitic spirit, although he urged his readers to be careful in their interpretation of his opinions. He stated expressly that Jews to-day were not Semites, but moderns, and he denied in his 'Judaism as Race and Religion' that there was such a thing as a Jewish race. The extensive literature of anti-Semitism shows throughout Renan's unconscious coloring. It was but a short path from him to von Hellwald, who called the Jew a "cancer," to Goldwin Smith, who termed him a "parasite," and to Stewart Chamberlain, the latest and keenest in his attitude of aversion.

In Ancient Authors.— The curious persistence of anti-Semitism in modern cultured writers and the faulty generalizations which they do not hesitate to proclaim as scientific truth, this finds its parallel in many famous authors of antiquity. Thus Manetho, high priest of the Temple at Heliopolis and court historian under the early Ptolemies, considered the Jews descendants of the Hyksos usurpers and attributed their expulsion from Egypt to sacrilege and irreligion, stigmatizing them at the same time as afflicted with leprosy — and the story was repeated by Chaeremon and Lysimachus, to reappear in Schiller's 'Mission of Moses.' Diodorus Siculus asserts that the prevalence of a plague in Egypt led to the banishment of foreigners, most of whom entered "the country now called Judaea;" at the same time he vindicates the character of Moses and the traditional religion. Apollonius Molo, a Greek rhetorician who lived at Rome in Cicero's time, pronounces Moses "a conjuror and deceiver;" and his disciple, Cicero, went further in his utterances to show his contempt. There are several passages in his 'Pro Flacco' which display his animus against a people whose wealth and influence were beginning to be feared. "Their barbarous superstitions must be fought," he exclaims; they are a nation addicted to "suspicion and slander;" they "display contempt for the Roman power." Tacitus, the model for historians, repeats the fables of Manetho as to the origin of the Jews and adds that their laws are "hostile to men and calculated to inspire the Jew with hatred and opposition to the rest of mankind"—"the first instruction they receive is to despise the gods, to forswear their country, to forget father, mother, and children." Horace and Martial could jest at the Jew and his ceremonies, like a modern comic journalist, while Juvenal exercised his wit more than once in the same direction, and Seneca, with all of his philosophic insight, deplores that "this abominable nation" has spread its customs everywhere and "the conquered have given their laws to the conqueror." Under such teachings from moralists and orators, what wonder that the spirit of persecution was roused in Rome, Antioch, Lybia, and the Greek cities, with its accompanying bloodshed. In this era Christian and Jew were brethren in suf-

fering and despised alike for harboring a "detestable superstition;" and many of the accusations which in after centuries the church hurled against the Jew were now forged against the Christian.

Apion and His Accusations.— It was Apion, an Egyptian teacher of rhetoric at Rome in the reign of Tiberius, who was probably the most violent anti-Semite in his field of his or any day; for his statements as preserved by Josephus in the historian's treatise 'Against Apion,' are modern in their variety and bitterness, while they are as baseless, as Josephus succinctly shows. Among his many charges, Apion claimed that the Jews derived the name Sabbath from the circumstance that they were obliged to rest after journeying for six days because they were afflicted with a painful disease which the Egyptians called Sabbatosis. He asserts that they put up a head of an ass in the Holy of Holies, that they caught a Greek annually, and fattened him for sacrifice. He accuses them of having produced "no wonderful men, not any inventors of arts or any eminent for wisdom." He states that "they swear by God to bear no good will to any foreigner, especially to Egyptians, while they have no just laws of their own and do not worship God as they ought." One of the replies made by Josephus can be given here. If the Jews, said the historian, had set up the head of an ass, it would not have been more contemptible than some of the animals, such as the goat, which the Egyptian deify. But the statement, he continued, is an untruth, which Apion would not have told had he not the heart of an ass or the impudence of a dog.

In the Dispersion.—The spirit of antagonism to the Jew which was displayed after the final destruction of Jerusalem and the gradual dispersion of the Jews, East and West, can hardly be called anti-Semitism, for it was really anti-Judaism and directed against the Jew and his religion. It was practically a religious, not a social or political crusade, in direct contrast to the modern movement which ostensibly claims to be without any religious motive and to work purely for the welfare of society and the state. Under the Romans there was often some approach to a legal residence, but the attitude of the church toward Jews and heretics was decisive. While here and there a kindly voice was heard and occasionally priest and prince championed them, the ages until the French Revolution were periods of enforced seclusion and repressive legislation. With the iron power of religion and the state checking them at every step, the Jews became a special class, awakening to new life and vigor for a few centuries under the Moslem, but liable at any moment to be at the mercy of the mob in Mohammedan Spain or Christian Europe. Being thus the weaker class both in numbers and prestige, upon whom insult could be heaped with impunity, the morale of the Jews was not to be improved by the policy which herded them in the Ghetto and restricted them from ordinary avocations. Most of the faults which their enemies discerned in them were acquired, not hereditary. The famous dramatist who to suit the London temper of his day consciously transposed the characters in the original story at the basis of 'The Merchant of Venice' and branded the Jew as a Shylock for all time, illustrates the attitude of those centuries. Springing from these conditions, came the conception of a Jew as a kind of Barabbas, in Marlowe's play, who poisons wells, murders children, commits all kinds of wickedness in his hatred of the Christian. In the heated atmosphere of the Dark and Middle Ages no accusation was too vile to fasten on the Jew. Hence their responsibility for the "Black Death," a plague which ravaged Europe between 1348 and 1351. A myth arose especially in Germany, that the disease sprang from the wells which the Jews had poisoned. Alleged confessions were sent from town to town and the maddened populace wreaked vengeance, forgetting that the Jews were suffering as much as their neighbors from the pestilence. In nearly every town in Germany, exclusive of Austria, about 350 in all, the Jewish communities were attacked, only three large Jewish centres by the end of the 15th century being left in that land. A further source of odium was the Jewish usurer. Owing to the canon law forbidding loans on money, the money trade of Western Europe fell into the hands of the Jews in the early Middle Ages, who charged high interest, first because there was little if any competition, and secondly because of the insecure tenure of their property,— emperors, prelates, and powerful individuals could not be depended upon long to remain under a burden of debt to heretics. However, Christian evasions of the canon law became frequent and Jews were soon despoiled of their capital; and as reputable trades, professions, and agriculture were denied them, they were forced into humbler occupations, but the taint of the money-lender has clung to them even in later days when money-lending has become the vital international pursuit. Undoubtedly it was imprudent for them to lend on interest, but they had no other resource and one can understand the sense of power it gave to a despoiled race, for which they had to pay dearly in exactions and expulsions from land to land until England was closed to them for centuries.

The Blood Accusation.— Among the many popular accusations which have been fostered upon the Jew, none is more revolting than the charge of using Christian blood for ritual purposes, notably in connection with the Passover. The origin of such a myth is still unknown, but the frequency of its occurrence the past seven centuries is not to be denied. When in our day Christion missionaries in China can be accused by the populace of slaying Chinese children for church purposes, one may faintly understand how such accusations originate in ignorance and fanaticism in any age or clime. But the slander seems doubly incredible when one realizes that there is no Jewish ritual which prescribes the use of human blood. It is needless in this connection to trace the history of the blood-accusation which appears first to have been alleged against the Jews in 1144, in the

case of St. William of Norwich, although the first literary mention dates from the middle of the 13th century, in a work of Thomas Cantimpré. The Norwich case was thus developed. A convert — and it must be confessed that converts were not averse to make mischief — said that the Jews annually sacrificed a Christian child at Passover, and when the boy was missing, the Jews were accused. It seems, however, that during an attack of catalepsy he had been buried alive by his relatives. No Jew was tried or punished in Norwich, but the rumor led to charges against the Jews in other English towns. A list of similar incidents from the 13th to the 16th centuries could be given. Chaucer has mentioned the story of Little Hugh of Lincoln — a lad of eight years, whose sudden disappearance was laid at the door of the Jews with tragic consequences. Most remarkable, however, is the survival of such a myth in the 19th century, cases having occurred in 1882 (Hungary), 1891 (Corfu and Prussia), 1899–1900 (Bohemia and Prussia), and of course without a shadow of proof as to the alleged crime. It is of interest to note that in recent years August Rohling of Prague, who was most conspicuous in his efforts to prove the truth of the blood-accusation, was completely refuted by a Christian theologian of distinction — Professor Strack in his scholarly book 'Das Blut.' Christian divines have protested against the charge, which has received the condemnation of many Popes and the sanction of none. Yet, such is the persistence of the anti-Semitic spirit, the accusation may reappear at any time in Eastern Europe.

Recent Movements.— In long-continued attempts to prevent the complete emancipation of the Jews in German about the middle of the 19th century there was ample opportunity for anti-Semitism to show its hand. Prominent leaders in politics, literature and the church alike advocated the denial to the Jews of civil and political rights so long as they remained Jews. The ideals of the French Revolution had been forgotten. When the unwholesome era of reaction had passed and liberalism became the nation's rallying cry, the clerical party scenting danger to absolutism began anew a crusade against the Jews as the cause of every evil, the prominence of Jewish members of the Reichstag like Ludwig Bamberger and Edward Lasker arousing fresh hatred. Hence arose anti-Semitism both in German and Austria as a distinct political program. In 1878 a Christian Socialist party, under Court Chaplain Adolf Stoecker, was formed, whose avowed purpose was anti-Jewish. "The Jews are our misfortune," said Prof. Heinrich von Treitschke (1834–96) in 1880 and for two decades the anti-Jewish agitation continued, it being made an issue in all elections and scattered riots took place, while books and pamphlets antagonistic to the Jews were published in the chief cities. It was even proposed to exclude Jews from public office, but that attempt was not successful. Bismarck acted as a check while in office and his influence led to Stoecker's retirement as court chaplain, while powerless or unwilling to prevent the growth of anti-Semitism. Renewed agitation appeared when Bismarck ceased to hold office (20 March 1890), and Ahlwardt began his attacks on the Löwe firm with their "Judenflinten" which were to be furnished the German army to ensure its defeat by the French; but his animosity was without ultimate effect, and he passed into obscurity like so many of his class, Henrici, Förster, Stoecker, and the rest. In 1891 the "Verein zur Abwehr des Antisemitismus," a society to combat the attacks of the anti-Semites, was formed by prominent German authors and scientists, showing the growing sympathy of the better classes, and little by little the agitation appears to have lost much of its virus, with the disappearance, often through imprisonment for various crimes, of notorious leaders. In Austria George von Schönerer was the first to begin a distinct anti-Semitic movement (1882), whose adherents were elected in steadily greater numbers to the Reichsrath and the provincial Diets. To Luegar, mayor of Vienna, the party is indebted for its turbulent character, although of late years its excesses have been less marked. In France, Edouard Drumont's book, 'La France Juive' (1886) was the beginning of an open anti-Semitic campaign which grew into the Dreyfus affair nine years later, as books and pamphlets were published, and Dumont's paper 'La Libre Parole' became widely read. The story of Captian Dreyfus shows to what length the anti-Semites will go; if Clericalism inspired their efforts the present dissolution of religious orders in France tells its own moral. In Russia anti-Semitism has produced since 1881 a succession of disorders in many cities which culminated in the excesses of Kishenef and elsewhere (1903) that have aroused the world to indignation. It remains to be seen if mediæval restrictions against the Jews will be abolished partly or wholly now that Russia is apparently on the road to Constitutional government. In Roumania, despite the provision of the Berlin Congress (1878) guaranteeing civil and religious liberty to all citizens, the Jews continued to receive harsh treatment, became victims of popular outbreaks; were restricted in trade and profession, and debarred from public schools. As the natural result of such treatment the past two decades have witnessed an increasing emigration from Russia and Roumania to all portions of the globe, the great majority settling in the United States.

Future of Anti-Semitism — In the diffusion of education and the gradual recognition of the truth that nations and creeds are partners in the great work of human betterment, one may expect a general disappearance of antipathies and animosities as the borderland of the religions is broadening and the era of co-operation and confederation is less distant than at any epoch in the world's history. This reconciliation is not to be hurried — one must be satisfied to think that the agreements among people and creeds are more numerous than the diversities which drive them apart. And the Jew will do his share to promote good will among men, as his race and religion are universalized and memories of persecution and prejudice no longer promote disharmony or exclusiveness. There will be no Jewish problem when civil and religious liberty is everywhere acknowledged and class privileges have ceased to exist in the growing consciousness of human brotherhood.

Bibliography — In the extensive literature on the subject the best general works are Le Roy Beaulieu, 'Israel chez les Nations,' (English translation by Mrs. Hellman); B. Lazare, 'Contre l'Antisemitisme' (English translation New York 1903); Joseph Jacobs, 'The Jewish Question' (London 1885). On the blood-accusation, beside Strack's work, compare Chwolson 'Blutanklage' (Frankfort 1901); Franz Delitzsch, 'Schuchmatt, den Blutlügnern, Rohling and Justus' (Erlangen 1883); M. Joel, 'Die Angriffe des Heidenthums an Juden und Christen in den Ersten Jahrhunderten Römischen Cæsaren' (Breslau 1879). A useful little work is John Gill, 'Notices of the Jews and Their Country by the classic writers of antiquity' (2d ed. London 1872).

ABRAM S. ISAACS,
Professor of Semitic Languages, New York University.

12. Judaism — Zionism — *Past and Present.* The first Basel Congress (1897) declared that the movement it organized "aims at establishing for the Jewish people a *publicly* and *legally assured* home in Palestine;" but modern Zionism is too complex to be defined by any formula. It is a broad stream wherein flow, but partially commingled, many currents. The first in point of time is the expectation founded on biblical prophecy and its traditional interpretation, that God's purpose concerning His people can only be fulfilled by regathering the dispersed of Judah and Israel in the land of their fathers; and that this will be brought about through a divinely-commissioned prince of the House of David — hence an "anointed one" (Messiah). This hope is expressed in many prayers of the established synagogue liturgy and even in the individual or collective "grace after meat." In those countries and times, however, wherein Jews have enjoyed a practical civic equality with their neighbors, the Messianic expectation has been for many centuries and with the vast majority rather an article of faith and a pious hope of the indefinite future, than a matter of immediate concern. Everywhere, Jews have exhibited the most ardent attachment to the land of their birth or adoption and have rendered it faithful and patriotic service. In Germany the 19th century witnessed a conference of Rabbis (Frankfort, 1845) who faithfully represented a large body of "Reform Jews" resolving to expunge from the prayer-book "the petitions for a return to the land of our forefathers and the restoration of the Jewish State;" while in the United States this example was not only followed by two rabbinical conferences (Philadelphia, 1869, Pittsburg, 1885), but bettered by the declarations of preachers and orators that "America was [their] Palestine and Washington [their] Jerusalem." In those countries wherein the Jews have been continuously oppressed, as Russia, Roumania, Galicia, Morocco, the "dream" of re-establishment in the Holy Land as a priestly nation, under the direct protection of Providence, has naturally been more prolonged and more intense; and a strong intelligent minority — not all of whom may be characterized as "enthusiasts" — has nurtured the same hope, even in free countries. The belief that restoration was to be signalized, as of old, by some unmistakable sign of miraculous intervention, necessarily tended to discourage human initiative. Hence the many attempts, fantastic, tragic, or simply premature, of pretended Messiahs (*e.g.* Serene, 729; David Alroy, 1160; Sabbathai Zebi, 1648); of Jewish statesmen in the service of European states (*e.g.* Joseph Nasi, Duke of Naxos, Venice, 1550, Constantinople, 1565); or of benevolent Jews of local prominence (*e.g.* Mordecai M. Noah of New York, C. 1820) to establish self-governing Jewish communities in Palestine or elsewhere proved abortive or disastrous. A less ambitious and more frankly philanthropic movement has, however, in recent times, met with a somewhat greater measure of success. In 1870 Charles Netter, acting for the "Alliance Israélite Universelle," established a farm-school near Jaffe, on land presented by the Sultan (Mikveh Israel) and in 1878 under the influence of Laurence Oliphant, active work in planting Jewish agricultural colonies in Palestine began. Baron Edmond de Rothschild now became interested and gave wise and practical aid. In 1882, and subsequently, many settlements arose. This was brought about largely through agitation in Germany and, especially, in Russia, by means of various societies which finally took the name of Chovevei Zion ("Lovers of Zion"). Stimulated by the Roumanian and Russian persecutions of 1880 and 1881, the movement continued to spread in these and other countries, including England, France, and the United States; and in 1884 a conference was held in which more than 50 societies were represented. This phase of Zionism reached its height in 1890. In 1892–1894, perhaps because the immigrants were so largely of Russian nativity as to raise the question of a possible complication with a persistent enemy, the Sultan's government restricted the entry of foreign Jews into Palestine, and the colonization movement received a temporary check, only recently removed. Meanwhile two other currents, always more or less active, began to flow strongly; one of them, turbulently. The latter third of the 19th century was marked in Europe by the recrudescence of separatist and nationalist sentiment. The French Revolution had made "universal brotherhood" a watchword, and this influence persisted until after the failure of the revolutions of '48 in Germany. The Franco-Prussian War (1870) and the Russo-Turkish War (1878) marked the returning intensification of racial and national hatreds. To this a false philology and a falser anthropology brought its pseudo-scientific jargon of "Aryan," "Semite," and "Hamite." Out of the whirlpool that arose issued the two streams that have most influenced modern Zionism — renascent Jewish Nationalism — a *Volk Geist* no longer religious in motive, and anti-Semitism. George Eliot in 'Daniel Deronda' (1876) described the first; the resurrection of obsolete oppressive laws and government-incited massacres in Russia (1880 to 1906) typify the last. (See JUDAISM — ANTI-SEMITISM.) In Germany, France, and Austria Jews were not killed or subjected to legal disabilities, but they were harassed and restricted in social and professional life until finally the high-water mark of

this form of persecution was reached in the "Dreyfus Affair" in France (1894-1906).

The Herzl Movement.— It may have been his observation and experience while sojourning in Paris in 1895 as correspondent of the *Neue Freie Presse* of Vienna, that led Dr. Theodor Herzl (b. 1860, d. 1904), an Austrian playwright and feuilletonist not before identified with Jewish life or affairs, to write his 'Judenstaat'; an attempt to prove that the "Jewish question" can only be solved by the establishment of a Jewish State. At first intended only for private circulation, this pamphlet was later published broadcast (1896) in German, English, French, Hebrew, and Yiddish. Assuming that anti-Semitism is uneradicable; that whatever may be true as to individual Jews here and there, the Jews as a whole are not welcomed into the social life around them; and that true assimilation is possible only by means of intermarriage — which means disappearance — Herzl proposes an organized effort to obtain a territory wherein Jews may build up a State of their own. The underlying motive being political and economic, not religious, one part of the globe will serve as well as another, and he at first suggested that Argentina might be available. Later, he was brought to realize the sentimental importance of the Holy Land, and now for the first time his proposition becomes in truth Zionistic. In some of its details it was, indeed, anticipated by Benedetto Mussolino (1870), an Italian Christian, who had vainly journeyed to London in the attempt to interest Lord Palmerston and Lord Rothschild in his project. In both plans Turkish suzerainty is to be acknowledged, and the holy places of other faiths made extra-territorial. For the accomplishment of its object the 'Judenstaat' suggests first, a "Society of Jews" to do the preliminary scientific and political work (since measurably realized in the Zionist organization, especially its "Palestine Committee"); then a chartered "Jewish Company," similar to the British East India or South African Company, with a capital of £50,000,000 and with headquarters in London (partially realized in the "Jewish Colonial Trust"). In July 1896, Herzl was induced to present his plan in person before representative London Jews. It was received with polite coldness or active hostility — in striking contrast to the enthusiasm evoked from an assemblage of poor Jews in the east end of that city. The difference was typical and prophetic. Indifference or opposition was manifested by the vast majority of prosperous Jews, not only in England but also in Western and Central Europe, and virulently in America.

Spread of the Movement.— The 'Judenstaat' nevertheless exerted an influence in the crystallization of opinion and action among Jews imbued with or susceptible to the nationalist sentiment. More important was the change gradually wrought in the attitude of Herzl himself, who, forced far beyond his primary intention of literary propaganda into the active rôle of leader and organizer of a reawakened people, and brought into contact, as not before, with religious Jews of both orthodox and reform wings, began better to understand both his people and their destiny. His new thought sprang into extemporaneous and epigrammatic utterance when he declared at Basel that "the return to Judaism must precede the return to Zion." For by this time much support had come from among the "Chovevei Zion" and kindred societies, and an alternative territory to Palestine could not be considered. The Jewish bankers and rich Jews in general continued to be either indifferent or antagonistic to Zionism. Certain orthodox rabbis opposed it as an endeavor to anticipate Providence; Reform rabbis denounced it as an attempt to reverse history. Many sincere thinkers, regarding anti-Semitism as a temporary aberration, regretted the movement as an apparent abandonment of the position won by Jews in countries where their only distinction from fellow citizens is in creed, not in nationality — a position to be stoutly contended for wherever it has not yet been attained.

Herzl was not, however, altogether without the help of Jews of learning and distinction, and among those who early declared in his favor were representatives of the strictest orthodoxy, of the most extreme radicalism, and of the supremest indifferentism to all religion. Sympathy also came from the Gentile world from men eminent in art, literature, statesmanship, and Christian theology. A call was issued for an international convention at Munich, but so great was the opposition of the most influential rabbis and laymen among the Jews of Germany that Basel in Switzerland was chosen instead, and there, on July 29, 30, and 31, 1897, the first Zionist Congress assembled. It was composed of 204 members, most of whom came as private individuals, though a number represented various organizations, especially the "Chovevei Zion" societies, which later became virtually merged into the Zionist body here constituted. This Congress issued the document known as the 'Basel Program,' defining the Zionist aim in the words cited at the head of this article and proposing the following means for its attainment: (1) The promotion of the settlement of Jewish agriculturists, artisans, and tradesmen in Palestine; (2) the federation of all Jews into local or general groups according to the laws of the various countries; (3) the strengthening of the Jewish feeling and consciousness; (4) preparatory steps for the attainment of those government grants which are necessary to the achievement of the Zionist purpose. The scheme of representative organization was formulated, an executive body (Actions Comité) constituted, and steps taken toward the establishment of a "Jewish national fund" and the formation of a banking corporation which should be custodian of the national fund and perform the functions which the 'Judenstaat' had suggested for the "Jewish Company." "The National fund," now about $265,000, is derived from the sale of stamps placed upon all official Zionist communications, and upon other correspondence by ardent Zionists; from free-will offerings, and from payments made to inscribe persons and societies in the "Golden Book." It is to be used exclusively for the purchase of land in Palestine, and although originally intended not to be touched until it had reached $1,000,000 has recently been drawn upon for such pur-

poses. The Zionist bank, officially known as the Jewish Colonial Trust, Limited, of London, was chartered under the laws of Great Britain, "to promote, develop, work, and carry on colonization schemes in the East, by preference in Palestine and Syria, or in any other part of the world." Its authorized capital stock is £2,000,000 in £1 shares, of which somewhat less than £325,000 has been paid in, chiefly by the joint efforts of the very poor and upon an instalment plan. Control is lodged in 100 "founders' shares," which must be held by members of the "council of administration," who must in turn be chosen from the "Grosses Actions Comité" (Greater Executive Committee) of the Zionist organization. In 1902 a subsidiary corporation, "The Anglo-Palestine Company" was formed and a branch opened in Jaffe. Quite recently branches have been opened in Jerusalem and in Beïrut. Through the Colonial Trust the Zionist organization hopes to obtain concessions of territory, and to promote therein agriculture, industry, and commerce. Meanwhile it is the custodian and administrator of the Jewish National Fund and devotes its capital to the encouragement and development of private enterprise on the part of the settlers in Palestine. In 1906, its statutes were so altered as to restrict its operations to Palestine and adjacent regions.

Work of the Congresses.— The second and third congresses were held at Basel in 1898 and 1899 respectively. Organization had now so far progressed that only delegates were permitted to vote. A proposition to acquire Cyprus was rejected. With a view of making propaganda the fourth congress (1900) was held in London; the fifth returned to Basel and decided that subsequent assemblages should be biennial. Herzl necessarily became president of all congresses held during his lifetime and chairman of the smaller executive committee which had its seat in Vienna. He practically gave up his life to the work, except in so far as his refusal of salary made it necessary to continue his literary labors for a livelihood. He had interviews with ministers and crowned heads, including the Sultan and Kaiser Wilhelm II., from both of whom he received sympathetic expressions, but he was never able to report more than "progress" to the congress. Negotiations with representatives of the Egyptian and English governments for a concession of land at Al'Arish in the Sinaitic peninsula (1898) failed because of the necessity for irrigation, as diversion of any part of the Nile water could not be permitted. Herzl continued, however, to keep in touch with the British government and at the sixth Zionist congress held in Basel, 23 to 28 Aug. 1903, was enabled to make public the willingness of Lord Lansdowne "to entertain favorably proposals" from the Jewish Colonial Trust, Limited, "for the establishment of a Jewish colony or settlement" in British East Africa; with the "appointment of a Jewish official as the chief of the local administration, . . . and permission to the colony to have a free hand in municipal legislation . . . such local autonomy being conditioned upon the right of His [Britannic] Majesty's government to exercise general control." The proposition to send a commission to examine the country offered and to report to a subsequent special session of the congress was bitterly opposed by the Russian delegates, who on its adoption withdrew, and only Herzl's personal pleading and the agreement that no funds of the Zionist organization should be expended by the Commission of Inquiry prevailed upon them to return to subsequent sittings. Much delay was experienced in forming and despatching the Commission; opposition becoming meanwhile more and more pronounced in Russia, spreading to Germany, England, and America. Simultaneously with the sixth Basel Congress, the first Jewish Congress had met in Palestine in the colony Zikron Jacob, under the presidency of M. Ussischkin of Ekaterinoslav, apparently never proceeding further. Ussischkin, however, organized an aggressive movement within the Zionist organization to discredit and defeat the East African project. Others proceeded with greater considerateness but no less determination. A conference of Russian members of the "Greater Actions Comité," held at Kharkof in October 1903, demanded the abandonment of all schemes of "Territorialism"; by which term the movement for Jewish State-building outside of Palestine now became known. Meanwhile the East African Commission had reported to the Actions Comité 16 May 1904. The report was not unanimous, but two of the three members agreed that the territory offered by the British Government (the "Ghas Ngishu plateau") was insufficient for a large number of Jewish settlers, and was fitted for grazing rather than agriculture. At the sixth congress Herzl had exhibited signs of physical weakness. The worry consequent upon the dissensions that followed this congress completed what nine years of overwork and anxiety had begun, and on 3 July 1904 he died after a few days of acute illness. The seventh congress (Basel 1905) attended by more than 600 delegates, was controlled by the followers of Ussischkin. It voted overwhelmingly to "reject either as an end or as a means colonizing activity outside Palestine and adjacent lands," and that "the Zionist organization shall not engage itself further with the proposal of the British Government." As a result, the Territorialist delegates, under the leadership of Israel Zangwill (q.v.), met upon the adjournment of the congress and organized the "Jewish Territorial Organization" (Ito), which has since perfected an international organization, aiming to obtain wherever feasible, "a publicly, legally assured place of settlement upon an autonomous basis" for those Jews who are persecuted in the countries wherein they now live.

Many anti-Zionists and non-Zionists have joined the Ito, and many who remain Zionists, particularly in America, have united likewise with the new organization. It has recently appointed a "Geographical Commission" embracing such men as Lord Rothschild and Hon. Oscar S. Straus.

Present Status.— The number of Zionist societies throughout the world runs well into the thousands. They are composed of members subscribing to the Basel program and paying "one shekel" (25 cents) yearly into the general fund, with such local dues as may be

exacted. For every 200 shekel-payers one delegate may be sent to the congress. The societies in various countries are aggregated more or less completely into federations. The present head of the executive committee and president of the Jewish Colonial Trust is David Wolffsohn of Cologne, to which city the headquarters has been transferred. Here also is now published 'Die Welt,' the Zionist organ founded by Herzl, and here will meet the "yearly conferences" of the Larger Executive Committee, which will probably take the place of frequent congresses. One of the most promising features in recent reorganization is the "Palestine Committee," headed by Prof. Otto Warburg of Berlin, which systematically studies industrial and other conditions in Palestine. There are many parties in present-day Zionism — some being religious, others non-religious or even irreligious, and having various economic aims, such as the "Po'ale Zion," a frankly proletarian or even socialistic organization. The "Ziyone Zionists," probably representing the old "Chovevei Zion," demand immediate work in Palestine. The "Political Zionists," headed by Nordau and Wolffsohn and embracing Herzl's closest adherents, insist on diplomatic action, while the "Practical Political Zionists," regarding autonomy as of less importance than legal authorization, favor systematic colonization in Palestine and neighboring lands under the best attainable assurances. "Moral Zionism" pleads for a national spiritual rather than a political centre in Palestine. Doubtless in time the fusion of these varied elements will lead to useful results. Meanwhile the Jewish population of Palestine is increasing with rapidly developing activites, agricultural, industrial, commercial, educational; while Zionism has brought closer together the Jews of different lands; stimulated anew the study of Hebrew literature and Jewish history and led to a reexamination and increasingly better understanding of the fundamentals, ethnic, religious and economic, of Judaism.

13. **Judaism—Spirit of Rabbinic Legislation.** In Deut. iv. 2, Israel was told: "Ye shall not add aught to the word that I command you, nor shall ye diminish aught therefrom." In the course of time, however, many new laws unavoidably crept in, along with new outward conditions, habits of life, tastes and beliefs; aside from relapses towards the old Babylonian statutes, forming a kind of common law for all Semitic Asia.

The Law-making Power.— For lack of an elective body wielding undisputed authority, with the early disuse of the sovereign assemblies of all Israel known from the book of Judges, the law-making power rested only with the learned men, who were wont to interpret and apply the existing laws, that is with the judges. These sat not only in civil and criminal cases but also passed on all questions of morals, ritual, and doctrine, for state and church were one. After the death of Herod, it seems, any man learned in the law began to be called "rabbi," or "my master"; but the rabbi's office and spirit fell to Ezra and his companions. The leading scribes from their time down to Simeon the Just were comprised under the vague name of the "Great Synagogue." Of their names and activity hardly anything is known with certainty; but there were ascribed to them these maxims (Mishnah Aboth, i. 1): 'Be slow in judgment, raise up many disciples; make a fence around the law.' The last maxim led to many additions to the divine commands; for the rabbis narrowly construed the verse forbidding additions or diminutions thus: Whenever the law names so and so many things to be used for one purpose; for instance, four paragraphs in the phylactery (Ex. xiii. 9, 16; Deut. vi. 8; xiii. 18), you must not use one more nor one less than this number. The grouping of the three maxims shows that the same men were judges, religious teachers, and law-makers.

Making of New Laws.— New laws were worked out mainly by a bold interpretation of the Torah (Pentateuch), which when accepted by the people became part of the traditions or of the oral law. This was carried down the ages by word of mouth from teacher to pupil or in the remembrance of judicial decisions until towards the beginning of the third century it was written down in the Mishnah, the commentaries on Exodus and Leviticus and in the Aramaic version (Targum) of Onkelos. The Mishnah in turn became the text of the later discussions of the Talmud (see The Talmud), and this whole mass of religious and juridical lore proved the starting point for the rabbis of later ages. Many of the new rules were avowed innovations, bearing the name of "Gezeroth" and of "Taqqanoth" (prohibitions and institutions).

Scope and Method.— The drift of rabbinical legislation ran always along four lines: the desire to set up a "fence" or outworks around the law; to render it more humane, fitted for a higher culture; to create a more rational and spiritual worship of God than that of the sacrificial altar; in times much later than the Talmud to adapt the Jews to the demands of their non-Jewish neighbors. It is to be understood, however, that the Talmud itself lays the groundwork for such concessions. The "fence" was sometimes thrown around a moral prohibition, such as that against receiving usury from fellow-Israelites; but it was mainly

directed to ritual observances, such as Sabbath rest and abstention from forbidden foods. The rabbis frankly declared that certain acts, if done on the Sabbath, constitute "work" in the scriptural meaning, while other acts, although not capitally sinful as work, should be avoided, as they would lead to sinful work. Thus to bake or cook any food on the Sabbath is a scriptural sin; to eat anything on the Sabbath cooked or baked by a Jew, or even by a non-Jew at a Jew's request, is forbidden by the scribes. Again, the law forbids the eating of blood, but adds, "Thou shalt pour it on the earth like water"; which indicates that only blood which can be poured out, not blood which can be drawn from the flesh by artificial means, is scripturally forbidden. Yet the rabbis prescribed a course of salting and watering the flesh of mammals and fowl, although these had been bled to death in the act of slaughtering. They feared that the taste of the inhering blood once acquired might tempt the people to eat also the flowing blood. In like manner, the prohibition of leavened food on the Passover was surrounded by many minute rules which were avowedly not demanded by the true meaning of the text: for example, that against the use of "Median strong drink," that is a fermented infusion of barley. On the strength of the command (Num. xxxi. 23) for cleansing the captured utensils of the Midianites the use of dishes which have been employed for forbidden food, unless they have first been appropriately cleansed, is prohibited. Earthenware thus defiled cannot be cleansed, but must not be used at all. Thus the dietary laws of the Jews address themselves as much to the kitchen utensils as to the stomach. The thrice written words: "Thou shalt not seethe the kid in his mother's milk" were construed "thou shalt not cook, eat or use flesh in milk." While admitting that fowl's flesh is not within this wider scope of the prohibition, as its mother gives no milk, the rabbis nevertheless told the faithful that the flesh of fowl must also be kept out of touch with milk or cheese. The task to keep flesh and milk and the dishes for each apart is quite an obsession to observant Jewish housewives. The desire to bring humanity into the law and the ministrations of justice was shown by construing "eye for eye, tooth for tooth," etc., into a rule under which the assailant must pay in money both for the loss of earning capacity and for the pain inflicted; while damages for the affront were deduced from Deut. xxv. 12, which hard-sounding verse was held to signify this and nothing more. The Mishnah may have been right in its construction of "eye for eye," but to change the amputation of a woman's hand into a rule that awards a solace in cash for the disgrace of a whipping, is judicial legislation of the boldest type; but it was evidently borne out by ancient custom running back to the code of King Hammurabi. In the cause of mercy the rabbis taught that a man condemned to stoning should be thrown headforemost on a large stone; one condemned to be burnt should have hot lead poured into his throat at the moment of being strangled. The penalty of death or of forty stripes (at least for ritual offenses) was to be adjudged only when the culprit had been previously warned of the sinfulness of his act; and criminal proceedings were beset with such technicalities as to render conviction almost impossible. The position of women, both as wives and daughters, was much more favorable, the power of the husband and father much more restricted, than if the text of the Pentateuch alone had been regarded. Thus at the age of twelve years and a half a girl was termed "mature" and thenceforward freed from the father's control. The law for maintaining and endowing orphan daughters put them in a majority of cases in a more favorable position than the sons and heirs.

Spiritual Growth — The returned Babylonian exiles naturally craved a more spiritual mode of worship than that of bloody sacrifices. In the land of their captivity they had worshipped God without an altar. King Josiah's reform restricting all offerings to one chosen place had taken root. The farmers of Judea could bring or even see a sacrifice but rarely; they could fulfil Hosea's prediction: "We shall make good the bullocks with our lips." Still there was the temple with its altars of incense and sacrifice; there was the caste of the "Cohanim" claiming descent from Aaron, alone qualified to minister and partly supported by a tribute paid in kind ("Terumah"), which might be eaten only in "levitical cleanness" by them and their households. Then Ezra, although of the priestly caste, and his associates and successors of the Great Synagogue, began building up the liturgy which in its outlines is used still by the Jews of our day. Its main elements are: the reading of the Shema' ("Hear O Israel"), which is Deut. iv. 4–9, xi. 13–21, and the last five verses of Num. xv.; the former two passages inculcating belief in God's unity and in national reward and punishment, demand "thou shalt speak of them when thou liest down and when thou risest"; the latter to commemorate briefly the liberation from Egypt. When "thou liest down and risest" was interpreted to mean at even and morning tide, thus enabling many to join in worship. Among the benedictions drawn up to precede these readings one was written to combat three forms of false belief. It blesses the Lord "who formeth light and createth darkness," in protest against Persian dualism; it asserts that He renews on each day the work of creation, in opposition to a godless philosophy; it names Him as the maker of sun, moon and stars to rebuke those who worshipped the luminaries as gods. The other chief element is the prayer proper, modified for Sabbath, festivals, new moons and fasts, spoken in standing posture twice daily, morning and afternoon; a third recital in the night service was made obligatory only by the efforts of the patriarch Gamaliel about 100 A.D. A grace after meals was elaborated, based on the command in Deut. ix. 1: "thou shalt bless the Lord thy God for the goodly land, etc."; and other home devotions for hallowing Sabbaths and festivals at the evening meal, to denote the return of work time, special services for Passover night, and for many other domestic occasions, were prepared. To the duty of reciting the liturgy was added that of hearing at stated times — Sabbaths, festivals, Mondays and Thursdays — the written Law read in public. Nehemiah's wooden turret (viii.) is the pattern for the platform from which the

scroll of the law is read today, as Ezra read it to men, women and children assembled around him. Later on lessons from the prophets were added; in the days of Jesus it had become customary to preach on a text from this lesson. Thus while sacrifices went on in the temple, the synagogue (see SYNAGOGUE) was ready in and outside of the holy land whenever the Israelites met, to satisfy their needs with common exercises — confession, praise, prayer, the study of God's law, comfort from the prophets, monition to faith and good works. When the temple fell, the synagogue had almost supplanted it by greater usefulness. The Pharisees (see JEWISH SECTS), or "Haberim," companions as they called themselves, had already taught the people that learning in the written law and in the traditions was weightier than priestly descent; as the Mishnah bluntly puts it: an adulterine bastard, if a disciple of the sages, is of more importance than an unlearned high priest. The rabbis of the Mishnah and Talmud and all their successors in the rabbinical office have been either Pharisees or the spiritual descendants of the Pharisaic party, which represented the main current of Jewish thought.

Influenced by Conditions.— The rules comprised under the name of the "ban of Rabbenu Gershom" (Rabbi Gershom ben Judah, b. at Metz 960; d. at Mayence 1040), form the best illustration of a principle proclaimed by the rabbis and accepted by the Jewish people as a concession to the nations among whom they dwell. The date and place of the synod which issued this "ban" is rather uncertain; the latest researches fix it at about the year 1000 and at Mayence. It was pronounced against Jews living in Christian countries, and accepted by those alone, who should be married to more than one wife at a time, or who should divorce a wife (except for notorious adultery) without her consent, or who should put obstacles in the way of one apostatizing under fear of death when he tried to return to the fold. But this decree of comparatively late date is only the outcome of the principle declared by Samuel at Nehardea (about 235 A. D.): "The statute of the kingdom is law"; that is, when the law of a country does not demand from the Jew anything contrary to the law of God, he should obey the law of the country in which he lives.

14. Judaism — A Century of Emancipation. Up to the close of the 18th century the Jews had no political or civil rights anywhere. The only serious attempt at remedying this state of affairs before that time was made in England in 1753, when Parliament passed the Jews' Emancipation Bill, but so great was the outcry raised throughout the country that it was immediately repealed. In Germany a kindlier spirit had arisen in the latter half of the 18th century, the era of enlightenment, notably through the influence of Moses Mendelssohn (q.v.). Lessing's friendship had resulted in 'Nathan the Wise', and another friend of the "Jewish Socrates", Christian Wilhelm von Dohm, made the first extended plea for the political emancipation of the Jews in his work 'On the Civil Improvement of the Jews' (1781). In 1782 the Emperor Joseph of Austria issued the famous Toleration Edict; its object was not the political but rather the educational emancipation of the Jews; schools were established in which other branches than the Hebrew, the only subject of instruction then offered to Jewish children, were taught. After Mendelssohn's death the French orator and statesman Mirabeau (q.v.) published a book entitled 'Moses Mendelssohn and Political Reform' (London 1787), in which he urged the cause of the Jews.

France.— The country in which these seeds first bore fruit was France. A year before the French Revolution the Royal Society of Sciences and Arts of Metz offered a prize for the best essay on the subject 'What are the best means to make the Jews happier and more useful in France?' Nine were offered in competition for the prize which was awarded jointly to three contestants, one of whom was the Abbé Gregoire, to whose efforts as a member of the National Assembly the passing of the bill on 27 Sept. 1791, granting full rights of citizenship to the Jews of France, was largely due. Some time earlier (23 Jan. 1790) the assembly had voted rights of citizenship to the so-called Portuguese Jews. The status of the Jews also engaged the attention of Napoleon I. In 1807 he convened in Paris an assembly of Jewish notables from the various sections of France and Italy, known as the French Sanhedrin, to which he propounded a number of questions, the sixth of which was "Do the Jews who are natives of France, and are treated as French citizens by the law, look upon France as their fatherland? Do they consider themselves in duty bound to defend it? Are they obliged to obey the laws and satisfy all the demands of the civil code?" These questions were answered with a decided affirmative: the emperor was assured that the Jews looked upon other Frenchmen as their brethren and upon France as their native country. The final step which placed the Jews for once and all on terms of absolute equality with all citizens of other faiths was taken on 13 Nov. 1830, when the minister of education offered a bill providing for the payment of the salaries of the rabbis from the public treasury as was the case with Catholic priests and the Protestant clergy. This became a law 8 Feb. 1831. The last vestige of mediæval discrimination against the Jews disappeared when the Supreme Court abolished the oath "More Judaico" in 1846.

Holland.— In the national convention of the Batavian Republic a bill was passed on 2 Sept. 1796, which declared that "No Jew shall be excluded from rights or advantages which are associated with citizenship in the Batavian Republic and which he may desire to enjoy." Since then the Jews of Holland have had all political rights; how absolutely their equal standing with other citizens is assured appears from the adoption of a resolution by the Legislature in 1845 giving the widows of rabbis the same pensions as the widows of the Protestant clergy.

Germany.— In none of the many German States was political emancipation definitely

granted to the Jews before 1848. True, the Prussian edict of 11 March 1812, issued by Frederick William III. at the instance of his liberal-minded prime minister, Hardenberg, did declare the Jews to be natives and granted them citizenship on the condition of their taking family names and using the German or any other living language in place of the German-Jewish jargon. They were given permission to settle anywhere and to acquire real estate; all special Jew taxes were abolished; in return they had to assume all the obligations of citizenship, notably the payment of taxes and military service. After the Congress of Vienna and the fall of Napoleon a spirit of reaction set in and this edict remained practically a dead letter. Not till 1848 was definite political emancipation granted the Jews of Prussia. Paragraph 4 of the law of 5 Dec. 1848, declared that "All Prussians are equal before the law. Class privileges are not recognized. Public offices are open to all who are capable of filling them." and paragraph 11 stated that "The enjoyment of political rights is independent of religious confession and of membership in any religious association." In that same year the delegates from the various German States in Parliament assembled at Frankfort-on-the-Main formulated a statement of the fundamental rights of the German people. Paragraph 13 was to the effect that "The enjoyment of civil and political rights is to be neither conditioned nor limited by religious belief; neither are political duties to be interfered with by it." The chief champion of the cause of Jewish emancipation in Germany was Gabriel Riesser (1806–1863). Notably during the fourth and fifth decades of the 19th century when this question was prominently before the Legislatures of the various German States was he active. In each one of these States the Jewish question had a varied course, but in time one after the other removed the civil disabilities of the Jews, Hanover and Nassau in 1848, Wurtemburg in 1861, Baden in 1862, Savony in 1868, and Bavaria last of all in 1869.

England.— In England the final struggle for Jewish emancipation began in 1830 and continued till into the 20th century, when in 1903 the religious test at London University was abolished with the appointment of a Jew (Israel Gollancz) to a professorship. In 1829 the bill removing the civil disabilities of the Catholics had passed the Houses of Parliament. The following year Robert Grant introduced a bill in the House of Commons granting the same boon to the Jews; this bill was passed in the Lower House in 1833 but was defeated in the House of Lords; the same fate met the bill in 1834; in fact the bill was passed ten times in the House of Commons and rejected as often in the Upper House before a Jew was finally permitted to take his seat in the House of Commons in 1858. In 1835 a bill was passed called the Sheriffs' Declaration Bill permitting Jews to hold the office of sheriff. In 1836 David Salomons was elected sheriff in London. In 1845 a bill became law whereby Jews were permitted to hold municipal offices. The Religious Opinions' Relief Bill passed in 1846 removed some minor disabilities from Jews and dissenters from the established church. The situation became particularly acute when Lionel de Rothschild was elected to Parliament in 1847 for the City of London. A bill was introduced in December of that year to permit him to take his seat. It took the course of its predecessors of like nature, passing the Commons, and being thrown out by the Lords. The year 1850 witnessed a similar experience. David Salomons who was elected a member for Greenwich in 1851 took the bull by the horns when he persisted in holding his seat although ordered to withdraw by the speaker; he aggravated the offense when he voted "no" on a motion for adjournment made after his refusal to withdraw. The prime minister now ordered that he leave the chamber. Salomons addressed the House and although the members sympathized with him they sustained the prime minister. The case was carried to the courts; the decision was against Salomons on the ground that he had no right to vote before taking the oath prescribed for members of Parliament. He was compelled to pay a fine of £500 for each time he had voted. Three times more, in 1853, 1856, and 1857, the Commons passed the bill, but the Lords persisted in rejecting it; finally in 1858 a bill passed both houses which declared the House of Commons competent on occasion to modify the form of oath by special resolution. Lionel de Rothschild by such special resolution of the House was now permitted to take his seat, omitting from the oath the words "on the true faith of a Christian." In 1860 this concession was made a standing rule and in 1866 the Parliamentary Oaths' Act was passed which omitted the objectionable words altogether and thus removed the discrimination which marked off the Jewish members. The University Test Act was abolished in 1870; in 1885 the first Jew (Baron Nathaniel de Rothschild) became a member of the House of Lords, and in 1890 all religious tests for all offices excepting the kingship itself were removed and all offices were thrown open to all subjects of the realm without distinction of creed.

Austria.— The Toleration Edict of Joseph II. was of no significance as far as the political emancipation of the Jews of that realm was concerned. There was no definite step toward removing civil or political disabilities until the year 1846 when the oath "More Judaico" was abolished; on 25 April 1848 the new Constitution granting free exercise of religion and civil rights irrespective of religious creed was promulgated; five Jewish deputies were elected to the first Parliament which convened after the new Constitution went into force. On 28 Oct. of that same year the special Jewish taxes were abolished. As in a number of German States a period of reaction set in in Austria after the revolutionary fire of 1848 had spent itself, and the Jews suffered from this reactionary spirit; the rights granted them were revoked; when the concordat was signed in 1855 whereby the reins of government fell altogether into the hands of the clerical party the anti-Jewish spirit was accentuated and some mediæval decrees touching the status of the Jews passed at this time. The reactionary regime was in power till July 1859 when the peace of Villafranca was signed. Soon thereafter, in Feb. 1860, some new legislation in reference to the Jews was framed of a more liberal spirit. On 21 Dec. 1867 the new Constitution was issued,

which established the political equality of all citizens of the empire regardless of religious faith.

Hungary.— In the other portion of the dual kingdom political emancipation was greatly agitated in the fifth decade of the 19th century. As early however as 1790 the Jews of that land had laid before Leopold II. a petition requesting equality with other citizens; the following year the Diet passed legislation "De Judaeis" affording the Jews protection. At the same time a promise was made that a commission would be appointed to look into the situation and to report measures for the betterment of their condition. A half century passed before any real relief was afforded. The Diet of 1840 passed a law which allowed all Jews of good repute whether native or naturalized to reside anywhere except in mining towns; this law also permitted them to study for the professions and engage in manufacture; however, their right to own real estate was restricted to the cities. In 1846 the toleration tax was abolished. Nowhere did the Jews take so prominent a part in the revolutionary struggle of 1848 as in Hungary. This was appreciated by the party of freedom and in the national assembly of the Hungarian Republic held at Szegedin in 1849 a bill was introduced and passed on 28 July granting the Jews all rights of citizenship. This republic was of very short duration. The Jews enjoyed their newly won rights just two weeks. The overthrow of the Hungarian Republic was followed by the most stringent restrictive measures and the Jews were made to suffer severely for their sympathy with and participation in the revolutionary struggle; a very heavy tax was imposed and every right that had been granted was revoked. The question of Jewish emancipation was not agitated again till 1861 but no remedial legislation was passed till 1867. In December of that year both houses of the Hungarian Parliament passed a bill granting political emancipation. Full emancipation was secured when on 11 May 1896 the Upper House after two previous rejections concurred in the bill passed by the Lower House two years earlier recognizing the Jewish religion as one of the legally acknowledged faiths of the country.

Denmark.— When the deliberative assemblies were established in the various provinces of Denmark by the laws of 28 May 1831 and 15 May 1834, the Jews were granted the right to vote but they were not permitted to stand for election to Parliament; the Constitution adopted 5 June, 1849 granted them full political rights and removed all restrictions.

Belgium.— The Jews were emancipated politically in 1815.

Italy— When Italy passed into the dominion of Napoleon I. the Jews of that country secured the advantages of the liberal French legislation. With the fall of Napoleon and the reinstatement of Pius VII., the Jews were deprived of the liberties they enjoyed under French rule and the old mediæval legislation was re-enforced. This continued till 1848, the revolutionary year, when as everywhere else a brighter day dawned for the Jews of Italy; however, in the reaction which followed they were again forced into mediæval conditions. This continued till 1859 when with the achievement of Italian unity in 1859 the Jews received full political rights; in Rome alone were those withheld but there, too, they were granted upon the downfall of the papacy as a temporal power (Sept. 1870).

United States.— The first amendment to the Constitution announces unequivocally the separation of church and state; all men are equal before the law whatever their religious creed; however a number of the 13 original States which adopted State Constitutions before the Constitution of the United States was framed demanded religious tests of a character to exclude all but believing Christians from holding office. The Constitution of Delaware of 1776 had such a test which was abolished in the amended Constitution of 1792. The Constitution of Massachusetts which had a similar provision was not amended till 1822. According to a constitutional provision of New Jersey only Protestants could hold office; not till 1844 was this article amended; the article of the Constitution of Pennsylvania which posted a belief in the Old and New Testaments as prerequisite for office-holders was amended in 1790 to the effect that belief in God and the future state should be the condition; Vermont repealed the religious test of the Constitution of 1777 in 1703; Rhode Island, Connecticut, Virginia, and Georgia required no religious tests in their original Constitutions. In Maryland a long struggle was necessary before the provision of the Constitution of 1778 requiring belief in the Christian religion as a condition for office-holders was abolished. The Jew bill introduced in the Legislature in 1818, whose object was to remove the civil disability of the Jewish citizens of the State was not passed till 1826. The new Constitution adopted in 1851 still contained the original clause accompanied, however, by a special provision for the Jews; the Constitution of 1867 definitely removed all religious tests excepting the belief in the existence of God. The Constitution of North Carolina of 1776 made a belief in the Protestant religion a condition for holding any office of trust or profit; in 1835 the words "Christian religion" were substituted for "Protestant religion"; this emancipated Catholics but not Jews; not till 1868 was this remedied, when only such were declared as being disqualified for office who "shall deny the existence of Almighty God."

Roumania.— In 1878 the representatives of the powers of Europe assembled at the Congress of Berlin, made the political and civil emancipation of the Jews one of the conditions of the independence of Roumania. These rights have not been granted, and alone among European powers Russia and Roumania refuse to grant their Jewish citizens the rights of men.

15. Judaism — The Synagogue, Its Origin and Development. See SYNAGOGUE.

16. Judaism — Reformed Judaism in America finds its roots in the beginning of the Reform movement that took place in Germany in the first quarter of the 19th century. The cause of the religious advance of the Jew in Europe was the breaking up of the Ghetto in the latter half of the 18th century. As long as the Jew was excluded from the world, its culture and its opportunities, he found his greatest comfort in his Hebrew studies and in his religion. The latter developed only along its own narrow lines and was protected from every admixture of foreign elements. The Jew, as it were, built a "fence around the law." When the bars of the Ghetto fell and the Jew was initiated into a new world of thought, language, literature and activity, he found the old religion incongruous with modern life and the rabbinical law too rigid for the new conditions. Reconciliation between the two was difficult. A bitter struggle ensued between the old religion and the new life. A compromise was the only solution. Judaism was equal to the demand. Heartburnings, personalities, domestic schism, often followed in the wake of innovations. The wheels of progress, however, could not be stayed.

Moses Mendelssohn translated parts of the Bible into German and thus opened up a new field of study for the Jew. This was followed by a translation of the Prayer Book into German by David Friedlander. The Talmudic regulations were either openly isolated or interpreted in a liberal spirit. Religious schools for instructing the younger generation in the principles and practices of Judaism as well as in the literature and history of Israel, were instituted and conducted according to modern pedagogical methods. Religious services in many synagogues were modified, rituals were shortened, objectionable features were omitted, and prayers, sermons and hymns in the vernacular were introduced. Israel Jacobson was the first who successfully established reformed religious schools and services in Germany and later built a Reform Temple at Sessan, which was consecrated 17 July 1810. This Reform movement soon spread to Berlin and Hamburg and before long it reached America and found expression here in 1788 in the city of Charleston in the organization of the "Reform Society" of Israelites, which instituted divine services that consisted of a short ritual with sermons, etc., in English and the abolition of offerings during the divine service. A great ecclesiastical battle resulted and many questions of reform were delayed for several years. An organ was purchased and the system of family pews adopted in spite of much opposition. It may here be mentioned to the everlasting credit of Reformed Judaism, that it instituted family pews and gave to women the right to worship in the same pew with their husband and sons. The practice of the orthodox wing, which still prevails in many congregations, of isolating women in a screened gallery, is both improper and without warrant in this age of enlightenment. Reform differs further from Orthodoxy in the interpretations put upon the Scriptures and the Talmud and the authority with which they are severally credited. Orthodoxy gives to both Scripture and Talmud a binding authority over Jews without regard to circumstances of time and place. Reform seeks to set up a higher standard of authority than merely the literal texts and to find a way of reconciling ancient laws and traditions, if possible, with modern requirements. The usual custom of Reformers is to be reasonable and to discriminate between the essentials and the non-essentials of Judaism. Reformed Judaism has discarded belief in bodily resurrection, in the coming of a personal Messiah, in the national restoration of Palestine and the re-institution of the ancient temple with its Levitical cults. Reformed Judaism is also manifested in a refusal to abide by the rigorous enforcement of the Mosaic and Rabbinical dietary laws and in certain changes in the ritual and religious observances. The reform instituted at Charleston soon spread to the North where in the city of New York the Temple Emanu-El was organized in 1845 under the leadership of Rev. Dr. Leo Merzbader who formed his own ritual for the congregation. Temple Emanu-El has led the van of the Reformed Jewish congregations of America for over half a century and has given much impetus to the progress of Israel. Under Dr. Samuel Adler and Dr. Gustav Gottheil, this congregation made vast strides and is now the largest and wealthiest Jewish congregation of the world. Its place of worship is situated at the corner of Fifth Avenue and 43d Street, and its present rabbi is the Rev. Dr. Joseph Silverman. Har Sinai congregation was soon organized in Baltimore under the banner of Reform and adopted the prayer book of the Hamburg Temple. Some of its noted rabbis were Dr. David Einhorn, Dr. Samuel Sale, Dr. D. Philipson, and Dr. F. Shanfarher. The present incumbent is Rabbi Charles Rubenstein. A stronger note than all these, however, was sounded in the early days of reform at Albany where Rev. Dr. I. M. Wise officiated from 1846 to 1854. He had come from Germany, impregnated with the new spirit of progress, and at once carried his cherished ideals into practice in this country. He fought some of the early battles of Reform in America which went far beyond the expectations or desires of the Reformers of Europe. He contended for choir and organ and for a prayer book in the vernacular and his *Minhag America* (the American Ritual) was acceptable to most American Reform congregations for almost 50 years. It later became the basis of the Union Prayer Book now generally in use. Wise was not alone in his strenuous battles for progress. Leo Merzbacher, Max Libienthal, Samuel Adler, David Einhorn, and Samuel Hirsch ably entered the lists and contributed valuable aid to the new movement. These men were later reinforced by such valiant Reform leaders as B. Felsenthal, J. K. Gutheim, and Gustav Gottheil. Rev. Dr. Isaac M.

Wise, rightly called the father of American Reformed Judaism, gave to this movement a greater impetus than it had ever received, when in 1873 he organized the Union of American Hebrew Congregations and under its auspices, in 1875, the Hebrew Union College, a theological seminary for the training of American rabbis. A great drawback to the progress of the reform element was the lack of leaders and rabbis with modern scholastic education who could enter into the spirit of American conditions and the needs of Israel in this country. In the last 25 years over 100 graduates of this college have found pulpits in reform congregations where, with their modern culture and the ability to appeal to the younger generation, they have had eminent success and have given reformed (or Progressive Judaism, as it is sometimes called) a firm foothold on American soil. The Union of American Hebrew Congregations is now actively engaged in providing circuit preachers for small congregations and in organizing congregations and religious schools in communities where none exist. Another source of active strength to Reformed Judaism has been the Central Conference of American Rabbis, which the late Rev. Dr. I. M. Wise called into existence in Detroit in July 1889. This had been preceded by several Reformed Rabbinical Conferences which from time to time discussed burning ecclesiastical and ritual questions. The most noted of the conferences was the Pittsburg Conference held in November, 1885, at which the following platform of Reformed Judaism was adopted and which in the main, has been approved by nearly all Reformed Rabbis and teachers and been generally accepted by the laity.

Act 1.— Judaism conveys the highest conception of God and of his relation to Man. God is the Creator and Ruler of the world, Father and Educator of the human race.

Act 2.— The Holy Scriptures are the record of Divine Revelation and of the consecration of the Jewish people as the missionaries of the one God. In composition and literary arrangement the Scriptures are only the work of men with the unavoidable limitations of their age.

Act 3.— The results of natural science are the best helps to the understanding of the working of Divine Love in the world, the Bible serving as guides to illustrate the working of Divine Power within us.

Act 4.— The Mosaic laws are intended for the training of the Jews of Palestine in their former surroundings; only the moral laws are divine; all social, political, and priestly statutes, inconsistent with our modern habits and views, are to be rejected.

Act 5.— The Mosaic-rabbinical laws on diet, purity and dress fail to imbue modern Jews with the spirit of priestly holiness; their observance to-day would obstruct rather than enhance moral and spiritual elevation.

Act 6.— Israel's Messianic hope relates to the establishment of the authority of peace, truth, justice and love among men. No return to Palestine is expected, nor the re-institution there of a Jewish state, or of a worship conducted by descendants of Aaron.

Act 7.— Judaism is an ever growing, progressive and rational religion of modern civilization and asserts the necessity of preserving identity with the great past of the Jewish nation.

Act 8.— Judaism hails the efforts made by various religious denominations toward removing the barriers separating sect from sect.

Act 9.— It is the duty of Jews to spread the knowledge of their religious truths and mission amongst Jews and non-Jews.

Act 10.— The present agitated state of Judaism is a period of transition from a blind belief in authority and exclusion to a rational and humanitarian conception of religion; the masses, therefore, should be enlightened as to the history and mission of the Jewish people and their social and spiritual condition elevated through press, pulpit, and school.

The Central Conference of American Rabbis has, under the regime of its founder and first president, Dr. I. M. Wise (1889–1898), and its second president, Dr. Joseph Silverman (1899–1903), formulated many decisions which have been put into practice by the people at large, the most important of which are the abrogation of circumcision for adult proselytes, permission to the rabbis to officiate at cremations, the interdiction of rabbis from officiating at intermarriages (between Jews and non-Jews), etc. The most important work of the Conference has been the publication of the Union Prayer Book and Union Hymnal both of which have become very popular and have been the means of bringing unity into the religious services of almost 200 reformed congregations and of abolishing the many different rituals which had been a source of confusion in modern Judaism. Of late years some reformed congregations have been holding Sunday services in addition to the regular Sabbath services and many people have had grave fears lest this movement might lead to the substitution of Sunday for the Jewish Sabbath. The Central Conference of American Rabbis at its convention at Detroit July 1903, allayed those fears by adopting a resolution to the effect that this Conference favors adherence to the historical Sabbath as the fundamental institution of Judaism, and that Sunday services, whenever held, must only be regarded as supplementary to the regular Sabbath services. The future of Reformed Judaism in this country is pregnant with great possibilities. It is to be shaped, in the main, by the Union of American Hebrew Congregations, the Central Conference of American Rabbis and the Hebrew Union College (Cincinnati, O.) presided over by Dr. K. Kohler, the successor of Dr. I. M. Wise, and by the graduates of this college of whom the older and more prominent are: A. Aaron, H. Berkowitz, Jos. Krauskopf, Louis Grossman, R. Grossman, M. Heller, David Phillipson, Jos. Stolz, Jos. Silverman. Among the scholarly and leading Reform rabbis of America may be counted E. G. Hirsch, K. Kohler, S. Sale, Leon Harrison, I. S. Moses, M. Samfield, J. Voorsanger, S. Shulman, M. H. Harris. It is hoped that the new Jewish Theological Seminary of America (New York), Dr. S. Schechter, President, will also in time add power and influence to progressive Judaism in America, notwithstanding its present conservative tendency. The main problem for the reformers of the future will be how to promote assimilation with modern conditions without sacrificing the integrity

of Judaism. Consult: 'Reports of the Union of American Hebrew Congregations'; 'Reports of the Central Conference of American Rabbis'; 'Yearbooks of the American Jewish Historical Society'; 'Reminiscences of I. M. Wise'; Philipson Grossman, 'Life and Writings of I. M. Wise'; Kohler, 'Settlement of Jews in North America'; and 'The Jewish Encyclopedia.'

JOSEPH SILVERMAN,
Rabbi, Temple Emanu-El, New York City.

17. Judaism — Education and the Jews. The rise of education among the Jews during the period before the Babylonian Exile is, like all the beginnings of national and intellectual life in antiquity, enveloped in obscurity. But enough can be learned from many casual allusions in biblical literature, to prove that even during that early era education had attained a high standard, and had become a solid foundation upon which generations could continue to build. So much is certain, that education began at a very tender age, from the moment when the intelligence of the child first awakened. Then the impressions had to begin to produce what was regarded the end and aim of all education, namely to make a perfect man.

Among the Jews the virtuous man was one who realized his likeness to God in whose image he was created. This ideal was taught by the Hebrew prophets, and formed the basis of their education, which religion commanded should be given to all alike. Every duty to the individual and the community was a religious duty; therefore there was a perfect union of religion and life, and education had as its end systematically to form and elevate humanity. Of the highest truth and duties it was commanded "Thou shalt teach them unto thy children, and shalt talk of them when thou sittest in thy house, and when thou walkest by the way, and when thou liest down, and when thou risest up." (Deut. vi. 7.) "This instruction educated the whole people to the consciousness, that conduct is the largest concern of life, so that righteousness became Israel's ideal" (Matthew Arnold).

The survival of the Jews after the twice repeated destruction of their national life, their salvation from disappearance under eighteen centuries of systematic persecution and their constant high standard of intellectual and moral attainments is due to the high value they placed upon education and the manner in which it has been adapted by them to every age and time, so that no progress, caused by the advance of science, found opposition among them for any length of time. Therefore a modern educator has said truly, "If ever a people had demonstrated the value of education, it is the Jews."

In Biblical Times.— During the earliest period the instruction was domestic — the home was the only school, the parents were the only teachers. (Deut. iv. 9; vi. 7; xi, 19.) Ceremonies were introduced in the house for the purpose of impressing upon the plastic minds of the children the glorious achievements of the fathers and government of the world by God. (Ex. xiii, 8.) Abraham's merit was found in the assurance, that he would give his children such training. (Gen. xviii, 19.) There are many evidences that the arts of reading and writing became more and more widely diffused. The well-educated child is the joy of his parents. (Prov. x, 1; xvii, 25.) But religion and virtue remained the foundation of all education. "The fear of the Lord is the beginning of wisdom." (Prov. i, 7.) The main object of the Sabbath assemblages was instruction; everyone was made thoroughly acquainted with the national literature. (Deut. xxxi, 12–13.) So the Jews were trained to become 'the people of the book.'

In the Rabbinical Era.— During the period of the second Temple systematic instruction and schooling was introduced. First the High School (Beth ha-Midrash) in connection with every Synagogue, (first mentioned Ecclus. li, 23). The New Testament refers to these schools many times. Luke, v, 17 speaks of teachers from every town in Galilee and Judea which proves how numerous they were. It seemed indeed so unthinkable that such schools had not existed from primeval times, that the later Haggadah anticipates the Beth ha-Midrash for the time of Moses, Joshua and Samuel, that it reported Solomon built schoolhouses and Hezekiah supported them. Primary education was made compulsory by Simon ben Shetah about 75 B. C., and the High Priest Joshua ben Gamla 63–65 A. D., enacted that teachers be appointed in every province and town for children from the ages of six to seven years up. It was then that the elementary school (Beth ha-Sefer) was established, and together with the high school connected with every Synagogue. (Talm. Babl, Ber. 17, a, Ta'anit 23, b, Kidd. 30, a, Yalkut Is. 257.) At the time of Josephus the duty of universal education for every child was regarded as so important that he says, (Ap. I, 12) "Moses commanded us to instruct the children in the elements of knowledge, reading, writing and the deeds of the forefathers." He could state with pride (Ap. II, 25) "Amongst us every child must learn to read." In addition to reading, writing and the history of the past it was the duty of every father to have his son taught the art of swimming and to give him manual training by letting him learn a trade.

In the midst of the convulsions caused by the destruction of Jerusalem and the Temple R. Jochanan ben Sakkai obtained from Vespasian the permission to establish an academy at Jamnia which at once became the centre of Jewish learning, the mother of the succeeding High schools where the discussions were held whose records are preserved in the Talmud, (See TALMUD) which is filled with evidences of wise pedagogic insight in the arrangement of schools and courses of studies, and anticipates many of the new movements in education which mark the present time. Especially is the high importance of the teacher and the respect due to him expressed in the most emphatic manner. "A President of the Academy," relates the Talmud, "sent some scholars to examine the schools, and established them where none existed. They came to a city and demanded to see the keepers of the city. The magistrates and police officials were introduced to them. 'These are not the city's keepers!' said the wise men. 'Who then are?' asked the citizens. 'The city's keepers are the teachers

of the children,' was the reply." "A city without elementary schools deserves to be destroyed," is another saying. Nothing was permitted to interfere with the school lessons, not even the rebuilding of the Temple. Rabbi Jehudah said "The world is saved only by the breath of the school children." The subjects of instruction were in the first place the religious literature, the Bible and the Talmud. But the studies were so arranged that by the nature of the talmudic discussions they embraced all known sciences: natural history, anatomy, medicine, geometry, astronomy and foreign languages.

In Later Times.— The succeeding ages were dominated by the wise rules laid down in the Talmud referring to discipline, qualifications of the teachers, the respect due to the teachers, rules about limiting the size of the classes taught by one teacher, and the attention paid to the individuality of the pupils. The great regard paid to the school by the Jews in the middle ages, when among Christians education was limited to the small number of the favored classes, is apparent from a detailed scheme preserved from the 12th century for the course of instruction followed in the schools. The order of studies is carefully elaborated from the elementary schools for all children through the secondary schools up to the academies. In the 13th century the "seven sciences" comprised the prescribed curriculum among the Jews as it did among the Christians. Especially in Italy systematic education received great care and encouragement at that time, and the same is true of Spain and Provence. Great Rabbis stimulated interest in science outside of religious lore. Hebrew books of ethics of the period contain side by side with the moral teachings of the Rabbi's maxims from Aristotle, Porphyry, Theophrastus and others. The Jewish educational curriculum in Italy included the whole field of knowledge, theology, poetry, philosophy and natural science long before the Renaissance.

In Spain the ordinary course of Jewish study was Bible, Hebrew poetry, Talmud, the relation of philosophy and revelation, the logic of Aristotle, the elements of Euclid, arithmetic, the mathematical works of Nicomachus, Theodosius, Menelaus, Archimedes, and others, optics, music, mechanics, medicine, natural science and metaphysics. So it happened that during the darkest medieval times Jews were conspicuous as scholars, philosophers and physicians; to them, in fact, is owing the scientific elaboration and advancement of medicine; they took the most active part in the progress of astronomy, founded the famous schools of Montpelier and Salerno, and contributed essentially to the flourishing condition of Padua. Without Jewish inventions neither Columbus, nor Vasco de Gama could have made their daring sea voyages, Moritz Steinschneider in his great work 'The Hebrew translations of the middle ages, and the Jews as interpreters' has shown the inestimable services rendered by them in being the mediators of Greek and Mohammedan civilization for the nations of the occident. All of this high education and respect for scholarship was based upon the broad foundation of the elementary school which existed in every and even the smallest Jewish congregation.

Child Training.—Although little attention was paid to the education of the girls, nevertheless many of them became distinguished by scholarship, and all were imbued with the highest appreciation of learning. The mothers took their little sons to school, and both the mother and father participated in the important function of introducing the boy to school for the first time. This was made a solemn religious ceremony, so arranged as to leave an indelible impression upon the tender mind of the child. The initiation took place in the synagogue on the Feast of Pentecost, the traditional anniversary of the revelation on Mount Sinai. Early in the morning the boy was dressed in new clothes and three cakes of fine flour and honey were baked for him by a young maiden. Three eggs were boiled and apples and other fruit were gathered in profusion. Then the child was taken in the arms of the Rabbi or another learned friend first to the school and then to the synagogue or vice versa. The child was placed on the reading dais before the scroll, from which the Ten Commandments were read as the lesson of the day. In the school he then received the first lesson in reading Hebrew. On a slate were traced in honey some of the letters of the alphabet, or simple texts, such as "Moses commanded us a law, an inheritance for the congregation of Jacob" (Deut. xxxiii, 4); the first verse of Leviticus and "Let instruction be my vocation." The child was then handed over to the arms of his mother who had stood by during this delightful scene. (Abraham's 'Jewish Life in the Middle Ages' p. 348 from Machzor Vitry p. 628.)

Rabbis as Educators.—The influence of Jewish education became very conspicuous when at the time of the Renaissance the revival of learning took place. Then the Jews were the only ones through whom the Hebrew Bible could be rediscovered for the Christian world. As once Origen and Jerome so now the religious Reformers learned to read and interpret the Hebrew scriptures from the Jews, and Luther in his commentaries is altogether dependent on Nicholas de Lyra, who in his turn had appropriated the commentary of Rashi (Rabbi Solomon ben Isaac of Troyes 1040–1105), which was familiar to every Jewish child. So the Italian Jews especially became the teachers of nearly all Hebraists among the Humanists. Wherever the Jews found a refuge during the persecutions in Germany, and when expelled from England and France, Spain, Portugal and Sicily, they carried their educational ideals with them and it was their first concern to establish elementary schools, and schools for higher education. Especially praised by contemporaries on account of its excellent systematic arrangement was the school at Amsterdam, where Spinoza received his primary education.

In Modern Times.—Less systematic were the educational establishments in Germany and Austria in consequence of the centuries of oppression to which the Jews were subjected and their total deprivation of all civil rights in those countries. But even there they did the best possible under their arduous condition, and at no time were men distinguished by scholarship lacking among them. The system was finally improved in Germany by the influence of Moses Mendelssohn and his followers, and in Austria

through the initiative of Hartwig Wessely who stirred up the Jews to improve their schools in accordance with the suggestions of the Emperor Joseph II. So at the end of the 18th and the beginning of the 19th centuries a number of Jewish schools were founded on the old Jewish principles combined with the most modern pedagogic developments. The Jewish Free School was founded in Berlin in 1778, the Wilhelm School of Brelau in 1791, the Franz School of Dessau in 1799, the Jacobson School at Seesec in the Harz in 1801, the Philanthropin at Frankfurt-on-the-Main in 1804, the Samson School at Wolfenbüttel in 1807. At the latter school Leopold Zunz received his education and imbibed that love of learning which made him the founder of the scientific treatment of Jewish religion, literature and history. These schools were so excellent that most of them were patronized by Christians also. They set an example for schools with similar ambitions in every Jewish congregation in Western Europe. Immediately the necessity was felt for competent teachers at such schools and for Rabbis systematically trained and endowed with general education. The first teachers' seminary was founded at Cassel in 1809. Others followed in rapid succession. For the education of Rabbis many institutions sprang up which have won deserved distinction in France, Germany, Italy, Austria, England and America.

The New Education.— Guided by the conviction that education would be the best means of improving the wretched condition of the Jews in Roumania and Turkey, the Alliance Israelite Universelle (See JUDAISM —ALLIANCE ISRAELITE UNIVERSELLE) has opened in those countries many schools for the teaching of elementary branches, languages and manual training, their high standard being so well recognized that in Turkey they are largely patronized by Mohammedans and Christians also. Trade schools and schools for technical training have been founded by Jews. Those established in America for the benefit of Jewish immigrants and their children, in New York city the Educational Alliance by the Baron Hirsch Fund, and in Chicago the Jewish Manual Training School deserve special mention on account of the magnificent work they are doing.

MAX LANDSBERG,
Rabbi Temple Berith Kodesh, Rochester, N. Y.

18. Judaism — Commerce and the Jews. Commerce or the exchange of goods is and has at all times been one of the prime motors of civilization. In antiquity the Phenicians were the great trading nation, and together with the various products they carried from one land to another they spread the elements of culture into remote parts of the earth. Thus they furnished the Greeks with the very elements out of which their industry, art and literature afterwards developed until they themselves became heirs to the Phenician trade. Less known and recognized is the fact that during the early middle ages the Jews, owing to their dispersion over the globe and their connection with one another, were the merchant people *par excellence*, filling the position of the Canaanite of old as intermediaries of the world's trade.

Early Traders.— On the soil of Palestine the Hebrews were gradually transformed from a people of shepherds into farmers. Trading was greatly discouraged by legislation which prohibited loaning money on interest, and the merchant's honesty was distrusted alike by prophet and by sage (Hosea xii. 7; Ecclesiasticus xxvi. 29 — xxvii, 2; Kiddushin iv. 14.) The great caravan routes from Arabia and Egypt to Tyre and Damascus did not touch the highlands of Judaea and Samaria; it was the Canaanite or Phenician who "walked around" from town to town and from house to house with his merchandise (Isaiah xxiii, 8; Hosea xii, 8; Ezek. xvii, 4; Zech. xiv, 21; Prov. xxxi, 24.) Once or twice the attempt was made to join the Phenicians in maritime expeditions but without success (I Kings x, 15–22; xxii, 48). In the Babylonian exile the Jew imbibed an unquenchable love for the wide world; his eyes were opened to the facilities of commerce as he watched the markets of Babylonia and of Tyre (Ezek. xxvii; Genesis x; Tobit i, 13). Travel on land or on sea for the pursuit of commerce became a matter of frequent occurrence also among Palestinian Jews under the Persian dominion (Prov. vii, 19–20; Ps. cvii, 23; Tobit i, 13; 21; iii, 7; Jonah i, 3), although the markets of Jerusalem were chiefly occupied by Phenician traders at the time of Ezra (Nehem. iii, 31; xiii, 16). Josephus also writes rather in a spirit of contempt for trade: "We neither inhabit a maritime country no do we delight in commercial occupation, but take pains in cultivating the fertile land we inhabit." (Contra Apionem i, 12).

Hellenic Jews.— It was chiefly since the time of Alexander the Great and under the Ptolomies and Seleucides that the Jews settled in large numbers in the great centres of commerce all along the Mediterranean and engaged in mercantile pursuits acquiring wealth and influence to such a degree as to rouse the jealousy of their Greek competitors. This was especially the case in Alexandria where they inhabited a large portion of land along the sea and became owners of ships and great merchant princes controlling the navigation of the Nile. (Philo In Flaccum 8; III Macca. iii, 10; Josephus Contra Apionen ii, 5; Comp. Frankel Monatschrift, 1874, p. 147 and Theodore Reinachart, "Judaei" in "Dictionaire des Antiquite's Golques et Romaines.") There was scarcely a commercial town throughout the whole Roman empire from Asia Minor to Spain in which they had not a colony of their own enjoying the protection of the Roman rulers because of their success (Josephus Ant. xiv, 7, 2–3; Jewish War ii, 16, 4). They were Jews in race and faith, but Hellenes in culture; commerce broadened their views and rendered them cosmopolitan. Jewish merchants carried Jewish ideas wherever they went; they paved the way for a world-conquering faith. They ploughed the soil for Saint Paul and Christianity to reap the great harvest.

Judæa also came under the influence of the commercial spirit of the Hellenic Jew. The large list of goods mentioned in the Mishnah gives evidence of the extensive international

trade carried on by the Jews which flooded the mother-country with merchandise imported from all parts of the globe and which enriched the Jewish vocabulary with a great variety of Greek terms (Herzfeld, 'Handelsgeschihte der Juden des Alterthums,' 1879; Schuerer, 'Gesch. d. juedischen Volkes' II³, 50–63). The ships sculptured upon the Maccabean mausoleum point to the possession of a mercantile fleet by the Jews stationed at Joppa, the port at which Simon the Maccabean prince endeavored to develop the foreign trade (I Macc. xiii, 29; xiv, 5), whereas King Herod desired to make Cæsarea a more convenient harbor (Josephus Ant. xv, 9, 6). As a typical man of wealth of this time a high priest by the name of Eleazar ben Harsom is mentioned in the Talmud who is said to have inherited from his father a thousand towns on land and a thousand ships on sea (Yomna 35ᵇ). But the best proof of the gradual transformation of the Jews from an agricultural to a commercial people at the time of Herod is given by the fact that Hillel, the great master of the rabinical schools, felt induced to institute a legal mode of procedure in regard to loans of money which virtually did away with the Mosaic prohibition (Gittin v, 5). It shows that investment of capital in commercial speculation had become a necessity with the people.

The Jews in the Dispersion.— The fall of Judæa in the year 70 and the final defeat at the Bar Kokba war in 135 changed the destiny of the Jews altogether, and they bent their efforts to a far larger extent than before upon mercantile pursuits. Scattered over the wide globe, they were enabled through extensive travel and good connections to establish flourishing trade everywhere. Especially in Babylonia under the dominion of the Parthians they amassed great fortunes by their commerce, enjoying the favor of wise rulers (see Herzfeld l. c. 118–119; 336). Along the Phenician seacoast they became heirs to the Phenician trade and industry to such an extent that far into the middle ages they are found to be the chief manufacturers of Tyrian glass and of purple, as shown by Benjamin of Tudela's Travels. Ere Christianity spread its arms westward, they marched as peddlars under the shadow of the Roman eagle up the Ebro as far as Toledo and Saragossa, up the Rhine as far as Cologne and along the Danube as far as the Black Sea, carrying on an importing trade in spices and perfumes, in pearls and jewels and in costly clothes of the East. Particularly was the silk-trade greatly developed, if not altogether monopolized by them, and this accounts for ancient Jewish settlements in China, the home of silk, and for the protection accorded to Jewish silk manufacturers by the rulers of Sicily, France and Spain (See Heyd, 'Gesch. des Levanthandels' i, 6–9, 12; 24; 26: Mommsen, 'Roemische Gesch.' v, 465–470; Herzfeld, 119; 308: Graetz, 'Gesch. d. Juden' v³. 55, 228, 329, and elsewhere). The same seems to have been the case with the trade in spices (Heyd, l. c. 12, 141; Depping, 'Die Juden in Mittelalter,' p. 132; Bedarride, 'Les Juifs de France' 46; 454). It is significant that the Jews were assessed to pay their taxes in the shape of pepper (Depping, l. c. 132). The existence of black Jews in Malabar indicates the establishment of Jewish colonies in India for commercial purposes. Throughout the early Christian centuries Jews are mentioned as importing silk, spices and embroidered goods from the East to the markets of Spain and France. The flourishing period of Jewish trade came when the victorious flag of Mohammed united the East and the West into one great empire offering new incentives to industry and commerce. Jews were employed by the Moslem rulers as commissioners of the army and as financiers. Jewish merchants, partly on their own ships, made regular trips from far off China, India and Egypt to Marseilles and Narbonne bringing the produce of the East to the Western depots of commerce. They carried the fur and amber of Russia brought to the Crimea or to Bohemia, the shawls and embroideries of Constantinople, the spices of India and drugs of Arabia to the markets of Narbonne, Lyons, Cologne and Mayence (Bedarride, l. c. 57 and elsewhere). Descriptions of the mercantile routes taken by such Jewish traders have been preserved by Arabic geographers, showing the important position taken by them as international mediators between the Orient and the Occident. Jews were indeed in those centuries the merchants (mercatores or negotiatores) par excellence. This accounts for the fact that Jews were selected as ambassadors by German emperors like Charlemagne and Otto I and made secretaries of finance and prime ministers by the Moslem rulers. Conversant with the languages of many countries, they had the opportunity of controlling the market and accumulating great wealth as no other class of people (Heyd, l. c. 138–142; 87; 194; 258; Jacob, 'Handelsartikel der Araber,' 1891, p. 9; Stobbe, 'Die Juden in Deutschland' 6–7; 103; 199–200; 231; Kremer, 'Die Kulturgeschichte des Orients,' I. 188; II. 176; and Leo's 'Spanish Inquisition.'

As Addison says in the Spectator, they were so disseminated through all the trading parts of the world that they became the instrument through which the most distant nations conversed with one another and by which mankind were knit together in a general correspondence.

The trade in slaves was almost exclusively in their hands for a long time (see Heyd and Stobbe l. c.). Some they brought from Gaul, but to a larger extent they bought slaves from the Slavonic rulers (Benjamin of Tudela p. 111ᵇ and Graetz Gesch. V. 303). With the Chazar Kings in the Crimea they also stood in close relationship, as is proven by the fact that the latter embraced the faith of the Jews (Graetz, l. c. 176 *et seq.*; Beer, 'Gesch. des Welthandels,' 198 229–230). The entire trade with the products of the Baltic provinces seems to have been in their hands since the time of the Roman Empire (Schucrer, l. c., III, 18). Besides woolen and silken goods, spices, tapestry, embroideries and furs, we find jewelry, gold and precious stones also monopolized by them. Nor was the commercial activity of the Jews merely confined to the exchange of goods. They reared those centres of commerce in Western Europe which were afterwards occupied by the rich burghers or merchant guilds who drove them out of their possessions in order to rid themseves of their competitors or masters in the art of trading. The beginnings of the history of cities such as Narbonne and Lyons, Cologne and Mayence, Nuremberg, Regensburg, Ulm and

Augsburg, London and York and dozens, if not hundreds of others, coincide as a rule with Jewish settlements in these places, one far-sighted Jew being the pioneer of commerce whose success attracted other Jewish traders, to render the market there a centre of commerce until, finally, the growing wealth of the Jews rouses the jealousy of the Christian people and becomes the cause of their oppression and expulsion. As Kieselbach 'Der Gang des Welthandels' and Roscher 'Die Juden im Mittelalther' in his 'Ansichten der Volkswirthschaft' II, have shown, the Jews opened new sources of wealth everywhere by creating the means and methods of communication for the trade, for which neither the peasant or farmer nor the nobleman had the capability or the understanding. Only wise rulers, realizing the benefits conferred by the Jewish traders upon the country, encouraged these by special privileges to settle therein and develop its resources. This was done by Charlemagne and his successors in France and in Germany, by Alfred the Great and William the Conqueror and Cromwell in England, by King Roger of Sicily, Kasimir the Great in Poland, and Sultan Bajazid in Turkey. Everywhere the commercial genius of the Jewish people developed the prosperity of the cities. (See also Lecky, 'History of the Rise of the Spirit of Rationalism in Europe' II, 272–273.) "They were the teachers and tutors of the commercial activity of Europe," says Roscher, l. c., and no sooner did the cities feel that they could do without them than they dispossessed them of all they had acquired, though half of the houses of Paris, London or Nuremberg had been theirs, and either killed or expelled them. But even when driven by a bloodthirsty mob or by hostile guilds and by state legislation out of his original domain, the world-commerce, the Jew carried his small stock of merchandise into the villages to bring, as Kieselbach says, the elements of culture also into parts more remote from civilization, or he took up the despised work of the money lender, finally to rise to the influential position of banker and prince of finance. The whole system of modern exchange of money is, if not his invention, certainly to a large extent his work. To his financiering skill and international trade the banks of Amsterdam, Hamburg and finally of England owe their existence and their success.

Results of Their Activity.— What Jewish commerce achieved in all these lands became manifest in France after their expulsion in 1306, and in England after their expulsion in 1290, and still more so in Spain after 1492. Jewish fugitives of Spain carried the trade into Turkey and Holland and into Italian cities like Leghorn and Ancona, just as Poland's commercial industry was entirely due to fugitive Jews of Germany (See Graetz, 'Gesch. d. Juden' index and 'Jewish Encyclopedia' s. v.) So did the new world profit by the persecutions of the Jew in the old. Jewish Marranos built up the trade in tobacco, coffee and sugar in South America, and with the help of the Jews of Amsterdam for some time brought the world's commerce into the hands of Holland until Cromwell succeeded in opening England for the Jews and thus paved the way for the British trade with the West Indies. (See Beer, 'Gesch. d. Welthandels' II, 211, 366; Max Kohler: 'Jewish Activity in American Colonial Commerce' in Publications of the American Jewish Historical Society X, 47–63). The trade between America, Europe and the Levant was almost entirely in the hands of Spanish Jews or Marranos; families like the Gradis, Caceres, Mendez, Lopez, and Henriques had their branches and their ships in almost every part of the world (See Lucien Wolf, 'Menasseh ben Israel'; Gruenwald, 'Portugiesengraeber auf deutscher Erde.') Jews were instrumental in starting the East India Companies (Picciotto 'Sketches of Anglo-Jewish History,' 134). They were the pioneers of commerce in North America. Jewish merchants (Marranos) enabled Columbus and other navigators to discover the new hemisphere and provided the new lands with grain, horses and other needs (Kayserling, 'Christopher Columbus' and the article 'The Jew in America.') They possessed large tobacco, sugar and coffee plantations in Cuba, Brazil, Surinam, Curaçoa, and kept up commercial connections through navigation, partly by means of their own ships, with North America, Amsterdam, Leghorn in Italy, and the far East (Gruenwald, l. c.).

When with the era of the Reformation the systematic oppression of the Jews somewhat relaxed and they were again allowed to pursue more honorable and profitable occupations, we find them for a century or two, up to the time of the better regulated traffic by steam railroads, the chief visitors of the annual or semi-annual fairs held at Leipzig, Frankfort on the Oder, Prague, Wilna, Novgorod and other great market places, whither they bring their clothes, silk and velvet, fur, leather and other goods, for sale. On these occasions Jewish merchants from the remote parts of the continent met, exchanging the products of the various lands and providing their specific districts with goods for home consumption. In some provinces of Europe, Jews became the principal dealers in cattle and the chief attendants of the cattle markets; elsewhere as in Russia they deal chiefly in grain and lumber.

The new modes of industry finally transformed the former peddlars in old clothes and the like into manufacturers of woolen, silk, and leather goods. The first silk and velvet factories in Prussia and the woolen factories in Austria were introduced there by Jews. Henceforth Jews monopolize this trade again in a large part of the world. (Compare for the whole also the article "Commerce" in the 'Jewish Encyclopedia,' and art. "Juifs" in 'La Grande Encyclopaedie.')

Owing to his constant expulsion from the land inhabited and cultivated by him, whether in Palestine or in Babylonia, in Africa or in Southern Europe, the commercial instinct was developed in the Jew, thus making him excel his competitors. As a skilful and far-sighted merchant he not only acquired the wealth and power needed to maintain himself amidst the perils surrounding him wherever he was treated and regarded as an alien, but he proved the most valuable promoter of civilization in the lands in which he lived, the foremost liberalizing element in the shaping and broadening of human culture.

KAUFMANN KOHLER,
President Hebrew Union College, Cincinnati, Ohio.

19. **Judaism-Food and Health Laws.**— Food Laws.— The food laws of the Jewish people form a very complex system, with numerous and diversified enactments. These refer to the determination of the species of animals, birds, fish and insects that may be eaten; the method of slaughter; the inspection of the animal for disease and lesion; the prohibition of the blood, fat and certain parts of the animal; the treatment of meat prior to cooking; the prohibition of certain food mixtures; certain vegetable food laws, such as the prohibition of leaven during Passover, first fruit crops—Orlah, and the new corn—Hadash; and various anti-heathen food laws, affecting the use of wine, etc. It is certainly very suggestive of the importance of food legislation that the first direct command of God to Adam should be a food law (Gen. ii. 17), and that the punishment for its trangression should be the advent of death. The exposition of the dietary laws has given rise to a vast literature to which every century and almost every school of thought has made its contribution, but the general result is chaos. This is due mainly to three causes: (1) The essentially monistic nature of the Jewish thought has been quite overlooked. Conceptions that appear almost antithetic for the modern mind were apprehended as an undifferentiated whole by the ancient Hebrew. His language had no word that would be equivalent to "nature"; the physical and the psychical, the legal and the ethical, the spiritual and the vital, were all unified manifestations of the Theocratic Will. So that when the Bible declares with all emphasis that the end of the Law is "life"—"that ye shall live by them"—"your life and the prolongation of your days," it is just as uncritical to exclude physical life from this end as it would be to exclude from it the life of the spirit and the life everlasting. (2) The second cause of the overwhelming confusion prevalent in this literature is the unscientific exaltation of every observed effect of the laws into a motive for their promulgation and observance. (3) The avowedly different character of many of these laws in origin and purpose has been largely disregarded. The exposition of the dietary system would have been much simplified and innumerable controversies avoided if it had been clearly understood that the statement of effects does not involve their predication as motives; that motives apparently diverse could yet remain unified and undifferentiated for the Jewish mind, and that there is no one explanation that will cover all the Laws:

1. *Clean and Unclean Species.*— Among the quadrupeds only the ruminants that are provided with fully cloven hoofs are declared to be fit for food; and of these only the kine, sheep and goats are fit for sacrifice (Lev. xi., Deut. xiv). The Rabbis refer to another distinguishing mark possessed by all clean animals, namely the absence of incisors from the upper jaw (Talmud Bab., Hullin 59A). Among the fish, only those that have fins and scales are clean; thus all the siluridæ, eels and shell-fish are prohibited. As all that have scales have also fins, the presence of scales is the decisive mark (Talmud Bab., Niddah 51A). No marks are given in the Bible to determine the clean fowl, but a long list is recorded of species that are unclean. These are birds of prey, scavenger birds and marsh fowl. The bat is also included in the list. All the species not named are declared fit for food. The Rabbis have formulated certain marks distinguishing the clean fowl — but finally only those birds that are traditionally known to be clean are permitted to be used for food (Talmud Bab., Hullin 63B). All insects are declared unclean, with exception of four species of locusts. All creeping things are unclean (Shulhan Aruch, Yore Deäh §§ 79–85).

The earliest explanation of this distinction between clean and unclean is afforded in the allegorical interpretations of the Apocrypha (IV Maccab. 5, Letter of Aristeas, etc.), the works of Philo and the Fathers of the Church (Agustine, Irenæus, Cyril, Tertullian, Novatian "On the Jewish Meats"). The unclean animals are all regarded as typifying vices.— the hare libidinousness, the swine impurity, the fox craft, etc. The cloven hoof, the first sign of purity, typifies the distinction between good and evil; the chewing of the cud symbolizes the constant repetition of the law. This method of interpretation, while certainly leading to curious results, has some justification in the Bible presentation of the Serpent as the agent of temptation (Gen. iii. 1.) and also in the figures employed by Ezekiel (chap. xxiii. 20). Another explanation bases itself upon the natural and instinctive antipathy and loathing that destructive and death-dealing animals arouse. It is only natural that beasts of prey, serpentine and snake-like fish, slimy crustaceans, birds of prey, marsh fowl and scavenger birds, insects feeding on corruption and ordure, should be held unclean and polluting by a people striving to keep itself pure and holy (Lev. xi. 43). The consequences of this striving after holiness affect the whole of Jewish thought and life, and are of primal importance for the comprehension of the dietary system (Schechter, *Jewish Quart. Rev.* Vol. X Art. "Holiness"). That death-dealing creatures were regarded as abhorrent and imperfect is proved definitely by the prophecy of Isaiah, who sees as one of the conditions of the Messianic period "that the wolf shall dwell with the lamb — and the lion shall eat straw like the ox — they shall not hurt or destroy in all my holy mountains," etc. (Is. xi. 6–9, lxv. 25). There must further be noted the special shrinking evidenced in many ways from the hybrid and border species as departures from the true order of nature, which was that "all creatures should be after their kind" (Gen. i. 11, 21, 24). This would specially apply to the bat, the hybridous ostrich of the desert and the "winged quadrupedal creeping things" (Lev. xi. 23): The grass-eating locust would alone be excepted of all the insect tribe.

Others have seen in the distinction made between the clean and the unclean the means to separate Israel from the rest of the surrounding nations. "It was necessary for Israel to sever all intercourse with the desert tribes and in order to accomplish this the camel, for instance, was declared unclean. It was even more necessary to separate Israel from the corrupt and degenerate Caananites, and so the swine was pronounced impure." (Ewald.) The

argument is entirely without warrant, as the kine, sheep and goats were all eaten by the neighboring nations, and yet are regarded as clean for Israel.

Many have striven to connect the food laws of Israel with those of Manu. It is true that the food laws of Manu, with regard to the clean and unclean, have a great many elements in common with the Jewish Code, but the differences are too great to permit of any direct connection. Both give expression to the natural repugnance for certain classes of animals, but the details do not agree. In Manu's laws the hare, rhinoceros, porcupine, hedgehog, are all permitted, but they are unclean in the Jewish Code. The prohibitions relating to the birds, too, are not the same. Manu prohibits birds dwelling in cities and those that strike with the beak. There are also differences with regard to the fish. Manu prohibits all but a few species, and declares the crocodile, turtle and tortoise clean, but these are unclean in the Jewish Code. The Jewish law stands even further removed from the Zend-Avesta, as it knows nothing of the dualism of the latter (Gen. i. 31; Is. xlv. 7; Ps. cxlviii. 10). The most recent interpretation is the one advanced by W. Robertson Smith and accepted by Stade and Cheyne. He regards the prohibitions as identical with the taboo that Totemism places upon the use for food of the sacred ancestral animals. But it is the essence of Totemism that while sacred animals are not to be eaten generally, they are to be eaten eucharistically, as a religious rite; and further, these animals being regarded as ancestral, their names are reproduced in the names of tribes and individuals. With regard to the first point, there is absolutely no proof that the unclean creatures were ever eaten eucharistically in Israel. The two verses usually cited (Is. lxv. 4 and lxvi. 17) which condemn the consumption of swine are altogether too doubtful in meaning and too decidedly the subject of dispute (Duhm, Marti) to be in any way important. Still less fortunate is the attempt to prove the existence of Totemism from the occurrence of such names as Achbor and Chesir; for there is a larger number of clean animals whose names occur as names of individuals-Zimri (?) Hagab, Eglah, Epher, Rachel, Jonah, etc. (Jacobs, 'Stud. in Bib. Arch.'). If any further proof were needed that the bestowal of names has no connection with Totemism and is the result of accident or the suggestion of environment, it would be afforded by the large number of plants, excluded from consideration of clean and unclean, that furnish the names of individuals. Thus Susanna (Lily), Hadassah (Myrtle), Tamar (Palm), Carmi (Vineyard), Elah (Terebinth), Elon (Oak), Keziah (Cassia), Zetham (Olive). Totemism, moreover, would utterly fail to account for the extensiveness of the list of the unclean, and for the evident principles of selection guiding the compilation of the list. But the presence of Totemism altogether, characteristic as it is of the lowest stages of savage life, would be a startling anachronism in the highly complex and ethical civilization of the Hebrews (Nöldeke, Zeitsch. d. Deutsch. Morg. Gesell. 1886). The consideration of the dietary laws as hygienic enactments will come under the section in this article HEALTH LAWS.

Blood.— The prohibition of blood is avowedly different from the prohibition of the unclean creatures. Blood was too precious to be used by man. It was identified with the vital sentient principle. It was therefore to be consecrated to God. It is declared to be the medium of atonement representing the very life of the animal sacrificed (Lev. xvii. 11). The injunction concerning the blood is coeval with the very permission to use flesh as food (Gen. ix. 4). It is enunciated as a duty for all humanity, and the stranger was bound to respect the prohibition equally with the Israelite.

In the case of non-sacrificial animals or birds, the blood had to be poured on the ground and covered with earth (Lev. xvii. 10–15). The prohibition only applied to blood of mammals and birds, not to the blood of fish or locusts. It referred only to the free blood in the blood-vessels, and not to that absorbed in the tissues. The blood prohibition was one of the chief factors for the law of Shehitah or ritual slaughter. So great is the abhorrence of the Jews towards blood that bread is rendered unfit for use if in the process of eating, it become tinged by a speck of blood from the teeth (T. B. Kethuboth 60A). The monstrous absurdity of the "Blood Accusation" has been adequately treated by Strack ('Das Blut in Glauben,' etc., Munich 1900) and Chwolson ('Blutanklage,' 1901). Early Christianity accepted the blood prohibition (Tertullian, Apolog.), and it remained in force for various Christian sects till comparatively recent times (Grotius on Acts xv. 20). For Moselems, the prohibition is still in force (Koran, Sura II, V, VI). For the hygienic consideration of the blood prohibition, see under section HEALTH LAWS.

Fat.— The fat, like the blood, was reserved for the altar. Its prohibition was therefore limited to the fat of sacrificial animals,— kine, sheep and goats — and did not refer to that of other clean animals or birds. It was further limited to the fat similar in character to the intestinal fat, lying in layers separate from the flesh, and did not refer to that which was grown with the flesh (Lev. iii. 16, 17; Shul. Aruch, Yore Deäh § 64). The traditions of Karaitic Jews differ from those of Rabbinical Jews with regard to the extent of the fat prohibition (Aderet Eliahu, chap. 19). The curious suggestion of Michaelis that the prohibition was due to the desire to further the oil culture of the country has no foundation. For hygienic aspect, see section HEALTH LAWS.

"Sinew which Shrank." — "Therefore shall the children of Israel not eat of the sinew which shrank which is upon the hollow of the thigh" (Gen. xxxii. 32; cf. Septuagint). The prohibition of the nervus ischiadicus (?) commemorates the great triumph of Jacob, when, through his victory over the Angel of the night, he received the name Israel, and despite his own injury, compelled his conquered opponent to bless him. It is the special moment of great achievement to Jacob (Hosea xii. 4,5) and of supreme destiny to his children (Gen. xxxv. 10, 11). Owing to the disputed nature and locality of the prohibited sinew, the prohibition

has been extended to both the nervi ischiadici, the adjacent veins, tubular sinews and fatty fibres. The removal of all these, however, demands a special knowledge and expertness infrequent in many Jewish communities; so that the sirloin, etc., is not generally available for food except in the Orient and Eastern Europe (Shul. Aruch, Yore Deäh § 65).

Slaughtering.— All animals that die otherwise than by Shehitah, ritual slaughter, are termed Nebhelah (that which dieth by itself), and all that are torn by beasts or are afflicted by any fatal disease or lesion are called Trefah (the Torn). In both cases their use for food is prohibited. The ritual slaughter, Shehitah, is one of the most important functions in the Jewish ceremonial and is always in the hands of trained experts (Deut. xii. 21). The knife used is specially sharpened and repeatedly tested by experts to ensure a perfectly sharp and smooth edge. Its blade being usually 14 inches in length and two inches in width, is specially adapted for rapid manipulation. It must then be drawn with a steady stroke across the throat, severing the trachæa and esophagus and dividing the pneumogastric nerve controlling cardiac action, and the carotid artery and jugular vein. Reserving hygienic considerations for "Health Laws," the following effects of the process must be noted. They formulate the result of a vast number of experiments comparing all the known methods of slaughtering animals, conducted by Dr. Dembo in Saint Petersburg under the auspices of a scientific commission. (1) Comparative Painlessness of Death.—(a) The severing of the great blood-vessels, producing instantaneous anaemia of the brain, results in absolute unconsciousness — the gray matter of the brain ceasing its function at once and complete loss of consciousness following in three to five seconds. (b) The cut is exceedingly rapid, seldom consuming more than one second in time, as the knife is sharpened and smoothed with extraordinary precaution; consequently the pain of death is minimised. (2) Economical Considerations.—(a) Through the much earlier appearance of rigor mortis, the meat is sooner available for food. (b) Through the much later appearance of decomposition, the meat remains longer available even in summer (Shul. Aruch. Yore Deäh §§ 1–27).

Inspection.— While the proper performance of Shehitah excludes the animal from the category of Nebhelah, it must be further examined to ascertain beyond all question that it is not Trefah (suffering from any mortal disease or lesion). This examination, Bedikah, is purely hygienic and is treated under section Health Laws. But just as the Shehitah (ritual slaughter), with all its far-reaching ethical, economical and hygienic consequences, originated in all probability with the necessities of the altar service — to pour out the blood for sacrifice — so the Bedikah (examination for disease) with all that it involves had its prototype in the temple service in the priestly examination of the sacrifice for disqualifying blemishes (Lev. xxii. 20–25; Malachi i. 8).

Extraction of Blood-Vessels, etc.— The prohibition of the blood, the fat and the nervi ischiadichi necessitates the careful extraction (nikkur) of certain blood vessels, membranes, fat layers and tissues, sinews and fat-fibres from various parts of the body (Shul. Aruch. Yore Deäh § 65.) English-speaking Jews call this process of extraction "porging," a word derived from the Judaeo-German "porschen". The process is very elaborate ('Jewish Encyc.,' art. Porging) in the case of animals. It is, however, very simple in the case of fowl, where neither the prohibition of fat nor of the nervi ischiadichi obtains.

Salting, etc.—There still remains one further process Melihah (salting), before the meat is fit for food, and that is the soaking and salting thereof to remove the surface blood. Salt also came on the altar with sacrifices (Lev. ii. 13; Ezek. xliii. 24). The hygienic importance of Melihah is referred to under section Health Laws.

Products of the Prohibited.—Not only are the unclean and the diseased animals prohibited but all their products. Thus the milk and cheese of both unclean and diseased (Trefah) animals are prohibited. Milk and cheese should not therefore be purchased in the general market without superintendence. Human milk is prohibited for the adult and even for the child who has once been properly weaned. So the eggs of unclean birds and all eggs on whose yoke a drop of blood is found are prohibited. In like manner the roe of an unclean fish cannot be eaten. Honey, however, is permitted, as it is not regarded as a product of the bee, but simply as the nectar gathered by the insect (Shul. Aruch, Yore Deäh § 81). In the case of any mixture of the forbidden and the permitted,— if the taste of the forbidden object be discernible, then all is forbidden. So cheese which has been curdled with a prohibited rennet is entirely prohibited, and some superintendence ought to be exercised over the manufacture of cheese.

Meat and Milk.— The threefold repetition of the command "Thou shalt not seethe the young in its mother's milk" (Deut. xiv. 21) is traditionally interpreted as referring to the threefold prohibition of cooking meat and milk together, of eating this mixture or of deriving any benefit from it. The interpretations of the command have been many and varied, but two predominate, and have certain justification. Philo construes it as an ethical law similar to (Deut. xxii. 6 and Lev. xxii. 28), denouncing cruelty to animals and intended for the moral discipline of the people. The milk that was set apart by nature for the nourishment of the young should not be used as the medium in which the young is seethed. Maimonides explains the prohibition as directed against an old heathen custom or magical rite of propitiating the nature gods by sprinkling the fields with this meat and milk broth. This explanation of the prohibition has also been advanced by Spencer and Cudworth and has received some support from modern authorities. Meat and milk are never partaken of together at the same meal, sufficient interval being allowed, if the meat has been eaten first, for it to be digested before partaking of milk. The prohibition refers with equal force to any preparations in which meat or milk enters (Shul. Aruch, Yore Deäh §§ 87–97).

Vegetable Dietary Laws.— Not all the food

laws concern themselves with meat. There is the injunction concerning Orlah which forbids the use for food of the fruit of a tree in the first three years of its growth (Lev. xix. 23–25). The yield of the fourth year, or its money equivalent, was brought to Jerusalem and used for special rejoicing and feasting. The prohibition of the fruit crop of the first three years continues binding to the present day. Another law of somewhat similar character is that of Hadash which prohibits the eating of the new corn until the time of the offering of the Omer (Lev. xxiii. 9–14). The sowing of mixed seeds in a vineyard is prohibited (Deut. xxii. 9). Should, however, the prohibition be transgressed, then the produce cannot be used for food. But the most important vegetable dietary laws are those of Hametz and Mazzah commemorating the Exodus from Egypt. During the eight days of the Passover festival no leaven (Hametz) can be eaten and none may be permitted to remain in the house (Ex. xiii. 7). There is furthermore the positive law that unleavened bread (Mazzah) shall be eaten.

Heathen Food Laws.— Another group of dietary laws are either prohibitive of the objects of idolatrous worship or of intercourse between Jews and idol-worshippers. The most important of these refer to the use of wine. Wine that has been consecrated to an idol is absolutely prohibited. But even the ordinary wine of the heathen is prohibited, partly because of the suspicion that he may have consecrated it to his idol, but also to create a social barrier that would make the possibility of intermarriage more remote (Ab. Zarah 36B). Furthermore wine that has been touched by an idolator though belonging to a Jew, will be under suspicion of having been idolatrously consecrated and its use prohibited. The general stringency of the regulations is, however, influenced by the specific conditions of social environment.

Health Laws.—There has been considerable dispute as to the existence of a class of professional medical men distinct from the priestly class in Biblical times. The occurrence of the expression "thy healer" (Exod. xv. 26) has been advanced as an argument for the affirmative, but the whole verse may be interpreted as referring to a union of the sacerdotal and the medical offices. Certainly the context in Exod. xxi. 18–20 seems to imply that the doctor was paid; and there is mentioned in Isaiah the Hobhesh or wound-binder. Asa, King of Judah, is reproached for having sought help from the physicians and not from God. The Prophets were frequently appealed to for aid in sickness and one interesting cure is recorded as having been made by Isaiah. King Hezekiah had fallen sick of a disease which Lauder Brunton identifies with the inflammation of the tonsils. The prophet cures him with a plaster of figs,— a remedy not unknown to modern treatment. Later, we find physicians highly honored (Ecclesiasticus xxxviii. 1–8), and numerous evidences of considerable skill on their part. A long array of famous physicians is recorded in the Talmud and many difficult operations are credited to them (Kotelmann, Virchow's Archiv. Vol. 84). A prolonged controversy has raged round the interpretation of a passage in the Talmud (T. B., Niddah 40 A) which according to one reading refers to the successful performance of "Cæsarian Section," Hysterotomy, mother and child both being saved. Of special importance is the physiology and pathology of the Talmud tractate Hullin. Certainly the health laws of the Bible give eloquent testimony to the advanced condition of Social hygiene. Certain biotic advantages have been claimed for the Jew. Greater longevity, greater fecundity, greater exemption from tuberculosis and syphilis, special capacity for acclimitisation, are among these. But the advantages do not appear to be racial and seem to be entirely dependent upon the degree of the observance of the special laws, and to be forfeited with the non-observance of these (Adler, Nossig).

Work and Rest.— The first health laws are given in the Decalogue with the institution of the six days of labor and the seventh day of rest. The hygiene of labor is clearly recognized in Jewish law. Even the scholar is enjoined to acquire a handicraft (Pirke Aboth ii. 2). The necessity of physical training is insisted upon with emphasis, and it is accounted a paramount duty for the father to teach his child a craft and to train him to swim. Even the women of the wealthiest class are enjoined to work because of the destructive effect of idleness upon moral strength and mental sanity (T. B. Kethuboth 59 B; cf. Proverbs xxxi.). but over pressure has been guarded against by the complementary regulation of a full day of periodical rest. Since the nature of the toxins produced by fatigue and the extremely gradual rate of their elimination from the system have been more clearly recognized, the Sabbath rest has become a scientificially demonstrable hygienic necessity, which no shortening of the day's labor can possibly supply.

Food.— Nearly all the food laws have their hygienic aspect. The prohibition of the carnivore with their exclusively nitrogenous diet; of the swine with its tendency to trichinic infection, and the readiness of its meat, as most freely productive of gelatine, to provide a favorable nidus for morbific bacilli (Dr. E. Ballard), has been welcomed as a health law of importance. Dr. Borell of Göppingen (Virchow's Archiv. 65) describes the presence of worms similar to trichina in the blood of the raven, and Virchow adds, that this is a variety of Filaria similar to the Filaria sanguinis hominis which is known to be the cause of chyluria and chylous hematuria and supposed to be the cause of Elephantiasis. Similar discoveries have been made by Herbst in the blood of the crow, the daw, the hawk and the jay. The rejection of eels, muræna, oysters, mussels and crabs from the list of foods has been regarded as hygienic since these feed largely on sewage, and have been the causes of numerous epidemics, especially of typhoidal character. The ordinary mussel, mythis edulis, has had its poison examined and analyzed by several specialists (Virchow's Archiv. Vol. 103, 104, 110, 115). The preference for the scaled fish of the sun-bathed, purer and more highly oxygenated surface waters has also its hygienic aspect. Recent investigation as to the propagation of disease

through insects and animals,— malaria and yellow fever by the mosquito, typhoid by the fly, pneumonia by mice, hydatid cysts by the dog, etc., seems to afford continually growing evidence to the hygienic value of the food laws and of the elaborate regulations concerning the defilement of person, clothes, foodstuffs and utensils by contact with the various species (Lev. xi. 32, et seq).

The rejection of blood has also its hygienic effect. It is in the blood that toxins produced by disease germs and occasionally the germs themselves, circulate, and this makes it a vehicle for communication of disease; and further by its own rapid decomposition, it becomes also an original source of disease. The intestinal fat has also been considered by many hygienically objectionable, as harboring parasites in the lymphatic ganglia (Ebstein). In the method of slaughter (Shehitah) a valuable group of health laws is encountered. (1) The two main characteristics of the Shehitah are the quick bleeding and the accompanying epileptoidal convulsions. These produce, after certain chemical reactions, the acid phosphate of Potash KH_2PO_4 which is antiputrefactive. It hinders the development of micro-organisms, delays the formation of the products of decomposition, of ptomaines and toxins, and imparts an additional savor to the meat. (2) Through the epileptoidal convulsions the blood left in the meat is less alkaline and therefore less favorable to the development of bacteria (Dembo). The Bedikah (Examination) is avowedly a pure health law. Its function is to determine whether or not the animal was suffering from any fatal disease or lesion, as this would make it Trefah, "Torn," and unfit for food. For this purpose the chief organs have to be examined, especially the lungs. It must be clearly determined whether or not there are any adhesions either of one lobe of the lungs to the other, or the whole or part of the lungs to the diaphragm or chest wall. The lungs are tested for perforations by inflation during immersion in water. The surface of the lungs is examined for tubercules of any kind (Dr. Behrend in *Nineteenth Century*, 1889). Inspection of other organs only occurs when symptoms are observed indicating the presence — or when there is general prevalence — of some affection. Nor are the lungs of a fowl examined unless there is special ground for suspicion. Koch (Inter. Med. Cong. 1890) has, however, shown that tuberculosis of fowl is a species distinct from human or bovine tuberculosis and is inocuous to man.

Melihah, or "salting the meat" prior to use, has for its purpose the removal of the stagnant, impure, diseased, germ-laden, surface blood. When the conditions, under which meat has often to be kept before use, be remembered, the health value of the Melihah law will be clearly apparent (Hyamson, *Jew. Quart. Rev.* Vol. IX.). The avoidance of the mixed meat and milk diet has also been hygienically commended. It is claimed that the simultaneous ingestion of soluble and fibrinous albumen is not well borne by the gastric apparatus (Aronstam). Of importance are the special laws aiming at the purity of water and milk. In countries where poisonous reptiles abound, water and milk must not be left uncovered. Articles of food should not be kept in any unclean place, as under the bed, nor be served from any impure vessel. Timely and simple diet is recommended. There are 83 diseases that are prevented by an early breakfast of bread and salt and a pitcher of water. For health reasons, it was enjoined that meat and fish should not be eaten simultaneously.

Body.— In its insistence on the purity of the body Jewish law presents a unique phenomenon. As Leroy Beaulieu declares, "for 25 centuries the Jew has striven to be clean, and alone has observed the laws of moral and physical purity." Yet here as elsewhere there should be no confusion between effects and motives. Though the motives were to a considerable degree avowedly hygienic, yet predominantly, they were religious. Ablutions were demanded from the Jew, for prayer could not be pronounced amid physical uncleanliness; his body had to be scrupulously clean for the Phylacteries could not otherwise be worn. At the very moment of rising, ablution of the hands and face was enjoined,— without this he could not offer his morning prayer (Psalm xxvi. 6). Before and after every meal the hands had to be washed and a special benediction for the injunction of cleanliness pronounced. After every unclean bodily function, after touching any unclean object, after visiting a cemetery, ablutions had to be performed. Although water is truly precious in the East, yet there never was stint of it for the purposes of cleanliness. Rabbi Akiba in prison, preferred to leave his thirst unassuaged, and used his dole of water for ablutions. It was prohibited to live in a town that had not a bath, and the use of water was regarded as the infallible panacea. "Better a little cold water in the morning and a warm hand and foot bath in the evening than all the salves in the world" (Shab. 109A): "Man endangers the eye, nose, mouth and ear if he touch them with unwashed hands." The value of the warm baths of Emmaus near Tiberias, of Gadara in Peræa and Callirrhoe near the Dead Sea, was thoroughly appreciated. Nor were aesthetic considerations overlooked in the case of the body. Physical beauty was highly valued (T. B. Berachoth 20A). The long list of blemishes and disfigurements, over 150 in number, that were disqualifying for the priesthood points to the existence of a high standard for physical conformation (Sifra, Emor III).

Clothes.— The view entertained as to the cleanliness of clothes is tersely stated in the apothegm, "the sage upon whose garments a grease spot is found is worthy of death." The uncleanliness of his garment was an insult to the holy law whose dignity it was his duty to protect. Whenever the man has been in contact with any impurity, whether it be one of the leproidal diseases or the impurity of the corpse, or any sexual impurity, it is not only his body, but also his clothes that have to be washed. It is perhaps unduly imaginative to see in the law which prohibits the wool being mixed with flax in the manufacture of garments, an anticipation of Jaeger (M. N. Adler). But Ebstein insists nevertheless that such a garment would be hygienically harmful as the wool

would tend to warm and the cotton or flax to cool the body and there would be unequal protection for the body surface (Deut. xxii. 11). There is a reference in Leviticus to a peculiar species of reddish or greenish discolorations occurring in garments and destroying the material. It is termed leproid and may be some form of fungoid growth. Where garments are worn for long periods such growths may occur. Directions are given for inspection and seclusion, lustration or destruction (Lev. xiii. 47).

Sanitary Arrangements.— The Bible already makes provision for the protection of the camp from the usual plagues of typhoid, diarrhœa and dysentery attendant on camp life. The consignment of all putrid matter to the earth — in a place without the camp — ensured disinfection and the protection of the water and the air (Deut. xxiii. 9–14). These admirable hygienic provisions are the direct consequences of the Holiness motive with its psychophysical implications; "that thy camp shall be holy." In the subsequent city life similar precautions were taken. It was prohibited to rear poultry or keep wild animals or permit dung-heaps to gather in Jerusalem (T. B. Baba Kama, 82 B.). No tannery could be erected within 50 cubits of the city limits, and then only to the east of the city so that the prevalent west wind would carry away the effluvia. Kimhi maintains in his comment to Psalm xxvii. that a fire burnt continually without the city for the destruction of all cadavers and offal and refuse. Many scholars, though not all, accept this statement. Certain writers have referred to the extremely valuable sanitary results of the minutely scrupulous removal of all leaven from the homes before the advent of Passover (M. N. Adler). As this involves the thorough overhauling of the whole house from garret to cellar, the purification and cleansing of all utensils and kitchen accessories, and the destruction of the accummulation of scraps, etc.— the hygienic effects, however undesigned, must be acknowledged (Ex. xii. 19; Deut. xvi. 4).

Temperance.— Both in food and drink temperance was enjoined. Gluttony and drunkenness is the special crime of the rebellious son whose punishment is death. Wine was so important an article of food, that special influence was necessary to prevent its abuse. The stories of Noah and Lot conveyed their own moral. The priests were held unfit for office if they indulged in strong drink. The order of the Nazarites, and the clan of the Rechabites, upheld an ideal of abstinence. But yet the value of wine as a medicine was recognized (Prov. xxxi. 6). Nor was the ascetic attitude entirely approved of. The Nazarite brought his sacrifice when the term of his vow was over for having denied himself that which God permitted. "In the future world, man will have to account for every enjoyment that was offered to him and he has unnecessarily refused" (Jerus. Tal. Kid. IV). Yet there is no limit to the denunciation of drunkenness throughout the Bible.

Dwelling.— The Bible records the special protection to be afforded to the flat roofs of the houses. They were to be surrounded by a battlement so there should be no blood upon them (Deut. xxii. 8). The height of the battlement is fixed at a minimum of 3.06 ft. It must be strongly built and able to stand any ordinary strain. There are further injunctions prohibiting the presence of any open well or pit, or the presence of unsafe ladders about the house. There is a remarkable series of hygienic laws referring to a diseased condition of the house (Lev. xiv.). The reference is probably to houses attacked by dry rot — merulius lacrymans, a fungoid growth inimical to the health of the inhabitants. There are clearly formulated in the regulations — (1) duty of declaration; (2) duty of examination and diagnosis; (3) complete removal of the affected parts without the camp; (4) scraping of the interior of the house and removal of the dust and débris without the camp to the unclean place; (5) on return of the affection, the house is to be completely destroyed; (6) all the persons who have been in the house, eaten or slept therein, must be purified through the washing of clothes and person (Baginsky).

Disease.— Proceeding upon the principle that the whole law was given for life and not for death (Lev. xviii. 5, T. B. Ab. Zarah 27B), the interest of the patient is declared superior to any of the ordinary religious obligations; — even the sanctity of the Sabbath and the Day of Atonement giving way to the necessities of medical treatment. The duty of visiting the sick is a part of the great *Imitatio Dei* (T. B. Sota 14A) and the neglect of this duty is declared by Rabbi Akiba to be a criminal indifference to human life (T. B. Nedarim 39B). But the visiting must be helpful in act and reverent in spirit since the Divine Shechinah stands ever watching at the head of the bed of suffering. This visiting should, however, be entirely omitted if the nature of the disease or the attendant circumstances make it a source of embarrassment to the patient. In certain cases of disease or contact with disease measures for putrification and disinfection have been enacted. Wherever there has been contact with the dead, or pseudo-leprous symptoms of disease, or sexual secretions and discharges — an elaborate process of washing and bathing for person and garments prevails.

Burial.— Interment must take place as speedily as possible (Deut. xxi. 22). It is the last and most unselfish act of kindness one can perform to one's fellow. God himself showed the example by burying Moses. All can claim interment, even the criminal executed on the gallows (Deut. xxi. 23). Cemeteries were extramural and were prohibited within a circuit of 60 cubits from the city limits. The dead were placed in caves and vaults and were visited by their relatives for three days after, to avoid all possibility of their being buried alive. After some time the remains were then interred in the grave proper. The rapid decomposition of the body to its constituent elements is regarded as desirable. While cremation is opposed to Jewish practice (Gen. iii. 19; Eccles. xii. 7), yet quicklime is frequently placed in the grave in some countries. The prevalent custom among observant Jews in Eastern Europe and the Orient is to have the coffin of the simplest construction,— a few boards nailed together,— with the bottom perforated,— so as to interpose no obstacle to rapid decomposition.

The selection of the soil for cemetery purposes is of hygienic value,— as the ground must not be in contact with any water sources, and thus the danger of contamination of the water supply is minimised. An interesting account is given in the Bible of the composition of the "Water of Lustration" used for all who had been in contact with the dead. Undoubtedly the ingredients possess high disinfecting qualities. Into its composition entered cedar wood (coniferæ), rich in phenol and cresol and cedrene camphor; hyssop with its camphoraceous oil of penetrating aroma and other oils, rich in oxygen; the cremated carcase of the heifer, rich in potash and soda (Numb. xix.).

Sexual Relations.— There is a vast legislation controlling all the circumstances of sexual relation. The penalty of death is imposed for all acts of sodomy or unnatural intercourse, for connection within specially prohibited degrees and for adultery with a married woman (Lev. xx. 10–16). Excision is the penalty imposed for all other illicit connections. Prostitution is absolutely prohibited (Deut. xxiii. 18) and chastity is demanded from both sexes. Two of the commandments of the Decalogue are devoted to the maintenance of the purity of married life (Exod. xx. 14, 17), and the elaborate table of prohibited degrees protects it hygienically (Lev. xviii. 7–18). Thus the marriage institution is enabled to perform its proper function, the fulfilment of the law: 'Be ye fruitful and multiply' (Gen. i. 28). Anticonceptional acts invited the Divine doom (Gen. xxxviii. 9), and the duty of begetting children is declared the supreme privilege and blessing (Psalm cxxvii. 3–5; Psalm cxxviii. 3–4). In opposition to the powerful current of opinion, favoring childlessness, that found support among Epicureans and Stoics in the interests of greater independence and possibilities of self-indulgence or self-development, and in Essenaic and Christian monachism in the interests of chastity and personal holiness, the Rabbis compare a man voluntarily childless to a "shedder of blood" and "an opponent of God" and adjudge him unworthy of life (T. B. Yebamoth 63B et seq.). Yet marriage is acknowledged to be also an end in itself (Gen. ii. 18), and an eloquent panegyric is pronounced over it. "He who is without wife, dwells without joy; without blessing; without good; without religion; without citadel; without peace. The wife is to be loved as one's self; to be honored, more than one's self" (T. B. Yeb. 62B). The age recommended for marrying is about 18 years for the male and extreme disparity of age is discountenanced. The influence of modesty in love is declared of paramount importance for the character of the children (T. B. Niddah 71A), and temperance is absolutely enforced by the rigid prohibition of sexual relations for a certain period succeeding the menses and parturition (Lev. xii. 2–5; xx. 18). Behrend maintains that the enforced temperance ensures procreation at a specially favorable period. The fecundation that occurs after the lapse of seven days following the cessation of the menses is much less likely to result in abortions. Circumcision was regarded by Philo and Maimonides as assisting in the promotion of temperance by weakening the erotic element (cf. Bereshith Rabbah § 80) while increasing functional power. Motherhood was honored even in animals (Lev. xxii. 28; Deut. xxii. 6). The time preceding and following parturition is the occasion for the exercise of extreme care both dietetically and mentally (Jud. xiiii. 7; T. B. Yoma 8; T. B. Kethuboth 60B). The nourishment of the child is the duty of the mother (I. Sam. i. 23); the mother's milk being regarded as the best food. With regard to sexual impurities the laws are very minute and detailed and refer to the impurity through coition, the menses, parturition, secretions and discharges of various kinds. Segregation, bathing and washing of the clothes, etc., are the means by which purity is restored. The laws in Leviticus (Chap. xii-xv.) are elaborated in the Shulhan Aruch, Yore Deäh §§ 183–200. The fullest protection is given to woman and the utmost hygienic precautions are taken (Baginsky).

Leproid Impurity.— Much controversy prevails concerning the leproid affections referred to in Leviticus (Ch. 13 et seq.). One group of interpretors identify the disease here referred to with true leprosy, Lepra Arabum or Elephantiasis Graecorum (Häser, Michaelis, Neumann, Fox). A second group regard the Zaraath of Leviticus as a generic term covering a large variety of skin diseases ranging from true leprosy to the comparatively mild Psoriasis (Lepra Graecorum), Scabies, Eczema and possibly Syphilistic affections. (Aug. Hirsch, Liveing, Munro). Others again find no connection at all with true leprosy (Hebra, Münch, Hillary, Finály, S. R. Hirsch). Thus Münch maintains that the Lepra Arabum was quite unknown to the early Hebrews. Finály gives a peculiar and unwarranted connotation to the diseased "skin of the flesh" (Lev. xiii. 2) and would confine the whole legislation to syphilistic affections. Hirsch, Hoffmann and other theologians regard the disease as a purely symbolical affection, similar possibly to the 'mark of Cain' (Gen. iv. 15).

The following are the main negative considerations that influence those that deny all reference to true leprosy. (1) The absence of the characteristic symptoms of Lepra Arabum; anæsthesia, muscular atrophy and loss of extremities, etc. (cf. Sforno on Lev. xiii. 2). (2) The extreme brevity of the interval of seven days, between the different inspections that determine the presence or absence of a serious affection, points away from leprosy which is characteristically slow in development. (3) The excessively mild enforcement of the regulations in the later development of the law, makes the identification of Zaraath with true leprosy highly improbable (T. B. Moëd Katan 7B). (4) The Biblical Zaraath seems to be regarded as an hereditary and contagious disease. Many authorities, however, consider true leprosy to be neither contagious nor hereditary. (5) Certain anomalies in the regulations suggest a symbolic disease or infliction of stigmata expressive of Divine displeasure rather than a true disease (T. B. Arachin 16A; cf. Exod. iv. 6; Numb. xii. 10.). Thus when the white leprous efflorescence covers the whole body, the affection is pronounced clean and neither isolation nor further inspection follows. Yet this complete efflor-

escence is apparently a characteristic of the incurable Egyptian leprosy (Deut. xviii. 35).

None of these considerations is however conclusive, and most probably, Zaraath in the Bible is a generic term including many diverse skin diseases and among them, true leprosy. The characteristics of the advanced stages of Lepra Arabum do not seem to have been unknown (Numb. xii. 10, 12; Deut. xxviii. 27, 35), and the reference to Egyptian leprosy seems to point to true leprosy, which was known in Egypt (Ebers). In Leviticus however, the earliest symptoms alone are given to determine the presence of the disease. The laxity in the enforcement of the rules in later times may be explained by the gradual decrease of true leprosy among the Jews, and the consequent limitation of Zaraath legislation to the minor skin affections. The terrible diseases, that decimated the army of Pompey, were largely leproid in character (Pliny), and the immunity of the Jews to all these is affirmed by Tacitus. Similar testimony to the freedom of the Jews from leprosy is afforded by Plutarch (Sympos.) and Aelian (De Natura animal), who assert the consumption of swine to be the cause of leprosy and skin disease (cf. T. B. Kiddushin 49B). The apparent anomalies are removed if Zaraath be regarded as a term covering many widely different skin affections. Modern science has discovered the special leprosy fungus, Bacillus Leprae, and has, on the whole, vindicated the Bible view of leprosy as contagious. Its hereditary character has been less clearly determined, but it is also less clearly implied in the Bible. The main points of hygienic interest are those referred to in the affected house,—the insistence upon declaration of disease, diagnosis, isolation, lustration, etc.

20. Judaism — Jewish Charities. See Jewish Charities.

21. Judaism — Alliance Israelite Universelle. An organization with headquarters at Paris, France, having for its purpose the protection, improvement, and education of the Jewish people. Its activities have been directed, in the main, toward safe-guarding and educating Jews in Eastern Europe, Asia Minor, and North Africa. During the first half of the last century several attacks made on the Jews by fanatical mobs, owing chiefly to false charges of ritual murder, evoked fervent appeals for organization, to which apparently little heed was at first paid. Public sentiment began to crystallize after th Damascus blood accusation in 1840. A temporary cessation of difficulties produced indifference to the needs of organization when, on 23 June 1858, the world was startled by the announcement of the details of the Mortara case. Edgar Mortara, aged six, a son of Jewish parents, was forcibly abducted from his parents' home in Bologna by papal soldiers on the grounds that four years earlier, during a supposed spell of sickness, a servant, Anna Morisi, had secretly baptized the child.

Origin of the Alliance.— Public sentiment now became inflamed. The need of some central organization to watch over Jewish interests was keenly felt and the "Alliance Israélite Universelle," founded in 1860, was the result. Six Parisian Jews, at that time but little known, but whose names have since become almost household words in Jewry, were chiefly instrumental in founding the Society. They were Aristide Astruc, later chief Rabbi of Belgium; Isidor Cahen, editor of the 'Archives Israélites;' Jules Carvallo, civil engineer; Narcisse Leven, lawyer; Professor Eugene Manuel; Charles Netter, merchant.

Objects.— The object of the Society is: "To defend the honor of the Jewish name whenever it is attacked; to encourage, by all the means at our disposal, manual labor and the pursuit of useful trades and professions; to combat, whenever necessary, the ignorance and vice resulting from oppression; to contend, by the power of persuasion and moral influence, for the emancipation of our brethren who still suffer under the oppressive burden of exceptional legislation; to advance and promote the complete enfranchisement of our brethren by in ellectual and moral regeneration." Article I of the Society's Statutes states its object: "(1) To toil everywhere for the emancipation and moral progress of the Jewish people; (2) To extend effective help to those who suffer persecution because they are Jews; (3) To encourage all publications calculated to promote these ends." When it is remembered that about 75 per cent. of the Jews still dwell in lands in which modern concepts of justice, liberty, and equality are almost unknown, the herculean undertaking of the Alliance may, perhaps, be understood.

Management.— The Alliance is managed by a Central Committee of 62 persons, 23 of whom reside in France, and 39 in other countries. Its headquarters are located at 35 Rue de Trévise, Paris. The Central Committee is elected for nine years, one-third of the members retiring at the end of three years, being, however, eligible for re-election.

Methods.— The *modus operandi* of the Alliance is solely along lines of moral force. The results achieved have, therefore, been slow of growth. They are, however, permanent in character and are beginning to bear fruit in the

most unmistakable manner. The work has naturally divided itself into three branches, (1) political; (2) educational; (3) literary. Political activity has not been resorted to with a view of intermeddling in the affairs of the powers, but of appealing to political leaders to secure justice. The necessity for such work arises from the fact that the Jews are followers of a religion which has no government to support it.

Political Activities.—While the undertakings of the Alliance in this direction have not been uniformly successful, they have served to stir the world's sluggish moral sense, and in many important respects to improve the political status of the Jews. Switzerland and Sweden first yielded to the appeals of the Alliance, and after these initial successes, Russia and the Balkan provinces were the European countries in which the strongest efforts were made, because in these lands the Jews suffered most from all kinds of disabilities. At the time when this Society was formed the lot of the Jews in the Balkan provinces was most unfortunate. At its instance remedial legislation was promised and when Adolphe Crémieux went to Bucharest in 1866 and pleaded with the Roumanian authorities, it was believed that Jewish emancipation had been effected. But conditions went from bad to worse, until in 1878 the Berlin Treaty in Article 44 (inserted in the main through the influence of the Alliance), demanded recognition of the political rights of Jews in the Balkan provinces. Servia and Bulgaria have been faithful to the terms of the treaty, but to this day Roumania considers the Jews as aliens. Roumania remains the scene of great activity on the part of the Alliance, large subventions being annually granted for charitable and educational purposes. In spite of persistent representations to the Russian government little success has been achieved in Russia. The political status of the Jews is that of aliens. Social, economic, civil, and religious disabilities of every character menace the progress of about 6,000,000 Jewish souls. During the famine of 1809, when Poland and the West-Russian provinces suffered, the Alliance came to the rescue of the unfortunate, provided funds for the purchase of food, helped many to emigrate to Occidental lands, took charge of several hundred orphans, and founded trade-schools for Russo-Jewish children in Western Europe. When the persecutions of 1881–83 were inaugurated, when the "May Laws" were put into operation, and the Pale was again made the compulsory residence of millions of unhappy Jews, the Alliance again became an angel of mercy for them. Kishineff, Odessa, Kieff are names which recall the recent barbaric massacres of many Jews, and during 1905 the Alliance became the agent of the world's beneficence, distributing over 3,000,000 francs among the sufferers. The soldiers wounded during the Russo-Japanese War, widows and orphans deprived of their natural protectors during the massacres, 8,000 workmen rendered penniless through riots and mob violence, emigrants who sought opportunity and liberty in foreign lands, have all been efficiently assisted by the ministrations of this "universal" agent. In Mohammedan countries Jewish disabilities are of a different character. Here the people suffer from poverty and lack of education, rather than from political inequality. Still, large sums of money have been spent by the Alliance in Morocco, Tunis, Egypt, Persia, and Turkey, to protect the Jews from the violence of the mobs incidental to the misrule prevailing in most of these countries. Its representations have been strengthened by the intervention and support of the British and French, and, in recent years, of the American, consuls, with gratifying results.

Educational Work.— The most hopeful work conducted is the educational activities designed for intellectual and moral improvement. The bulk of the world's Jewish population in 1860 resided in unprogressive countries, and the intellectual status of the majority was necessarily low. In 1862 a school was founded in Tetuan (Morocco), in 1864 another was opened in Tangiers, and in 1865 a third was started in Bagdad. In 1880 there were 34 schools; in 1890, 54; in 1899, 94 — 58 of which were for boys and 36 for girls, having an attendance of 24,000 pupils. To-day the Alliance conducts 132 schools, with an enrollment of more than 40,000 pupils, in Bulgaria, Turkey in Europe, Turkey in Asia, Egypt, Tripoli, Tunis, Algeria, Morocco, and Persia. Schools are free to the poorest children, who also receive, free of charge, and at the expense of the Alliance, a mid-day meal each day and one or two suits of clothes each year. Whenever possible the scholar must pay a fee, which, in the case of the most prosperous, is as high as 20 francs a month. The schools are open to children of all denominations, and non-Jews, as well as Jews, are found among the pupils and instructors. In some localities night-schools for adults are now being conducted. A Rabbinical seminary was founded in Constantinople in 1897. In order to provide instructors for the 132 schools conducted by the Alliance, a normal school was founded in Paris in 1867. As far as possible the teachers are selected from the communities in which they are to teach in later years, and are sent to Paris for tuition. The "Ecole Normale Israélite" has a magnificent building in the French capital in which, in 1905, 98 male and 45 female students were receiving an education to fit them for their profession. Theory and practice go hand in hand under the system of the Alliance. Elementary school education is supplemented by manual and agricultural training. On 5 April 1870 the Mikveh Israel (Hope of Israel) Agricultural School was founded in Jaffa, upon a grant of land of about 600 acres, sympathetically granted to the Alliance by an imperial firman of the Turkish government. Fortunately for the undertaking M. Charles Netter was ready to devote his energies to the development of the school, whose existence was due to his suggestion, and whose success has been greatly due to his initiative and capable administration. M. Netter died in 1882. The Jaffa Agricultural School has over 220 pupils. Graduates of this school have become the instructors of the colonists who have settled on the Baron Edmond de Rothschild colonies in Palestine and in the de Hirsch colonies in Argentina. Another agricultural school was founded in 1895, in Djedei, a few miles from Tunis. A tract of land of about 3,000 acres was purchased, suitable buildings erected, and in a few years there was an enrollment of over 210

pupils. The Alliance also provides means of earning a livelihood through training given in the trade-schools. In 35 different centres of the Near East, "apprentice-schools" are conducted in which children are taught remunerative trades. The trade-school in Jerusalem, founded in 1882, has been particularly successful.

Further Activities.— Another branch of educational work undertaken is directed toward the formation of public opinion concerning the Jews. It has spread abroad a knowledge of Jews and Judaism by means of help given to Jewish scholars by subventions granted to assist them while writing and publishing their works. It is said that no important work referring to Jews and Judaism has appeared during the past 35 years without some assistance being granted by this Society. The Alliance library consists of nearly 25,000 volumes.

Bibliography.— The 'Bulletins,' annual, semi-annual, and monthly, published usually in French, and occasionally in English, German, Dutch, Italian, Judæo-German, and Hebrew. 'Publication of the 25th Anniversary of the Foundation of the Alliance Israélite Universelle,' issued in 1885, and published in French, English, German, and Judæo-Spanish; 'Publication,' issued in 1896, containing a review of work done from 1860–1896; French pamphlet by M. Nissim Behar, American Agent of the Alliance.

22. Judaism — Jews in America. See Jews in America.

23 — Judaism — Present Status of the Jews Throughout the World. With the voluntary and enforced emigration which marks the Jew in every age, and to which the past century was as little an exception as the present bids likely to prove, it is difficult to regard the status of the Jews as fixed for any length of time. The population is as shifting as conditions. Within the past two and a half decades there has been a Jewish migration of fully 1,500,000 from Eastern Europe to western lands, and across the sea to North and South America, Australia, and South Africa. Even if the new environment be permanent adaptation takes time, and one must be prepared for inequalities in many ways. Yet it is possible to give an accurate and fairly comprehensive sketch of the present-day status of the Jews in every land.

Australia.— In the gradual settlement Jewish merchants and men of affairs took a prominent part, and as a result they have entered largely into colonial life, and form an important factor in its prosperity. Their population is about 20,000, with the greater number in New South Wales (7,000), Victoria (6,000), New Zealand (3,000), with communities in South and West Australia, Queensland, and Tasmania. The discovery of gold in 1892 drew emigrants to West Australia, and a flourishing Jewish congregation exists in Perth, although it is liable to decline, if the mines cease to attract, as happened in Coolgardie, where the synagogue built in 1896 was sold for a Masonic hall, owing to lessening numbers. Throughout Australia, in most of the capitals and many of the smaller towns, Jews have been mayors; the agent-generalship of New South Wales has been held by Sir Saul Samuel and Sir Julian Salomons. Many have sat in the various Parliaments, and some have been colonial ministers; for example V. L. Solomon (1899), premier of South Australia, and Sir John Vogel, long premier of New Zealand. In Adelaide J. Lazar, J. M. Solomon, and Lewis Cohen (1883–4) have been mayors; M. Lazarus has been president of its Chamber of Manufactures. In Melbourne Edward Cohen was three times mayor, E. L. Zox being his successor in Parliament. I. A. Isaacs was attorney-general (1894–99), his brother J. I. was a member of Parliament (1894), other members being N. Steinfeld of Ballarat, Joseph Steinberg of Bendigo, F. J. Levien of Geelong, Theo. and B. J. Fink, and D. B. Lazarus. In Sydney the name of J. G. Raphael is preserved in several of its streets; he with Charles Collins, L. W. Levy, and J. J. Cohen occupied official positions; George J. Cohen, Richard Gotthelf, and other Jews were presidents of the Chamber of Commerce; H. E. Cohen was one of the judges of the Supreme Court. In 1905 J. J. Cohen, Daniel Levi, and A. E. Collins were members of the Legislative Assembly. It must be added that intermarriages have been very frequent in Australia, particularly in Sydney. Exceedingly handsome synagogues are in Sydney and Melbourne, and smaller ones elsewhere. The better class of Jews are well represented in professional and mercantile life.

Africa.— It is not easy to give exact statistics as to the Jews in Africa, but to follow the figures given by Isidor Loeb, about 20 years ago their numbers were then 468,000 — the population of the different localities being Abyssinia, 200,000 (a palpable exaggeration); Algeria and Sahara, 43,500; Cape Colony, 1,500 (since then increased probably to 50,000); Egypt, 8,000; Morocco, 100,000; Tripoli, 60,000, and Tunis, 55,000. In Abyssinia exists a colony of Jews called Falashas, "emigrants," who have other appellations in different parts of the country. Their origin is obscure, but they preserve Jewish customs. Agriculture is their chief occupation. They are ignorant of Hebrew, but preserve the Mosaic religion based upon the Ethiopic version of the Pentateuch. They are found in various districts of Abyssinia and have had an eventful history. In Algeria, the condition of the Jews was greatly improved by the French conquest, and their religious status is on a par with the Jews of France. The consistory of Algiers has five congregations, and 14 outlying communities; Constantine's includes 21 communities, and Oran 38. In 1891 Leroy-Beaulieu gave a total Jewish population of 47,564. Practically due to M. Drumont and the French clericals anti-Semitism raged in Algiers for some years, but has grown less violent. Of the Jews of Algiers a recent census showed a large proportion followed handicrafts. It has 19 synagogues, 13 being private. In South Africa the Jewish population may be stated to have reached nearly 50,000, including the Transvaal, 25,000; Cape Colony, 22,000; Natal, 2,000. Cape Town has four synagogues, and they are scattered in every district, the large influx of Russians being noticeable. Kimberley's synagogue has a memorial tablet to Jewish officers and soldiers who fell in the

recent Anglo-Boer War. Natal has two synagogues. Jonas Bergthal (1820–1901) was a member of the Assembly, while in the '90s A. Fass and M. G. Levy held official positions; in the Orange Free State Isaac Baumann was twice mayor of Bloemfontein; M. Leviseur and W. Ehrich have had civic honors. In the Transvaal the Jews enjoy a large share of prosperity, and among the men of prominence can be mentioned Samuel Marks, the Barnatos, Neumann, Albu, Eckstein, Alfred Beit. In the latest Boer War, about 2,800 Jews fought on the British side and many were in the Boer ranks. Jewish services are held in Rhodesia, where communities are growing — Buluwayo has a synagogue, as well as in Bechuanaland and in Portuguese territory in Lourenço Marques. There are numerous Zionist societies, and the religious training of the young is steadily improving.

In Egypt, according to the census of 1898, the Jewish population numbers 25,200, of whom 12,693 are natives, 12,507 strangers. The condition of the Jews has been greatly improved of late decades owing to the work of the Alliance Israélite Universelle (q.v.), which established many schools. Cairo has 10 synagogues in all, with 10,000 Jewish inhabitants. Morocco had in the '80s of the last century about 40,000 Jews, although widely varying estimates are given. They are of two classes: the descendants of the early settlers, who are found mostly in the Atlas and hilly section; and of those who sought shelter in Morocco from Spain and Portugal. The former, speaking the Berber, are antagonistic to modern ideas; the latter form a progressive settlement, many speaking Spanish. In the ports they are fair linguists, are active in business, particularly in Mogador; and are employed by the foreign consulates. With the exception of a few under foreign protection all suffer from Moorish injustice, and are confined in the Mellah, or Ghetto, of each town. Such treatment has not been without its effect in making a spiritless people, who live in poverty, largely due to early child-marriages, while superstitions abound. The Jews of Tripoli number about 12,000 and share the superstitions of their environment. They have 18 synagogues, small and large, and are engaged in commerce and trade. Nearly 5,000 live in neighboring towns. Tunis, a dependency of France since 1881, grants equal privileges to Mohammedans and Jews — the latter number about 50,000 in the whole district — 30,000 of whom are in the city of Tunis. They are divided into two classes: the Tunsi, descendants of the first settlers; the Grana, descendants of the exiles from Spain and Portugal, and of Jews of Leghorn (Gorneyim). There are 27 synagogues, and while a few of the people are financiers and professional men, the great majority are petty traders. The other 12 towns in the regency contain about 12,000 Jews.

Asia.— The Jewish population approximately is thus divided: Asiatic Turkey, 300,000; Asiatic Russia, 115,000; British possessions, 20,000; Persia, China, etc., 30,000; total, about 465,000. They vary in their political status according to the political complexion of the countries which hold sway — Turkey, Russia, or Great Britain. Their status has gradually improved — Turkey since 1876 has instituted a close approach to civil and religious freedom, and has frequently made Jews public officials. In Yemen, Kurdistan, and Persia, their condition continues less favorable. In Asia Minor, half of whose Jewish population reside in the vilayet of Smyrna, they are active petty traders and handicraftsmen; schools, including an agricultural one, and workshops, are making the outlook bright for the future. In Asiatic Russia, the Caucasus, some of the Jews (who numbered about 58,000 in 1897) have become Mohammedans and Christians, and present strange types to the ethnologist. The Mountain and Georgian Jews present widely different traits. A curious sect are the Sabbatarians, who use Russian, not Hebrew, in their prayers, but conform to many Jewish customs. Siberia had 34,477 Jews, according to census of 1897. They have had to endure many exactions and their position is very anomalous; yet they are welcomed because of their energetic business methods. In Bokkara are about 5,000 Jews who wear a special badge and dwell in an enforced Ghetto. The cotton trade is largely in the hands of the Jews. In the British possessions, Aden has 2,500 Jews, who have almost monopolized the trade in ostrich feathers. At least 25,000 reside in British India, the greatest number in Bombay, where the Sassoons have done so much to educate and uplift the poor. In this city, too, can be found the Beni-Israel, a sect of black Jews, of whom about 5,000 live in Bombay and 2,000 elsewhere in the Bombay presidency, and about 2,500 in Calcutta. They speak the Mahrati and were originally oil men or oil pressers, as their native name implies. Many are educated men and have entered the professions. They have several synagogues, some very handsome. In Calcutta the Jews number many prominent men in trade. Although the vernacular of the rich Jews is Arabic, their habits and dress are European. Afghanistan has fully 40,000 Jews in the chief cities. They pay a war-tax, which exempts them from military service. They live in special quarters in the larger towns. Persia treats its Jews with continued exactions that have broken the spirit of the people, who engage perforce in the lowliest avocations. Teheran has 5,500; Ispahan, where their condition is a little better, about 3,700. China has flourishing communities of foreign Jews at Shanghai and Hongkong, who deal largely in opium and cotton. A native body of Jews reduced to 100 in number by the census of 1900 exists in Kai-Fung-Foo, in the province of Honan. Since 1870 their synagogue has been in ruins, and poverty has compelled them to sell their possessions, sacred and otherwise. Their origin is obscure. They are probably from Persia and have interesting traditions. Palestine has probably 45,000 Jews out of a total population of 500,000, with Jerusalem, Hebron, Safed, and Tiberias the favored places of residence. In Jerusalem, with about 23,000 Jews, including many colonies of foreigners in its suburbs, the poverty is universal, but the Rothschilds, the Alliance Israélite, and other organizations have done much to ameliorate conditions. Schools, common and technical, abound. There are 2,000 Jewish artisans in various callings, but the great majority are dependent on foreign

charity. The other towns call for no special mention. In 1902 the total imports of Jaffa reached £405,550; exports, £203,390.

Europe.— In Austria, with the dawn of freedom in 1860, followed by the constitution of 1867, the status of the Jews began to improve, several were returned to Parliament, and Baron Anselm de Rothschild was made a peer; in 1903 there were three Jewish members of the House of Lords, the brothers Gomperz and Baron von Oppenheimer, while many are university professors in various lines, with a full quota of journalists, musicians, dramatists, scientists, scholars. Vienna in 1900 had 146,926 Jews, with a large proportion of conversions to Christianity, 559 in 1900, and 617 in 1904, due doubtless to anti-Semitism in the capital. They form one community, whose receipts in 1903 reached 2,243,449 kronen, expenses 2,147,506, and which is particularly rich in educational and charitable institutions. Belgium has about 14,000, with larger communities at Brussels and Antwerp. In the latter city, they number about 9,000. One of their principal industries is diamond cutting, which occupies about 750. Brussels has an important Jewish community, with many charitable societies and representatives in the arts and learned professions. Bohemia imposed some mediæval exactions as late as 1849, and even in later years there have been occasional Czech outbreaks, but the general prosperity has been uninterrupted. Prague has the largest Jewish community (20,000), while in about 150 of the smaller towns are included 50,000. In Bosnia 4,000 out of the 7,500 Jews reside in Yarajevo, where many are lawyers, physicians, and public officials. Bulgaria has 30,000, divided into 35 communities, the largest being Sofia, Rustchuk, and Philippolis. Since the Alliance Israélite has opened its trade schools, trading has been supplemented by handicrafts. The general prosperity has been somewhat affected by popular hostility (see JUDAISM — ANTI-SEMITISM) which promotes emigration to Turkey in Asia. Owing to their bravery in saving Sofia from destruction by the Turks in 1877, Prince Alexander decreed in 1879 that the fire brigade should be enrolled exclusively from Jewish citizens, with a place of honor at all processions. Denmark has 3,600 Jews, Copenhagen having the largest community (500), and include varieties of occupation from trade to agriculture; in the latter calling are landed proprietors and peasants. There are many intermarriages with the non-Jewish population. It is only since 1849 that complete civil and religious liberty was proclaimed.

France, with its 110,000 Jews, of whom about 65,000 live in Paris, offers an example of practical assimilation, for despite the existence of a certain social prejudice, many of them occupy prominent positions in every walk of life, in literature, art, science, law, the army, and in no other country do they include such an array of names known beyond their own country. The patriotism and generosity of the wealthier representatives have done much to strengthen the Jewish status, which has gained morally by the Separation Law. While the Jews of France are conservative, a reform movement has just begun in Paris, whose supporters are sanguine of success. Paris has an extended number of Jewish institutions, religious, benevolent, and educational, with five large synagogues and many smaller ones.

Great Britain.— The 160,000 Jews in London, forming the bulk of their number in the British Isles (estimated at 250,000), have attained the fullest civil and religious liberty, and their favorable condition has resulted in a fair, if not remarkable display of talent in art, science, literature, the law, and political life, while they have done more than their share in colonial expansion. They have held the office of mayor in a number of cities, including London, have entered Parliament where they belong to different parties, such is their individuality. Their influence is such that again and again have imposing meetings been held by prominent Christian divines and leaders throughout England to protest against the spirit of persecution in Roumania, Russia, and elsewhere. Within the past year or two the question of immigration has aroused much debate and ill-feeling, a new Alien Bill was passed, whose real purpose was to check Jewish arrivals from Russia, not from any Anti-Semitism, but a desire to prevent further overcrowding in the east end of London. During the recent war in South Africa fully 1,000 Jewish soldiers participated. At present S. Alexander is professor of mental philosophy, and E. Schuster of physics in the Victoria University, Sir Philip Magnus is one of the chief authorities in technical education, Israel Abrahams is reader in rabbinics at Cambridge University, where lately C. Waldstein was Slade professor of fine arts. Solomon Hart, S. J. Solomon, and Simeon Solomon are prominent names in art, while S. L. Lee, I Gollancz, Claude Montefiore, Israel Zangwill are known in literature. The Jews of England have secured their present status largely because of the vigor with which they fought for their rights, and won public opinion in their favor, while their splendid record in philanthropy with names like the Rothschilds, the Goldsmids, the Mocattas, the Montefiores, has done much to add to their fame. In commerce and finance they number a large number of important firms in London, Manchester, and Liverpool. The condition of the Russian element in the chief cities is more or less a problem, whose solution requires patience and forbearance. The younger element soon becomes English, but the older transplants to English soil the Ghetto atmosphere — a phenomenon which is seen all over the world. In 1902, according to official data, the sum of £111,639 was spent by London Jewish charities. Of the Russian and Polish Jews in London in 1901, amounting to 28,574 males, 24,863 females, it was found that 24,164 males and 5,358 females earn their own living in a great variety of trades. The Jewish population of Ireland in 1901 was given as 3,771, the bulk residing at Dublin, 2,200; Belfast, 450; Cork, 400. Russian immigration is adding steadily to their numbers. Sir Otto Jaffe was lord mayor of Belfast (1899–1900), high sheriff a year later, and is now justice of the peace for that city, and consul for Germany. Lewis Harris and his son, A. W., were aldermen of Dublin; Trinity College, Dublin, has graduated many Jewish students. Scotland has almost its entire body of Jews in Glasgow and Edinburgh, about 9,000 in all; there are congregations in Dundee, Aberdeen, and Greenock. Recent immigration has built

up the Scotch communities. Glasgow has 7,000 Jews, with three congregations, with several benevolent and educational societies. Two of their representatives are justices of the peace.

In Germany's various sections, the Jewish status is distinctly favorable, after centuries of conflict which has not wholly died away. Baden includes 27,000 Jews in 15 rabbinical districts, who enjoy equal rights with the other inhabitants. Bavaria numbers 55,000, with a long list of names who are adding to its strength in trade, and industry, and scholarship. Some are members of the Bavarian Diet, others are prominent in law and the learned professions. Fuerth has a number of Jewish industrialists in mirrors, bronzes, toys, and hardware, leaders in their line. In Nuremberg, Fuerth, and Bamberg they control the hop business; the cattle trade is entirely in the hands of the country Jews. In the duchy of Brunswick about 2,200 reside. In Elsass-Lothringen, despite the emigration of many Jews after the annexation, about 37,000 reside in the province, chiefly in Strasburg, Mühlhauser, and Colmar; they are largely manufacturers and merchants. Hesse-Cassel has 18,500; Hesse-Darmstadt in its three districts about 26,000, with numerous educational and charitable institutions, and with every calling open to them. Prussia in 1900 had a Jewish population of 392,332. Of its chief cities, Berlin has 19 synagogues and numerous educational and benevolent institutions, with a brilliant coterie of prominent names in all the arts and professions, trades, and industries, many being authorities in their callings, and prolific contributors to art, science, and literature. There are fully 110,000 Jews. Breslau has about 25,000 and here, too, in the various professions, particularly medicine and the natural sciences, they number very eminent names. They are in every trade and manufacture, and hold many chairs in the university. Hamburg has about 20,000. Within recent years it has had some prominent representatives in different fields — with many institutions, such as schools, hospitals, and synagogues. Hanover has a prosperous community of about 5,000, who number leaders in commerce and trade. Saxony, where the Jews were late in securing complete freedom, had in 1904, 12,196, 7,000 being in Leipsic, and 3,059 in Dresden; in both cities they are identified with the chief industries. In 1900 the Jews of Wurtemberg numbered 11,916. The criminal status of the whole population in that year was 0.089 per cent.; of the Jews, 0.083. Many charitable institutions abound, and there are handsome synagogues in the chief cities. In Stuttgart in 1903 there were 3,015 Jews, who include manufacturers, lawyers, and merchants of note, while they are members of the city superior court and of the faculty of its polytechnic and its conservatory of music. Greece has 10,000, with about 4,000 in Janina and Prevesa in Epirus, including Corfu, 4,000; Larissa, 2,750; Athens, 400. In Athens, the majority are of Levantine-Spanish descent, and are peddlers or artisans. In Corfu they are exporters and manufacturers. There are no restrictions on their progress in Greece under the present government. Although it was not until 16 May 1896 when Hungary declared Judaism a "legally recognized religion," the Jews have long attained prominence in varied lines of political, industrial, scientific, and artistic development, and contributed a long list of notable names. They have founded important institutions for religion, charity, and education, their new synagogues are among the handsomest in the Old World, and in their chief communities, Budapest (166,198), Szegedin (5,863), Temesvar (5,916), Presburg (7,110), they are prominent in every calling.

In Norway, where Jews have been allowed to live since 1851, their present number is hardly a thousand, who are engaged exclusively in industrial pursuits and are on the whole prosperous. The majority reside in Christiania, with the rest in Trondhjem and Bergen. Roumania's treatment of the Jews, marked by constant exactions and neglect of the provisions of the Treaty of Berlin (1878), has not only reduced the Jewish population to less than 225,000, but made their condition pitiable in the extreme. Mediæval conditions have led to wholesale emigration — at least 80,000 having left between 1898 and 1905, chiefly to the United States; and unless exactions cease their numbers are likely still further to decrease. Much poverty exists among the Jews, although there is a small wealthy class. From recent data as to the Jews of Russia, it appears (1897) that they number 5,189,401 or 4.13 per cent., a figure which has been reduced by steady emigration from cities large and small to all parts of the world. In the Pale of Settlement reside 93.93 per cent. of the Jewish population, or 11.46 of the total population. They are massed together most densely in Northwest Russia and Poland, where they form 14 per cent. of the entire population, figures which throw light on recent outbreaks. A number of agricultural colonies, 301 in number, including 10,721 families, with 68,959 population, who occupy 100,107 deciatines of land, exist in a number of governments, but these are necessarily limited. In 1898 the number of artisans in the Pale and Poland reached 500,986, or 13.2 per cent. of the total Jewish population. Technical training having been only recently introduced, old-time methods of learning prevail, save in some of the larger cities. Owing to keen competition the income of the Jewish artisans is insufficient to support their families, and extreme poverty with its attendant unsanitary surroundings prevail. In addition, in the Pale and Poland are 105,000 Jewish day laborers, about two per cent. of the entire Jewish population. Without the Pale, in the interior of Russia (1893) were 1,948 Jewish workshops compared to 24,020 belonging to non-Jews, being most numerous as tailors and metal-workers. Some idea of the great poverty in the Pale may be gathered from the number of loan associations, of homes of shelter for the transient poor, 226 in all, and similar institutions, of medical committees and hospitals, and of other charities for their benefit. From 1870–1904 the Russian emigration to the United States, chiefly Jewish, has reached about 725,000, due to political as well as economic conditions. It is not necessary to dwell upon existing legislation regarding the Pale, and until an enlightened government holds sway no permanent change for the better is possible. Despite unfavorable circumstances, the scholarly abilities of large numbers of the Russian Jews are evidenced by the Hebrew Renaissance

among them, and the enthusiasm with which liberal studies are followed by thousands of young men and women. In literature, journalism, archæology, medical and natural science, jurisprudence, art, they show much activity. Old-time rabbinical education holds its own among the great majority of the people, while early marriages powerfully promote poverty. In 1899 the percentage of Jewish students to total number in the Russian universities was 10.9. According to the census of 1897, the Jews of Russia number 5,215,805 souls, or 4.2 per cent. of the entire population, and fully one half of all the Jews in the world. Yet they constitute 15.6 per cent. of the residents in urban centres. A striking illustration of Jewish concentration in towns is furnished by Berditscheff, where they number 41,617, or 78 per cent. of the total population, or by Warsaw, with 219,128, or 34.3 per cent. The birth rate of 1877 was 35.43 per 1,000, being less than other sections, except Protestants, 34.73. The rate of illegitimacy in European Russia was small — 5.4 per 1,000 births; among the Catholics 36. In 1897 the Jewish death rate was 17.82 per 1,000 as against 34.28 for orthodox Christians, and 22.76 for Roman Catholics. The predominant language among the Jews is Yiddish, 96.90 per cent. of the entire population using that medium. For insanity the Jewish figure (9.84 per 1,000) is greater than that of the Poles and Russians (8.51 and 9.54), but much less than the Letts (13.75), and the Germans (15.04). The May laws of 1881, which restricted the free movement of the Jews outside the Pale of Settlement (Russian Poland and 15 Russian provinces), set the stream of emigration into permanent motion toward all parts of the world. In one year alone (1904–5), in consequence of the Russo-Japanese War and internal disorders, 92,388 Jews left the country. It is estimated that in the past 20 years 1,123,000 have emigrated from Russia — more than one fifth of the whole of Russian Jewry. (See Dr. Arthur Ruppin's work issued by the German Bureau for Jewish Statistics. Berlin: Jüdischer Verlag 1906). In regard to age distribution the Jews have a higher percentage of persons under 10 years of age, owing to lower infant mortality, but in consequence of this excess of children 100 Jews have dependent on them for support two more than the orthodox Christians, three more than Catholics and Mohammedans, and six more than Lutherans. In Finland a movement is taking place in the early part of 1906 to put the Jews on a footing of equality with the rest of the population. They are found at Helsingfors and a few other places, and suffer from many political restrictions. Servia, since 1889, has abolished all anti-Jewish laws, but the Jews take little part in public affairs until their equality is more generally recognized by the people. They number about 7,500, chiefly in Belgrade (4,500), including a few lawyers, physicians, and engineers, with some State officials. Spain, whose early settlement by the Jews is attested by a tombstone unearthed in Adra, with a Latin inscription, which dates back to the 3d century, has within recent decades opened her territory to the Jews, very few of whom have settled on its historic soil. In 1858, under General Prim, the edict of expulsion was repealed, and in later years Senor Lapuya headed a movement to invite Russian emigrants to Spain, but without more than a limited response, although in time the settlers may be larger in number. Madrid has about 25 families, who hold holiday services — they came from Tunis, Mogador, Lisbon, Alexandria, etc. In Toledo, where but a few reside, the government ordered the restoration of El Transito (see SYNAGOGUE), formerly a Jewish place of worship, but which had been converted into a church. Seville had (1905) 200 Jewish families, the majority poor, being emigrants from Tangier and elsewhere in Africa. In this connection the Jews of Portugal may be mentioned. In 1903 they numbered 500 persons, the majority being merchants and shipowners. According to the constitution of 1826 they are not allowed to hold service save in places not bearing the signs of a public house of worship. Lisbon has 400 Jews, mostly natives of Gibraltar, Morocco, or the Azores. A number are prominent in science, letters, and the arts. There is one communal synagogue (1902), situated in an inclosure, and without any outward sign. The cemetery dates back to 1801. Switzerland, where civil and religious liberty exists apart from a statute (1903) declaring illegal slaughtering of animals according to the Jewish ritual law, has fully 12,000 Jews, with congregations in the larger towns, Zurich being the most important, with 2,500 Jewish population, as international in character as the city itself. In the Cantoral Council are two Jewish representatives and at the university, polytechnic, and gymnasiums are several Jewish professors and prival-docents. The Jews are mostly merchants, excluding the Polish and Russian immigrants who begin as pedlers but soon enter other callings. The canton of Bern has about 1,500, with many Jews as university professors. Basel has about 240 families.

Sweden grants full civil and religious freedom to the Jews, barring a few privileges which neither they nor any other non-Lutherans can obtain. There are synagogues in all of the larger cities, with a total Jewish population of fully 5,000. Turkey in Europe has (1904) 188,896, of whom the largest number are in Constantinople (65,000), Adrianople (17,000), Salonica (75,000). The condition of the young people has appreciably improved owing to the spreading of schools, technical, agricultural, and religious, by the Alliance Israélite, with 6,651 children in European and 6,299 in Asiatic Turkey. The Jews speak usually a mixture of Spanish and Hebrew, often a Judæo-German dialect, and rarely Turkish, although they are making strong effort to speak the latter more generally. They enjoy the same privileges as all "rayahs," non-Moslem subjects. According to the constitution of 1876 the equality of all Ottomans is proclaimed before the law and in the short-lived National Assembly of the following year several Jews were among the members. The present Jewish administration, ratified by the Sultan in 1865, consists of three councils, a national assembly of 80, a temporal council of 7 lay members, and a spiritual council of 9 rabbis. Of the various Turkish communities, Salonica is the largest and most picturesque. While the majority are poor and engaged in all kinds of handicrafts and petty

trade, the city has, with the professions represented, 37 synagogues, with numerous charitable institutions. Constantinople contains, among other callings, some wealthy wholesale merchants and bankers. The only glass works in Turkey is carried on by a Jewish manufacturer. The schools of the Alliance Israélite teach many handicrafts, but their graduates become largely accountants in financial institutions. Elias Cohen is physician to the Sultan; the civil list in the ministry of public instruction and the consular offices includes a number of Jews, 20 of whom are physicians and druggists.

North America.— With increasing Russian emigration within the past five years, Canada's Jewish population must reach at least 30,000, with 12,000 in Montreal, 2,000 in Manitoba, 4,000 in Toronto, and 8,000 in Quebec. There are several agricultural colonies in the Northwest, due to the gifts of Baron de Hirsch (1892), in a section called Assiniboia, at three settlements. Jews have sat in the Canadian Parliament, Mr. Nathan of British Columbia being the first to attain the honor. In 1845 there was only one synagogue in all Canada; now they exist in Toronto, Victoria, B. C., Hamilton, Winnipeg (2), Halifax, St. John, N. B., Ottawa, London, Quebec. It is of interest to note that Christian sympathizers in Montreal, headed by the Anglican bishop, contributed to the fund in aid of the Russian refugees. In their occupations the Jews are indistinguishable from other citizens. United States.— The history and development of the American Jews have already been described (see JEWS IN AMERICA); it only remains to gather a few additional facts and note further tendencies. In the effort to promote education, uplift the destitute, and Americanize the incoming masses of emigrants, the lines of demarcation between reform and orthodoxy seem to be growing fainter, and a spirit of conservatism, free from fanaticism of either extreme, appears to be growing. It is proposed (1906) to organize a kind of national assembly of entire American Israel, whose purpose is to champion the Jews in persecuting lands, and aid in their complete emancipation. Doubtless in time this congress, if successful, will develop into a national synod, with consequences good or bad for the Jew's development. Greater interest is being shown in agricultural and technical education, which will help in turning thousands to the soil, but divert thousands of the young to the arts and handicrafts. More energy, too, is being displayed in distributing emigrants from the congested centres of New York and elsewhere, although with increasing immigration the results are comparatively slight. Recent arrivals are of a better class on the whole, and include many who have ample resources. In the larger cities, however, the general character of the Jews is being unconsciously changed, owing to the gradual elimination of the distinctively American, English, or Portuguese type, and the appearance in every line of the Russian, who competes keenly with the less numerous German. But this is only a reflex of American phenomena in general, as the emigrant outnumbers the native, or appears to do so by reason of his aggressiveness in securing a foothold. The skilled Jewish laborers in New York city number (1905) 75,000, one third belong to the United Hebrew Trades, and two thirds are Russian, being found as well in the silk mills of New Jersey, the machine shops of Connecticut, and jewelry factories of Rhode Island. In 1903 in the New York State prisons out of 9,820 prisoners 257 were Jews; in the city prisons (1904) out of 3,251, 479 were Jews; in the Blackwell's Island workhouse for year 1904 were 1,036 Jews out of 19,520 prisoners. More than 60 per cent. of the students in the New York Normal and City College are Russo-Jewish emigrants or the children of Russian Jews, who include in their number in New York 400 physicians, 1,000 druggists, 300 dentists, 400 lawyers, 25 architects, and many in the professions of art, music, engineering, etc. The chief lines of commerce in which the Jews in New York are thus given, in the order of importance: Clothing manufacturers, jewelry jobbers, wholesale butchers, liquor dealers, leaf tobacco jobbers, cigar manufacturers, cloak manufacturers, chamois importers, leather and hides, manufacturers of overshirts, watch importers, artificial flowers and feathers, furs, undergarments, lace and embroidery, white shirts, hats, and caps. In 1905 the real property of synagogues and Jewish charitable institutions in New York city, exempted from taxation, was valued at $13,558,100. With the gradual settlement of the far West they are found among the pioneers in Alaska and the far Western plains.

South and Central America.—While Jews are to be found in all the more prosperous cities of the South American continent, their numbers are very small, except in the Argentine Republic, where agricultural colonies exist, swelling the Jewish population to 20,000. Brazil has 2,000, and there are about 4,000 scattered in the other States. A few are found in Panama, with an old cemetery; there is a small community in the City of Mexico. The Dutch colonies have supplied most of the 300 Jews in Dutch Guiana and Venezuela. Jews of German descent are the leading jewelers at Lima and Santiago. The only synagogues (2) are in Buenos Ayres; in the Argentine many of the Russian colonists have found their way to the chief cities. The imperial purchase of land for colonization by Baron de Hirsch included over 17,000,000 acres. Their present condition is fairly reassuring, but they require continual support and they cannot be regarded as entirely successful. Moïseville, the oldest of the colonies, in the Santa Fé province, is the next prosperous, with 1,200 settlers, and a good outlook for the future. Mauricio, in the province of Buenos Ayres, is less favorably situated and has 1,100 colonists. Clara, in Entre Rios province, is the largest, with 5,000 souls, who dwell in 19 villages. The future success of these colonies will depend on the independent character of the colonists. The equipment is thorough and has cost millions. In Santiago, Chile, there are many Jewish merchants of prominence but no organized congregation.

West Indies.— Jewish activity in these islands was early displayed and is still continued, although fluctuating from time to time, and declining sadly in some places. At St. Thomas, once the seat of an important Jewish community, hardly 50 survive. Jamaica shows a similar decline, with its diminished commer-

cial importance. Its former historic settlements at Spanish Town, which had two congregations 60 years ago, Montego Bay, Falmouth, and Lacovia have passed away. Kingston has one fair-sized congregation, since the merger of the two existing in 1900. The Jews hold positions of prominence in various lines, but lose many of their best material through emigration to England or the United States. The hurricane of 1831 brought about a decline in the prosperous Barbados community, whose numbers have dwindled to hardly 20. Curaçoa has an influential body numbering about 1,100 in two congregations, including lawyers, physicians, druggists, merchants, members of the executive and colonial councils, judges, bank presidents, and officers in the militia. The Jews of Surinam number 1,500 and occupy a prominent position, being large property-owners.

Bibliography.— For the present status of the Jews, see Jewish Year-Books, issued annually in London and Philadelphia, as well as annual reports of Union of American Hebrew Congregations, Deutsche Gemeindebund, Alliance Israélite, Anglo-Jewish Association, American Jewish Historical Society, and similar societies. E. Adler's 'Jews in Many Lands' (Philadelphia, 1905) throws light on the condition of the Jews in the East and in scattered communities.

ABRAM S. ISAACS,
Professor of Semitic Languages, New York University.

Judas, or **Jude,** one of the twelve apostles. He appears in the apostolic catalogue of St. Luke as "Judas of James," that is, son or brother of James; in St. Mark's and St. Matthew's list he is styled Thaddæus, of which Judas may be an abbreviation. Nothing is known of his life except what is ascribed to him by widely spread tradition. According to western legend he went in company with Simon the Canaanite to evangelize the Persians, and closed his life by martyrdom.

Judas Iscariot, ĭs-kăr'ĭ-ŏt (that is, of the family of Cariot in the tribe of Judah). One of the twelve apostles of Christ. He is styled the son of Simon, and was treasurer to the little company that attended Jesus, whom he betrayed with a kiss into the hands of the Jewish priests, for thirty pieces of silver. His divine Master addressed to him the mild reproof—"Dost thou betray the Son of Man with a kiss?" Remorse drove him to suicide.

Judas Maccabæus. See MACCABEES.

Judd, Garritt Parmlee, Hawaiian statesman: b. Paris, Oneida County, N. Y., 23 April 1803; d. Honolulu, Hawaiian Islands, 12 July 1873. In 1828 he went to Honolulu as a medical missionary, and in 1842 was appointed recorder and interpreter to the native government. He organized the first Hawaiian ministry for Kamehamaha III. in 1843, and held the portfolio of finance from 1844 until his retirement in 1853. He placed Hawaiian finance on a sound basis.

Judd, Orange, American journalist: b. near Niagara Falls, N. Y., 26 July 1822; d. Chicago, Ill., 27 Dec. 1892. He was graduated from Wesleyan University in 1847, became editor of the 'American Agriculturist' in 1853, was its owner and publisher in 1856-81, and in 1855-63 was also agricultural editor of the New York 'Times.' At Chicago he edited the 'Prairie Farmer' (1883-8), which became the 'Orange Judd Farmer.' In 1871 he gave to Wesleyan University the Orange Judd hall of natural science, in which he established in 1875 the first State agricultural experiment station.

Judd, Sylvester, American author and Unitarian clergyman: b. Westhampton, Mass., 23 July 1813; d. Augusta, Maine, 20 Jan. 1853. He was graduated at Yale College in 1836, and subsequently becoming a Unitarian studied theology at the Harvard Divinity School. In 1840 he was ordained as pastor of the East parish in Augusta, Maine, and continued to hold that pastorate till his death. In 1845 he published 'Margaret, a Tale of the Real and Ideal,' a very noteworthy example of American fiction. In 1850 he published 'Philo, and Evangeliad,' a didactic poem in blank verse, and in the same year 'Richard Edney,' a romance. 'The Church,' a collection of sermons, appeared in 1855.

Jude, Epistle of, a general or ecumenical letter reckoned among the canonical writings of the New Testament. The writer, while speaking with something like apostolic authority, does not claim to be an apostle. He is merely "the brother of James," probably James the Just, the author of another general epistle. Difficulties have been raised about this book because of its resemblance to II. Peter, and it is quite uncertain which epistle was written first. It also contains references to two apocryphal books, the 'Assumption of Moses' and the 'Book of Enoch,' but as in the New Testament citations are made not only from uninspired, but even from heathen writers, this does not impair the authority or authenticity of the epistle. As to its date, the earliest probable is 64 A.D. and the latest 67 or 68 A.D. The contents include address and salutation; false teachers are condemned, their fate illustrated by Biblical examples; their wickedness specifically described and woe is pronounced upon them. The letter concludes with an exhortation to consider how the apostles predicted the coming of these mockers; to cling to the love of God; to treat such perverted ones with discrimination.

Judge, public officer to whom is committed the exercise of judicial power of the State in the administration of justice in its courts. It is his province to decide questions of law, and in cases in which facts are to be decided by a jury to instruct the jury as to the law which is applicable and to point out to them what the exact questions for their determination are. (See JURY.) He pronounces the sentence, or enters the judgment, of the court.

The word is not a technical one. The officers of the King's Court, when that tribunal began to take definite shape, were known officially as justices. Until the recent Judicature Acts in England it was customary formally, as well as popularly, to speak of the Judges of the superior courts at Westminster, though the members of the courts of King's Bench and Common Pleas were properly justices, and of the Court of Exchequer barons, and at the present time the members of the Supreme Court of Judicature, including the Lord Chancellor, the Lord Chief Justice, the Master of the Rolls and the Lords of Appeal are spoken of as the judges of that court. English judges are appointed by the Crown (this patronage being exercised by the Lord Chancellor, who is the head of the legal profession) from the leaders of the Bar, and hold office during good behavior.

In all the Federal courts, in all the higher courts of the several States and in most of the inferior Courts, judges must be trained in the law, though lay judges were common in the State courts of first instance until quite recent times. Federal judges are appointed by the President, by and with the advice and consent of the Senate, and hold office during good behavior, being removable only by impeachment. Any Federal judge who has served for ten years and is 70 years of age may retire on full pay for life. The choice of judges in the States is determined by the State constitutions. As a general rule they are elected for a term of years. The fear was quite generally expressed at the time the tendency to make the office an elective one became general, that judges so chosen would be inferior to those appointed by the State governors, but does not seem to have been justified by the result. In most of the State courts the small salaries paid and

the limited terms of office prevent the leading members of the bar from seeking, and in many cases from accepting, the office of judge.

A judge must be impartial and any interest in the cause or the parties will disqualify him from presiding at the trial. While in office he is precluded from practising before the court of which he is a member, and he is commonly, and should be universally, precluded from practising before any court. He is not answerable to any suitor for the correctness of his rulings or decisions, and in the absence of positive fraud is not answerable in damages for any decision he may render. Every judge has power to punish for contempt of court in case of acts committed during the court's session, and even of such acts committed outside the court, though this latter power is to be exercised with care, and its limits are naturally not defined with certainty. For the peculiar functions exercised by American judges as interpreters of the Federal and State constitutions, see JURISDICTION.

JOHN DOUGLASS BROWN,
Philadelphia.

Judge-advocate, a title given the prosecutor in a court-martial or military commission. In the United States the judge-advocate is generally a member of the judge-advocate-general's department. In Great Britain the duties of judge-advocate usually devolve upon a detailed staff officer, or the prisoner's commanding officer. The prisoner has a right to call on any regimental officer to speak in his behalf. See LAW, MILITARY.

Judge Lynch. See LYNCH LAW.

Judges, Book of, a book of the Hebrew scriptures which relates the exploits of successive rulers of Israel who delivered the land from the heathen, 'judge' in the Hebrew sense being used to designate the defender of a cause, and not necessarily a judicial magistrate. These judges were raised up at times of national emergency to assert the independence of the nation. Abimelech attempted to maintain the succession to this office as being the son of Gideon, but he failed, and the office was never hereditary. Samuel did indeed appoint his sons judges, but the government was at that time undergoing a transition to the settled form of hereditary dynasty.

The period comprised in the book of Judges is from Joshua to Samuel and Saul. In 1 Kings vi. 1, it is stated that from the Exodus to the building of the first temple was 480 years, and the time enumerated by the writer of the Book of Judges amounts to 410 years, but on the very probable hypothesis that some of these judges were of merely local authority, and judged Israel contemporaneously, this will be reduced to 299 years. As the accession of Saul is reckoned at 1037 B.C., we may roughly estimate that the judges ruled Palestine from 1336 to 1037 B.C. The book opens with a preliminary review of the condition of the tribes at the close of Joshua's wars, for the purpose of showing how imperfectly they had carried out the command "Go in and possess the land." The succession of judges, occupied in repelling the encroachments, is the result of this dilatoriness and neglect. The main section of the work is taken up with the exploits of the judges, namely Othniel, who broke the yoke of Mesopotamia; Ehud, who threw off the oppression of Moab; Deborah and Barak, who drove off the northern Canaanites; Gideon, who repelled the Midianites; Jephthah, who fought with the Canaanites; and Samson, who contended with the Philistines. In regard to the public services of the other six we are told little. These are Shamgar, Tola, Jair, Ibzan, Elon, and Abdon. As an epilogue or appendix comes in the stories of idolatrous Micah, and the hideous outrage at Gibeah. The experience of Israel under the judges was educative. In their distress they appeal to Jehovah for deliverance and every answer to their prayer is a rebuke to their forgetfulness and a reminder of their duty to conquer and possess the land.

Judges' Cave, a crevice between some large fallen rocks on West Rock, New Haven, Conn., now a municipal park, which in 1661 was a temporary hiding-place for Goffe and Whalley, two of the English regicides.

Judgment, the decision rendered by the authority to which a question or issue has been submitted for determination. In a more restricted sense, the decision by a court of law of an issue raised by parties litigant, or the determination and declaration by such court of a legal right. There are many rulings by such a court which are not judgments, but determine merely some incidental question, and there are judgments which are interlocutory, as well as final judgments which put an end to the controversy. But every judgment in a judicial proceeding is an adjudication by the court of some right of a suitor, and until set aside or reversed, is the law governing such right.

In early times the solemn character of a court record and the means which the law furnished for the enforcement of an obligation thus established caused such a record to be adopted for the purpose of entering into an obligation as distinguished from resort to a court for the vindication of the obligation when disputed by the other party. A modern survival is found in the confession of judgment, by which a man causes his obligation to pay a sum of money to be entered upon the court records in the form of a judgment against him for the amount due. In consequence of the early practice — aided also by the fact that a judgment may be sued upon outside the jurisdiction of the court in which it was entered, like a contract — the older legal writers speak of judgments as a species of contract. But this classification has been shown to be unscientific by recent writers, since the courts have pointed out that these obligations are not contractual in either their origin or their incidents, and it is now customary to speak of them as *quasi*-contracts.

It is stated above that a judgment is interlocutory or final. In a suit for partition of real estate a judgment that partition be made is interlocutory, and is the basis of further

proceedings which result in the final judgment establishing the partition. A final judgment is one which ends the controversy, at least as to some of the parties. It is a general rule that no appeal can be taken, except from a final judgment, and while there can rarely be a case of doubt as to the finality of a technical judgment, that is the decision rendered by a court of common law jurisdiction, questions frequently arise as to the finality of decrees (which correspond to judgments) entered by courts of equity. The test is whether the right is finally settled by the decree; for example, when a creditor has claimed to intervene in an equity proceeding to establish his right to share in a fund being distributed, a decree excluding him is final as to him and appealable, though in all other respects the suit remains undetermined by the court below.

A judgment of a competent court having jurisdiction of the parties and the subject matter is conclusive, except so far as it may be the subject of appeal to a higher court. The direct issue thus determined will not be re-tried by another court, and such a determination cannot be attacked collaterally except on the ground of fraud or lack of jurisdiction of the court in which the judgment was rendered. A judgment *in personam* binds only parties to the cause and those in privity with them; a judgment *in rem*, which is a judgment determining the *status* of person or property, binds all the world. Decrees of courts of admiralty are judgments *in rem* and conclusive of the *status* of the subject-matter of the cause upon every one. Decrees of divorce are judgments *in rem*, and determine the *status* of the parties to the proceeding. In the United States they are pronounced by the State courts in the administration of very diverse statutes relating to the subject of divorce, and as the courts of all the States, in addition to the general principles of comity observed between courts of different jurisdictions, are bound by the mandate of the Federal constitution requiring that "Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State" many perplexing questions have arisen. These cases afford good illustrations of successful collateral attacks upon judgments on the ground of fraud or lack of jurisdiction of the court entering the judgment. It is now well settled that a decree of divorce may be successfully attacked collaterally on the ground of fraudulent collusion between the parties or lack of jurisdiction of the court pronouncing it over the person of the defendant. It is to be observed that a final judgment is conclusive of the particular cause, and finally determines the right therein litigated, and may be pleaded in bar of any future attempt to assert the right, except in a case in which there has been no determination on the merits; as for example, where the plaintiff has suffered a voluntary non-suit, that is, has elected in advance of a verdict to abandon his case. He loses that particular case and must pay the costs, but is not prevented from bringing another action.

In most of the United States a judgment for a sum of money found to be due, from the date of its entry, and without the issuance of a writ of execution, constitutes a lien upon the real estate of the judgment debtor; that is, a claim which must be paid out of the proceeds of any judicial sale of the property in its due order of priority as compared with other liens upon the same property. This lien usually extends only to real estate within the jurisdiction of the court in which the judgment was entered with provision for filing a transcript to create a lien in other counties of the same State in which the debtor owns real estate. A foreign judgment, in which are included the judgments of others of the United States, must be sued on and a judgment recovered upon it to make it effective in any of the States. In such suit no defense which could have been interposed in the original suit will be allowed to the judgment debtor.

JOHN DOUGLASS BROWN,
Philadelphia.

Judica, joo'dĭ-kạ ("judge," or "give sentence"), the first word in the 43d Psalm, used as an introit in the Church of England (1549) for the 3d Sunday in Lent, and in the Roman Catholic Church for the 5th Sunday in Lent. Hence "Judica Sunday" as a term to designate those several days.

Judic'iary, that branch of government concerned with the administration of justice, in cases civil or criminal; the system of courts of justice in a country; the judges collectively. For judiciary in the United States, see COURT.

Judiciary in the Philippines. The United States government organized in 1902 a complete judicial system covering the whole archipelago, the municipal code providing for the trial of violators of municipal ordinances by the local *presidente*, other special laws authorizing the appointment of justices of the peace for trial of minor offenses, civil actions involving small amounts and the preliminary investigation of higher crimes, creating courts of first instance that are courts of record and of general jurisdiction, one being provided for each province, except in the city of Manila, where there are two judges. The courts of first instance hold sessions at least twice a year in the smaller provinces and in the more important ones three or four times. The archipelago is divided into 14 judicial districts outside the city of Manila, one judge for each judicial district, with a special tribunal for disposing of arrearages of litigation in the island of Negros. There is a Supreme Court, consisting of a chief justice and six associate justices, with adequate provisions for reporting the decisions of the court, and for representation of the government, general and local, in all litigation by the attorney-general, solicitor-general and their assistants, and provincial fiscals, with a special municipal system of courts for the city of Manila and with a notarial system for the archipelago. A considerable number of the judges in the various courts are native Filipinos. All the fiscals, or prosecuting officers in the islands are natives.

Judith, Jewish heroine. She was the widow of Manasses, a citizen of Bethulia. When Holofernes, general of King Nebuchadnezzar, according to the Book of Judith, besieged Bethulia, a city of unknown geographical position, she went armed with faith in Jehovah to the tent of the invader and was admitted because of her stately beauty. While he slept she cut off his head with his own sword, and thus de-

livered Israel. This incident has been a favorite subject with artists, for in the first place the Book of Judith is written with abundant literary point and skill and is naturally suggestive to the sculptor or painter. It is the subject of Donatello's bronze group in the Lanzi palace at Florence, and of many pictures, notably that of Cranach in the Dresden gallery, and those of Horace Vernet, 'Judith on Her Way to Holofernes'; and 'Judith in the Tent of Holofernes.'

Jud'son, Adoniram, American Baptist missionary: b. Malden, Mass., 9 Aug. 1788; d. at sea 12 April 1850. He was graduated from Brown University in 1807, and immediately after opened a private school in Plymouth, Mass. Skeptical views which he had held were overcome by his examination of the evidences of Christianity, and he was graduated from Andover Theological Seminary in 1810. With some of his fellow students at Andover he addressed a letter to the General Congregational association of Massachusetts which ultimately led to the formation of the American board of commissioners for foreign missions. Impatient at the slow progress of the American movement he embarked for England to consult with the directors of the London Missionary Society in regard to co-operation with that society by the newly formed American board. On his return to America he and three others were appointed missionaries to the Burman empire by the American board; they were ordained 6 Feb. 1812 and Dr. Judson, with his wife, sailed on the 19th for Calcutta. They were subjected for a full year to much annoyance by the East India Company's regulations, and finally took refuge in Rangoon (July 1813). Meanwhile they had adopted Baptist views, and had surrendered their connection with the American board. The Baptist general convention (now the American Baptist Missionary Union) organized in 1814 and immediately appointed Mr. and Mrs. Judson its missionaries. Established in Rangoon they applied themselves to the learning of the language, without grammar or dictionary; in April 1819 the first *zayat* was opened for Christian worship, and in 1820 the number of baptized converts was 10. The growth of the mission had excited the displeasure of the new viceroy, and Dr. Judson determined to appeal to the king for protection, but the plea was unavailing; later, however, their mission was transferred to Ava, at the request of the king. The sudden breaking out of war between the East India Company and the Burman government brought upon the missionaries the severest privations; in June 1824 Dr. Judson was arrested and thrown into prison, enduring the most brutal treatment until February 1826, when he was released on the demand of Sir Archibald Campbell, the English general. Removing to territory ceded by the Burman government to the English, he and his wife commenced missionary work at Amherst; shortly after Judson went with an embassy to Ava to negotiate a new treaty, and during his absence his wife died. On his return to Amherst he took up again his missionary work, where he was chiefly occupied in the translation of the Bible (completed 1834); and the preparation of a Burman-English dictionary. In April 1834, he married Mrs. Sarah Hall Boardman, and remained in Burma till 1845, when he visited the United States. Mrs. Judson died on the voyage. He was received in the United States with distinguished marks of respect by public meetings in many cities, especially by the Baptist missionary conventions at New York and Richmond. In July 1846, he again sailed for Burma with his third wife, Emily Chubbuck, and settled at Maulmain; took the pastorate of the Burman church there, and continued his work on the dictionary. In 1849, illness forced him to leave Maulmain, and he died on the voyage to the Isle of Bourbon. Consult: Lives by his son, Edward Judson (q.v.) (1883); Wayland (1853); Conant, 'The Earnest Man' (1856).

Judson, Ann Hasseltine, American missionary, wife of Adoniram Judson (q.v.): b. Bradford, Mass., 22 Dec. 1789; d. Amherst, Burma, 24 Oct. 1826. She was married to Dr. Judson in 1812, and sailed with him to Burma, where she took active part in all his missionary work. Her health compelled her to visit the United States in 1822–3, where her personal appeals were the means of largely increasing the missionary interest in the churches. Shortly after her return to Burma, her husband and other foreign residents at Ava were imprisoned, and she herself suffered many indignities; but by constant appeals to the king and the wise use of money and presents she was successful in relieving somewhat the sufferings of her husband and the other prisoners. She wrote 'History of the Burman Missions' (1822).

Judson, Edward, American Baptist clergyman: b. Maulmain, Burma, 27 Dec. 1844. He is the son of Adoniram Judson (q.v.) and came to the United States in 1850 after the death of his father. He studied at Madison (now Colgate) University, and was graduated from Brown in 1865. He was principal of the academy at Townsend, Vt. (1865–7) and subsequently professor of Latin at Madison (now Colgate) University. In 1875 he accepted the pastorate of the Baptist Church at Orange, N. J., then became pastor of the Berean Baptist Church, New York city, and later secured a site on Washington Square, New York, and erected the Judson Memorial Church (in memory of his father) of which he is pastor. Here he has built up an institutional church, with many different lines of work, including gymnasium classes, a dispensary, and a children's fresh air fund.

Judson, Emily Chubbuck ("FANNY FORRESTER"), American writer: b. Eaton, Madison County, N. Y., 22 Aug. 1817; d. Hamilton, N. Y., 1 June 1854. She was the third wife of Rev. Adoniram Judson (q.v.) to whom she was married in 1846. As "Fanny Forrester" she achieved some little reputation as a writer of graceful sketches and poems, and besides the life of the second Mrs. Judson (1850), published 'Alderbrook' (1846); 'The Kathayan Slave' (1853); 'An Olio of Domestic Verses' (1852); 'Trippings in Author Land' (1846); 'My Two Sisters' (1854).

Judson, Harry Pratt, American educator: b. Jamestown, N. Y., 20 Dec. 1849. He was graduated from Williams College in 1870, was professor of history in the University of Minnesota 1885–92, professor of political science 1892–1907 in, and president since 20 Feb. 1907 of the

University of Chicago. His works include: 'Cæsar's Army, a Study of the Military Art of the Romans' (1888); 'Europe in the Nineteenth Century'; 'The Growth of the American Nation' (1895); 'The Higher Education as a Training for Business' (1896); 'The Government of Illinois' (1900); etc.

Judson, Sarah Hall Boardman, American missionary: b. Alstead, N. H., 4 Nov. 1803; d. St. Helena 1 Sept. 1845. She was married on 4 July 1825, to Rev. George Dana Boardman, and on 16 July they embarked for Calcutta. They established the mission station at Maulmain, and Mrs. Boardman made rapid progress in the acquisition of the language. Transferred to Tavoy for a similar service, they worked among the Karens partly at the schools at Tavoy and partly by visiting their villages in the wilderness. After two years Mr. Boardman died, but she continued her missionary labors, and beside managing a school with great success, was accustomed to make long journeys among the mountains. In these excursions, assemblies of hundreds gathered around her and she conducted the worship and gave them religious instruction. In April 1834, she became the wife of Adoniram Judson (q.v.). She was perfectly familiar with the Burman language, and translated into Burmese the first part of Bunyan's 'Pilgrim's Progress' and various tracts, prepared a hymn book, and several volumes of Scripture questions for Sunday schools. Before the Peguans had a missionary, she acquired their language, and translated or superintended the translation of the New Testament and the principal Burman tracts into the Peguan tongue.

Juggernaut, jŭg'ẽr-nât. See JAGANNATH.

Jugular (joo'gū-lar) **Vein,** one of the large trunks by which the greater part of the blood that has circulated in the head, face and neck is returned to the heart. There are two on each side, an external or superficial, and an internal or deeper.

Jugurtha, joo-gẽr'thạ, king of Numidia: d. Rome 104 B.C. He was a natural son of Masinissa. Micipsa, his father's brother, and king of Numidia after Masinissa (149 B.C.), adopted him and brought him up with his own sons, Adherbal and Hiempsal. Micipsa did his best to conciliate him, and declared him joint-heir to the crown with his two sons. But after the death of Micipsa, Jugurtha had Hiempsal murdered and drove Adherbal from the country. Adherbal appealed to Rome, and after several Roman expeditions into Numidia, Jugurtha was captured (106 B.C.), led in the triumph of Marius at Rome, and finally thrown into a dungeon, where he was starved to death.

Jujube, joo'joob, a spiny and deciduous shrub of the order *Rhamnaceæ* and genus *Zizyphus,* a native of Syria, whence it was introduced into Europe. The fruit is blood-red or saffron-colored, with a sweet, granular pulp. The species are numerous, and of several the fruit is wholesome and pleasant to eat, both fresh and dried, and forms an article of commerce; and in southern Europe it is used at table in desserts as a dry sweetmeat. *Z. Lotus,* which gave its name to the ancient Lotophagi, a shrub 2 or 3 feet high, is a native of Persia and the north of Africa. Its berries, which are about as large as a sloe, are collected for food by the Arabs of Barbary, are made into cakes, and a kind of wine is sometimes made from them. *Z. spina-christi,* or Christ's thorn, is said to have furnished the branches of which Jesus' crown of thorns was made.

Jujuy, hoo-hwē', Argentine, a province situated in the extreme northwest of the republic, between Bolivia and the province of Saltá. Nearly the entire area, estimated at 18,977 square miles, is occupied by mountains in which are extensive deposits of gold, silver, copper, mercury, salt, petroleum, and asphalt. Fertile valleys in the eastern part of the province produce sugar-cane, wheat, tobacco, and rice. There are immense forests and an abundant supply of water. The provincial capital, also called Jujuy, a town of about 10,000 inhabitants, is connected by railway with Buenos Ayres, and has two banks, a custom-house, a national college, a normal school for girls, and 7 public schools. The population of the province, according to the census of 1895, was 49,713. Estimated population in 1903, about 57,000.

Jukes, The, the name given to a family of New York State that had an unusual record of crime and pauperism. In 1874, Mr. R. L. Dugdale, while making investigations in behalf of the New York Prison Association, found several of the same family imprisoned for various crimes. Becoming interested in the subject, he traced the history of the family through several generations; they were descendants of the two sons of a backwoodsman, called Max, who married two of the Jukes sisters, one of whom is known as "Margaret, the Mother of Criminals." Exact information was obtained in relation to 709 out of the 1,200 descendants and blood relations; of these, 140 had been imprisoned for crime, 280 had been paupers, dependent upon public support, and the large majority were of low physical and moral standard. Consult: Dugdale, 'The Jukes.'

Julia, only child of the emperor Augustus; b. 39 B.C.; d. 14 A.D. She was his daughter by his second wife Scribonia, and was first married (25 B.C.) to her cousin, the young Marcellus, and afterward to Marcus Vipsanius Agrippa, to whom she bore three sons and two daughters. On Agrippa's death, in 12 B.C., she was married to Tiberius, who left her on account of her licentiousness. Augustus banished her to Pandataria, a desolate island on the coast of Campania, ultimately allowing her to live in Rhegium. After the death of the emperor, Tiberius treated her with great severity. She died in poverty and distress. Her son, Agrippa, had been put to death by Tiberius shortly before.

Julia Domna, Roman empress: b. Emesa, Syria, 170 A.D.; d. 217 A.D. She was the second wife of the Emperor Severus, and mother of Caracalla and Geta, and a distinguished patroness of art and science.

Julian, joo'lyan, FLAVIUS CLAUDIUS JULIANUS), Roman emperor, surnamed the Apostate: b. Constantinople 17 November 331; d. 26 June 363. When hardly six years old his father and several members of his family were murdered by the soldiers of his cousin, the Emperor Constantius. He was brought up in the Christian religion, studied philosophy and letters,

and resided in Athens, where he was induced to embrace Paganism. Having received command of an army against the Germans, he defeated them at Strasburg, and drove them beyond the Rhine. He also displayed great talent as an administrator in Gaul. The emperor now became jealous of Julian, and recalled his best troops under pretense that he wanted to employ them against the Persians. This order caused a rebellion among the soldiers, who proclaimed their leader Julian emperor in March 360, in spite of his own resistance. Constantius prepared to proceed against him, but soon after died, and Julian was generally recognized as emperor. He began by putting a stop to many abuses, and limiting the splendor of his court, and was thus able to remit to the people the fifth part of all their taxes. He sought to restore the heathen worship in all its splendor, and on that account opposed Christianity as much as was in his power, without, however, persecuting the Christians themselves. In 363 he headed an expedition against the Persians and took several cities. He was an able ruler, and had also a reputation as an author. Some of his works have come down to us, including speeches, letters, and satirical pieces; the latter are distinguished for wit and humor. He wrote also a work against the Christian religion, of which we have yet some extracts. Consult: Schwartz, 'De Vita et Scriptis Iuliani Imperatoris' (1888); Hoffmann, 'Julianus der Abtrünnige' (1880); Gardner, 'Julian: Philosopher and Emperor' (1895); Dill, 'Roman Society' (1899).

Julian, George Washington, American politician: b. Centerville, Ind., 5 May 1817; d. Irvington, Ind., 7 July 1899. He studied law and was admitted to the bar at the age of 21. In 1845 he was elected to the State legislature, as a Whig, but being a strong opponent of slavery he severed his party connection with the Whigs and became one of the founders of the Free Soil party in 1848. In 1849 he was elected to Congress; in 1852 was candidate for vice-president of the Free Soil party, and in 1856 a delegate to the first national convention of the Republican party, where he was vice-president of the convention and chairman of the committee on organization. In 1860 he was again elected to Congress, and served continuously for ten years. He was a member of the committees on the conduct of the war, on reconstruction, on the preparation of the articles of impeachment against President Johnson, and on public lands, being chairman of the latter. He opposed any monopoly of the public lands, was an advocate of the homestead system, and strongly favored giving the franchise to the negro. In 1868 he proposed a constitutional amendment providing for woman's suffrage. In 1872 he joined the Liberal Republicans, and after that became a Democrat; in 1885–9 was surveyor-general of New Mexico; and after 1889 retired from public life. He published 'Speeches on Political Questions' (1872); 'Political Recollections' (1884); and 'Life of Joshua R. Giddings' (1892).

Julian Calendar. See CALENDAR; EPOCH.

Julien, Alexis Anastay, American geologist: b. New York 13 Feb. 1840. He was graduated from Union College in 1859, was resident chemist at the guano island of Sombrero 1860–4, studied geology and natural history there, and on the establishment of the Columbia School of Mines became an assistant in the quantitative laboratory. He was in charge of the department of microscopy there, 1885–97, and subsequently became instructor in geology. He has published valuable scientific reports included in the Geological Survey's 'Geology of Michigan,' vol. II. (1872); and 'Geology of Wisconsin,' vol. III. (1880); etc.

Julien, zhü-lĭ-ăn, **Stanislas Aignan,** French sinologist: b. Orleans 20 Sept. 1799; d. Paris 14 Feb. 1873. Possessed of an extraordinary linguistic faculty, he taught himself Greek, English, Italian, Spanish, Portuguese, and German, and in 1823 commenced the study of Chinese. At the end of a year he published a Latin translation of the philosopher Mencius. Henceforth ancient and modern Chinese, Manchu, the Mongolian tongues, and Sanskrit, were the subjects of exact and profound study. In 1832 he became professor of Chinese at the Collège de France; librarian at the Bibliothèque Nationale, 1839; president of the college, 1855; commander of the Legion of Honor, 1863. His most important works are: 'Voyages des Pérelins Boudhistes' (1853–8); 'Syntaxe nouvelle de Langue chinoise' (1869–70). Julien was the foremost Chinese scholar of his time.

Julius I., pope: d. 12 April 352. He became pope in February, 337, and was a staunch defender of Athanasius, who, under the protection of Julius, sought refuge in Rome against the enmity of the Eastern prelates.

Julius II., pope (GIULIANO DELLA ROVERE, joo-le-ä'nō dĕl'lä rō-vā'rā): b. Albezuola 1443; d. Rome 21 Feb. 1513. He was elevated by his uncle Sixtus IV. to the rank of a bishop and cardinal in 1471, and subsequently held eight bishoprics and the archbishopric of Avignon. He was appointed papal legate to France in 1480 and in 1503 was elected pope. Immediately on his elevation to the pontificate he planned the complete re-establishment of the papal sovereignty in its ancient territory, and the extinction of foreign domination, and influence in Italy. Refusing to attend the Council of Pisa convened by the king of France, he in 1511 formed the "Holy League," to which Spain, England, and Switzerland were parties. In 1512 he made open war against Louis XII., and the Fifth Lateran Council was convoked by him in the same year. The French defeated the papal army near Ravenna, but were soon after driven out of Italy. He was a far-sighted and patriotic sovereign, and a liberal and judicious patron of art and literature, Michelangelo, Raphael, and other great artists of the time receiving commissions from him. To procure means for building St. Peter's he ordered the preaching of indulgences, which was one of the immediate causes of the Reformation. Consult: 'Life,' by Du Mesnil (1873); Brosch, 'Papst Julius II., und die Gründung des Kirchenstaates' (1878).

Julius III., pope (GIOVANNI MARIA DEL MONTE, gō-van'nē mä-rē'ä dĕl mōn'tā): b. Arezzo 10 Sept. 1487; d. Rome 23 March 1555. He was made archbishop of Siponto in 1512 and of Pavia in 1520, and was appointed cardinal by Paul III. in 1536. He took an active part in the Council of Trent as papal legate, was

elected pope in 1550, and in the following year reopened the Council of Trent, which had been suspended for two years. He endeavored to effect a union with the Nestorians, and commissioned Cardinal Pole to organize, in conjunction with Mary, the reunion of England with Rome.

Julius Cæsar. See CÆSAR, GAIUS JULIUS.

Julius Cæsar, Play of. The material for this stately drama, the noblest of Shakespeare's historical plays, was taken from Plutarch. The action covers nearly two years,—46 to 44 B.C. See CÆSAR, GAIUS JULIUS.

July, the 7th month of the calendar, which in the Roman year bore the name of *Quintilis,* as the fifth in the computation of Romulus, even after Numa had prefixed January and February. Mark Antony effected a change in its name in honor of Julius Cæsar, who was born on the 12th of the month, and thenceforward by a decree of the senate it was called *Julius.* It originally contained 36 days. It is said that Romulus reduced them to 31 and Numa to 30. Julius Cæsar fixed the number at 31, which is still retained. The Dog-days are supposed to commence on the 3d of this month.

Jumbo, the name of a large African elephant for 25 years on exhibition at the Royal Zoological Gardens in London. The animal was purchased in 1882 by P. T. Barnum (q.v.), American showman, for $10,000, and for three years was exhibited in the United States. Jumbo was killed in 1885 by a railroad train in Canada. He was 11 feet 6 inches in height, and weighed 6 tons. His skeleton is preserved at the Smithsonian Institution, Washington, D. C.

Jumel, zhū'mĕl, **Eliza,** American heiress: b. at sea 1769; d. New York 16 July 1865. Her maiden name was Capet, and after her mother's death she was adopted by Mrs. Thompson, of Newport. She was a wayward, beautiful girl; at 17 she eloped with a British officer named Peter Croix, with whom she lived in New York. There she was greatly admired, and soon after her first husband's death married Stephen Jumel, who took her to Paris, where her social success was as great as in New York. After Jumel's death, she married at 61 Aaron Burr (q.v.), from whom she separated soon afterward. Her home during her last years was the famous Jumel mansion, built by Roger Morris in 1758, the home of Mary Philipse Rogers (q.v.) and Washington's headquarters during the New York campaign. It was bought by Madame Jumel in 1810, and is still preserved, its site being in Roger Morris Park, New York, which was opened 28 Dec. 1903.

Jum'na, or **Jamna** (Sanskrit YAMUNA), a river of India which rises in the Himalayas, at the height of 10,849 feet. It flows in its upper course in a generally southwest direction, then bends to the southeast and, passing the cities of Delhi and Agra, falls into the Ganges, of which it is the chief tributary, at Allahabad (q.v.) after a course of 860 miles. Important irrigation works derive their supply of water from this river.

Jumpers, a class of religionists who manifest their devotion and feeling by jumping from the ground during the time they are assembled for worship and exhortation. They are said to have originated in the Methodist congregations of Wales during the preaching of Whitfield (1760). They were also called "Barkers" from the incoherent guttural sounds they uttered during their excitement. They still exist in some parts of the Eastern States, having emigrated to America after being repudiated by English Methodists.

Jumping Beans, various large seeds of euphorbiaceous plants infested with the larvæ of certain small moths (*Carpocapsa saltitans* and *Grapholitha sebastianæ*), which by their movements make the seeds roll, and even jump as if alive. The larvæ spin cocoons in the seeds, a large part of the interior of which they have devoured, and when ready to emerge as adults, push open a previously cut circular door which has been held shut by silken threads. Both species are found in Central America, Mexico, and the southwestern United States, where they are called "broncho beans."

Jumping Hare, or **Springhaas,** a jerboa-like animal (*Pedetes caffer*) of South Africa, as large as a hare, and much resembling one, which is now set apart in a family (*Pedetidæ*) by itself. It will leap 25 or more times its own length, and where numerous does great damage at night to growing crops.

Jumping Mouse. See JERBOA.

Jumping Shrew, a curious little animal of Africa, one of the insectivora of the Elephant-shrew family (*Macroscelidæ*), which has very large hindquarters and moves by leaping like a jerboa. They inhabit rocky and desert places, remain in holes and hiding places during the day and go abroad at night in search of insect food. The best known, perhaps, is the Cape jumping-shrew of South Africa (*Macroscelidus typicus*), which is tawny brown, about five inches in length, has a long, flexible proboscis and a long naked tail.

Jumping Spiders, small spiders of the family *Attidæ,* which dwell in low vegetation, and are exceedingly agile. They are usually short and stout in form, rarely more than a quarter of an inch long, and are often brightly colored, especially in the case of the males, which take curious attitudes in order to display their ornaments to the females. Consult Emerton, 'Common Spiders of the United States' (1902).

Jun'co, a genus of slate-colored and white sparrows, present in the United States mostly in winter. See SNOWBIRDS.

Junction City, Kan., city and county-seat of Geary County, at the junction of the Republican and Smoky Hill rivers, 135 miles west of Kansas City; and on the Missouri, K. & T. and the Union P. R.R.'s. The two rivers here form the Kansas River, and make an important shipping point for grain, flour and limestone. A government military post, Fort Riley, is located three miles east of the city. It was settled in 1858 and under a charter of 1870 is governed by a mayor and city council.

The city owns the waterworks. Pop. (1890) 4,502; (1900) 4,695.

June, Jennie. See CROLY, JANE G.

June, the 6th month in the calendar. The etymology is uncertain. Vossius gives three etymologies of the name — one from Juno; another from *jungo* (to join), referring to the union between the Romans and Sabines under Romulus and Titus Tatius; a third from *juniores* (the young men), Romulus having been said to have assigned the month of May to the elders, and that of June to the young men, when he divided the people into these two great classes, the former to serve in counsel, the latter in war. The name has also been traced to Junius Brutus, the first consul. It consisted originally of 26 days, to which it is said Romulus added four, and Numa took away one. Julius Cæsar again lengthened it to 30 days, and it has ever since remained unaltered.

June Beetle, or **Fig-eater,** a green and brown beetle (*Allorhina nitida*) of the family *Scarabæidæ* common in the central and southern United States. The adults often eat figs, peaches, small fruits, corn, etc. The larvæ are white grubs which resemble their northern relatives (see MAY BEETLE), but are far less injurious since they normally feed upon decaying vegetable matter in the soil and not on living roots of plants. The adults may be decoyed away from ripe fruit by placing little piles of decaying fruit within their reach; but since they are probably beneficial they should not be destroyed.

June Berry. See AMELANCHIER.

June Bug. See MAY BEETLE.

June Grass. See BLUE GRASS; GRASSES IN THE UNITED STATES.

Juneau, joo-nō′, **Laurent Solomon,** American pioneer: b. L'Assumption parish, near Montreal, Canada, 9 Aug. 1793; d. Shawano, Wis., 14 Nov. 1856. He emigrated to Green Bay, Wis., and thence in 1818 to Milwaukee, where he was active in trade with the Indians. He was not, as has been sometimes stated, the first white settler on the site of Milwaukee. A grant of considerable land had there been made by the Indians to one Mirandeau, a previous resident, and of this grant, Juneau, on Mirandeau's death, secured possession. Juneau made the first survey of Milwaukee village, was its first postmaster and president, and the first mayor of the subsequent city. On ground presented by him, he helped to build the first court-house in the State. For years he was agent for the American Fur Company. A heroic statue of him was placed in Juneau Park, Milwaukee, in 1884. See MILWAUKEE.

Juneau, Alaska, city in the southern district, on a promontory between the Taku River and Lynn Canal, opposite Douglas Island, about 80 miles north of Sitka. It was settled in 1880, is incorporated, and has been selected by Congress as the capital of Alaska. From its situation in the mining region it has become a centre of trade in outfitters' articles and general supplies; while its exports, including gold, furs, and other products of Alaska, have grown to a considerable commerce. Among the manufactories are iron-works, breweries, sawmills, cigar factories, etc. In the vicinity are the Treadwell gold mine and the Silver Bow mines. Villages of the Auk and Taku Indians in the neighborhood are of interest to tourists. At Juneau is the United States land office for Alaska. Its public schools are well conducted, and its waterworks, electric-light system, and other public improvements give it all the essential conveniences of a modern American city. Cable service is established here. Pop. (1890) 1,253; (1900) 1,864.

Jung-Stilling, Johann Heinrich, yō′hän hīn′rĭH yoong stĭl′lĭng, German mystical author: b. Grund, Hesse Nassau, Germany, 12 Sept. 1740; d. Carlsruhe, Baden, 2 April 1817. In the early part of his career he was by turns, a charcoal burner, school master, and tailor, and in 1771 went to Strasburg to study medicine. Here he became acquainted with Goethe, who has sketched him in 'Aus meinem Leben.' He was professor of political economy in the Universities of Marburg and Heidelberg, 1787–1806, and the remainder of his life was passed at the court of the Grand Duke of Baden. His writings, which include several romances as well as distinctly religious works, are more or less mystical in tone. Among them are 'Geschichte des Herrn von Morgenthau' (1770); 'Geschichte Florentins von Fahlendorn' (1783); 'Theobald' (1784–5, an English version of which appeared in New York 1846); 'Das Heimweh'; 'Theorie der Geisterkunde' (1808, in English 1834); 'Scenen aus dem Geisterreiche' (1797–1801), and his famous autobiography 'Heinrich Stillings Leben' (1806). In the publication of this he was aided by Goethe. The work was completed in 'Heinrich Stillings Alter' (1817).

Jungfrau, yoong'frow (Ger. "virgin," or "maiden"), a mountain of Switzerland, in the Bernese or Helvetic Alps, on the frontiers between the cantons of Bern and Valais, 12 miles southeast of Interlaken. It is one of the most magnificent mountains in Switzerland and the loftiest calcareous mountain in Europe; height 13,670 feet. It was first ascended in 1811.

Junghaus, yoong'hows, **Sophie,** German novelist: b. Cassel, 3 Dec. 1845. She became well known by the publication of 'Kathe, the Story of a Modern Maid' (1876). Later works of hers are: 'The House of Eckberg,' a study of life during the Thirty Years' War (1878); 'Die Erbin wider Willen' (1881); 'Die Gäste der Madame Santines' (1884); 'Der Bergrat' (1888); 'Zwei Brüder' (1889); 'Zu rechter Zeit' (1892); 'Um das Glück' (1896); 'Junge Leiden' (1900).

Jungle, an Indian term applied to a desert and uncultivated region whether covered with wood and dense vegetation or not, but in English it is applied to land covered with forest trees, thick impenetrable brushwood, or any coarse rank vegetation.

Jungle Books, The (1895), by Rudyard Kipling. The central figure in these books is the boy Mowgli, who, straying from his village home when an infant, had been lost in the forest, and there sheltered and nursed with her own cubs by a mother-wolf, and the hairy Orson. Joined to this element of human interest, and with the coloring of high romance, these

stories picture the personal characteristics and social and political life of the gaunt wolf-family in their cave and the free republic of wolves. Unlike the talking beasts in Æsop's fables, those of the 'Jungle Books' are not men in hides and on all fours discussing human problems. Kipling's genius represents them thinking and behaving each according to his own peculiar beastly habit and experience, with great dramatic skill.

Jungle-cat, or **Chaus,** the common wildcat of India (*Felis chaus*). It is 26 inches long in head and body, has a short tail, reaching only to the heel, and is yellowish gray, more or less dark and unspotted, tinged with reddish on the sides, marked by a dark stripe from the eyes to the muzzle, and with reddish black ears slightly tufted. Another Indian "jungle-cat" is the handsome *F. ornata,* which is profusely spotted; it dwells in the desert regions of the Northwestern provinces. Both these cats are said to interbreed with domestic cats, and thus no doubt long ago influenced the varieties of the tamed stock.

Jungle-fever, a severe variety of remittent fever, prevalent in the East Indies and other tropical regions. It is characterized by the recurrence of paroxysms and of cold and hot stages. The remissions occur usually in the morning and last from 8 to 12 hours, the fever being mostly typically developed at night.

Jungle-fowl, the English book-name of a genus of pheasants, the source of domestic fowls, characterized by a fleshy frontal comb and wattles, and the peculiarly laterally compressed tail with its long, drooping, curved feathers. This genus (*Gallus*) is represented by several species in southern Asia, especially India, and the Malay and Philippine Islands. The common jungle-fowl (*Gallus gallus* or *bankiva*) is especially noteworthy as the original stock of our barnyard fowls. The wild birds, which are quite common in cultivated parts of central India and about the bases of the Himalayas up to an elevation of 5,000 feet, closely resemble some of the varieties of game cocks and hens. The sexes differ as in the domestic birds in size, character of tail feathers, combs, wattles, spurs and color. Although naturally living in flocks in the jungles and forests, these haunts are often forsaken for the purpose of feeding upon grain in the cultivated fields. They run with great speed, are tolerably good flyers and roost in trees. The cock crows and the hen clucks and cackles much as domestic fowls do. In the wild state the jungle-fowl is said to be monogamous; eggs to the number of 10 or 12 are laid in a simple depression in the ground lined with leaves and grass. Consult Darwin, 'Animals and Plants under Domestication'; Tegetmeier, 'Ibis' (1891); and Blanford, 'Fauna of British India.'

In Australia this name is often given to the mound-birds.

Juniata, joo-nĭ-ăt'a, a river of Pennsylvania formed at Petersburg, about six miles northeast of Huntingdon, near the centre of the State, by two streams rising in the Alleghany Mountains — the Little Juniata and the Frankstown Branch. Its course is winding, but it flows in a generally eastern direction for about 150 miles, entering the Susquehanna at Duncannon, 14 miles above Harrisburg. Along the greater part of its course the scenery is picturesque, often marked by grandeur where the river breaks through the mountains that rise in parallel ridges across its path. The Juniata is not a navigable stream, but from its source to its mouth its banks are followed by the Pennsylvania Canal and the Pennsylvania Railroad, the latter crossing the river several times.

Juniata College, a coeducational institution, located at Huntingdon, Pa.; established in 1876 under the auspices of the German Baptist Brethren. Special attention is given to the religious education of the students; one of its principal courses is the history and literature of the Bible. It has art, music, normal, and commercial departments, also a preparatory school. The courses lead to the degrees of bachelor of arts, and of English and sacred literature. In 1903 there were in attendance 350 students, and 21 professors and instructors were connected with the school. There were about 21,000 bound volumes and over 4,000 pamphlets in the library.

Junin, hoo-nēn, Peru, department in the interior; has an area of 23,347 square miles. It is located in the wildest parts of the Cordilleras. Agriculture is neglected and large deposits of silver remain unworked. A railroad connects the southern part with Lima on the coast. The capital city is Cerro de Pasco. Pop. of the department 394,393.

Junior Order of United American Mechanics. See United American Mechanics, Junior Order of.

Ju'niper, a genus (*Juniperus*) of ornamental evergreen trees and shrubs of the order *Coniferæ,* consisting of about 35 species distributed mainly throughout the cooler parts of the northern hemisphere, but also in America extending to Mexico and the West Indies. The species have branches which spread in all directions from the main trunk and limbs, small, rigid, needle-like or scale-like opposite leaves; unisexual flowers, the two sexes usually upon separate plants, the staminate, yellow and in catkins, the greenish pistillate ones followed by fleshy, berry-like cones containing from one to six, sometimes 12 seeds, which may not attain maturity until the second or third year. The best known species in the United States is probably the Virginian juniper, red cedar or savin (*Juniperus virginiana*), to be found everywhere east of the Rocky Mountains, upon rocky and sandy soils, mountain sides, etc. It often attains 100 feet in height, its upright or spreading branches forming a handsome conical head. Its numerous attractive horticultural varieties are largely planted in parks and cemeteries. The trunks are highly prized for fence posts, being exceedingly durable; the handsome, red, heart-wood is valued for turning, cabinet work, cooperage, and especially for lead-pencils; but the tree is looked upon with disfavor by the orchardist, because it is one of the hosts of apple rust. See Apple, paragraph *Diseases.*

The common juniper (*J. communis*) is a smaller species, rarely reaching 50 feet in height and usually less than 25 feet tall, and many of its numerous varieties less than 10 feet. It is

widely distributed throughout the northern hemisphere, especially in the colder latitudes and altitudes. Like the preceding species its wood is valued, when of sufficient size, for posts, veneers, pencils, and for turning. The tree itself is also used for ornamental planting. Its bark is sometimes twisted into ropes and its long, tough, fibrous roots are used for making baskets. Its blue-black fruit, which it yields profusely, is used for flavoring certain liquors, as is also the oil obtained from them and from the twigs by distillation with water. This oil has been used in medicine as a stimulant, but is less popular than formerly. The Bermuda cedar (*J. bermudiana*) resembles the Virginian juniper, but is of stouter build, though it rarely exceeds 40 feet in height. Its wood is rather more fragrant than that of the preceding species, like which it is used. Formerly it was employed in the ships built in the Bermudas, but the forests which supplied this industry were mismanaged and the industry perished. Several other species are of more or less economic importance; for instance, the Spanish juniper (*J. oxycedrus*), a shrub which attains a height of about 12 feet, whose fruits yield a disagreeable smelling oil (oil of cade), used in veterinary medicine; and African juniper (*J. procera*), a useful timber species and probably the largest of the genus, often attaining heights of 150 feet in the mountains of eastern Africa, where it is native.

Junipers succeed best in moderately moist, sandy loam in open, sunny situations. They make excellent windbreaks and shelter belts, especially where the soil is too dry, rocky or gravelly for other trees. They may be propagated by seeds which, however, usually require two, sometimes three, years to germinate. Cuttings of almost mature wood are taken in the autumn from the needle-leaved kinds and grown under glass or in the open; species with scale-like leaves are generally side-grafted in the greenhouse during winter. Some of the shrubby species are propagated by layers.

Junipero, Miguel José Serra, mē-gĕl′ hō-sā′ sĕr′rä hoo-nē′pā-rō, Spanish missionary in America: b. island of Majorca 24 Nov. 1713; d. Monterey, Cal., 28 Aug. 1784. He became a member of the Franciscan order in 1729, in 1750 arrived in Mexico City as a missionary, and in 1750–69 was active among the native tribes. In 1769 he went to the site of San Diego Cal., where he founded a mission. He gathered about him a band of sixteen of his order, and these missionaries converted over 3,000 Indians, of whom Junipero himself is said to have baptized more than 1,000. Junipero instructed the natives in the arts of civilization, and the colonies which assembled about the mission stations constituted the first settlements in California. His headquarters were at Monterey, but he founded several other missions. Bret Harte incorrectly gives his name as Serro.

Ju'nius Letters, The. During the period between November 1768 and 21 Jan. 1772, there appeared in the London *Daily Advertiser* a series of mysterious letters aimed at the British ministry of that day, and signed by various pen-names — the most remarkable of them by that of one "Junius." During the century ensuing, the authorship of these epistles has been assigned with some degree of probability. The merits of the 'Letters' have been sufficient to give them a life all the more vigorous, perhaps, because they have been conjecturally assigned to Sir Philip Francis. The author was a man thoroughly cognizant of British politics; a vehement opponent of the government, and a fiery pleader for popular liberty. The dominant message is sounded in these words from the first letter of the series: "The admission of a free people to the executive authority of government is no more than compliance with laws which they themselves have enacted." Much constitutional knowledge is shown in these trenchant attacks, which continually refer to the British Constitution as the bulwark of the people's rights. In manner, the letters are vigorous, bold, and among the finest specimens of impassioned invective and irony in English literature.

Junkers, yoong′kĕrz, a name given to the younger members of the nobility of Prussia and the adjoining states. "Junkerthum" was a term of reproach used in the 19th century to designate the party of reaction in Prussia, which found its most strenuous supporters among the nobility.

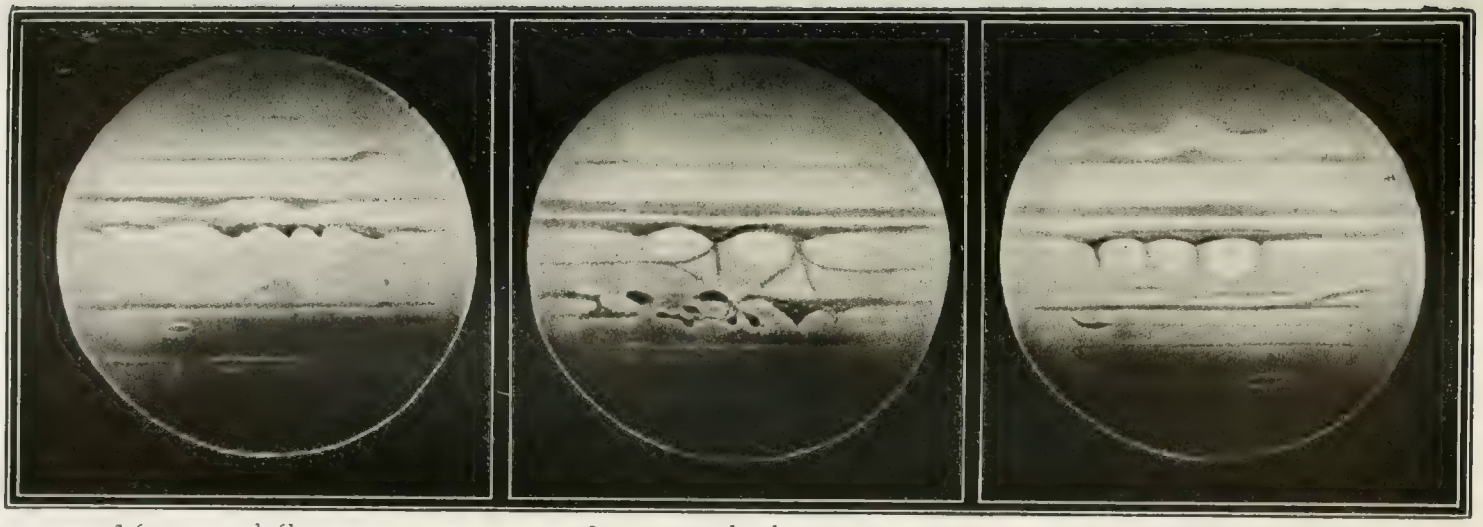
Junk'in, George, American Presbyterian clergyman: b. near Carlisle, Pa., 1790; d. 1868. He was graduated from Jefferson College (Pa.) in 1813 and entered the Presbyterian ministry in which he became prominent as a leader of the party known as Old School Presbyterians. He founded Lafayette College at Easton, Pa., in 1832, and was its president till 1841, returning thither in 1845, after three years spent as president of Miami College at Oxford, Ohio. In 1848 he became president of Washington College (now Washington and Lee). He was an outspoken upholder of slavery, but was opposed to secession, and on account of his Union sentiments resigned the presidency of the college in 1861. Consult: 'Life' by D. X. Junkin (1871).

Junks, large flat-bottomed vessels, from 100 to 150 tons burden, used by the Chinese. They have three masts, and a short bowsprit placed on the starboard bow. The masts are supported by two or three shrouds, which, at times, are all carried on the windward side. On the fore and main mast is a sort of lug-sail, of cane or bamboo.

Ju'no, the most exalted divinity of the Latin races in Italy next to Jupiter, of whom she was the sister and wife; the equivalent of the Greek Hera. She was the queen of heaven, and under the name of Regina (queen) was worshiped in Italy at an early period. She bore the same relation to women that Jupiter did to men. She was regarded as the special protectress of whatever was connected with marriage. She was also the guardian of the national finances, and a temple, which contained the mint, was erected to her under the name of Juno Moneta on the Capitoline.

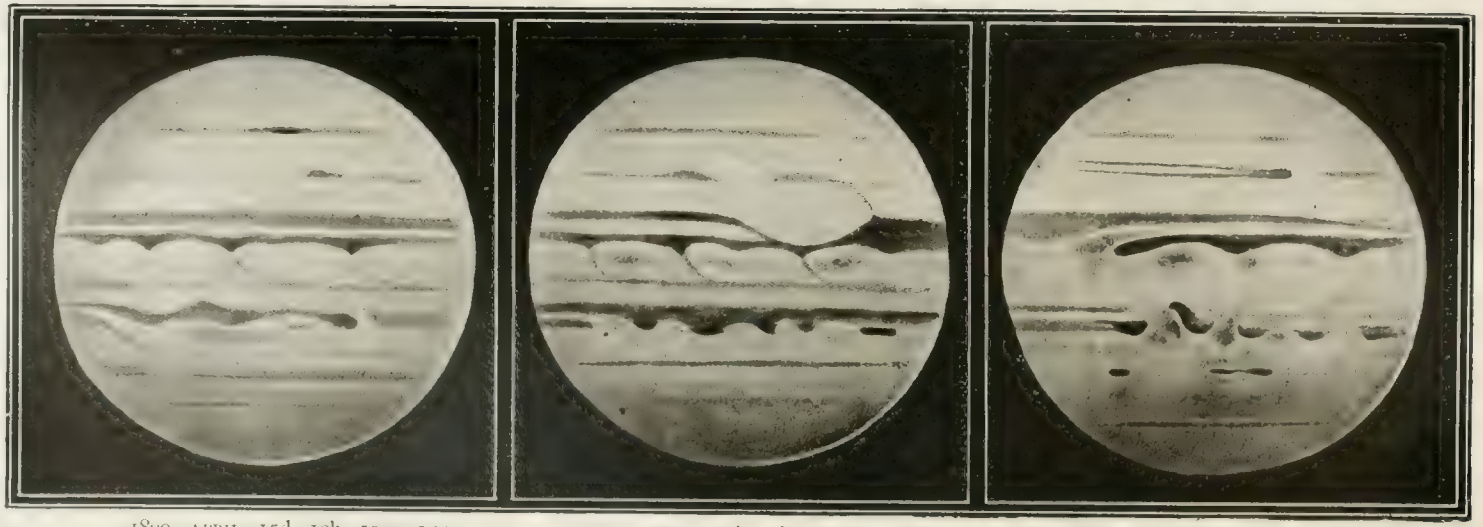
Junot, Andoche, äṅ-dōsh zhü-nō, Duke of Abrantes, French marshal: b. Bussy-le-Grand 23 Oct. 1771; d. Montbard 22 July 1813. He was intended for the bar, but on the outbreak of the revolution joined a volunteer battalion,

and soon attracted notice. At the siege of Toulon, in 1793, he became secretary to Napoleon, and went with him into Italy and Egypt in the capacity of aide-de-camp. In Egypt he was advanced to the rank of general of brigade. In 1800 he was made commandant of Paris, and he particularly distinguished himself at the battle of Austerlitz in 1805. In 1807 he was sent with an army into Portugal, and made his entry without opposition into Lisbon, his success being rewarded with the title of Duke of Abrantes. On the arrival of the British he was defeated at Vimeira, and was then obliged to submit to the humiliating convention of Cintra. Although he subsequently took part in the campaigns (1809) against Austria, (1810) against Spain, and (1812) against Russia, he failed to retrieve his reputation. In 1813 he became insane, and lost his life by leaping from a window.



Junta, a high council of state; a term common in all Spanish-speaking countries. It was originally applied to an irregularly summoned assembly of the states, as distinguished from the cortes or parliament regularly called together by the authority of the king. In Cuba the term was adopted by the insurgents before the Spanish-American war, to designate the general legation of the Cuban republic abroad. This legation or junta was first appointed 19 Sept. 1895, by the Constituent Assembly that formed the insurgent Cuban government, which at the same time made T. Estrada Palma head of the junta and chief Cuban representative abroad, with authority to appoint ministers to all governments and to have control of Cuba's diplomatic relations and representatives throughout the world. The junta established its headquarters in New York, and was the organization through which the insurgents' friends outside of the island communicated with the Cuban soldiers in the field during the Spanish-American war. See CUBA.

Junto, The, a club formed in Philadelphia by Benjamin Franklin for mutual improvement. Morals, politics, and natural philosophy, as well as the social well-being of man, were the main subjects discussed. It continued for about 30 years. The name was also applied to an English Whig ministry in the reign of William III., the chief members of which were Admiral Russell, Somers, Lord Wharton, and Montague, the great financier. This was the first ministry ever made of one and the same party politics. It was the suggestion of Robert, earl of Sunderland, to William III., who shrewdly said, if all the ministers were of one party they would pull together.



Jupati, joo'pä-tē, a palm (*Raphia tædigera*) of the tide-flooded lands of the lower Amazon and Pará rivers, remarkable for its leaves, probably the largest in the vegetable kingdom. The trunk is only 6 or 8 feet high, and 1 foot in diameter. The leaves rise nearly vertically from the trunk, bending out on every side in graceful curves, forming a magnificent plume 70 feet in height and 40 in diameter. Leaves have been measured 50 feet long, and the leaf-stalk is often 12 or 15 feet long below the first segments of the leaf, and 4 or 5 inches in diameter, perfectly straight and cylindrical, and when dried light and strong as the quill of a bird. The Indians split it into laths for a variety of purposes — window-shutters, boxes, bird-cages, partitions, and even entire houses being constructed of it, with the addition of a few supporting posts at the angles. The fruit, a large oblong drupe, has a bitter oily flesh.

Jupiter, joo'pĭ-tẽr, or **Juppiter,** the supreme deity of the Latin races in ancient Italy, the same as the Greek Zeus. As the supreme deity Jupiter received from the Romans the title of *optimus maximus* (best greatest), and as the deity presiding over the sky he was considered as the originator of all the changes that took place in the sky. From him accordingly proceeded rain, hail, and the thunderbolt, and he it was that restored serenity to the sky after it had been obscured by clouds. Hence the epithets of Pluvius (rainy), Tonans (thundering), etc., were applied to him. The most celebrated of his temples was that on the Capitoline Hill dedicated to him as Jupiter Optimus Maximus, jointly with Juno and Minerva. He was represented with a sceptre as symbolical of his supreme authority. He was the guardian of all property; and every Roman was believed to be under his protection, and that of his consort Juno, the queen of heaven. White animals were offered up to him in sacrifice, his priests wore white caps, and his chariot was represented as drawn by four white horses. See JUNO.

Jupiter, the largest planet of the solar system, and the fifth (excluding the asteroids) in order of distance from the sun. Its mean diameter is about 85,000 miles; polar diameter about 82,000; its mean distance from the sun 475,692,000 miles; its period of revolution round it 11 years 10⅓ months; its orbit is inclined to the ecliptic at the angle 1° 18′ 40.3″. The inclination of its axis is 3° 5′ 30″, so that changes in the seasons must be almost unknown; its volume is 1,300 times that of the earth, but its mass is only 300.857 times. Jupiter has five moons, the last was discovered by Barnard, at Lick Observatory in 1892. The other four were discovered by Galileo in 1610 and are visible through an ordinary telescope. They are at average distances of from 267,380 to 1,192,820 miles from the planet; they appear to make one revolution on their axis while passing once round the planet. Europa, the smallest, has a diameter of 2,099 miles, somewhat less than that of our moon; Ganymede, the largest, has a diameter of 3,436 miles. The planes of their orbits are nearly the same as the ecliptic and the orbit of Jupiter. The disk of Jupiter is crossed in a direction parallel with the equator by three or four vividly marked bands or belts; other of these belts vary in density and distinctness. Spots also appear and remain for some time on its surface. In particular, a large red spot of varying dimensions has been observed from time to time. Professor George Washington Hough sums up the results of his 23 years of observations of Jupiter somewhat as follows: First, its equatorial belt changes both in size and position slowly and gradually. Second, the fainter belts also vary. Third, the circular white spots are very permanent in latitude, but are not fixed in position one with another. Fourth, the dark spots of the same size as the circular white spots are not so stable as they, and probably lie at the level of the equatorial belt. Fifth,

1896, MARCH, 2d. 6h. 30m. G.M.T. 1897, MARCH, 9d. 11h. 55m. G.M.T. 1898, APRIL, 4d. 9h. 55m. G.M.T.

CHANGES IN THE ASPECT OF THE PLANET JUPITER OBSERVED AT VARIOUS TIMES.

the large, irregular white spots near the equator make one rotation in 9 hours 50 minutes. As to the constitution of the planet, Prof. Hough concludes that the matter at the visible boundary of Jupiter has a density about half that of water (the average density of the planet is 1.37 times that of water). The medium at the boundary is in the nature of a liquid. In it the great red spot and the circular white spots are located. In such a medium all motions would be slow and gradual and the shape and size of an object would be very permanent. The equatorial and polar belts may be located on the surface or at a higher level than the red spot. In middle latitudes within 20° of the equator the higher atmosphere carries a layer of dark matter. In this envelope are formed the openings that we call white spots, and by unequal distribution black spots. The belts may be assumed to be some sort of vapor of considerable density. The planet is at a high temperature, but not self-luminous.

Jura, joo'rä, a chain of mountains in central Europe, partly belonging to France, partly to Switzerland, between which they form a sort of natural barrier, extending from southwest to northeast, and exhibiting a number of parallel ridges. The greatest length is nearly 200 miles, from Belley in France, department of Ain, to the banks of the Rhine; and the greatest breadth about 60 miles, between the Lake of Geneva and the banks of the Doubs. The principal geological formation is the Jura limestone, with greensand, belonging to the lower cretaceous series. Stalactite caves are numerous. The two chief rivers having their source in the chain — the Ain and the Doubs — are both French. They descend from its western slopes, and belong to the basin of the Rhone. The highest peaks of the Jura are Crêt de la Niège, Reculet, Mont Tendre, and Dôle, all over 5,500 feet.

Juras'sic, a system or series of formations with like characteristics, and containing fossil remains indicating a time occupying the first half of the Mesozoic period, and characterized by many changes in the distribution of sea and land, especially in the northern hemisphere, where the present continental areas were apparently represented by archipelagoes. The formations of this period take their name from their prominent exposure in the Jura Mountains; but are known in Great Britain as the Oölites because there made up of granular (oölitic) limestones below the Cretaceous and above the Lias, from the latter of which the series is separated by no very definite boundary. In America synchronous formations are, indeed, called "Juratrias" and represent the transition from the Permian to the Cretaceous. The Jurassic is represented somewhat in South America and in the western United States, as in the highly fossiliferous "Como stage" beds of Wyoming, and the auriferous state of California, but most strikingly in the brown "bird-track" sandstones of the Connecticut Valley, in Nova Scotia, and in the red rocks that crop out along the eastern foot of the Alleghanies from New Jersey to South Carolina. During this period most of the globe now dry land was covered with shallow seas which were the abode of a great variety of lowly fishes and reptiles. On land it was the height of the age of reptiles, and especially of dinosaurs (q.v.) and pterodactyls. Toward its close the progenitors of birds appeared in the shape of *Archæopteryx* (q.v.), and traces of mammals are found. Consult authorities mentioned under GEOLOGY.

Jurel, joo'rĕl, or **Xurel,** a fish of the genus *Caranx,* especially *C. crysos,* more widely known as the yellow mackerel and hard tail. Unlike most members of this tropical genus, the jurel is common as far north as Cape Cod. In Florida and the Gulf States it is an important food-fish, caught in seines during the spring and summer when in shallow water for the purpose of spawning. It is migratory, and like most wandering fishes carnivorous and voracious.

Jurisdiction includes both the right to exercise authority (*imperium*) and the field within which such authority may properly be exercised (*dominium*), whether its limits be territorial or personal. In early law, jurisdiction in the second sense was rather personal than territorial, and the same must be true wherever distinct races occupy together the same territory. While the tendency is to gradually work out a system of law applicable to all inhabitants, the state must of necessity recognize the fact that its subjects of different races will consent to be governed only by separate and often contrasting systems. Such is the case, for example, in British India to-day. So, too, jurisdiction was divided according to the subject matter, and the Church secured and jealously maintained authority over all matters of conscience, and managed to extend the jurisdiction of the ecclesiastical courts to very important questions, including marriage, legitimacy, wills, and administrations, and to actions affecting the personal rights of the clergy.

The Constitution of the United States discriminates clearly and sharply between the executive, the legislative, and the judicial powers of government, and its provision that the Constitution and the laws of the United States made in pursuance thereof shall be the supreme law of the land, taken in connection with the provision that the judicial power shall extend to all cases arising under the Constitution, forms the basis of a jurisdiction which, at least in the extent to which it has been carried, is without precedent outside of the United States. It is by virtue of these provisions that the Federal courts exercise the power of declaring void acts of Congress or of the State legislatures which conflict with the Constitution of the United States. To this power and the energy and ability of the Supreme Court in its exercise, are due the vigor and efficiency of the Federal government and the establishment of its supremacy within the field of its jurisdiction. This feature has been imitated in the several State constitutions with results unquestionably beneficial as a whole, and so important that the courts have come to be spoken of as the guardians of the constitution. But one result not so fortunate is that the legislative branch of the government, though in theory as much bound by constitutional restrictions as though there were no authority to which an appeal against the validity of its enactments can be taken, is manifesting a disposition to disregard them altogether, leaving the whole question of con-

stitutionality to the courts. As our system of government provides no method by which the question can be raised, except in the course of a litigation in which one party relies upon the right conferred by such a statute, there are possibly many unconstitutional acts in force in the various States. A more important consideration is that a disposition on the part of the judiciary to interfere with matters properly legislative may thus be created, and lead to forced constructions by which any law which the judges believe to be bad is held obnoxious to the constitution — resulting in illogical and inconsistent decisions, and a weakening of the authority of the courts.

The Constitution provides that the judicial power of the United States shall extend to controversies "between citizens of different States." The purpose was to open the way for legislation which would provide a tribunal in which the right of a citizen of any State to pursue his legal remedies could not be denied; probably, too, to afford him a tribunal less likely to be affected by local prejudice than a State tribunal of first instance, probably a county court. It is not contended that anything further was designed, but upon this clause depends the most extensive and, except for the provision as to constitutional interpretation which we have just considered, the most important, body of Federal decisions. The tendency of the Supreme Court was at first to hold that the Federal court should administer the law of the State in which it was sitting and that while a citizen of Pennsylvania, for example, having a claim against a citizen of New York, might, if he saw fit, bring his action in the Federal, rather than in the State, court — the law to be applied would be the law of the State of New York. But this rule has been departed from in the later decisions, and while the Federal courts still hold themselves bound to follow the interpretation put upon State statutes by the State courts (unless, of course such statutes are attacked as in conflict with the Constitution of the United States), they hold themselves free to disregard the interpretation of the common law by the State courts, and the system of law built up within the State by the adjudications of its courts, and to adopt their own interpretation, and follow their own judgment. That the Federal courts are popular is shown by the fact that the most important litigation, estimated on the basis of the amount at stake is, where possible, usually brought before them, notably proceedings against corporations and especially the foreclosure of corporation mortgages where it is quite common for the trustee for the bondholders to be a corporation or individual of an other State, or where a committee of bondholders, or even a single bondholder, residing outside the State which is the domicile of the debtor corporation, is the plaintiff. This is sufficient to give jurisdiction to the Federal court.

We have therefore a most interesting condition of concurrent jurisdictions applying to every inhabitant of the United States. The Federal courts are courts of limited jurisdiction — limited to authority expressly conferred by the Constitution and laws of the United States, but once jurisdiction is established, unlimited in the scope of its exercise. Congress has prescribed that the jurisdiction shall only exist when the matter in controversy has a pecuniary value exceeding $2,000, and that actions shall be brought only in the district within which the plaintiff or the defendant resides, and has made provision for the removal from the State courts of causes which might originally have been brought in the Federal courts. Some of the States have attempted to prevent this increasing jurisdiction of the Federal courts; for example, by the passage of acts providing as a condition of a license to a foreign corporation to do business within the State, that such corporation, if sued, would not remove the cause into the Federal court. Such acts are manifestly unconstitutional, and have been so declared.

JOHN DOUGLASS BROWN,
Philadelphia.

Jurisprudence. See LAW.

Jury, twelve impartial men legally competent to act, who, under the sanction of their oaths, determine by their unanimous verdict the innocence or guilt of the accused in a criminal trial, or decide the issues of fact which are contested between plaintiff and defendant in a civil trial.

The jury is the characteristic feature of English or Common law, distinguishing it from the systems of Continental Europe derived from the law of the Roman Empire. It is peculiar in itself and incidentally it has produced characteristic developments of our law not found in the Roman or Civil law systems, of which perhaps the most noteworthy is our law of Evidence. The history of the jury system has been most thoroughly and ably investigated, especially in recent years.

Its function has completely changed. Originally those persons from the vicinity who had knowledge of the subject matter were summoned to court to state, upon their solemn oaths, what the common opinion of the neighborhood was as to those facts which formed the basis of the criminal charge to be tried, or the basis of the right to possession or enjoyment of land which was at issue, which were the typical cases of early days. It seems to have been soon established that 12 substantial men were a sufficient number to determine this question. As the judicial system developed, courts came to have more extended territorial jurisdiction, and litigation grew more extensive. Attendance of 12 persons acquainted with the facts of each cause to be tried would impose an intolerable burden upon the community, and our forefathers worked out the plan of submitting their legal controversies to the decision of an impartial jury sworn to determine the facts in issue upon testimony given under oath by witnesses summoned by the parties.

Students of English and American history would probably unanimously agree that as a part of our system of civil government the jury has been a valuable institution. There can be no doubt of its educational value, and of its importance in making each freeholder who served on a jury feel that he was individually performing an important public duty. Juries played a conspicuous part in defense of popular rights against attempts at tyrannical exercise of authority by the executive government. In the libel cases of the 18th century the contest was bitterly fought, the judges, under the lead of Lord Mansfield, maintaining that whether a document

was libellous or not libellous was a question of law for the court (that is, for the judge) to determine, the jury being limited to finding affirmatively or negatively the fact of publication; while the juries, on the other hand, contended for their right to find general verdicts ("guilty" or "not guilty"). The contest was settled by Fox's Libel Act in favor of the right of the jury to determine the guilt or innocence of the accused.

Students of law differ as to the merits of the jury system. Arguments drawn from the supposed mental inferiority of juries need not be considered, since this is not an inherent defect, and there is no more reason why a community should have inferior jurymen than inferior officials of any other class. But weighty objections of an essential character have been suggested. The chief is as to the requirement of an unanimous verdict, which, it is argued, must constantly produce a disagreement and failure to reach a conclusion, or the sacrifice of opinions conscientiously held by some of the jurors. There is no doubt that this requirement is an essential feature of the jury system as known to English law; it has been expressly so decided by the Supreme Court of the United States which, in interpreting the clause of the Federal Constitution which provides that in civil suits in the Federal courts "the right of trial by jury shall be preserved," has held that this requires the unanimous verdict of 12 men. A small number of the States have modified the system by providing for juries of less than 12, or of verdicts rendered by a vote less than unanimous. When such legislation is not in conflict with the State constitution it is lawful, as is doubtless the provision authorizing the service of women on juries.

Another objection is the doubt as to whether the jury is the best means of arriving at determinations of fact. This controversy has been bitterly fought, one side maintaining that the jury is not fitted, either by training or capacity, to decide fairly and intelligently doubtful questions of fact, and that one of its most important functions, that of assessing damages, is not properly performed, especially where the requirement of unanimity necessarily leads to compromise verdicts. On the other hand it is argued that the jury, if properly drawn, represents the average intelligence of the community, and that when it does so, no fairer tribunal can be discovered, and not, perhaps, very consistently, that in civil matters control of the case is really in the judge, who by careful instructions can usually so direct the jury as to bring about an intelligent verdict, or, as a last resort, can set aside one which is clearly wrong, and award a new trial.

A verdict of acquittal in a criminal proceeding finally disposes of the charge against the defendant both by the common law and, in this country, by the provisions of the Federal Constitution (and of most, if not all, of the State constitutions) that no person shall "be subject for the same offense to be twice put in jeopardy of life or limb." Doubtless from this arose the doctrine that in criminal cases the jury are judges both of law and fact, which caught the popular fancy, is not without the weight of respectable judicial authority to sustain it, from the time of Junius, who upheld it in opposition to Lord Mansfield, has been a favorite doctrine of popular leaders, and only in recent years may be regarded as finally disposed of. The doctrine was discussed by Chief Justice Mitchell, of Pennsylvania, in a capital case in 1891, and pronounced by him to be "unsound in every point of view, historical, logical, or technical," and in 1895 the Supreme Court of the United States (speaking by Mr. Justice Harlan) reached the same conclusion and held that in the courts of the United States it is the duty of the jury in criminal cases to receive the law from the court, and to apply it as given by the court, subject to the condition that by a general verdict a jury of necessity determines both law and fact as compounded in the issue submitted to them in the particular case. Mr. Justice Gray filed a long and able dissenting opinion concurred in by Mr. Justice Shiras, and in this case, reported in 156 United States Reports (page 51), all the arguments on both sides can be found.

The grand jury is, historically, a sort of representative committee of the people of the district throughout which the jurisdiction of the court extends, charged with the duty of reporting to the court offenses which have been committed which they consider should be inquired into, and persons whom they believe to have committed criminal acts for which they should be punished. Its development into the modern grand jury is not well understood. The highest authorities on our early legal history say of it, "The details of this process will never be known until large piles of records have been systematically perused. This task we must leave for the historian of the 14th century."

The grand jury as an existing institution consists of a number of persons drawn from the same class as the ordinary or petit jurors. At the common law the number summoned was 23. They are sworn to the faithful discharge of their duties, and the court then delivers a charge to them, calling their attention to the duties they are to perform, either generally or with reference to any matters of special public interest falling within their jurisdiction to which the court thinks proper to direct their attention, and they can then proceed to business. All indictments are submitted to them and, according as they determine, after hearing the prosecutor's evidence, whether they are well founded or not, they indorse them "true bill" or "ignoramus" (or equivalent words). In the former case the accused is held for trial, in the latter discharged. It is the custom for them to make report to the court on such matters as seem to them of public interest and importance, and to make such recommendations as seem good to them. The report made by them of any offense from their own knowledge or observation, without a bill of indictment laid before them, is called a Presentment.

For the history of the origin and development of the jury, consult: Pollock and Maitland, 'History of English Law'; Thayer, 'Preliminary Treatise on Evidence at the Common Law' (chapters ii.–iv.); Stephen, 'Commentaries on the Laws of England' (Bk. V., ch. xiv.); Stubbs, 'Constitutional History of England'; Cooley, 'Constitutional Limitations.' For a discussion of the merits of the institution under modern conditions which is generally accepted as full and impartial, consult 'The System of Trial by Jury,' by the late Mr. Justice Samuel F. Miller (21 Amer. Law Review, 859). For the origin of the grand jury: Pollock and

Maitland, 'History of English Law' (Bk. II., ch. ix., § 4). JOHN DOUGLASS BROWN,
Attorney at Law, Philadelphia.

Jusserand, Jean Adrien Antoine Jules, zhŏn ädrēăn än-twăn zhül zhü-sĕ-răn, French diplomat and author: b. Lyons 18 Feb. 1855. He was educated at the Faculté de Lyon, in 1878, entered the French ministry of foreign affairs as consul at London; subsequently held other posts in the ministry, among them that of chief of the bureau of Tunisian affairs, and that of associate sub-director of the protectorate; in 1887–90 was councillor of the French embassy in London. In 1890 he became minister to Denmark, and in 1902 ambassador to the United States. His best known work is his 'Les Anglais au Moyen Age: La Vie Nomade et les Routes d'Angleterre au 14me Siècle' (1884; trans. by Smith as 'English Wayfaring Life in the Middle Ages' 1892), which was crowned by the Académie. Of his further writings, the following have appeared in English: 'The English Novel in the Time of Shakespeare' (1890); 'A French Ambassador at the Court of Charles II.' (1892); 'Piers Plowman' (1894); 'English Essays from a French Pen' (1895); 'A Literary History of the English People,' vol. I. (1895); 'Shakespeare in France under the Ancient Régime' (1899).

Juste, Theodore, Belgian historian: b. Brussels 11 Jan. 1818; d. August 1888. He was secretary of the Belgian board of education and as such made many beneficial changes in the national methods of instruction. He was a prolific writer on Belgian and French history, the most noteworthy of his works being: 'Historie élémentaire de la Belgique' (1838); 'Histoire de la révolution Belge de 1790' (1846); 'Précis de l'histoire du moyen âge' (1847–9); 'Le soulèvement de la Hollande eu 1813, et la fondation du royaume des Pays-Bas' (1870); 'Guillaume de Taciturne' (1873); 'Léopold I. et Léopold II., rois de Belges' (1878); 'Les fondateurs de la Monarchie Belge' (27 vols., 1865–81); 'La révolution de juillet, 1830' (1883); etc.

Justice, Department of, in the United States, an executive branch of the government, the supreme head of which, the attorney-general, is appointed by the President and confirmed by the Senate. He is a member of the cabinet, according to the provisions of the Act of Congress of 19 Jan. 1886, ranking fourth, after the Vice-President, in the line of succession to the Presidency in case of a vacancy in that office, and his salary is $8,000 a year.

The office of attorney-general was established in 1789, almost at the beginning of the government, being provided for by the great act that established the federal courts, but the department of justice was not organized into a separate department nor placed under the charge of the attorney-general until 1870, when by the act of 22 June of that year, the establishment of this department brought under his control all United States district attorneys and marshals and secured uniformity in the trial and prosecution of cases. By this act the solicitors from the interior, navy and treasury departments and the examiner of claims of the state department were also brought under the control of the department of justice.

As head of the department of justice, the attorney-general is the chief law officer of the government, is the legal adviser of the President on any questions of law which may arise in the conduct of administrative affairs, and is also required by statute to give his advice and opinion, when requested, to the head of any executive department on any question of law arising in his department. The attorney-general represents the government in all cases at law to which it may be a party, but he rarely argues the case in person, this work being performed by his subordinates, whom he appoints, or by special counsel whom he is authorized to employ in cases of especial importance to the government. The attorney-general passes upon the validity of the title to public lands or other property to be purchased by the government for the erection of public buildings or for other public purposes; he also exercises general superintendence and direction over the attorneys and marshals of all the districts in the United States and the Territories as to the manner of discharging their respective duties. The supervision of the penal and reformatory institutions of the United States, the supervision of the revision and codification of the criminal and penal laws, the recommendation of judicial appointments, the administration of the national bankruptcy laws, etc., are other duties which come under the direction of the department of justice.

The solicitor-general, whose office was created in 1870, ranks as second officer of the department of justice; takes the place of the attorney-general in the latter's absence, and also has charge of the conduct of cases in the courts at Washington.

Justice, Lord, a person invested with royal authority in England for a short time, during the absence of the monarch. Queen Victoria and her successor Edward VII. have never appointed lord justices in their absence; George IV. was the last king of England to do so. The powers of lord justices have been confined to pardoning or reprieving convicts, summoning or proroguing parliament, disposing of treasury funds, and making church preferments. In the absence of the viceroy from Ireland lord justices have sometimes been appointed to perform his functions.

Justice of the Peace. See COURT.

Justification. Under this head fall many intricate problems toward the solution of which theology contributes in its discussions of that very abstract subject: Grace. The term explains itself and no matter where it is applied the fundamental idea is the same and means pardon, acquittal, readjustment, restoration. In divinity it alines itself very closely with atonement and imputation (q.v.). No matter how opinions may differ as to its nature, there is agreement on this, that justification may be defined as that process whereby fallen man is forgiven his transgression and restored as much as is compatible with his changed condition to the state and privileges which were his before his disobedience. All Christians admit that this repristination came and comes through Christ. It has been and is the duelling ground of the two religions which have most largely divided the world. Relating to this topic the attitude

of Catholics and Reformers is antipodal. The leader of Protestantism is clear in his affirmation. Catholic teaching and dogmatic enunciation is not one whit less positive. The question is cardinal for both. In the process of justification the agent is God through Christ; the object, man. The crux of the difficulty is how does God effect it and how is man affected by it. Is righteousness imparted or infused? Luther and his disciples consider justification as imputed to the individual. This restored condition is something outside himself, with which he has nothing to do. "The justified man is not only acquitted as innocent but regarded as having perfectly obeyed the Law in the person of Christ. There is to him the non-imputation of sin and the imputation of righteousness." "The faith doth not shut out repentance, hope and the fear of God in every man justified, but it shutteth them out from the office of justifying." (Church of Eng. Homily.) It becomes imperative for every attempt to solve this problem to consider man's will and divine grace. Luther apprehensive lest by any concession he might minimize the value of the latter denied free will in human nature and asserted that by faith, a strong faith in the special mercy of God and by that alone man was justified. To use his own words (Cap. 2 ad Galat.): "Faith, without and antecedently to charity, justifies." Faith does not cause justice in any way — it is not the cause but the organ of justification. Man is in no way intrinsically affected by it and its essence is in the imputation of the justice of Christ. Calvin referring everything to the elect teaches that faith once received can never be lost, that is, a man justified is so forever, independently of his actions. Baptism is not necessary for salvation. The predestination of the elect is their salvation. The breaking up of Protestantism into the many denominations which now exist, necessarily brought variants in this doctrine, yet it may be put down as the generally accepted formula. The idea was not new if we are to credit what Saint Augustine says (De fide et oper. 14) wherein he remarks that even in the time of the apostles some, not understanding, concluded from the epistles of Saint Paul that faith alone was necessary for salvation, whereupon Peter, James and Jude wrote to instruct the faithful that such was not the meaning of Saint Paul's words. The Catholic theology has been reproached with emphasizing the worth of man's works to the detriment of divine grace. The doctrine of Catholics is that the Pope, councils, the fathers, the doctors and the apostles, and hence Christ, affirmed that justification is of a nature to require, except in infant baptism, good works on the part of man to ripen unto salvation. Faith alone will not suffice. It is gratuitous and unmerited save through Christ. It is supernatural. It is a created gift and when bestowed, as in justification, the recipient becomes inherently just, not accidentally nor vicariously. Initial justification is infused in baptism, which sacrament incorporates the one baptized into and with the mystical body of Christ, his church, and lives by grace, which is living of the life of Christ as an engrafted branch lives the life of the vine. In this incorporation, since Christ is Son of God, is founded the adoption and heirship of the baptized as sons of God. What is said of baptism is held concerning justification as administered by the other sacraments. It is not contended that by it sin is blotted out "historically," that is, sins committed do not cease to be part of man's past, but are remitted in as much as they are provocative of God's anger and as truly pardoned as if the sinner had never rendered himself guilty of them; they are effaced in the moral order and in the physical order the stains they leave on the soul are washed out, stains which make the soul displeasing to God. Natural powers, no more than the Mosiac law, suffice for salvation which is to be reached through Christ only and for which in the adult some disposition of his own contributing is requisite. Moreover, while by justification sin is remitted, this remission calls for an interior disposition and renovation of soul, whence justification is a quality superadded to the soul to which it is inherent and therefore is more than transference or imputation. The fruits of justification are the rendering of man pleasing to God, just, beautiful, like unto Christ, a living member of Christ and God's son by adoption, heir to the kingdom of heaven, a participant in the divine nature (*consors divinæ naturæ*) and capable of condign merit. When a man is justified there is within him a special indwelling of the Holy Spirit. There is no understanding with accuracy these different theories of justification save by a thorough inquiry into the views of theologians on the very abstruse questions of the incarnation and grace.

P. A. HALPIN,
Saint Thomas' Rectory, New York.

Jus'tin I., Byzantine emperor: b. 450; d. 1 Aug. 527. He was a peasant of Dacia and rose from the rank of a common soldier to be commander of the imperial guard, and on the death of Anastasius I. in 518 became emperor. He relegated the civil administration to the quæstor Proclus, and between them the empire was governed with a fair amount of success. Consult Bury, 'Later Roman Empire' (1889).

Justin II., Byzantine emperor: d. 5 Aug. 578. He succeeded his uncle Justinian I. in 565. Beset with enemies outside the empire and harassed with internal discord, he in 574 solved his difficulties by abdicating in favor of Tiberius, captain of the guard. During his reign northern Italy was conquered by the Lombards, and the Persians took possession of several Asiatic provinces of the empire.

Justin (MARCUS JUSTINIANUS JUSTINUS), a Latin historian, who probably lived at Rome in the 2d or 3d century A.D. He made an epitome of the general history of antiquity by Trogus Pompeius, a native of Gaul, who lived in the time of Augustus, and whose work is no longer extant. This epitome, although incorrect in detail, is valuable for its compressed reproduction of the old histories. The first English version, by Goldingé, appeared in 1574.

Justin Martyr (JUSTINUS MARTYR), a Christian apologist and martyr: b. Flavia Neapolis, Shechem, Palestine, 100 A.D.; d. Rome 165. He began active life as a professor of Platonic philosophy, and subsequently embraced Christianity without abandoning Platonism. He was a staunch adherent of the Christian party in the empire, a keen confuter of Gnosticism, and an unwearied defender of the Christian doctrine of the Logos. In every department of Christian dogmas he stood foremost as a teacher. Eventually he went to Rome (150 A.D.) and during ten years of activity he wrote his 'Apology,' with a supplement known as the 'Second Apology,' addressed to the Emperor Marcus Aurelius. He afterward had a controversy with a Jew, an account of which is embodied in his 'Dialogue with Trypho the Jew.' He was put to death for his faith, and his day on the Church calendar is 31 April. Consult: Migne, 'Patrologia'; Semisch, 'Justinus der Märtyrer'; Aubé, 'Justin, Philosophe et Martyr' (1874).

Justin'ian I. (FLAVIUS ANICIUS JUSTINIANUS), surnamed the GREAT, emperor of the East: b. of Gothic peasant parentage at Tauresium, Illyricum, probably 11 May 483 A.D.; d. 14 Nov. 565. Patronized by his uncle, Justin I., who, from a Thracian peasant, had become emperor, he so flattered the senate and dazzled the people that he was made consul, and took the title of *Nobilissimus*. On the death of his uncle, with whom he had latterly shared the imperial power, he was proclaimed emperor, and married an actress named Theodora. During his reign the party disputes of the Greens and the Blues became so violent, that in his attempt to quell the tumults the emperor's own life was in jeopardy, and a great part of Constantinople was destroyed by fire. Aided by his generals, he was able subsequently to restore to the Roman empire a part of its former possessions, as when Belisarius in 523 and 529 defeated the Persians, and achieved victories in Africa, and when Narses put an end to the Ostrogoth rule in Italy. Turning his attention to the laws, Justinian commissioned ten learned civilians to draw up a new code, and the result was the 'Corpus Juris Civilis,' or body of civil law. He took great interest in building cities, fortifications, and churches; among the latter he rebuilt the church of St. Sophia at Constantinople. To maintain his public munificence he oppressed the people with taxes. Consult Finlay 'History of Greece' (1880); Hodgkin, 'Italy and her Invaders,' Vol. IV. (1880); Bury, 'Later Roman Empire' (1889); Hutton, 'The Church in the Sixth Century' (1897); Gibbon, 'Decline and Fall of the Roman Empire' (ed. by Bury 1896–1900).

Justinian II., surnamed RHINOTMETUS, Byzantine emperor: b. 669; d. December 711. He succeeded his father, Constantine IV., in 685, and was deposed and banished for his cruelty, by his general, Leontius in 695. He regained his throne ten years afterward, and was overthrown by Philippicus Bardens and killed.

Jute. Two species of plants yield the jute of commerce, *Corchorus capsularis* and *C. olitorius*. They are tall shrubs, 8 to 15 feet high, the fibre being produced in the bark, and known as bast fibre. Supposed to be indigenous to India, where the species grows wild, cultivated to a limited extent by other Eastern people, as the Chinese and Malays, *C. olitorius* is naturalized in all parts of the tropics to the shores of the Mediterranean. Jute was introduced into the United States by the Department of Agriculture in 1870 (see various articles in Monthly Reports of this department 1870–5), and was found to be adapted to cultivation along the line of Gulf States from Texas to South Carolina. It should be noted that the China jute of commerce is not jute at all, but a similar bast fibre derived from *Abutilon avicennæ*. This plant was experimented with in New Jersey 25 years ago, though unsuccessfully, the fibre being wrongly called American jute. In India many kinds of jute are recognized, all being known under local trade names, which are unimportant here. The value of jute as a textile lies wholly in its fineness, silkiness and adaptability to spinning, low cost of the raw material being another advantage. Several American fibre plants classed as weeds yield a better, whiter, and stronger fibre, though they cannot be utilized for economic reasons. (See special report on bast fibres, No. 6, Office of Fibre Investigations of the Department of Agriculture.) The fibre of jute, compared with other textiles, is quite inferior, the bleached filasse soon losing its whiteness and becoming a dingy, dirty brown, while its strength rapidly deteriorates. Nevertheless it may be regarded as one of our most useful fibres — too useful in certain directions, as its fineness and lustre, as well as cheapness, adapt it most readily to purposes of adulteration, and as it takes colors easily it can be stained or dyed to imitate many of the other fibres, though such frauds can be readily detected. The uses of the fibre are many, and it enters into all classes of textiles from woven fabrics of great beauty to coarse ropes and bagging. In the manufacture of fabrics it goes into curtains, chair coverings, and other forms of upholstery, carpets, webbing, burlap and bagging (especially cotton bagging), and it has been employed for imitation silk fabrics, although for this purpose the fibre requires a special treatment in order to subdivide it more finely and render it more glossy. The fibre is also made into all kinds of cordage, either honestly, as jute, or as an adulterant, considerable quantities having been used in past time for the manufacture of binding twine. It is largely employed for fine and coarse twines, small rope, sash cords, etc., and where cheapness is a desideration it fills the demand. During the fiscal year ending 30 June 1902 we consumed 131,192 tons of jute and jute butts, costing $4,480,000. The jute was worth $48, and the jute butts $24 per ton. The commercial use of jute dates back less than a century, the first exports in noticeable quantity (about 18 tons) having been made, to England, in 1828. By 1850 the exports had reached 30,000 tons; in 1871, 310,000 tons. Now some 800,000 acres are cultivated in jute, more than half of this area comprising nine districts of northern Bengal. Both high and low lands are employed for this culture, although the larger part of the crop is produced upon the "churs" or lands of recent alluvial formation along the rivers. In this country the "river bottoms" would be favorable for the culture, in localities of the South, where the requisite conditions of heat and moisture prevail.

Twelve to fifteen pounds of seed is the average quantity sown per acre, though Spon gives nearly double this amount. In India the yield is

about 400 pounds of fibre per acre. Little or no cultivation is given the crop save thinning out where overcrowded. The plants mature in three months and the crop is harvested with a bill hook or sickle at the time when the flowers have begun to show and the seed has not yet appeared. If the plants are allowed to seed, the fibre will be stronger and heavier, but harsher. In some districts, after harvesting the stalks are stacked in the field, until the leaves drop off, while in other localities stacking is not practised. The stalks are sorted as to length into three sizes, and made into bundles that one man can carry. The extraction of the fibre is accomplished by steeping the bundles in stagnant water, covering them with jungle plants, clods of earth or cow dung. When the setting is completed the ryots go into the water waist deep, and by thrashing the surface of the water with the stalks, assisting the loosening of the bark with the fingers, the fibre is separated from the wood. Afterward it is wrung out and hung upon lines to dry. Little may be said regarding jute culture in this country. Machinery would need to be used for stripping the fibre, and there are no practical machines; furthermore at the low prices which prevail for the imported jute, it is doubtful if it could be made a paying crop. The plant is adapted to cultivation in the United States and produces a superb fibre, but it would not be able to compete with India jute at 1½ to 2½ cents per pound. See Special Report (No. 8) office of Fibre Investigations of the Department of Agriculture; 'Dictionary of the Economic Products of India' and various Bulletins of the Royal Gardens, Kew, England. See CORDAGE; CORDAGE INDUSTRIES; FIBRE; INDIA.

CHAS. RICHARDS DODGE,
Commercial Fibre Expert, Washington, D. C.

Jutiapa, hoo-te-ä'pä, Guatemala, a department bounded on the north by Jalapa and Chiquimula; on the south by the Pacific Ocean; on the southeast by Salvador; on the west by Santa Rosa. It has an area of 1,563 square miles. The principal industries of the department are cattle-raising and the cultivation of coffee. Sugar, tobacco, and fruits are also grown. Capital, Jutiapa. Pop. about 50,000.

Jut'land, the peninsular portion of Denmark (q.v).

Juvenal (DECIMUS JUNIUS JUVENALIS), a famous Roman satirist. The evidence for his life, while fairly abundant, is of so dubious and conflicting a character that it is impossible to reconstruct the poet's career with any certainty. It is probable, however, that he was born at Aquinum, about 60 A.D., and that he was known, during the first half of his life, simply as an accomplished declaimer and rhetorician. After the accession of Trajan in 98, he began to publish satires in which, with extraordinary force and indignation, he described the conditions of life at Rome, for the most part as they existed during the reign of Domitian, 81–96. An inscription found at Aquinum records an offering to Ceres by a certain Junius Juvenalis (the stone was broken, so that the first name is lacking), tribune of the first cohort of Dalmatians, *duumvir quinquennalis* of the town, and priest of the deified Vespasian. This man has been generally identified with the poet (cf. *Sat.* 3, 319–320), but may be only a kinsman of his. There is a consistent tradition that he was banished for a number of years because of offense given to an imperial favorite, the actor Paris, but neither the time nor place can now be determined. He was apparently an intimate friend of Martial (who mentions him in three epigrams, VII. 24 and 91; XII. 18), though the two men were widely different in their outlook upon human life. The date of Juvenal's death is not known, but the fifth and last book of satires, comprising 13–16, was published in 128, and he may have lived seven or eight years thereafter.

In the hands of Juvenal, satire becomes almost a new literary type. Horace, who brought to perfection the method and manner of Lucilius, the first of the Roman satirists, says of his art (*Sat.* 1, 10, 9–14) that it aims at terseness, at a style that changes from grave to gay, that suggests now an orator who is a poet also, now a polished and witty talker who masks his strength. But Juvenal's passionate revolt against the hideousness of a time of which he could see only the dark side, gives to his verse one unchanging tone. For him satire is invective, biting, pitiless, and unrestrained, the expression of a towering moral indignation. Such humor as there is is always grotesque or of the grimmest kind. This is true, at least, of the first nine poems, which alone are really satires upon the Roman life that he knew. The remaining seven (the sixteenth is, of course, a mere fragment) are rather moral essays of a general character. He is, however, singularly deficient in power to discriminate. Mere offenses against good taste are classed with atrocious crimes: "Orestes (unlike Nero) did not mix poison for any of his relatives; he never sang upon the stage; he did not write an epic upon the Fall of Troy" (*Sat.* 8, 219–221). Such passages (and they are numerous) have raised at times the question of Juvenal's sincerity. But this should not be doubted. He was, on the one hand, swayed by the intense and narrow prejudices of a Roman of the old school; on the other, his long rhetorical training had developed to the utmost an inborn capacity and love for epigrammatic phrase. The possession of this power, while it sometimes led him astray, is one of his just claims to greatness. No Roman writer lends himself more admirably to effective quotation, none can describe a scene with more graphic realism.

The best text is the Jahn-Bücheler (Berlin 1893). There are excellent editions by J. D. Lewis, with a translation (2d ed. New York 1882), J. E. B. Mayor (London, Vol. I., 4th ed., 1889; Vol. II., 3d. ed., 1881); Pearson and Strong (Oxford 1892); L. Friedländer (Leipsic 1895); J. D. Duff (Cambridge 1900); H. L. Wilson (New York 1903). Dryden translated five of the satires. There is a spirited verse translation by Gifford (London 1817); and good prose translations by Strong and Leeper (New York 1882), and S. G. Owen (London 1903). Dr. Samuel Johnson's paraphrases of the third and tenth satires in his 'London' and 'The Vanity of Human Wishes' are deservedly as famous as the originals. See also J. Dürr, 'Das Leben Juvenals' (Ulm 1888); C. Martha, 'Les Moralistes sous l'Empire Romain' (Paris 1865); G. Boissier, 'La Religion Romaine' (Paris 1884), and 'L'Opposition sous les Césars' (Paris 1892).

NELSON G. MCCREA,
Professor of Latin, Columbia University.

Juvenile Offenders. In the United States the law with regard to juvenile offenders varies in the different States. The number of reform schools reported in 1900 was 82; instructors employed 578; pupils attending school, 22,692, and 14,673 in industrial departments. The total number of inmates was 24,925. The value of grounds and buildings was $18,873,587. The expenditures on buildings and grounds amounted to $605,010; for salaries and other expenses, $2,800,281, making a total expenditure of $3,405,291. The number of assistants, not including instructors in school departments, was 1,788. There were 16,609 white inmates and 2,784 colored inmates; 8,514 were of native parents, and 4,122 of foreign-born parents. Those that could only read when admitted were 2,207 and 1,595 could neither read nor write. The number committed to the institutions during the year was 11,676 and the number discharged 11,990. When discharged from the schools many of the pupils possessed a trade and were provided with good homes; all could read and write; the majority had received the equivalent of a common school education.

In Great Britain, in the eye of the law persons are considered capable of committing crime at the age of 7, and are punishable like other persons. But in England and Ireland, whenever a person under the age of 16 is convicted and sentenced to be imprisoned, the court or magistrates may also sentence him to be sent to a reformatory school for not less than two or more than five years. Such sentence, however, cannot be passed on an offender under 10 years of age, unless his offense is by law punishable with penal servitude or imprisonment, or unless the sentence come from a superior court, such as a court of assize or of quarter sessions. Children who have not yet committed crime, but are in a vagrant and neglected state, may also be sent to an industrial school.

Jux'on, William, English prelate, archbishop of Canterbury: b. Chichester, Sussex, 1582; d. London 4 June 1663. He was educated at Oxford, took orders and after holding church livings (in 1609 at Oxford, and then in 1614 at Somerton), in 1621 succeeded Laud as president of St. John's College. In 1627 he was appointed vice-chancellor of the university, and about the same time chaplain in ordinary to Charles I., who gave him the deanery of Worcester, and then the bishopric of London (1633). He attended the king on the scaffold. His fidelity cost him his bishopric, but at the Restoration he was made archbishop of Canterbury.

K

K the eleventh letter in the English and other alphabets of the modern languages of western Europe.

The character is derived, through the Greek, from the alphabet of the early Phœnicians, where its form is that of K reversed, ⋊. The k represents the sound produced when the back of the tongue is brought into contact with the palate and the breath expelled. The sound-value of k is the same in all languages; but k is not employed in the modern Latin languages save in spelling foreign words or names. Nor does it occur in Latin save as an abbreviation (K or Kal.) for Kalendæ, K for the name Cæso, or for Carthago, etc.

In English the c of the Latin orthography of words from the Greek is always retained, even when it represents the sound of k, for example, sceptic, pronounced skeptic; and we are beginning to pronounce ceramic keramic. We even substitute c for k in Greek words and names, though in reading Greek we give to the k always its hard guttural sound: hence for us Alkibiades is (in sound) alsibiades, and even Kimon is simon.

The k in Greek names suffers a similar change in the modern Latin languages; but in German speech the true k sound in such names is retained: Ankyra, not ansyra, Korkyra, not corsyra; Kephalos, not sephalos.

In Anglo-Saxon and in Gaelic the k is always represented by c.

The guttural sound of k seems to have stood unchanged in ancient Greek and Latin, whether represented by that letter or by c; but in the modern languages derived from the Latin the k sound underwent great changes, becoming a sibilant equal to s, as "sezar" for Cæsar, or being "palatized" into the sound tsh, for example, Gr. kyriake, Ger. kirche, Scotch kirk, Eng. church; to produce this change the middle of the tongue, instead of the back of it, is brought into contact with the palate; in French pronunciation the k-sound of c in Latin words, as camera, carbo, carnalis, is changed to sh, and the words are written chambre, charbon, charnel.

Kaaba kä'bă, or kā'ą-bą. See CAABA.

Kabbala, kăb'ą-lą. See CABALA.

Käbul, kä-bool', or **Cabool,** Afghanistan, capital of the country and of the province of Kabul, situated at the west extremity of a spacious plain, in an angle formed by the approach of two ranges of hills, and (with the exception of a suburb) on the right bank of the Kabul River, which is spanned, in or near the city, by several bridges. It stands at the height of about 6,000 feet above the sea-level, and has a delightful climate in summer, but the winter is severe. The houses are in general slightly built of mud and unburnt bricks, and there are no public buildings of any importance, though many of the mosques are spacious and commodious. Kabul is now becoming an important centre of trade with India and central Asia, and its population is greatly increased in the summer season by the influx of traders and others. Estimated pop. 75,000.

Kabyles, ką-bīlz'. See BERBERS.

Kadi, kā'dĭ or kä'dĭ. See CADI.

Kadiak, käd-yăk', an island of Alaska, situated southeast of the peninsula of that Territory. It is about 100 miles long and 60 miles wide, has a rocky mountainous surface, and an irregular, deeply indented coast, with some good harbors. Near the coast the soil is somewhat fertile, but little of it is profitable for agricultural purposes. The interior is mostly covered with low forests of pine and other trees. Bears and foxes are common, but other fur-bearing animals have become comparatively rare. The salmon-fisheries afford the inhabitants their chief occupation. Pop. about 2,000.

Kadiak Bears. See BEARS.

Kaffa, käf'fä. See FEODOSIA.

Kafir-bread, käf'ẽr-brĕd, the edible spongy pith of the stems and cones of any of several species of cycads (q.v.) growing in South Africa, especially *Encephalartos caffer.* This substance resembles sago in its farinaceous character.

Kafir-corn, Indian millet (*Sorghum vulgare*) extensively cultivated by the half-civilized negroes of south-central Africa. It is called kaoliang by the Chinese. See GRASSES; MILLET.

Kafiristan, kä-fē-rĭs-tän′ (Persian, "land of the infidels"), a region of central Asia northeast of Afghanistan, on the south slope of the Hindu Kush, and having as its southern boundary the Kabul River. Formerly the name was vaguely given to a much greater territory; it is now restricted to a country with an area of about 5,000 square miles, nominally under the government of the Amir of Afghanistan, but virtually belonging to an independent people. In the northern portion, which is mountainous, the surface is rugged and broken; in the south the land is mostly level or moderately undulating. Much of the soil has a high degree of fertility, and is adapted, especially in the valleys, to the cultivation of fruits and cereals of various kinds. Grapes are largely produced, from which is made an excellent wine. The number of the inhabitants is estimated at 200,000. They are said to be skilful workers in wood and metals, but their main pursuits are agricultural and those pertaining to the herding of cattle, sheep, and goats. In many of their traits — in features, complexion, beliefs, manners, and customs — they differ much from neighboring tribes, appearing to be of Aryan extraction, and they claim descent from soldiers of Alexander the Great. They are not without dissensions in the various tribal divisions in which they exist, but their isolation in a region of natural strength has enabled them to maintain a kind of political unity despite internal discords, as well as to preserve their independence against the invasions of other tribes. They have no literature, and in their language appear mingled traits of the Indo-Iranian dialects in their Iranian and Indian divisions. In religion they have largely withstood Mohammedan influences and preserved many of their tribal forms. Consult: Biddulph, 'Tribes of the Hindu Kush' (1880); Leitner, 'Kafiristan' (1881); McNair, 'A Visit to Kafiristan' (Proc. Royal Geog. Soc. 1884); Robertson, 'Kafirs of the Hindu Kush' (1896).

Kafirs, kaf′ĕrz, **Kaffirs, Kaffres,** or **Caffres** (from Arabic *Kafir*, infidel or unbeliever), the principal race inhabiting southeastern Africa, a branch of the great Bantu family. The name is now chiefly restricted to the tribes occupying the coast districts between Cape Colony and Delagoa Bay. They differ from the negroes in the shape of the head, it being more like that of Europeans; in the high nose, frizzled hair, and brown complexion, which becomes lighter in shade in the tribes of the more southern districts. They are a tall, muscular race, the average height being from 5 feet 9 inches to 5 feet 11 inches, and frugal and simple in their habits. Their chief occupation is raising and tending cattle, and hunting; garden and field work is mainly performed by women. They are of a peaceful disposition, but in times of war they display considerable bravery, tactical skill, and dexterity in the handling of their assagais or spears, shields, and clubs, as has been shown in their engagements with the British forces. There are several distinct branches or families of Kafirs, but the tribes which recent events have specially brought to the front are the Pondos, the Fingoes, the Zulus, and the Swazi. Kafirs, especially of the Zulu tribe, are distributed in large numbers over Natal and Cape Colony, and have become to some extent civilized. Frequent hostilities have taken place between the British and one or other of the Kafir tribes, beginning almost with the first acquisition by Britain of the Cape Colony.

Kagoshima, Japan, a city in the island of Kiushiu, capital of Satsuma province, and of the prefectural ken of the same name, on the northwest shore of Kagoshima Bay. The town is well built and is an important industrial centre with a considerable export trade. The celebrated Satsuma porcelain is manufactured in suburban Tanoura. Kagoshima was the feudal seat of the powerful Shimadzu daimios, and in 1863 was bombarded and destroyed by the British owing to the murder of an Englishman; the reigning daimio refusing satisfaction. Here in 1877 Saigo (q.v.) set up the standard of rebellion, and here also he was overwhelmingly defeated a few months later. Pop. (1898) 53,481.

Kagu, kä′goo, the native name of the remarkable bird (*Rhinochetus jubatus*) peculiar to New Caledonia, where it was discovered only in 1860, and is now rapidly disappearing. It is the only species of a distinct family most nearly related to the sun-bitterns. The kagu is about the size of a domestic fowl, with short wings, rather long legs, a ralliform beak, and a long crest. When the wings are folded, the colors are mottled gray, the wings and tail barred with a darker shade; but when they are spread, the wings are seen to be barred and spotted with white and black arranged in a conspicuous pattern. The kagu is noteworthy for the extraordinary dances and antics which it performs.

Kaguan, kä-goo-ăn′. See COLUGO.

Kahn, Julius, American politician: b. Kuppenheim, Baden, 28 Feb. 1861. Removing with his parents to California in 1866, he was educated in the public schools of San Francisco, and for ten years followed the theatrical profession. It failed to satisfy his ambition, however, and in 1890 he returned to San Francisco, where he studied law. In 1892 he was elected to the legislature of California, being admitted to the bar in 1894. He was elected to the 56th and re-elected to the 57th Congress as representative from the 4th district of California. He has championed with much energy the anti-Chinese bill and is regarded as one of the leaders of the movement to prohibit Chinese immigration to the United States.

Kahoka, kä-hō′kạ, Mo., city and county-seat of Clark County, on the Keokuk & W. railroad, 20 miles west of Keokuk, Iowa. It is an important shipping point for a large farming and stock-raising region and there are numerous grain elevators, besides flour-mills, brick yards, and fruit canning establishments. The city is governed by a mayor and council elected biennially. Pop. (1890) 1,425; (1900) 1,818.

Kai-fung, kī-fŭng′, or **K'ai-Feng-Fu,** China, a walled city, capital of the province of Ho-nan, 450 miles southwest of Peking, and 11 miles distant from the Ho-ang-ho, or Yellow River. It was the capital city of China from 960 to 1129 and was then known as Pien-liang. The city has been visited 14 times by flood, 9 times by earthquake, and 6 times by fire. Kai-fung is a station on the New Hankow-Peking

railway. It has a large commercial trade with the interior. Pop. about 150,000.

Kai-ping, kī-ping′, China, town in the province of Pe-chi-li, 80 miles north of Tien-Tsin. It is the centre of a large coal field, over 9,000 persons being employed in the mines. The output is over 800,000 tons annually. A branch railroad connects Kai-ping with the Trans-Siberian Railway.

Kaietur (kä-ę-toor′) **Fall,** a famous waterfall in British Guiana, on the Potaro River, a tributary of the Essequibo. It was discovered in 1870. Its total height is over 800 feet, and the sheer descent of the water 741 feet, the width of the hard rock over which it plunges being 370 feet. The water has worn a great cavern in the softer underlying layers, and against the dark background thus formed the whiteness of the spray is contrasted with magical effects. The scenery about this great waterfall enhances its beauty and grandeur.

Kailas, kī′läs, the highest summit of the Gangri Mountains in Tibet, between the sources of the Indus and the Brahmaputra, having an altitude of over 20,000 feet. It is a sacred mountain of the Hindus, who formerly regarded it as the abode of their gods.

Kain, John Joseph, American Roman Catholic archbishop: b. Martinsburg, W. Va., 31 May 1841; d. Baltimore 13 Oct. 1903. Educated at St. Mary's Seminary he was ordained priest in 1860 and was for several years stationed at Harpers Ferry, W. Va. In 1875 he was consecrated bishop of Wheeling, and in 1893 he was appointed titular archbishop of Oxyrychia as coadjutor to Archbishop Kenrick of St. Louis, succeeding to the archbishopric of St. Louis on the death of Archbishop Kenrick in 1895. Owing to failing health Bishop Glennon of Kansas City was made coadjutor in 1902, and succeeded him.

Kairwan, kīr-wän′, Tunis, a town 80 miles southeast of Tunis the capital, situated in a barren, sandy plain, and surrounded by a wall; founded about 670. It is connected by rail with Tunis and with the port of Susa, 30 miles distant. It ranks next to Tunis in population and trade, and is one of the holy Mohammedan towns; it was formerly almost inaccessible to Christians. Under the administration of the French, by whom it was taken in 1881, many modern improvements have been made, among which not the least important is a good water-supply. It has a variety of useful manufactures, including morocco, carpets, copper utensils, saltpeter, etc. Kairwan was the first seat of Saracenic empire in Barbary, and still has many fine relics of its ancient grandeur in the fragments of beautiful architecture which abound there, besides a number of interesting mosques, one of them being of great magnificence. Pop. (1900) about 27,000.

Kaiser, kī′zẽr, a title, the German equivalent for emperor. The Romans added the name of Cæsar to their own kings in honor of the "divine Julius," and this passed to Kaiser in the 10th century. When the Holy Roman Empire was dissolved the imperial title was retained by the House of Hapsburg, the head of which since 1804 has borne the title of Emperor (Kaiser) of Austria.

Kaiser-Franzensbad. See FRANZENSBAD.

Kaiser Wilhelm Land. See NEW GUINEA.

Ka′ka, a large, slow-flying, brownish parrot (*Nestor meridionalis*) of New Zealand, which inhabits forests, where it goes about in noisy flocks, and nests in hollows of trees. Its food is miscellaneous, but consists principally of nectarous flowers and of the grubs hiding under bark, which it tears away by its powerful hawk-like beak. A near relative is the Kea (q.v.); and other species on New Zealand, Norfolk and neighboring islands have become wholly extinct since the occupation of those islands.

Kakabek′a Falls, a cataract of the Kaministiquia River, Ontario, Canada, 14 miles west of Port Arthur. The falls, which are noted for their picturesqueness, have a height of 130 feet, and their width is about 450 feet.

Kak′apo, the Maori name of a large ground-keeping, owl-like parrot (*Strigops habroptilus*), which is now nearly extinct, owing to its inability to withstand the dogs, cats, rats, etc., introduced by civilization, in addition to which its flesh is good to eat. Its terrestrial habits have led to such a reduction of the wing-muscles that the keel has nearly disappeared from the sternum and the bird is practically flightless.

Kak′ar, a sportsman's name for a muntjac (q.v.).

Kakarali, kăk-ą-răl′ĭ, a South American tree (*Lecythis ollaria*), whose timber is much used in British Guiana for piling and structures exposed to salt water, since it endures well, and resists the boring of shipworms and the attacks of barnacles. The Indians beat its bark until it separates into thin layers convenient for use.

Kalahari (kä-lä-hä′rē) **Desert,** a region of South Africa, extending from the Orange River to Lake Ngami, and from lon. 26° E. nearly to the west coast; partly in British, partly in German territory; called a desert because it contains little water; but besides grass and creeping plants there are large growths of bushes, and also trees; great herds of antelopes roam over its plains; and on the game thus provided, as well as on the vegetable products, particularly water-melons and large tubers, a great number of Bushmen and Bakalahari subsist. The Kalahari is remarkably flat, and is intersected in different parts by the beds of ancient rivers. The soil is in general a light-colored soft sand, but in the ancient river-beds there is a good deal of alluvium, which, when baked hard, is so retentive that in some cases pools formed by the rain contain water for several months.

Recent studies have brought to light very interesting facts regarding the limestone basins of this region, peculiar formations, in which can be traced the influence of higher animal life on the shape of the earth's surface. These crater-like depressions served as watering-places for the large wild animals, and the crowding of great herds to these places, to drink and bathe, changed them from simple depressions to the walled basins which they now are, elephants and other animals, by rolling in the mud and rubbing against the walls, giving to the hollows their depth — sometimes 20 to 30 feet — and a diameter commonly of several hundred yards. The water in these basins contained lime carbonate in solution, and with the water drunk by the animals this carbonate disappeared, and the

fresh spring-water absorbed another supply from the rock, thus deepening the depression. Scientists estimate that 600 to 800 years may have passed before the natural water-pools became basins. It is surmised that similar depressions in calcareous districts of the American prairies are due, in the same way, to the enormous herds of bisons which formerly inhabited them.

Kalakaua (kăl-ą-kow'ą) I., **David,** king of Hawaii: b. 16 Nov. 1836; d. San Francisco, Cal., 30 Jan. 1891. He was the son of Kepaakea and Keohokalole, the niece of Kamehameha I., and was elected, 12 Feb. 1874, to succeed Lunalilo, and reigned till his death. In 1887 he was compelled to grant a new constitution, which very greatly restricted the royal authority.

Kalamazoo, kăl-ą-mą-zoo', Mich., city, railway centre and county-seat of Kalamazoo County; on the Kalamazoo River, and on the Michigan C., the Lake Shore & M. S., the Kalamazoo & S. H., the Grand Rapids & I., and the Chicago, K. & S. railways; 143 miles west of Detroit, 60 miles southwest of Lansing, and 45 miles south of Grand Rapids. It is in a rich agricultural region, the chief products of which are celery, fruit, and grains. Unlike the average city in western Michigan, Kalamazoo never was a lumber town. Located in the midst of a broad area of prairie land and oak openings, it was from the beginning an agricultural centre, with fresh-water, inland lakes in all directions and with the Kalamazoo River flowing along its eastern portion.

Industries. — Few cities of the United States of a corresponding population show such a diversity of industrial occupations. In 1904 there were 157 factories employing 6,499 persons, and representing an investment of $9,617,880. The chief manufactures of the city are paper, patent medicines, women's clothing, playing cards, wagons and carriages, machinery, caskets, coffins, foundry products, windmills, furniture, and flour. The nine paper mills employ more than 2,000 workers; the card factory, 900; the regalia and clothing factories, 1,000. The celery-raising industry, by which Kalamazoo is perhaps best known, employs more than 700 skilled workmen, chiefly from Holland, and represents an annual output valued at nearly $2,000,000.

Banks, Commerce, etc. — The seven national and savings banks reported in 1904: $650,000, capital; $539,367, surplus; $5,169,032, loans, discounts, and stocks; and $5,485,828, deposits. The total bank clearings were $35,450,000. The freight shipped and received in 1904 aggregated 325,342 tons. The total postal receipts were $534,354.

Institutions, etc. — Some of the prominent public institutions are the Kalamazoo College, opened in 1855 under the auspices of the Baptist Church; the Michigan Female Seminary, founded in 1886 under the auspices of the Presbyterian Church; Nazareth Academy (R. C.), one Normal School, Borgess and Queen City hospitals, Saint Anthony's School for feeble-minded children, Michigan Asylum for the Insane, Academy of Music, and the public library. Other prominent buildings are the Y. M. C. A., the City Hall, several fine churches, and the high school. The streets are well paved, and the electric light plant and waterworks owned and operated by the city.

Government, History and Population. — The government is vested in a mayor, public commissioners, and a council of nine members, elected annually. The school board is chosen by popular election. Kalamazoo was settled in June, 1829, by Titus Bronson of Connecticut. It was incorporated as a village in April, 1843, and for many years enjoyed the distinction of being the largest village in the United States. It was made a city in April, 1884. Pop. (1880) 11,937; (1890) 17,853; (1900) 24,404.

CHARLES S. HATHAWAY,
Kalamazoo Board of Trade.

Kalamazoo, a river which has its rise in the northwestern part of Hillsdale County, Mich., and flows west and northwest into Lake Michigan. From the source to the city of Kalamazoo it makes three southward curves, but from Kalamazoo the course is generally northwest. Its whole length is about 200 miles, only 50 of which are navigable. At the mouth is a good harbor for vessels of about 100 tons. The water-power is extensive, and has been of great value in the development of the southwestern part of Michigan. Allegan, Kalamazoo, Battle Creek, and Marshall are on this river.

Kalb, Johann, yō'hän kälb, BARON DE, officer in the American Revolution: b. Huttendorf, Bavaria, 29 July 1721; d. Camden, S. C., 19 Aug. 1780. After serving in the French army as lieutenant he became a brigadier-general in 1761. He came with Lafayette to America in 1777, and offering his services to Congress was appointed a major-general in September of that year. After serving under Washington in Pennsylvania and New Jersey till the spring of 1780, he was appointed second in command in the Southern army under Gates. He fell mortally wounded at the battle of Camden, S. C., in the following August, dying three days after. In 1886, on the 106th anniversary of the battle, a bronze statue of the baron was unveiled at Annapolis, Md. Consult Kapp, 'Leben des amerikanischen Generals, Joh. Kalb' (Stuttgart 1862; New York 1870).

Kale, or **Borecole,** a cruciferous plant (*Brassica oleracea*, var. *acephala*), differing from cabbage most strikingly in the non-formation of heads, the leaves being loose and free. It is largely cultivaled as a pot-herb, especially in the South, where it generally withstands the winter. It is rather coarse in texture and flavor, but frosts modify both somewhat. In some sections it is extensively used for cattle-feeding. One of the largest producing regions is that in the vicinity of Norfolk, Va., which ships about 200,000 barrels to the markets each year. The varieties cultivated in America are nearly all treated as annuals, being grown from seed much like late cabbage. Some varieties, however, are perennial and may be propagated by cuttings, etc. For cultivation see CABBAGE.

Kaleege, ką-lēj', or **Kalij, Pheasants,** a sportsmen's name in India for the pheasants of the genus *Genæus*, which range along the foot-hills of the Himalayan range and eastward to the China and down the Malay Peninsula to Java. They are of medium size, richly dressed, with flattened crests, naked cheeks and spurs on the male. White is conspicuous in the plumage of most, so that they are sometimes called silver pheasants, especially the Chinese species (*G. nycthemerus*), frequently seen in parks and

menageries. All are attractive as game birds, especially the Himalayan white-crested and black-crested.

Kaleidoscope, ka-lī'dō-skōp, an optical instrument invented by Sir David Brewster in 1817. It consists of a tube through the length of which pass two mirrors or reflecting planes, which are hinged together along one edge, and make with each other an angle of 180 degrees; while the one end is fitted up with an eye-glass, and the other is closed by two glasses, at a small distance from each other, between which are placed little fragments of glass or other colored objects. The eye looking into the tube perceives these objects multiplied, and the slightest moving of the instrument produces new figures.

Kalends. See CALENDS.

Ka'ler, James Otis, «JAMES OTIS,» American writer for young people: b. Winterport, Maine, 19 March 1848. His most popular juvenile tale is 'Toby Tyler' (1880). Among his other very numerous books may be named: 'Raising the Pearl'; 'Tom and Tip'; 'When Israel Putnam Served the King'; 'The Wreck of the Circus.'

Kalevala, kä-lĕ-vä'lä, **The,** the great Finnish epic. It is composed of ancient popular songs, orally transmitted until the early 19th century, when they first began to be collected for literary purposes. Scattered portions were published in 1822 by Zacharias Topelius. But the present form of the poem is due to Elias Lönnrot of Helsingfors, who traveled among the peasantry, and recorded the material exactly as he heard it. His first edition (1835) contains 12,078 lines in 32 runes (cantos); a second edition (1849) 22,793 lines in 50 runes. Lönnrot was the first to arrange the runic verses as a systematic whole. The poem is in eight-syllabled trochaic verse, alliterative but unrimed. An idea of its style may be obtained from the 'Hiawatha' of Longfellow, largely an imitation. There is a complete English rendering by J. M. Crawford (1888).

Kali, kä'lē, a Hindu goddess represented with four arms, wearing a necklace of skulls, and the hands of slaughtered giants round her waist as a girdle. Her eyebrows and breast appear streaming with the blood of monsters she has slain and devoured. One hand holds a sword, another a human head. She is the goddess of death and destruction, and goats and other animals are sacrificed on her altars.

Kalidasa, kä-lī-dä'sä, the greatest poet and dramatist of India. Native tradition assigns him to the 1st century B.C., but western scholars place him as late as the 6th century A.D. He was one of the nine «gems,» or poets, at the court of King Vikramanditya, but the fact that several monarchs were so named makes his date no more definite. His most famous work is the drama 'Sakuntalā,' translated by Sir William Jones in 1789, and highly praised by Goethe. This translation helped to call the attention of the Occidental world to Sanskrit studies. Kalidasa wrote two other plays, the 'Vikramorvaśī' and 'Mālavikā and Agnimitra,' and considerable lyric verse. Many doubtful works have also been attributed to him with various degrees of probability. His literary value has long been conceded. The most recent English version of the 'Sakuntalā' is that of Edgren (1894).

Kalisch, kä'lĭsh, **Isidor,** American rabbi and author: b. Krotoschin, Prussia, 15 Nov. 1816; d. Newark, N. J., 11 Nov. 1886. Educated at the universities of Berlin, Breslau, and Prague, on the outbreak of the revolution of 1848, he left Germany, and after a brief stay in London came to New York in 1849. For some years he officiated as rabbi in Cleveland, Cincinnati, Milwaukee, Indianapolis, Detroit, and Leavenworth, Kan. In 1868 he established a school in New York, which did not succeed. In 1870 he was called to Newark, N. J., as rabbi, and two years later to Nashville, Tenn. In 1875 he returned to Newark, where he devoted himself until his death mainly to literary work. He was a versatile author, and his works cover a wide field, from a volume of German poems and a translation of Lessing's 'Nathan the Wise' to a decipherment of a Phœnician inscription found near Sidon, a sketch of the 'Sefer Yetsira,' a Kabbalistic work. He took an active part in the American Jewish reform movement and was a frequent contributor to the Jewish press.

Ka'lium, another name for the metal potassium, whence its symbol K is derived.

Kalmar, käl'mär, or **Calmar,** Sweden, city, the capital of Kalmar Län (county); on Kalmar Sound, at a place where the distance to the island of Öland is not more than five miles. Kalmar is about 190 miles, in direct line, southwest of Stockholm. A part of the city is on the mainland, and a part on three small islands. The town, which was formerly strongly fortified, though the fortifications are now in great part leveled, has a good harbor, a handsome cathedral, and a fine castle, in which, on 20 July 1397, the «Union of Kalmar» was signed, which settled the succession to the three northern kingdoms upon Margaret of Denmark and her heirs. The commerce of the town is considerable, and it has manufactures of matches, chicory, and tobacco, and some ship-building. Pop. (1902) 12,847.

Kal'mia. See MOUNTAIN-LAUREL.

Kal'mucks, a nomadic, warlike Mongol race, inhabiting parts of the Chinese empire, Siberia and European Russia. They have been great warriors from very early times, fought many bloody battles with the Tartars, with the Chinese, and among themselves, and made predatory expeditions as far west as Asia Minor. They are intrepid soldiers, splendid horsemen, and troops of them are attached to almost every Cossack regiment. Physically the Kalmucks are small of stature. They number altogether perhaps 700,000.

Kalong'. See FLYING-FOX.

Kal'pa, in Hindu chronology, a day, or a a day and night of Brahma, or a period of 4,320,000 or 8,640,000 solar-sidereal years. A great kalpa comprises the life of Brahma.

Kalpi, käl'pē, or **Calpee,** British India, a town in Jalaun district, Northwest Provinces, on the right bank of the Jumna, about 45 miles south-southwest of Cawnpore. The original town stood on the plain, remote from the river; but repeated Mahratta incursions induced the inhabitants to remove it to its present position

among extensive ravines, where there is a small fort, which commands the navigation of the Jumna. It carries on a considerable trade, principally in cotton, and is noted for its manufactures of paper and refined sugar, the latter said to be the finest in the world, but too high-priced to be in general demand. During the Sepoy mutiny Kalpi became a principal rendezvous of the revolted Gwalior contingent, which was signally defeated, first by Sir Colin Campbell, in the vicinity of Cawnpore, on which it had previously made an unsuccessful attack, and afterward at Kalpi itself by Sir Hugh Rose, 26 May 1858. Pop. (1901) 15,124.

Kama, kä'mä, the largest tributary of the Volga, rises in the Ural Mountains, on the eastern frontiers of the Government of Vyatka, in Russia; flows first north, then northeast into the Government of Perm, then circuitously south-southeast to the town of Perm, then southwest into the Government of Kasan, and about 40 miles below the town of that name, after a course of about 1,200 miles, joins the left bank of the Volga, almost doubling its volume. It is navigable almost throughout its whole course, and a canal connecting it with a tributary of the Dwina, gives water communication between the Caspian Sea and the Arctic Ocean.

Kama, or **Kâmâdîva,** in Hindu mythology, the god of love and marriage. The accounts of his origin vary in the sacred writings of India. According to one authority he sprang from Brahma's heart. His wife is Rati or "Pleasure."

Kamakura, kä-mä-koo'rä, Japan, village, about 11 miles south of Yokohama. It is said to have been founded in the 7th century. From about 1190, for 400 years it was the political centre of Japan, the residence of many of the powerful men, and frequently the battle-ground for supremacy and power. It is no longer visited as a ruling city, but as a beautiful place, with many interesting relics of antiquity. See DAIB TSU.

Kama'la, a plant and drug known, under various names, to Indian and Arab physicians, as a specific against the tapeworm. It occurs as a brick-red powder, adherent to the fruit of the euphorbiaceous plant *Rottlera tinctoria,* formed by minute roundish, semi-transparent granules, mixed with stellate hairs. The active principle of the powder lies in the 80 per cent of resin it contains, which also supplies the coloring matter, called rottlerin, used as a silk dye.

Kamas'si, a South African tree related to the oleander (family *Apocyanaceæ*), the wood of which is extremely hard and durable, and is used in wagon-building, for tool-handles and similar purposes. The tree bears fragrant flowers.

Kambodja, kăm-bō'ja, a Burmese tree (*Plumeria acutifolia*) related to the oleander, which is commonly used as a shade-tree in the villages of that country.

Kamchatka, kăm-chăt'kä, or **Kamtchatka,** Siberia, a large peninsula of the Russian empire, 850 miles long from north to south, and of irregular breadth, the maximum being about 250 miles. It has an area of 100,000 square miles. The coasts are dangerous of approach on account of outlying reefs. A lofty range of volcanic mountains traverses the country in a southwesterly direction, with many peaks between 7,000 and 16,000 feet high. The snow line, in lat. 56° 40′, is at an elevation of 5,260 feet. Dittmar, a Russian traveler, devoted three years to the exploration of the geology of Kamchatka. He traced five successive formations, and found 17 volcanoes in active operation. Numerous rivers have their rise in the heights. The Kamchatka, with its affluent the Yelovka, is navigable for 150 miles. The most fertile portion of the peninsula for agricultural purposes lies along the valley of this river. The Russian settlers here raise oats, barley, rye, potatoes, and garden vegetables, but the rest of the country is little adapted for culture. The climate is very severe; the winter lasts nine months, and frost is common at all seasons. The mean annual temperature at Petropavlovsk on the east coast is 28.5°, while at Tigil on the west it is 43°. The average temperature of summer at the former place is 55.5°, and that of winter 19°, but the thermometer has been known to fall as low as —25°. Earthquakes are frequent and violent. Animal life is very abundant, and fish swarm in the seas and rivers. The wild animals, yet abundant in the more sequestered localities, are bears, wolves, reindeer, argalis or wild sheep, black, red, and gray foxes, ermines, sables, and otters. Wild fowl are very numerous. The principal varieties of fish are herrings, cod, and salmon. Whales are numerous in the adjacent seas. The mountains are covered with forests of birch, larch, pine, and cedar, of considerable size in the south, but diminishing northward until the northernmost portion of the territory is covered only with reindeer moss.

The Kamchadales, the principal native tribe, are of diminutive stature, but stout, with flat features, small eyes, thin lips, lank black hair, and scarcely any beard. They are a peaceable, honest, lazy, and intemperate race. In winter they reside in a sunken hut, in summer in one elevated on poles some 13 feet from the ground. Their dress is equally adapted to the changes of temperature, being of fur in winter and nankeen in summer. They are nominally governed by their own chiefs, under the jurisdiction of the Russian *ispravnik,* or chief judge, and the most of them are Greek Catholics. Dog trains are used as the means of transport. The other principal tribe are the Koryaks, who live north of lat. 58°. While the Kamchadales are hunters and fishermen, with fixed habitations, the Koryaks are a wandering tribe, subsisting on the produce of the reindeer, and differing from them in language and mode of life. The commerce of Kamchatka is chiefly with Okhotsk. Its exports are furs, skins, oil, etc. Its imports are flour, sugar, dry goods, whiskey, rice, and coffee, almost all passing through the port of Petropavlovsk, the capital, on Avatska Bay. Pop. of capital, 8,000.

Kamehameha, kä-mä"hä-mä'hä or kä-mĕ-hä'mĕ-hä, the name of five kings of the Sandwich or Hawaiian Islands. KAMEHAMEHA I., surnamed the "GREAT": b. 1753; d. Kailua, Hawaii, 8 May 1817. Becoming head chief of part of the island of Hawaii in 1781 he presently subdued the entire group of islands, becoming ruler of the whole in 1811. He was progressive in his views and encouraged intercourse with Europeans. He was succeeded by his eldest son, KAMEHAMEHA II. (LIHOLIHO):

b. Hawaii 1797; d. London 14 July 1824. He was intemperate but treated the missionaries kindly, professed Christianity, and recommended his subjects to do likewise. Anxious to secure the friendship of England he went thither with his queen, Kamamalu, but both died soon after arriving in London. He was succeeded by his brother KAMEHAMEHA III. (KAVIKEAOULI), surnamed the "GOOD": b. 7 March 1814; d. Honolulu 15 Dec. 1854. He came to the throne in 1833, the islands having been ruled by a regency since 1824. He introduced a constitutional form of government in 1840, and the independence of the islands was acknowledged by the United States in 1842 and by Belgium, Great Britain, and France in 1844. The more important public offices in his reign were filled by foreigners. He was succeeded by his adopted nephew KAMEHAMEHA IV. (ALEXANDER LIHOLIHO): b. 9 Feb. 1834; d. Honolulu 30 Nov. 1863. He married in 1856 Emma, adopted daughter of Dr. Rooke. In 1860 he founded the Queen's Hospital in Honolulu, personally soliciting subscriptions for this object, in which he took the deepest interest. His elder brother, Lot Kamehameha, succeeded him as KAMEHAMEHA V.: b. 11 Dec. 1830; d. Honolulu 11 Dec. 1872. He proclaimed a new constitution (less democratic than its predecessor), in 1864, satisfactory to the majority of the Hawaiians but distasteful to the foreign population. He never married and left no heir to the throne.

Kamehameha, Order of, an Hawaiian secret society founded in Honolulu in 1864 by Kamehameha II., the then reigning king of the Sandwich Islands. The order is divided into three classes. The badge of the order is a white enameled cross with gold rays surmounted by a crown.

Kamerun, kä-mĕ-roon'. See CAMEROONS.

Kames, Lord. See HOME, HENRY.

Kamila, kä-mē'lä, or **Kamala,** the glandular hairs of a small euphorbiaceous tree (*Mallotus philippensis*), widely distributed in eastern Asia and Australia. They are ground into a resinous powder which imparts a deep brick-red color to alkaline liquids, alcohol, ether and chloroform, and forms a rich dye especially applicable and extensively used for silk. The same name variously spelled is given to the tree.

Kaministiquia, ka-mĭ-nĭs-tĭ-kē'a, a river in Canada which has its rise near Lake Nipigon in the province of Ontario, and flows south into Thunder Bay, an inlet of Lake Superior. The town where the Canadian Pacific railroad crosses this river is named after the river. Along the course are several expansions of the river or lakes. Before the railroad entered this section this river and its tributaries formed important routes of travel. Its advantages for transportation were of great importance to the government at the time of the Riel Rebellion (q.v.) in 1870.

Kaminski, kä-mĕn'skē, **Stephan,** American Polish Catholic Independent bishop: b. German Poland, 26 Dec. 1850. He was educated in Poland, came to the United States in 1884; was ordained priest in 1893; was rector of various parishes; from 1897 edited and published the 'Warta,' a Polish weekly; and in 1898 was consecrated bishop. He was a leader in the independent church movement.

Kammat'ograph, The, a photographic camera in which a circular glass plate takes the place of the celluloid film for moving the pictures. The plate can be made to rotate rapidly by means of a multiplying gear, and at the same time to traverse laterally. A small lens forms an image upon the plate, and when the plate is put in motion these images are multiplied into a series of pictures arranged in a spiral. The plate is developed in the same way as an ordinary negative, and a positive is then taken from it. To display the pictures it is only necessary to place the positive in the camera and to arrange it so that the beam from the lantern close to it can pass through the lens. The plate is then rotated as before, the succession of pictures projected upon the screen reproducing the original movement. About 600 pictures can be photographed during the motion of a single plate at the rate of 12 or 14 a second.

Kam'loops, Canada, city in the province of British Columbia; on the Thompson River at the junction of the north and south branches, and on the Canadian Pacific railroad; about 255 miles northwest of Rossland and 260 miles northeast of Vancouver. The place where the city now stands was once used as a trading post by the Hudson's Bay Company, but a permanent settlement was made in 1820. Its growth was slow until mining began in the vicinity, and in 1892 it was incorporated. It has several manufacturing establishments, the chief of which are lumber-mills, mining-implement works, wagon factories, tanneries, and a woolen mill. The waterworks and the electric-light plant are owned by the city. The government seat for the Yale District is Kamloops, and the Dominion and Provincial governments have here land and registry offices. It has a mild climate, and in the vicinity in the river valley are many fine farms. Nearby are mountains and small lakes noted for the beauty of their scenery. Pop. (1902) 1,671.

Kampen, käm'pĕn, or **Campen, Jacob de,** Dutch Anabaptist leader. When he and his followers were driven out of Upper Germany, they attempted to diffuse their dogmas over the Low Countries. In 1534 John of Leyden nominated him bishop of Amsterdam, but on attempting to take possession of his see, he met with a cruel death at the hands of the people.

Kampen, or **Campen, Jan van** (so called from the town of Kampen), Dutch scholar: b. Kampen, Holland, about 1490; d. Freiburg 1538. He was professor of Hebrew at Louvain 1519–31. He wrote a Latin paraphrase of the Psalms, which has been translated into the chief European languages.

Kampen, Nikolaas Godfried van, Dutch historian: b. Haarlem 15 May 1776; d. Amsterdam 15 March 1839. He became professor of English and German in the University of Leyden in 1815. Among his historical and literary works, many of which were translated into German, are: 'History of the Literature of the Netherlands' (1812); 'History of French Domination in Europe' (1815–23); 'History of the Influences of the Netherlands Outside of Europe'

(1831–3). Consult: 'Life,' by S. R. Van Campen (1887).

Kampen, or **Campen,** Holland, a town and port in the province of Overyssel, 45 miles east-northeast of Amsterdam, on the Yessel near its influx into the Zuyder Zee, and where it is crossed by a bridge. Its principal buildings are a church of the 14th century, an elegant town-house, built in an antique style, and a custom-house. A theological school is located here. Anciently it was one of the most flourishing of the Hanse towns; and its commerce after a period of decline has again to some extent revived. Its manufactures also suffered, but it still produces machinery, steam-engines, hosiery, cigars, etc. It has also ship-building yards. Several canals intersect it, and a railway line from Germany through Zwolle terminates here. Pop. (communal) 20,000.

Kamphausen, Adolf Hermann Heinrich, ä'dōlf hĕr'män hīn'rĭH kamp'how-zĕn, German theologian: b. Solingen 10 Sept. 1829. He was educated at Bonn, in 1855 became secretary of Karl Josias Bunsen, whom he assisted in the latter's 'Bibelwerke,' and in 1863 was appointed professor of theology at Bonn. In 1871–90 he was active as a member of the theological commission for the revision of Luther's translation of the Old Testament. He resigned all professorial duties in 1901. His publications include: 'Das Lied Moses' (1862); 'Die Hagiographen des Alten Bundes nach den überlieferten Grundtexten übersetzt' (1868); 'Das Buch Daniel' (1893); 'Das Verhältnis des Menschenopfers zur israelitischen Religion' (1896). He also edited Daniel (1896) for Haupt's 'Polychrome Bible.'

Kan-Su, kän-soo', an inland province of China, in the northwestern part; area, about 125,380 square miles. At one time Shan-Si, on the east, was a part of Kan-Su, and until 1865 its jurisdiction extended over a much greater extent of territory than at present. The capital is Lan-Chau. The province is rich in minerals and hunting for the sake of the fur is one of the chief occupations. Tobacco of a superior quality is raised in this province. Pop. about 10,000,000.

Kanakas, kạ-nak'ạz, a popular name given the natives of Hawaii, New Caledonia, New Hebrides, and other islands in the South Seas.

Kananur, kä-nạ-noor', or **Cananore,** British India, a seaport town in the district of Malabar, presidency of Madras, 44 miles northwest of Calicut. It forms a municipality, and contains various public offices, jail, dispensary, schools, custom-house, etc. There are Anglican, German, and Roman Catholic missions here, and a number of mosques. It has a small trade by sea, but its chief importance is as a military station and the headquarters of the Malabar and Kananur force, being garrisoned by one European and one native regiment. There is a fort of triangular area, built by the Dutch and occupied by them till 1766. Pop. 27,418.

Kana'ri, or **Canari,** a tree of the genus *Canarium* (q.v.), many species of which flourish from India to Australia and the Philippines. The foliage is abundant and handsome, and the wood is hard, heavy and suitable for cabinet-work, house-trimming, etc. The fruit is a drupe with a hard oily kernel, which forms the particular food of the great cockatoos of the region. The kernel of *C. commune,* known as Java almond, is eaten by the natives either fresh or roasted; and the Amboynese dry it, grind it and bake the flour. Some other species also furnish edible kernels; and from all an oil may be pressed, said to be better than cocoanut oil, both for cooking and for use in lamps. An oil is obtained from the bark resembling balsam copaiba (see COPAIBA). These trees also yield the medical resin elemi, and a gum called black damar.

Kanawha River. See GREAT KANAWHA RIVER.

Kan'chil, the smallest species of chevrotain (q.v.). It inhabits Java and neighboring islands, is less than a foot tall, and is proverbially quick and clever in its movements and hiding in the forest. Its scientific name is *Tragulus javanicus.*

Kandahar, kän-dä-här', or **Candahar,** Afghanistan, one of the largest cities of the principality, on a fertile and well-cultivated plain, 3,484 feet above the sea, 200 miles southwest of Kabul. It is enclosed by a mud wall 27 feet high, with a large tower at each of the four corners, 54 semicylindrical bastions, and a broad and deep ditch in front, capable of being filled with water from the river. There are six gates, each protected by double bastions. The circumference of the city is nearly four miles. One of the most imposing buildings is the octagonal, domed structure containing the tomb of Ahmed Shah. It is claimed that this city was founded by Alexander the Great. Kandahar is chiefly supported by the transit trade, but it has important manufactures of felt and silk. It was held by the British in 1839–42, and again in 1879–81. Pop. variously estimated at from 25,000 to 100,000.

Kandy, kän'dē, or **Candy,** Ceylon, one of the chief towns on the island, is situated near the centre, 72 miles northeast of Colombo, at the height of about 2,000 feet. "Kandy is uniquely beautiful — the most charming little town in the world," travelers usually describe it. It is situated in a valley surrounded by hills, and boasts an artificial lake, Buddhist and Hindu temples, including the Daladá Máligáwa, the most sacred Buddhist temple in the world. This contains the so-called relic of Buddha's tooth, and also many ancient manuscripts written in Pali and Sanskrit. "The Pavilion," or official residence of the governor, is one of the finest structures in Ceylon. Kandy is connected by railroad with Colombo. The botanic gardens of Peradenia are three miles from Kandy. Kandy was the capital of the ancient kings of Ceylon. Pop. (1901) 26,915.

Kane, Elisha Kent, American Arctic voyager: b. Philadelphia 20 Feb. 1820; d. Havana, Cuba, 16 Feb. 1857. He was graduated as M.D. in the University of Pennsylvania in 1842, and shortly afterward became surgeon to the American embassy to China. After extended travels in India, Egypt, and the continent of Europe he returned to America in 1846, and was employed in the government survey of the Gulf of Mexico. In 1850 he obtained the appointment of senior medical officer to the expedition of two vessels, the Advance and the Rescue, which sailed from

New York on the 22d of May in that year in search of Sir John Franklin. On the return of the expedition Dr. Kane published 'The United States Grinnell Expedition in Search of Sir John Franklin — a Personal Narrative.' On the 31st of May 1853, the Advance alone, under Dr. Kane's command, sailed again from New York to resume the search, and proceeding up Baffin's Bay and through Smith's Strait, reached lat. 78° 43′ N. Here the Advance remained frozen up for 21 months, and was finally abandoned because provisions were becoming scarce and scurvy and other diseases had made their appearance. The object now was to reach the Danish settlements in Greenland, about 1,300 miles distant. This long and perilous journey, partly in boats and partly in sledges, was accomplished, after 10 weeks of severe privation, with the loss of only one man, and that by an accident. In 1856 Dr. Kane published: 'The Second Grinnell Expedition,' and was awarded gold medals from Congress, the New York legislature and the Royal Geographical Society. Consult: Elder, 'Biography of Elisha Kent Kane' (1857); Greely, 'American Explorers' (1894).

Kane, John Kintzing, American jurist: b. Albany, N. Y., 16 May 1795; d. Philadelphia, Pa., 21 Feb. 1858. He was graduated from Yale in 1814, was admitted to the bar in 1817, entered practice in Philadelphia, was elected to the Pennsylvania legislature as a Federalist in 1823, later became a Democrat, and supported Jackson in the canvass of 1828. In 1845 he became attorney-general of Pennsylvania, in 1846 United States district judge for Pennsylvania, in 1856 president of the American Philosophical Society. He won distinction by his legal attainments and his decisions in patent and admiralty law, but his commitment of Passmore Williamson for contempt of court in an action under the Fugitive Slave law was attacked by the Abolitionists.

Kane, Sir **Robert John,** Irish chemist: b. Dublin, Ireland, 24 Sept. 1809; d. there 16 Feb. 1890. He was educated for the medical profession and in 1832 became a member of the Royal Irish Academy. In the same year he founded the 'Dublin Journal of Medical Science' and was its editor for two years. From 1834 to 1837 he was professor of natural philosophy to the Royal Dublin Society; in 1846 originated the Museum of Industry in Ireland. He was knighted the same year, was president of Queen's College, Cork, for several years prior to his resignation in 1873, and in 1876 was elected president of the Royal Irish Academy. He wrote: 'Elements of Chemistry' (1842); 'Industrial Resources of Ireland' (1884); etc.

Kane, Pa., borough in McKean County, on the Baltimore & O., the Philadelphia & E., the Pennsylvania, and the Pittsburg & W. R.R.'s, 95 miles southeast of Erie, 175 miles north of Pittsburg and 122 miles from Buffalo. There are here several of the largest window glass factories in the world, plate glass and bottle factories, lumber-mills, wooden-ware factories and other flourishing industries. There are extensive natural gas and oil wells and deposits of silica in the surrounding country which are of great commercial benefit to the town. On account of its elevation of 2,000 feet, Kane is an attractive summer resort, with good hunting and fishing grounds in the vicinity. It was first settled in 1859 and became a borough in 1887. The government is vested in a burgess and a council of 9 members elected every three years. Pop. (1890) 2,944; (1900) 5,296.

Kang-Hi, käng-hē′, or **K'ang-Hsi,** emperor of China: b. 1655; d. 1722. He succeeded his father, Shun-Chih, founder of the Manchu dynasty, in 1661, but until he was 14 the government was administered by a regency. Kang-Hi not only greatly strengthened his empire, but extended it and governed with vigor and wisdom. He was favorably inclined toward the progress of Christianity; manifested great interest in the arts and sciences of the Europeans, and liberally patronized the missionaries. During his reign many important books were published under his oversight, such as the 'Imperial Dictionary'; a literary concordance in 110 volumes styled 'Pei-Wen-Yun-Foo,' and two large encyclopædias.

Kangaroo′, an Australian marsupial of the family *Macropodidæ*. The word is derived from a native name of the giant kangaroo. The *Macropodidæ* are readily distinguished from other marsupials by their shape. The head is small, with large mule-like ears; the neck slender, the trunk narrow before and very massive behind; the fore limbs small and weak with five toes and used chiefly as hands; the hind limbs long, extremely powerful, four-toed, and serving as the chief organs of locomotion; and the tail thick, heavy, and muscular, serving to support the body, in combination with the hind legs, as on a tripod. The dentition is noteworthy, having a somewhat rodent-like appearance. There are three pairs of incisors above, presenting a sharp cutting edge which the single pair of lower incisors passes like the blade of a shears. Canines are reduced to one in the upper jaw. The premolars are two on each side of each jaw. The four pairs of molars are flat-crowned and more or less cross-ridged, as well as tuberculate. The kangaroos are strictly vegetarian, and in Australia represent the deer, antelopes and hares of other regions. About 50 species belonging to 12 or 15 genera have been described from Australia and the neighboring islands. The giant kangaroo (*Macropus giganteus*), the largest, is frequently exhibited in zoological gardens. This, the first of the kangaroos known to white men, was discovered by Capt. Cook during his exploring voyage in 1770, and was described under the name *Didelphys gigantea* from specimens brought home by him. When standing erect in the attitude of scenting danger it is nearly as tall as a man, and when in full flight propels itself by bounds of 12 to 15 feet. On account of its destructiveness to herbage on the sheep-ranges, as well as for sport, it is much hunted by the colonists, a favorite method being coursing. When brought to bay by the hounds it proves no mean antagonist, and frequently kills a dog by seizing it in its arms and ripping it open with the great hind toe. As in other kangaroos the hind feet have a peculiar structure; the fourth toe is enormously developed and furnishes almost the sole support; the fifth is of moderate size; in sharp contrast the second and third toes are minute, slender, and bound together so that only their sharp claws project from the skin, their only function being to comb and cleanse the fur.

The one or two young are born in an exceedingly helpless state, and after being placed in the pouch of the female remain attached by their mouths to the nipples for several weeks or months; at first they are quite incapable of sucking, and the milk is injected into their mouths by the periodical contraction of the muscles of the mammary glands. Even after they are able to run about, they return to the mother's pouch for temporary rest and shelter. Closely related are the red kangaroo (*M. rufus*) and other species inhabiting the mountains, and the numerous species of large and small wallabies or brush-kangaroos, some of which inhabit New Britain and New Guinea, as well as Australia. The rat-kangaroos (*Potorous* and related genera) are a small group of species somewhat resembling rats and rabbits in size and habits. They are nocturnal and obtain their food largely by digging roots. The genus *Dendrolagus* includes the arboreal tree-kangaroos. Fossil forms are exhumed from the Pleistocene rocks of Australia very similar to modern genera, but some of the older ones were much larger than any existing species. Consult: Thomas, 'Catalogue of Marsupialia, and Monotremata in the British Museum'; Gould, 'Monograph of the Macropodidæ,' and 'Mammals of Australia,' and Aflalo, 'Natural History of Australia.'

Kangaroo-rat, a small and pretty jerboa-like rodent of the southwestern United States. It has very long and strong hind legs, and runs by a series of leaps with great swiftness. It inhabits arid regions, dwells in extensive burrows of its own digging, and feeds mainly upon sunflower-seeds, great quantities of which are stored up for winter use, when the burrows are warmly furnished with grass. It belongs to the pocket-mouse family (*Heteromyidæ*) and is named *Perodipus ordi* by systematists. Consult: Stone and Cram, 'American Animals' (1902).

Kangaroo-mice are smaller American rodents of the genus *Perognathus*. See POCKET-MICE.

Kankakee, kăn-ka-kē', Ill., city, county-seat of Kankakee County; on the Kankakee River, and on the Illinois C. and the Cleveland, C. C. & St. L. R.R.'s; about 133 miles northeast of Springfield and 56 miles south of Chicago. It was settled in 1850 and incorporated as a city in 1854. The water-power of the Kankakee River is extensive at Kankakee, and as a result the city is largely engaged in manufacturing. It is situated in an excellent agricultural region, and its good railroad facilities make it an important commercial centre for a large extent of country. The chief industrial establishments (1903) are agricultural implement works, in which are employed 600 men; piano factories, 250 men; furniture factories, 500; knitting works, 250; sewing machines, 300; and stone quarries, 250. Some of the other manufactures are starch, flour, wagons, bricks, tiles, nails, foundry products, mattresses, cigars, some dairy products. The churches are two Methodist Episcopal, one Presbyterian, four Roman Catholic, one Lutheran, one German Methodist, one Reformed Lutheran, one Seventh Day Adventist, and one Christian Science. The educational institutions are the public and parish schools, Saint Joseph's Seminary, a Conservatory of Music, and in Bourbonnais Grove, a suburb of the city, Saint Viateur's College, and Notre Dame Academy. It has the Illinois Eastern Hospital for Insane and the Emergency Hospital, a public library, the Y. M. C. A. building, and the city buildings. There are two national banks and two savings banks with a combined capital of $300,000. The government is vested in a mayor, who holds office two years, and a council of 10 members, one half of whom are elected each year. The council elects the administrative officials and the health and local improvement boards. Pop. (1890) 9,025; (1900) 13,595.

Kankakee, a river of northern Illinois, which has its rise in the northern part of Indiana, flows west and southwest and enters Kankakee County in Illinois. From where it receives the waters of the Iroquois from the south, the course changes to the northwest until it enters Grundy County, where it unites with the Des Plaines River and forms the Illinois.

Kano, kā-nō', in the province of Sokoto, in West Africa, the chief town of the extensive Sudanese sultanate annexed by Great Britain in 1903. Kano is the point of convergence of many caravan routes and is the principal market and centre of trade in the interior of Africa. Leather and cotton goods are extensively manufactured and dyeing is carried on. On account of its industries Kano has been called the Manchester and Birmingham combined of the Dark Continent. The annual attendance of the market at Kano exceeds 1,000,000 persons from all parts of Africa; Morrell estimates the attendance as twice as large. The market is held daily throughout the year and is believed to have existed at this place for over 1,000 years. Sign language is largely used by the heterogeneous crowd in making bargains. In addition to native wares and produce, such as ivory and ostrich feathers, European merchandise and ammunition are on sale. The objectionable feature of the market is the trade in slaves, a characteristic that will doubtless disappear under British rule. The wall surrounding Kano is reported to be 16 miles in circumference. The houses are chiefly of adobe and the streets are wide and clean. Kano was captured by the British in 1903. Pop. (estimated 1892) 120,000. See also SOKOTO.

Kansas, one of the great States of the Middle West, the 21st to be admitted into the Union, and a centre of human activity and achievement from its beginning. In less than 50 years a vast commonwealth has been erected, exceeding in population and resources many of the older States. The historian, George Bancroft, designated Kansas as "the miracle of the age." The name is derived from the Indian word "Kanza," having the dual significance of "wind" and "swift." In popular nomenclature Kansas is known as "the Sunflower State." Its State motto is *Ad Astra per Aspera* — "through difficulties to the stars." The State is situated in lat. 37° to 40° N., lon. 94° 40' to 102° W.; bounded on the north by Nebraska, on the northeast and east by Missouri, on the south by Oklahoma and Indian Territories, and on the west by Colorado.

Early History.— The territory forming the present State of Kansas was a part of the Louisiana Purchase of 1803, except a fraction in the southwest corner acquired from Texas in 1850. It is claimed that Coronado visited the country as early as 1541, and there are evidences

GIANT KANGAROO (*Macropus rufus*)

KANGAROOS.

1. Kangaroo Rat.
2. Hypsiprymnodon.
3. Tree Kangaroo.

6. Pademelon Wallaby.

of French and Spanish expeditions in later years. The Lewis and Clark Expedition, planned by President Jefferson, reached Kansas in June 1804, and, two years later, the expedition commanded by Zebulon Montgomery Pike, who gave his name to "Pike's Peak," crossed the territory from the Missouri River to the Rocky Mountains. The expedition of Major Stephen H. Long was made in 1819, and in 1824 was established the "Santa Fe Trail," the famous highway of Kansas, extending 400 miles directly across the Territory, and from Independence, Mo., to Santa Fe, a distance of 780 miles.

This was the beginning of the development and growth of Kansas. The outposts of civilization were being extended westward from the Mississippi River. The Indians of Missouri and other Mississippi Valley States were concentrated with the tribes already occupying the country west of the Missouri River. These included the Osage, Shawnee, Pawnee, Delaware, Kickapoo, and Kansas tribes, to which were added the Cherokee and other tribes from the States of the south, the Ottawas, Pottawatamies, Wyandottes and others from Ohio, Michigan and Indiana. Kansas became Indian Territory, and remained such from 1830 to 1854. Occupation of the country by white settlers was fraught with peril and hardship, and only accomplished by marvelous heroism, perseverance and endurance. To aid in the work of civilization missions were established on the frontier, and military posts located at Fort Leavenworth, Fort Scott and Fort Riley.

Territorial Days.— The admission of Kansas as an organized Territory dates from 30 May 1854, when President Pierce signed the Kansas-Nebraska Act. This brought on what may be termed the political troubles of Kansas, and later, as a result of the slavery agitation, precipated the great armed conflict between the North and the South in 1861-5. It was on Kansas soil that the first battle was fought for the freedom of the negro, and it was Kansas that developed the heroic figure of John Brown. From the time Congress took the first step for the admission of Kansas, with or without slavery, the Territory became the scene of contention, pillage and bloodshed. The pro-slavery men of Missouri endeavored to gain control of the Territory in 1854, and established the first city, Leavenworth. Soon afterward an anti-slavery colony from Massachusetts settled at Lawrence. No more hostile factions ever struggled for supremacy on this continent.

Andrew H. Reeder, of Pennsylvania, was appointed to be the first governor of the Territory. At the first contest for territorial delegate to Congress the slavery men of Missouri crossed the river and participated in the election, the candidate of the pro-slavery party being successful by reason of these illegal votes. The Free-soilers protested and held indignation meetings at Lawrence and other points. The Missourians repeated the same tactics at the election in the spring of 1855 for representatives to the legislature. When the legislature met at Pawnee the pro-slavery members were in the majority, and controlled the proceedings, even to the extent of driving out the Free-soil members and changing the seat of government.

The Free-soil party repudiated the acts of the legislature and refused to abide by them. Governor Reeder was removed from office and succeeded by Wilson Shannon, of Ohio. John W. Whitfield was elected delegate to Congress by the pro-slavery party, and Ex-Governor Reeder chosen to the same position by the opposition, but Congress refused to give either delegate a seat. A Free-soil constitution was adopted in December 1855, under which Charles Robinson was elected governor, but the election was repudiated by President Pierce, who had recognized the "bogus" legislature. The Free-soil legislature ignored the action of President Pierce, and, to meet this and other menacing circumstances, the military forces of the United States government were placed in command of Governor Shannon. Governor Robinson and Congressman-elect Reeder were indicted for high treason. The pro-slavery party received large accessions from Georgia, Alabama and South Carolina. In the troubles resulting from this conflict of authority the Emigrant Aid Society Hotel and the 'Herald of Freedom' and 'Kansas Free State' printing offices at Lawrence were destroyed, and the town of Osawatomie — the home of John Brown — was sacked and burned.

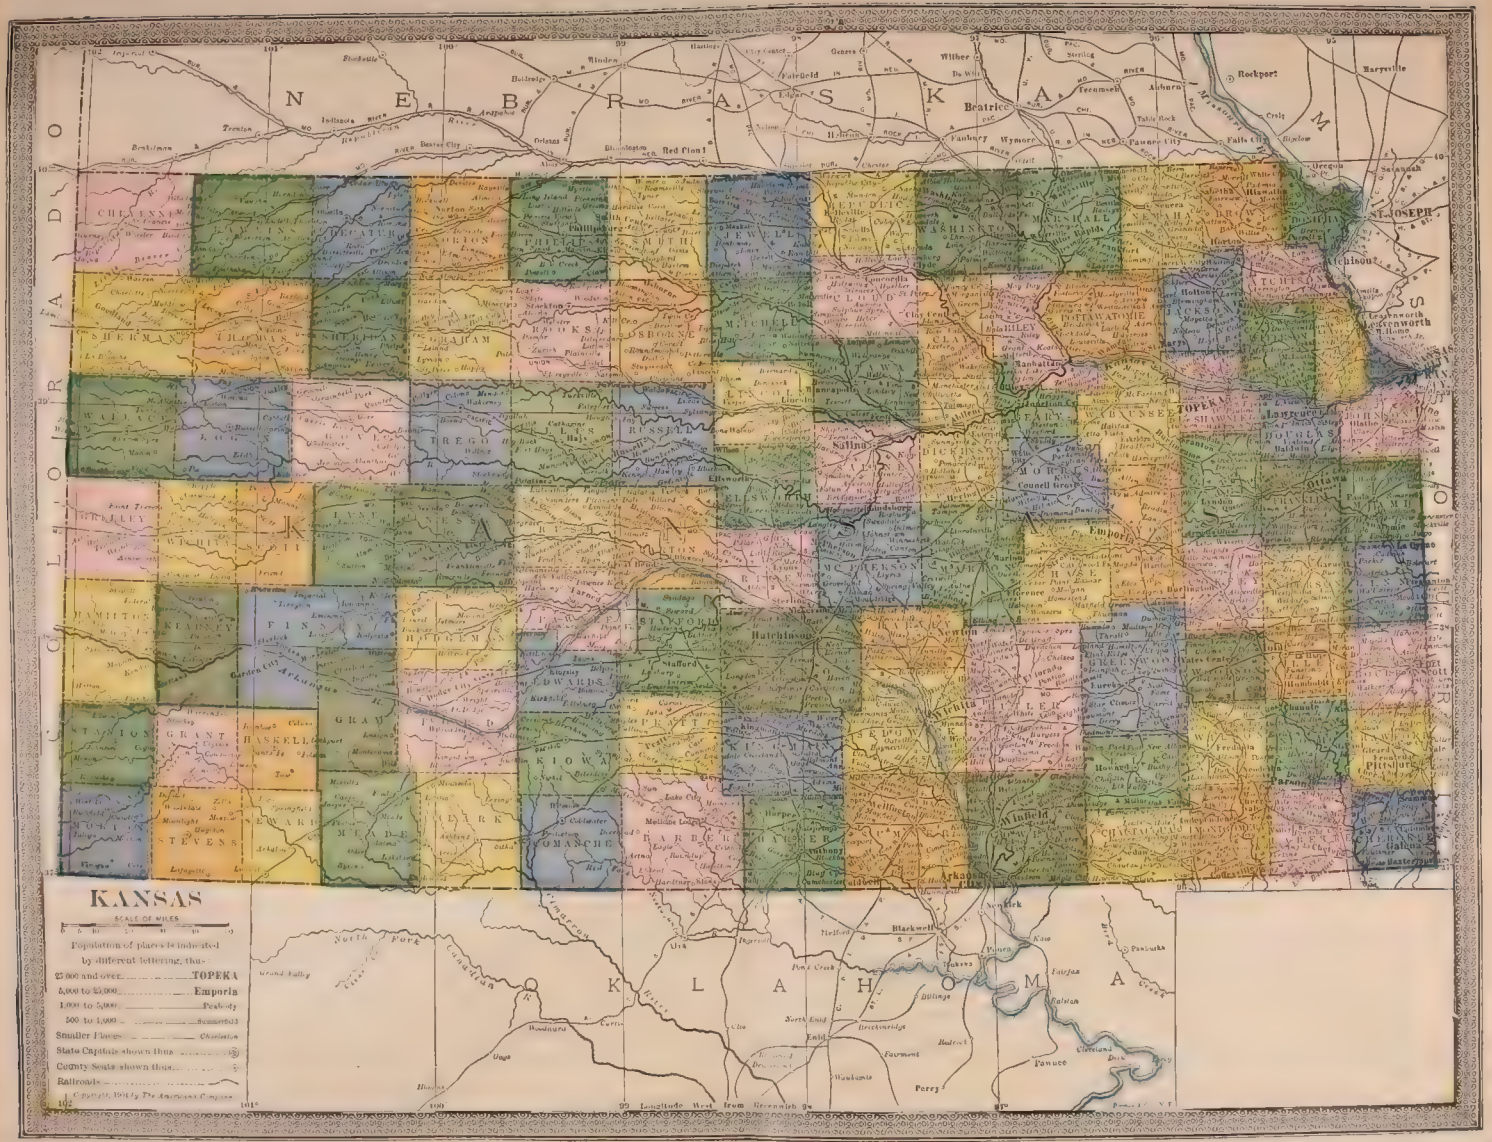
Struggles for Statehood.— A bill for the admission of Kansas as a State was passed by the lower house of Congress in June 1856, but was defeated in the Senate on account of the recognition it gave to the Free-soil constitution. A meeting of the Free-soil legislature in Topeka was dispersed by United States troops acting under orders from President Pierce. By this time the interest in the Kansas struggle became general throughout the United States. The suppression of slavery became a national instead of a state issue. While Congress debated and legislated, the pro-slavery and free-state factions continued to war against each other for possession of the Territory and control of the law-making machinery. Conflicting constitutions were adopted, rival legislatures elected, and civil government overthrown. Public meetings were held in all parts of the North to lend encouragement to the movement for making Kansas a free State. Similar sympathy and help came to the pro-slavery party from the States of the South. Horace Greeley and Abraham Lincoln visited the Territory, and made speeches in opposition to the further extension of slavery on American soil. Governor Shannon was removed from office, and the several governors appointed to succeed him found the duties of the position so onerous that they resigned in rapid succession.

After numerous battles, elections and vicissitudes, a constitutional convention was called to meet at Wyandotte 5 July 1859. It was composed of 35 Free-state and 17 pro-slavery delegates, who were now known as Republicans and Democrats, respectively. Under the constitution adopted by this convention slavery was prohibited and Kansas admitted as a State 29 Jan. 1861. The seat of government was located at Topeka. At the election held in December 1859, under the Wyandotte constitution, Charles Robinson was chosen to be the first governor of the State, and Martin F. Conway the first representative in Congress. When the first State legislature assembled at Topeka in March 1861 James H. Lane and Samuel C. Pomeroy were elected the first two United States senators from the new State.

In the civil war which followed the inauguration of President Lincoln in 1861, Kansas showed its loyalty to the Union by furnishing 20,000 trained soldiers out of a total population of but little more than 100,000 — a number greatly in excess of her quota, none of them drafted, and in proportion exceeding the enlistments from any other State. A large part of this force was employed in defending the borders of the State from invasion by southern troops, Indians and guerrillas. During one of these border raids a force of 400 men under command of Quantrell invaded Lawrence, burning and pillaging the town and killing 150 defenseless citizens. The war and the troubles with the Indians, together with a visitation of drought in 1860, greatly retarded the growth of Kansas, but when these obstacles were passed an era of progress and development set in which has never since abated. The splendid soil and auspicious climate and the general adaptability of the State to farming and stock-raising purposes have attracted thousands of settlers to the State, and the advancement in all lines has been rapid, substantial and permanent.

Governors—(*Territorial*) Andrew H. Reeder (1854 to 1855), Wilson Shannon (1855 to 1856), John W. Geary (1856 to 1857), Robert J. Walker (1857), James W. Denver (1858), Samuel Medary (1858 to 1860). (*State*) Charles Robinson (1861–3), Thomas Carney (1863–5), Samuel J. Crawford (1865–8), Nehemiah Green (1868), to fill the unexpired term of Samuel J. Crawford,resigned; James M. Harvey (1869–73), Thomas A. Osborn (1873–7), George T. Anthony (1877–9), John P. St. John (1879–83), George W. Glick (1883–5), John A. Martin (1885–9), Lyman U. Humphrey (1889–93), Lorenzo D. Lewelling (1893–5), Edmund N. Morrill (1895–7), John W. Leedy (1897–9), William E. Stanley (1899–1903), Willis J. Bailey (1903—). During the official interruptions incident to the territorial period the following persons served terms as acting governor: Daniel Woodson, Frederick P. Stanton, James W. Denver, Hugh S. Walsh, George M. Beebe.

United States Senators.— James H. Lane (1861–6), Samuel C. Pomeroy (1861–73), Edmund G. Ross (1866–71), Alexander Caldwell (1871–3), Robert Crozier (1873–4), James M. Harvey (1874–7), John J. Ingalls (1873–91), Preston B. Plumb (1877–91), William A. Peffer (1891–7), Bishop W. Perkins (1892–3), John Martin (1893–5), Lucien Baker (1895–01), William A. Harris (1897–03), Joseph R. Burton (1901), term expires 1907; Chester I. Long (1903), term expires 1909.



Government.— The State legislature consists of 40 senators and 125 representatives. Sessions are held biennially, in odd-numbered years. The legislature of 1903 was divided politically as follows: Senate, 34 Republicans, 6 Democrats and Populists; house, 95 Republicans, 30 Democrats and Populists; Republican majority on joint ballot, 129. The elective State officers include governor, lieutenant-governor, secretary of state, auditor, treasurer, attorney-general, State superintendent of public instruction, commissioner of insurance, 7 justices of the supreme court, and 3 members of the State board of railroad commissioners. Kansas has 8 representatives in the lower house of Congress, of which 7 are chosen by districts and 1 at large. Women have the right of suffrage at municipal bond and school elections. They have been elected to municipal and school offices, and in some cases to county offices.

Population.— The local census of 1855 gave Kansas a population of 8,501; this increased in 1860 to 107,206; in 1870 to 364,399; in 1880 to 396,096; in 1890 to 1,427,096; in 1900 to 1,470,495. The present population of the State, according to the local census of 1903, is 1,487,847. Population by counties follows:

County	Pop.	County	Pop.
Allen	26,468	Linn	15,534
Anderson	13,630	Logan	2,127
Atchison	30,369	Lyon	25,944
Barber	6,698	Marion	21,455
Barton	13,518	Marshall	23,851
Bourbon	26,324	McPherson	20,772
Brown	20,921	Meade	1,592
Butler	22,269	Miami	20,254
Chase	7,434	Mitchell	13,034

There are 118 cities and towns having a population of 1,000 or more. The 10 largest cities and their population are: Kansas City, 59,919; Topeka, 38,959; Wichita, 31,549; Leavenworth, 22,991; Atchison, 16,617; Fort Scott, 13,707; Pittsburg 13,116; Lawrence, 11,726; Hutchinson, 10,668; Parsons, 10,066.

Topography.— Although a part of the great plains which form the eastern slope of the Rocky Mountains, the physical character of the Kansas country is best described as rolling prairie. There are no mountains, and no marshes. The altitude varies from 750 feet in the eastern to 4,000 feet in the western part of the State. The bulk of the land is tillable, but crops are uncertain in the western third of the State on account of deficient rainfall. In this deficient area the vast stretches of prairie are largely used for grazing purposes. The rivers are the Kansas, Arkansas, Republican, Smoky

Hill, Solomon, Saline, Neosho and Verdigris — none of them navigable. There are numerous smaller streams, giving abundant water and drainage in the eastern two-thirds of the State. The land area comprises 82,080 square miles (52,531,200 acres), extending 408 miles from east to west, and 208 miles from north to south.

Climate.— The climate is mild, the great proportion of the days being fair and sunny. In summer the temperature ranges from 80° to 100°, with cool nights, and dry, pure air. In winter it rarely falls below zero. The violent winds of winter and spring, known to the early settlers, have been greatly mitigated by the cultivation of the soil and the planting of trees.

Agriculture and Stock-raising.— Fully 40 per cent (20,000,000 acres) of the farm land of Kansas is in a high state of cultivation. The cultivated farms have an aggregate value of $600,000,000. The acreage in field crops in 1902 was exceeded only by Iowa. The following table shows the acreage, quantities and values of farm products for the year 1902:

Crops	Acres	Quantities	Values
Winter wheat ..... bu.	6,254,747	54,323,839	$28,983,943.60
Spring wheat ..... bu.	46,293	325,397	155,546.57

The numbers and values of live stock for the same year were: Horses, 811,594 — $51,130,422; mules and asses, 95,671 — $6,696,970; milch cows, 791,844 — $23,755,320; other cattle, 2,555,800 — $61,339,200; sheep, 136,753 — $410,259; swine, 1,427,302 — $11,775,241; total value, $155,107,412.

Kansas ranks well in the production of fruit and is surpassed by but few States in the growth of nursery stock. The number of apple trees in bearing in 1902 was 7,295,415; peach trees, 4,062,463; cherry trees, 852,268; plum trees, 641,977; pear trees, 247,515; number of acres in nurseries, small fruits and vineyards, 13,226.

Manufactures.— The natural material for manufacturing is limited. There are no timber lands of consequence, and no deposits of iron. Manufacturing, therefore, is confined to the conversion of farm products into marketable commodities, such as flour and meat, and these industries are important and extensive. Including the large plants at Kansas City, Kan., the slaughtering and meat packing business of the State for the year 1900 amounted in value to $77,411,883. The flouring and grist mill products for the same year aggregated a value of $21,926,768. Other manufacturing interests for the same year amounted to the following sums: Car construction and railroad shop work, $6,816,816; zinc smelting and refining, $5,790,144; foundry and machine shop products, $3,652,530. The total value of the products enumerated was $118,402,409, covering the work of 860 establishments and 18,288 employees.

Mineral Resources.— These consist principally of coal, zinc, lead, natural gas, petroleum, cement and gypsum. With the exception of the three last-named commodities the mining industry is chiefly located in the southeast corner of the State, embracing the counties of Cherokee,

Crawford, Labette, Bourbon, Montgomery, Chautauqua, Neosho and Allen. Cherokee leads in coal, lead and zinc; Crawford is second in coal, Allen is first in natural gas, and Neosho first in petroleum. Extensive mines of coal are also found in Osage and Leavenworth counties. Reno and Kingman counties have the principal salt mines. Building stone of excellent quality is found in various parts of the State. Underlying the surface of Kansas are the three common formations known as the Carboniferous, Triassic and Cretaceous systems, running from north to south, and dividing the State into three belts of nearly equal extent. In the year 1900 the value of the mineral products of Kansas were: Coal, $5,516,534; zinc, $3,000,000; salt, $1,675,000; clay, $975,500; stone, $714,750; natural gas, $695,000; cement, $669,685; oil, $355,118; lead, $324,859; gypsum, $267,500; total, $14,193,946.

Railroads.— The total mileage of railway tracks operated in Kansas is 10,483. The prominent lines and systems are: Atchison, Topeka & Santa Fe; Chicago, Rock Island & Pacific; Union Pacific; Missouri Pacific; Missouri, Kansas & Texas; Saint Louis & San Francisco. The gross earnings of all Kansas railroads for the year 1902 were $28,000,000.

Banking.— There are 502 State and private banks in Kansas, with a total paid capital of $8,156,500, and deposits of $47,690,056.14. The 146 national banks have a paid capital of $9,936,400, and deposits of $50,973,729; making a total capital of $18,092,900, and total deposits of $98,603,785.14, these figures being for the year 1903. Of the total deposits it is estimated that 68 per cent is owned by farmers and stockmen.

Education.— Kansas spends more than $5,000,000 annually in the support of public schools. The school population is 500,000, the enrolment 390,000, and the average attendance 265,000. Number of teachers employed, 11,698. The percentage of illiteracy in the State is very low, being less than 3 per cent. The colleges in the State are: Baker University, Baldwin; Bethany, Lindsborg; Campbell University, Holton; Highland University, Highland; Kansas Wesleyan University, Salina; McPherson, McPherson; Midland, Atchison; Ottawa University, Ottawa; Southwest Kansas, Winfield; Saint Benedict's, Atchison; Saint John's, Salina; Saint Mary's, Saint Marys; State Agricultural, Manhattan; State Normal, Emporia; State University, Lawrence; Sisters of Bethany, Topeka; Washburn, Topeka.

Religion.— All of the religious denominations are represented, the Methodist being the largest numerically, followed in order by the Roman Catholic, Baptist, Disciples, Presbyterian, United Brethren, Congregational, Lutheran, Friends, African M. E., and Evangelical Association. The moral standard of the population is very high, Kansas being one of the few States that has adopted an amendment to its constitution prohibiting the manufacture and sale of liquor.

Newspapers and Libraries.— Kansas has 837 newspapers, including 51 dailies, 634 weeklies, 4 semi-weeklies, 116 monthlies, 14 semi-monthlies, 2 bi-monthlies, 11 quarterlies, and 5 occasionals. Of public, college and high school libraries there are 112, with a total of 525,519 volumes.

Charitable and Penal Institutions.— The institutions of this class, and the numbers of inmates of each, are: Insane asylum, Osawatomie (990); Insane asylum, Topeka (780); Insane asylum, Parsons (430); Blind asylum, Kansas City (93); Imbecile school, Winfield (210); Deaf and Dumb school, Olathe (263); Soldiers' Orphans' home, Atchison (150); Soldiers' home, Dodge City (146); State penitentiary, Lansing (1,020); Industrial reformatory, Hutchinson (260); Industrial school, girls, Beloit (125); Reform school, boys, Topeka (209). The Federal government maintains a military prison and a branch of the national soldiers' home at Leavenworth.

Bibliography.— Andreas, 'History of Kansas' (1893); 'Biennial Reports of the Board of Agriculture of Kansas'; Ewing, 'The Struggle for Freedom in Kansas' (1894); Goss, 'History of the Birds of Kansas' (1891); Hale, 'Kansas and Nebraska' (1854); Hinton, 'John Brown and His Men' (1894); Haworth, Geological Survey of Kansas' (1896, et seq.); Hodder, 'The Government of the People of the State of Kansas' (1895); Holloway, 'History of Kansas' (1868); Inman, 'The Old Santa Fe Trail' (1899); Hutchinson, 'Resources and Development of Kansas (1871); 'Kansas Historical Society Collections (1881, et seq.); Phillips, 'The Conquest of Kansas' (1856); Prentis, 'History of Kansas' (1899); 'Public Documents of Kansas'; Robinson, 'The Kansas Conflict'; 'Kansas: its Interior and Exterior Life' (1899); Spring, 'Kansas' (1899); Thayer, 'The Kansas Crusade' (1899); Wilder, 'Annals of Kansas' (1886); Wilson, 'Eminent Men of Kansas' (1902).

James L. King,
Kansas State Librarian.

Kansas, a river in the State of Kansas, formed in Geary County by the junction of the Smoky Hill and Republican rivers. The direction of its course is mainly east; but it makes one gradual curve toward the north between Junction City, at the source, and Topeka. After a course of about 250 miles through a rich agricultural region, the river flows into the Missouri at Kansas City. The largest tributary is the Little Blue River from the north. Several small tributaries enter the Kansas from the south.

Kansas, University of, a State educational institution, situated at Lawrence, Kan. The establishment of a State university was provided for in the State constitution, and an act of the legislature incorporated the university in 1863. In 1865 a preparatory department was opened, and in 1866 one building was erected and the collegiate department established; in 1891 the preparatory department was discontinued. The present organization includes the school of arts, with classical and literary courses leading to the degree of A.B.; the school of engineering conferring the degree of B.S.; the graduate school giving advanced courses in arts and engineering; the school of law; the school of fine arts, offering courses in music, painting and elocution; the school of pharmacy; the school of medicine, offering the first two years of a regular four year medical course; and the summer session of six weeks. The university is the head of the State's public school system, and is in

CAPITOL AT TOPEKA.

direct connection with the high schools, admitting those who have completed the high school course, or a similar course, without examination; no tuition is charged to residents of Kansas, and the university is open to both men and women; non-residents pay a small fee. The library in 1903 contained 40,840 volumes and a large number of pamphlets; $7,000 are annually appropriated for the purchase of books; the natural history museum contains over 250,000 specimens. In 1903 the State appropriated $50,000 for a building for the law school. Number of students (1903) 1,294; number of professors and instructors, 81.

Kansas City, Kan., city, county-seat of Wyandotte County; on the Kansas and Missouri rivers, and on the Union P., the Missouri P., the Chicago R. I. & P., the Chicago G. W., and the Atchison, T. & S. F. R.R.'s. Branches of other railroads enter the city and the nearby towns are connected by electric-trolley lines. Kansas City, Mo., opposite and east is one with Kansas City, Kan., in commercial development, but each has an independent municipal organization. A large number of bridges connect the two cities. In one part of the city, east of the Kansas River and south of the Missouri, the dividing line between the two cities is a street.

Kansas City is the largest city (1904) in the State. It was formerly known as Wyandotte, later as Kansas City, Kan., then, in 1886 the municipalities of Armourdale, Armstrong, Wyandotte, and Kansas City, united under the name of Kansas City. The area is 10½ square miles. A portion of the city is built on the river bottoms, and many fine public and private buildings are on the high bluffs and extend back on the level land. The city is on both sides of the Kansas River, so the boundary line between the States of Missouri and Kansas is in part the boundary line between the twin cities. It is noted for its live-stock and meat-packing industries; but the second largest live-stock-interest establishments in the country are on the boundary dividing the two cities. Some of its other chief industrial establishments are railroad car shops, machine shops, grain elevators, smelters, iron and steel works, flour mills, soap and candle factories, box and barrel factories, foundries, wholesale grocery houses, slaughter yards, lumber and brick yards. The slaughtering and meat packing industries have a capital of $15,000,000. In the State, in 1902, the value of the meat packing industries was $77,411,883, nearly all of which was the output of the Kansas City establishments. The manufacturing products of the city represented, in 1902, about $85,000,000. The city is the seat of Kansas City University, established in 1896 by the Methodist-Protestants; the State Institution for the Blind; College of Medicine and Surgery; Saint Margaret's and Bethany hospitals; and Carnegie Library. It has fine public parks, a magnificent high school and excellent public and parish schools. In August 1902 the city was visited by a severe storm and over 200 houses were destroyed, and a large number of public and private buildings were injured. Pop. (1890) 38,316; (1900) 51,418.

Kansas City, Mo., the second city in the State of Missouri and the 22d in population in the United States, it is located in the northwestern part of Jackson County in the angle formed by the Kansas River at its junction with the Missouri. At the intersection of 14th and Washington streets, the latitude is 39° north and the longitude is 94° 36′ 16.18″ west. The name is derived from an Indian tribe that formerly occupied and owned much of this section of the country and their title to which was extinguished in 1808, excepting a narrow strip of land 24 miles wide lying eastward of the State line from Fort Clarke, later known as Fort Osage, and extending southward to the Arkansas River. The Indians relinquished their title to this strip of land in 1825, and in it lies nearly all of Jackson County.

History.—Trading posts had been established at different points along the Missouri River from 1765 to 1799 as far upward as what is now St. Joseph, by the adventurous French trappers and traders who first explored much of this western country. The settlers who had been checked at the eastern limit of the Kansas Indian Reservation made a general rush into the newly acquired purchase. In 1826 a census was taken with the view of forming a county organization which was effected 15 December in the same year. Prior to this date, however, Daniel Morgan Boone, third son of Col. Daniel Boone, the noted pioneer, came from Kentucky in 1787 to St. Louis, where he made his home for 12 years, residing there during the summers, but in winters hunting and trapping beaver chiefly on the Big and Little Blue, in Jackson County, which he declared to be the best beaver country known. However, it was reserved for Lewis and Clarke to give the first distinct account of the country at the mouth of the Kansas River and this record made by them, is dated 26 June 1804. In 1800 Louis Barthelot, known in the early history as Grand Louis, moved from St. Charles, Mo., and settled at the mouth of the Kansas River; his wife being the first white woman to have a home on the present site of Kansas City. In 1821, Francis Chouteau established a camp opposite Randolph Bluffs. A flood in 1826 destroyed his trading post where he had made the first permanent white settlement within the corporate limits of Kansas City. These settlers were trappers, traders, laborers, and voyagers with their families. What is now the busiest part of Kansas City was called at first Westport Landing. The town of Westport was platted in 1833, and lies about four miles south of the landing on the Missouri River. Kansas City proper, that is, 250 acres of land, was laid out in town blocks and lots in 1838, but owing to a disagreement among the stockholders the project was abandoned till 1846, when a new company was formed who advertised and sold 150 lots. The town began to grow and soon had 600 inhabitants. At this time the chief agency in building up the new town was the trade with the Indians and with New Mexico. Within the short space of five years the town enjoyed almost exclusively the entire trade of New Mexico that came east to the Missouri River. This traffic was along what was known as the "Santa Fe Trail" (q.v.), a highway, extending at first from Franklin, Mo., on the Missouri River, to Sante Fe, New Mexico. Outside of these French settlers who had established themselves in the vicinity of what is now Kansas City, was James H. McGee, who came here in 1828, and whose family was prominently identified with the early history and de-

velopment of this part of Missouri. There was not a sufficient infusion of the American spirit, however, for a number of years materially to affect the character of the early French traders who gave their attention to the extensive fur trade with the Indians as far west as the Rocky Mountains. Prior to 1828, the only means of crossing the Missouri River at this point was by canoes, but this year a ferry was established, so that the few settlers could cross the river to take their corn to a horse-mill on the north side of the river.

Topography.— The original site of Kansas City presented a rugged, precipitous and uninviting aspect,— high bluffs composed chiefly of limestone, facing the Kansas River as it sweeps in from the southwest, thence veering west of north till it empties into the Missouri River,— thence continuing along the south bank of the Missouri River four miles to the valley of the Big Blue. Through these high bluffs cut by deep ravines, in some places 200 feet deep, ran streams into the river. These gorges were the channels through which the water that fell on the upland, flowed into the Missouri. Towering upward from the two rivers, stood the precipitous bluffs with but a few hundred feet in width of bottom land on which to begin a city. Just below where the Kansas River empties into the Missouri, the bluffs for a mile or more were composed chiefly of a rich loam which has been shaved down to a moderate grade and the dirt made into brick. Owing to the changeable nature of the Missouri River in cutting through the bottom land on either side of it, the town had to be built between the river and the bluffs, along the deep ravines, and on the hills. Persons who see the city as it is now, can scarcely realize the obstructions that had to be removed in grading down streets to a level and in filling cuts. The city is topographically divided into three parts, known locally as the Hills, including all that part of the town on the highlands, extending east and south into level upland which is of great beauty; West Kansas City, including the lowlands lying between the State line on the west and the east bluff of the Kansas River, and the East Bottom which takes in all the lowland lying east of the foot of Grand Avenue where it runs to the Missouri River, were originally covered with dense forests, as indeed was the entire town site, and it was not till after the Civil War that the timber was cut off the West Bottom; since then it has become the busiest part of Kansas City in which are located the stock yards, elevators, the most of the passenger and local freight depots, and a large part of the wholesale business houses of the city. From its earliest history as Westport Landing, Kansas City was noted for its steamboat traffic. It had one of the most permanent landings on the river, — a rocky bank with a deep current in front of it. Here were landed the goods for the Mexican and Indian trade West and Southwest, and in exchange were received the wool, furs, buffalo robes, and other articles for the eastern markets. The location of the city at the most southern bend eastward in the Missouri River, even before the age of continental railroads, was the natural route through which the Sante Fe and the Indian trade of the West and Southwest must pass to be exchanged for the products these people desired.

Commerce.— The men who have contributed so much toward making Kansas City the metropolis of the Missouri Valley turned their attention to the grain and produce market of this vast region thirty years ago. From an insignificant local trade in 1871 of a few hundred thousand bushels of grain handled that year, the business has grown now to 50,000,000 bushels annually. In 1902 there were received 24,018,400 bushels of wheat, 16,092,800 bushels of corn, 8,358,000 bushels of oats, 376,800 bushels of rye, 33,000 bushels of barley, 99,200 bushels of flaxseed, 15,060 tons of bran, and 146,320 tons of hay, while the export of grain was 36,206,400 bushels. In the elevators and mills the storage capacity is 6,320,000 bushels, and the handling capacity,— 1,518,000 bushels, while the total mill products aggregate 1,692,854 barrels. The numerous grain elevators enable the railroads to handle and transport grain to other points with facility and despatch. Its title as the "greatest winter wheat market", is known in foreign countries to which millions of bushels of Kansas, Nebraska, Missouri, and Oklahoma grain are annually shipped by Kansas City exporters. It is not alone as a centre for the accumulation of wheat, corn, and oats that it is famous, but also as a distributing point for cereals to be consumed in the south, east, and in foreign markets. The flour and meal manufactured by the half dozen local mills also go abroad in large quantities, as well as to many parts of the United States. The milling business is one of the rapidly growing industries. Enormous capital is involved in the transaction of the grain business. In elevators alone the investments run into millions of dollars. The growth of this market since its inception in 1871 has been marked by a uniform and rapid progress until it is one of the most important grain markets in the United States. Kansas City's bank clearings are more than $1,000,000,000 annually, and the deposits exceed $70,000,000 in 19 different banks, having a paid up capital of $6,000,000. At present Kansas City occupies the second position in the world as the leading live stock market. The stock yards are the most convenient for the quick and safe handling of stock in the United States. The aggregate value of live stock handled last year was $126,250,000. The packing-houses are eight in number, having a combined capacity for daily slaughter of 12,300 cattle, 34,500 hogs, and 14,200 sheep. These products are marketed in every civilized country. The stock yards cover 200 acres, containing 1,200 cattle pens, 625 hog pens, and 300 sheep pens. The receipts of cattle at the stock yards for 1902 were 2,279,166; hogs 2,279,337; sheep 1,154,084; horses and mules 76,844; shipped in 117,730 cars. The cost of the packing plants is estimated at $12,000,000, and the number of hands employed approximates 12,000; while the annual value of the output is over $150,000,000. In 1902 the wholesale trade of Kansas City exceeded $100,000,000, and the retail trade $45,000,000. Seventy firms did a business of $16,000,000 in agricultural implements. The geographical location of Kansas City with respect to other centres of trade is represented as follows: — distance to St. Louis 273 miles, Chicago 428 miles, Cincinnati 614 miles, Omaha 205 miles, St. Joseph 63 miles, St. Paul 515 miles. Minneapolis 518 miles, Albany 1,267 miles, Buffalo 981 miles, Boston

1,459 miles, New York 1,303 miles, Philadelphia 1,213 miles, Washington 1,267 miles, Pittsburg 896 miles, Atlanta 902 miles, Galveston 962 miles, New Orleans 942 miles, Denver 633 miles, Los Angeles 1,805 miles, San Francisco 2,093 miles, Portland, Ore., 2,050 miles.

Railroads.— Twenty different railroad systems enter the city, operating 33 different lines, representing more than 50,000 miles in length. The magnitude of this business may be inferred from the fact that 200 passenger trains arrive and depart daily from the depots, while 350 freight trains come into and go out of the freight yards, thus rendering Kansas City one of the greatest and most important transfer and distributing points on the continent, as well as one of the greatest express centres. Two railroad bridges span the Missouri River and a third is in process of construction. In telegraphic communication Kansas City is only surpassed by New York and Chicago in the number of wires entering the city and in the volume of business transacted.

Manufactures.— It has only been of recent years that manufacturing industries have sprung up along various lines in Kansas City. The energies of the business men were directed for two decades after the close of the Civil War to the live stock and agricultural trade, and in supplying the farmers with agricultural implements. Owing to the great deposits of bituminous coal in this vicinity and the abundance of raw material out of which so many products can be economically and rapidly manufactured, new industries are springing up each year. There are more than 600 factories in operation, employing 30,000 hands, who make $200,000,000 worth of merchandise annually. The minor manufactures represent an invested capital of $26,437,307, and output of $36,527,392, employing more than 16,000 persons.

Government.— At the head of the city government is the mayor, whose term of service is two years, upper house of aldermen, consisting of 14 members, whose term of service is four years, elected at large; lower house councilmen, 14 members, term of service two years; city treasurer, auditor, police judge, and city attorney, elected biennially. The other officers are nominated by the mayor and confirmed by the upper house. The board of park commissioners, the chief of the fire department, engineer, city physician, superintendent of buildings, superintendent of streets, plumbing inspector, superintendent of workhouse, etc., are appointed by the mayor and confirmed by the upper house. The board of police commissioners is composed of three members, the mayor, and two citizens appointed by the governor.

Public Service.— The assessed valuation of property is $93,260,070, an increase of more than $30,000,000 since 1893, and this valuation represents about one fourth of the cash value. The municipal indebtedness of the city is $5,331,900.00, the greater part of which is for the waterworks plant. The city is also the owner of much valuable property, including the city hall, hospital, the workhouse grounds, and parks. The comptroller's last report shows the expenditures for operating expenses of the several departments: Officers and employees, $99,000.00; police department, $280,000.00; fire and fire patrol, $249,000.00; hospital and board of health, $35,000.00; workhouse, $17,000.00; printing and stationery, $18,000.00; board of public works, $200,000.00; gas and street lighting, $100,000.00; parks, $48,000.00; garbage, $20,000.00; expense, $56,000.00; water department, $453,409.00. The city purchased the waterworks in 1895. The water used is obtained from the Missouri River at Quindaro, a pumping station eight miles up the river. During 1902 there were 19 miles, 1,667 feet of water mains laid, and 283 fire hydrants placed. The street railway service, which permeates all parts of the city, connects with suburban trolley lines, reaching Independence, Leavenworth and intermediate stations, and affords a means of rapid transit for a quarter of a million of people at a nominal expense. The revenue to support the municipal government is derived from taxes levied annually on personal and real property, and the annual tax levy is about 12½ miles on the dollar's valuation. The city has an area of 26.3 square miles, with 452 miles of streets, of which 117.55 miles are paved with asphalt, 39.65 miles with vitrified brick, 2.24 miles with stone blocks, and 39.17 miles with macadam.

Population.— The following figures show the steady progress with which year by year Kansas City has advanced to her proud position as the largest and most important city in the Missouri Valley. The population in 1838 was 300; (1846), 700; (1857), 2,000; (1860), 4,418; (1870), 32,260; (1880), 55,785; (1890), 132,716; (1900), 163,750. The death rate is exceedingly low, being 12.84 of every 1,000 inhabitants.

Religion.—In 1825 the Jesuit fathers organized a mission near the mouth of the Kansas River, and built a small log house near the foot of what is now Troost Avenue, just below the bluff, where they worshipped for several years. Father Roux came in 1830 and took charge of the congregation, and five years later he purchased from a Canadian Frenchman a tract of 40 acres upon the hill adjoining the present site of the Roman Catholic cathedral and the bishop's residence. A part of this tract was cleared of the heavy timber, and a log church was erected, and here the congregation, composed chiefly of French-Canadians and half-breeds, scattered over more than 400 square miles, worshipped for 20 years. As soon as the Indian land was purchased settlers poured into it from the settlements east of it. Other religious denominations came till at the present time the number of churches in Kansas City is 180. The following will show the number of religious organizations: Baptist (32), Christians (15), Christian Scientist (3), Congregational (10), Episcopal (8), Evangelical (4), Hebrew (4), Lutheran (4), Methodist Episcopal (25), Methodist Episcopal South (8), Presbyterians (16), Reformed (1), Roman Catholic (20), Universalists (3), Unitarians (1), miscellaneous (23).

Public Schools.— The present public school system was organized 1 Aug. 1867, and in October of that year the schools were formally opened in rented rooms which had been hastily and scantily furnished. Bonds were issued, sites were purchased, and school houses erected. Sixteen teachers were employed during the first year, and about 1,200 pupils were enrolled. From this small beginning the school district has been enlarged till there are 52 different public school buildings, including sites valued at $3,347,390, with an enrolment of 29,591 pupils,

of whom 3,700 are in the four high schools, being the largest per cent of high school pupils in any city in the United States having a population of more than 100,000 inhabitants. There are 718 teachers employed in the public schools. The public library, in which there are 43 persons employed, is also under the control of the board of education. In addition to the public school system, there are 60 other schools of various kinds, including private and parochial schools, medical and dental colleges, commercial schools, a school of oratory, fine arts, and an excellent school of law. Politics has been kept out of the city schools, and this is due largely to the plan suggested in 1876, when Superintendent Greenwood proposed that a non-partisan board composed of three Republicans and three Democrats be elected, and the board has been thus kept ever since. There are 850 persons employed in various capacities in the public schools and the public library, and the cost of operating the schools and public library is $663,979.52. It is a noteworthy fact that since the organization of the board of education 36 years ago with six men serving all the time, only 29 different men have composed its membership. Two members are elected every two years, and the term of service is six years. Kansas City was the first city in the United States to make its school board non-partisan.

Parks and Cemeteries.— The city has spent nearly $6,000,000 for its parks, which contain 2,089.9 acres, divided into six park districts: The North Park District, 219.39 acres; South Park District, 148.40 acres; West Park District, 165.07 acres; East Park District, 66.24 acres; Westport District 136.80 acres; Swope Park District, 1,354.00 acres. The system is divided into 19 different parks, nearly all of which are connected by an extensive system of 15 boulevards in connection with parkways, speedways, and pleasure resorts. Located in different parts of the city and easy of access are eight cemeteries, the largest of which are Union, Elmwood, St. Mary's and Forest Hill.

Public Buildings.— Among the public buildings are Convention Hall, which will seat 25,000 persons; city hall, county court-house, post-office, public library, Board of Trade building, New York Life building, Central high school, and the Manual Training high school, four large theatres, and also libraries and reading rooms. The public library, art gallery and museum, located at Ninth and Locust Streets, cost $250,000, and is under the management of the board of education. There are 90,000 volumes in the library, paintings in the art gallery of the value of $200,000, and a rare collection of natural history specimens in the museum, especially rich in Indian curios. There are 30 hospitals, asylums and homes. A large per cent of the citizens own their own homes, which adds to the civic pride and the material prosperity of the city.

J. M. GREENWOOD,
Supt. of City Schools, Kansas City.

Kansas-Nebraska Bill, a bill passed by Congress in 1854; the last of three compromises between the aggressive slavery expansionists of the South and their antislavery opponents in the North. It is famous because, by its repeal of the first, the Missouri Compromise (q.v.), it precipitated the organization and rapid growth of the Republican party, and especially incited the radical abolition sentiment of the North to aggressive action, thus causing or hastening the secession of the Southern States and the resulting Civil War. Its passage was mainly due to the leadership of Stephen A. Douglas (q.v.), of Illinois. The second compromise occurred when New Mexico and Utah came to be organized as Territories in 1850. The compromise consisted of the provision, which was also one of the two principal features of the Kansas-Nebraska Bill, that when these Territories came to be admitted as States they should come in with or without slavery as their constitutions, which would be framed by the people, might prescribe. The strengthening of the fugitive-slave law was the other feature of this compromise. This settlement of 1850 was the first step toward the final compromise, the Kansas-Nebraska Bill.

As early as 1844 Stephen A. Douglas introduced in the House of Representatives a bill "to establish the Territory of Nebraska," and Douglas afterward asserted that he took this method of serving notice on the secretary of war to discontinue using that Territory as the dumping-ground for Indians. In 1848 Douglas, now chairman of the Committee on Territories in the Senate, introduced in that body a bill for the same purpose. In December 1851 Willard P. Hall of Missouri gave notice in the House of a bill for the organization of Nebraska; but none of these bills got beyond the committee stage. On 2 Feb. 1853 William A. Richardson of Illinois, the leading lieutenant of Douglas in the House, introduced still another bill "to organize the Territory of Nebraska." This bill, which, like all of its predecessors in question, made no reference to slavery, passed the House, 10 Feb. 1853; but in spite of the strenuous endeavors of Douglas in its behalf, it failed of consideration in the Senate. The long debate over this bill in the House disclosed clearly that the primary object of members from the Northwest, who were its champions, was to protect and encourage travel over the great upper line to the Pacific coast, and make way for the ultimate construction of the already much talked of Pacific railroad; while members from the South, and especially from the Southwest, were bent on keeping this northern region open for the colonization of their undesirable Indian tribes, with the purpose of securing travel and the railroad to the Pacific coast through their own country.

Early in the session of the next Congress — 14 Dec. 1853 — Senator Dodge of Iowa, a coadjutor of Douglas in this enterprise, introduced "a bill to organize the Territory of Nebraska." This bill also originally contained no reference to slavery; but by amendment it became the famous Kansas-Nebraska Bill, which finally became a law 30 May 1854. On 4 Jan. 1854 the Senate Committee on Territories, through Douglas, reported a substitute for the Dodge bill which contained the compromise provision of the Utah and New Mexico acts; namely, that "the Territory of Nebraska, or any portion of the same, when admitted as a State or States, shall be received into the Union with or without slavery, as their constitutions may prescribe at the time of their admission." In his famous report, accompany-

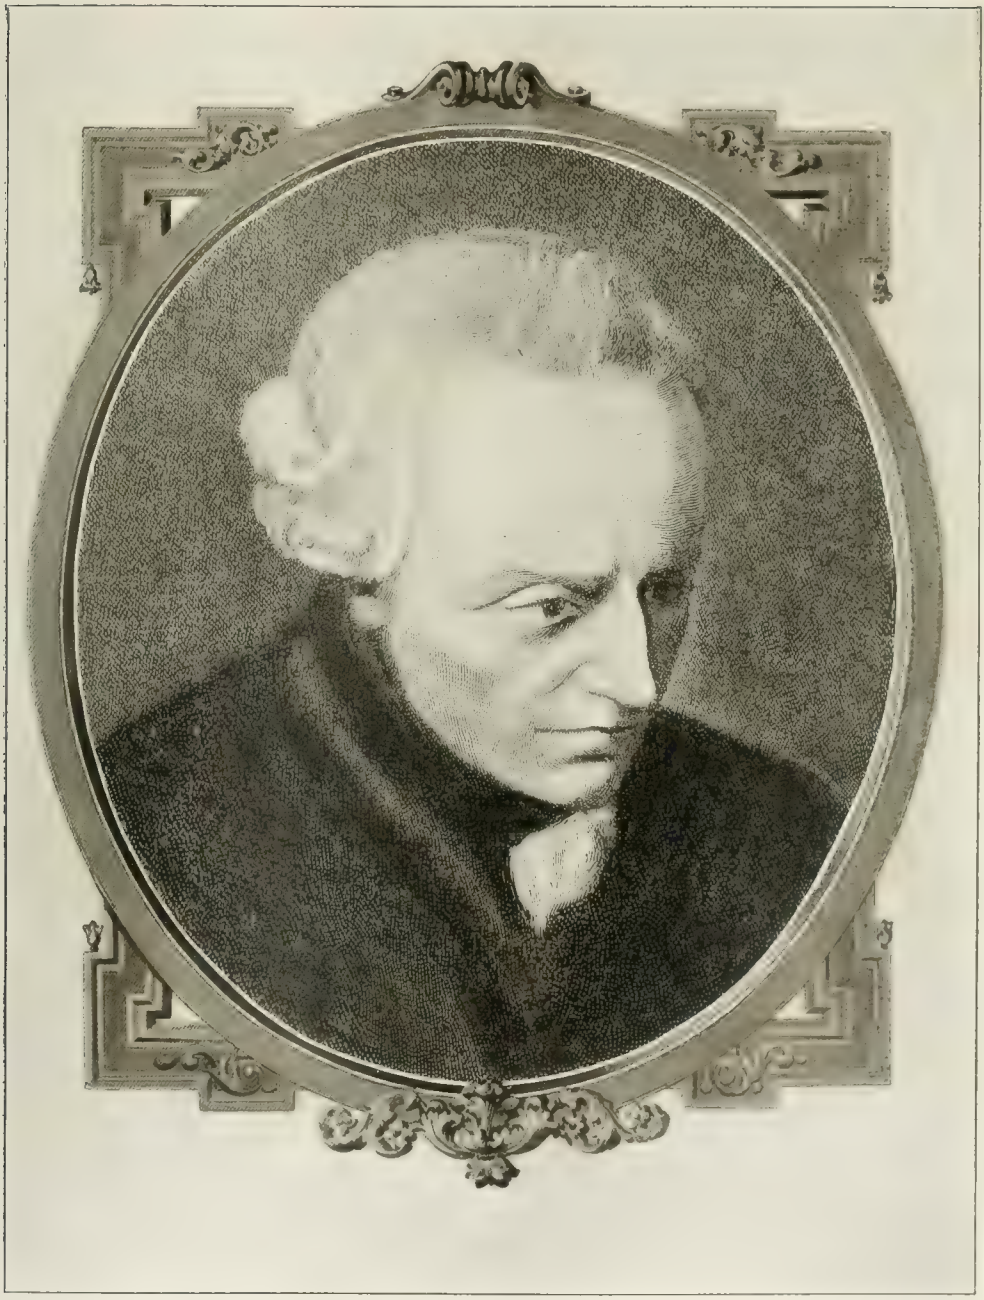
ing this bill, Douglas points out that "eminent statesmen hold that Congress is invested with no rightful authority to legislate upon the subject of slavery in the Territories, and that therefore the 8th section of the Missouri Compromise is null and void; while the prevailing sentiment in large sections of the Union sustains the doctrine that the Constitution of the United States secures to every citizen the inalienable right to move into any of the Territories with his property of whatever kind or description, and to hold and enjoy the same under the sanction of law." The report pointed out also that under this section it was a disputed point whether slavery was prohibited in the new country by valid enactment, and advised against the undertaking by Congress to decide these disputed questions. The bill was further amended so as to provide that all questions pertaining to slavery in the Territories and the new States to be formed therefrom be left to the decision of the people residing therein; that cases involving title to slaves be left to the courts; and that the provision of the Constitution in respect to fugitive slaves should be carried out in the Territories the same as in the States. On 16 January Senator Dixon of Kentucky offered an amendment, which was accepted by Douglas, expressly repealing the slavery restriction clause of the Missouri Compromise; and the bill passed with these amendments.

The repeal of the Missouri Compromise restriction was hotly denounced by the anti-slavery element, and was seized with alacrity and used with great effect as a political weapon by antislavery agitators and politicians; and Douglas was also savagely denounced for selfish subserviency to the South for the sake of winning the Presidency. But Douglas and his friends ably and plausibly defended the repeal of the Missouri restriction on the ground that it was consistent with and the natural sequence of the popular sovereignty compromise of 1850; that there was danger that it would be held unconstitutional by the courts; that there was ground for fear that Dixon's amendment, as he proposed it, would legislate slavery into the Territories, and that on the whole Douglas, as leader of the dominant party, and having regard to the preservation of the Union as well as to the vexatious slavery question, made the safest and best terms practicable in securing the right of the people to decide the question of slavery for themselves. In the course of the debate on the bill Douglas, as well as Thomas H. Benton, who was opposed to the repeal of the Missouri restriction, insisted that, left to the people, slavery could never be successfully introduced into Kansas or Nebraska.

Impartial consideration of all the facts bearing upon this phase of the question leaves no ground for the charge preferred by leading historians and others that the proposed Nebraska Territory was at last divided into Kansas and Nebraska at the instance of Southern members to gain opportunity to make Kansas a slave State. The "provisional" delegate in Congress at that time from Nebraska, well known by still living contemporary citizens of the Territory as a reliable man, in his published account of his part in the transaction asserts that, before he went to Washington to attend the session of December 1853, it was agreed among the enterprising citizens of western Iowa — there were then no citizens of Nebraska — who were pushing the project for Territorial organization, that division was desirable so that one of the Territories might be directly opposite their State, and that he urged this change upon Douglas, who assented to it. In the debate on this feature of the bill Senator Dodge of antislavery Iowa and Representative Henn of the Iowa district bordering on Nebraska urged the division for the frankly expressed reasons that it would be to their advantage to have the capital of an important commonwealth opposite them, and would aid in securing the route of the Pacific railroad through their part of the country; while the representatives of slave-holding Missouri were indifferent to the question of division. Douglas himself specified the wish of the Iowa members as the basis of his reason for the division of the Territory. It is significant, moreover, that Douglas had always stood for a northern Territory, as shown by his original bills of 1844 and 1848. It is a very significant fact that the northern boundary of the Territory in each of these bills was the 43d parallel, which is identical with the northern boundary of the present State; and that the southern boundary described in the bill of 1848 was also identical with the same boundary of the State, while the southern boundary described in the bill of 1844 was only two degrees farther south. These and other incidents of a like kind show a remarkable prescience and a persistent consistency in interpreting the wishes and interests of those most directly interested in the Territory opposite the State of Iowa and on the line of the great natural highway connecting Chicago, the commercial mart of the Northwest, and the home of Douglas, with the Pacific coast. Mr. Henn in resenting "the unjust charge made on this floor by several that it (the proposed division) was the scheme of Southern men whereby one of the States to be formed out of these Territories was to be a slave State," put the case concisely: "The bill is of more practical importance to the State of Iowa and the people I represent than to any other State or constituency in the Union."

The Kansas-Nebraska Bill was also distinguished by more completely safeguarding the rights of Indian occupants than any previous Territorial organic acts had done; and likewise in being the first Territorial bill of that class which provided for the choice of the members of both houses of the legislature by popular election, to drop the provision requiring the submission of all acts of the legislative assembly to Congress for approval. The Territory organized by this bill comprised all of the unorganized part of the Louisiana Purchase north of the 37th parallel, which comprised all of the Purchase north of that line except the States of Iowa and Missouri, and that part of the Territory of Minnesota between the Mississippi River on the east and the Missouri and White Earth rivers on the south and west.

ALBERT WATKINS,
Editor 'History of Nebraska.'



Kansas State Agricultural College, a co-educational institution, located at Manhattan, Kan.; established in 1863 by the presentation to the State of Bluemont College. The college has excellent opportunities for experimental works as it cultivates 544 acres of land; 323 acres of which is owned by the college, and 221 acres

leased. It is not a classical school; the departments, the courses of which lead to the degree of bachelor of science, are agriculture, English, mechanical and electrical engineering, general and domestic science. It has also a preparatory department, a music school, and a trade school. It has several short courses, as: dairying, 12 weeks in winter; agriculture and mechanics, 12 weeks in winter, for two years; horticulture and mechanics, 12 weeks in winter, for two years; and domestic science, 12 weeks in fall, for two years. The faculty numbered in 1902, 59, and the number of pupils in attendance was 1,400. The school has no income from tuitions; but receives from the State $22,700; from the "Land Grant Fund" of 1862, $32,300; and by the United States Appropriation Act of 30 Aug. 1890, $25,000, making a total annual revenue of $80,000. It received also for the experiment station (United States Act of 2 March 1887) the sum of $15,000. A weekly periodical, devoted to the interests of the subjects taught in the school, and called the 'Industrialist,' is published by the faculty. The library has about 25,000 volumes, and the value of the college property is about $600,000.

Kansas Wesleyan University, a coeducational institution, founded in 1886 under the auspices of the Methodist Episcopal Church, at Salina, Kan. In 1905 there were connected with the school 35 professors and instructors, and pupils in attendance 1,015. There were in the library 6,000 volumes.

Kant, Immanuel, one of the greatest of modern philosophers: b. Konigsberg, Eastern Prussia, 1724; d. there 1804. His father, who spelled his name Cant, was a poor saddler, and was said to be of Scottish origin, though this is denied by some authorities. Kant was educated in his native city at the Collegium Fredericianum and the University. After the completion of his studies at the University in 1746, he was a tutor in private families until 1755, when he became a teacher in the University. He did not receive a professorship, however, until 1770, when he was appointed to the chair of logic and metaphysics. In 1797 he retired from teaching. In the University he lectured at first on mathematics and physics in addition to the various philosophical subjects, and later added courses on physical geography and anthropology, lecturing also occasionally on pedagogy. He was small and weak physically; but by imposing upon himself a strict regimen he was able to accomplish a vast amount of work, and to live to be eighty years of age.

Kant's Critical Philosophy is contained in his three Critiques,— 'Kritik der reinen Vernunft' (1781) (Critique of Pure Reason, most important of all); 'Kritik der practischen Vernunft' (1788) (Critique of Practical Reason), and 'Kritik der Urtheilskraft' (1790) (Critique of Judgment). In these works Kant passed beyond the Rationalism (q.v.) of Wolff, in which he had been educated, and the Empiricism (q.v.) of Hume (q.v.), to which he had for a time been inclined, and originated the transcendental method of philosophy. For him there is no knowledge without experience; but experience is a compound, and implies not only a matter given in sensation, but also forms and principles of arrangement and synthesis which come from the mind. Experience gets its character from the knowing mind, and to understand the objects of ordinary experience it is necessary to know what forms and principles the mind employs in constructing them. Kant's transcendental inquiry, then, asks what the nature of the mind must be, our experience being as it is. He finds that experience can be understood only on the assumption that the mind has certain *a priori* forms and principles which belong to its very nature. These Kant calls transcendental elements of experience, and the procedure by means of which he attempts to discover these and demonstrate their application in experience he names a transcendental method of inquiry. It is necessary carefully to distinguish Kant's use of "transcendental" from what he calls "transcendent." As we have seen, transcendental elements do not themselves depend upon experience, but belong to the mind as the forms and principles which all experience presupposes, and through which alone it is possible. The transcendent, on the other hand, is that which lies beyond the sphere of all possible experience, and consequently that which can never be known. Kant's purpose in the 'Critique of Pure Reason' is at once to discover the transcendental forms of experience, and thus justify its validity, and to criticize and overthrow the false pretense of knowledge which professes to deal with transcendent objects. With respect to the first of these purposes Kant's undertaking was epoch-making, for he introduced a change in the point of view which he himself likens to that which Copernicus effected in astronomy. Whereas it had previously been held that the object had a fixed form and constitution which the mind in knowing had to passively copy, Kant teaches that objects to be known at all must conform to the concepts and principles of the knowing intelligence. In order to understand the nature of experience, then, it is necessary to ask what are the mind's ways of knowing, and what are the *a priori* forms and concepts under which it brings objects? In answering this question Kant makes a sharp division between perceptive knowledge and knowledge gained through concepts. It is true that he goes on to break down the grounds for this distinction by showing that neither perception nor thought can give knowledge apart from the other,—that "concepts without perceptions are empty, and perceptions without concepts are blind." Nevertheless, he himself always maintains this dualism in the constitution of experience. The transcendental basis of each form of knowledge is therefore investigated under a separate division of Kant's work, that of Perception in the 'Transcendental Aesthetic,' and that of conceptual experience in the 'Transcendental Analytic.' In Perception, the transcendental forms are found to be space and time. Space and time are not objective entities existing apart from the mind; nor are they concepts or general ideas. Kant shows that perceptive experience such as ours is only possible if we regard space and time as belonging to the mind as forms of perceptive arrangement. Space and time do not belong to objects in themselves, therefore, apart from their being known, but are the universal forms under which all perceptive experience is known. But, for experience, ob-

IMMANUEL KANT.

jects must be *thought* as well as perceived. That is to say, what we call experience is not a mere series of perceptively arranged objects, but a unity whose parts have been systematized by thought in accordance with certain principles or points of view which it supplies. These transcendental principles, or points of view, Kant calls the Categories of the Understanding. Since to think is to judge, in order to discover the complete list of Categories he falls back upon Aristotle's classification of judgments under the headings of Quantity, Quality, Relation, and Modality. To each of these general divisions again three categories belong, so that Kant presents his list of twelve categories with a great show of system and completeness, which however has no real warrant. Apart from the fact that there are several obvious repetitions and some omissions in the list, Kant does not find any organic relation between the different categories, such as might be shown to exist, for example, by exhibiting them as successive stages in the evolution of thought. It is true that Kant tells us that all of the categories are subordinated to the central unity of consciousness, the "transcendental Ego" or "transcendental unity of Apperception," but he never explains concretely the relation of the various categories to each other and to this unity. The "transcendental Ego," the supreme category, is not a thing or an unchanging soul-substance, but an immanent and ever active principle of organization. It is impossible to make an object of it, or to describe it as something existing by itself; for it exists only in relation to experience. It is at once the persupposition and the necessary correlate of a coherent and unitary experience of objects, a universal principle, not a particular substance.

The world of objects which is thus constituted through the forms of perception and the categories is only phenomenal; that is, only the world as it appears to us, not the world of things-in-themselves. These things-in-themselves always remain for Kant a real background with which he contrasts the world of phenomena. We can *know* only phenomena, but we are obliged to *think* things-in-themselves as existing, though we cannot give them any positive determination. Kant seems to regard them as the causes of the sensations which arise in the mind. But, since casuality is a category supplied by the mind, it can only apply to objects as known, and hence cannot consistently be taken to apply to things-in-themselves. It is very difficult to make Kant consistent on this point. It is certain that he continues to contrast the world as known with a more ultimate form of reality which remains beyond the sphere of knowledge but whose certainty is guaranteed by faith or practical reason; and it is equally certain that the spirit of his philosophy tends to break down the very opposition which he has set up so carefully.

The Understanding (*der Verstand*), as Kant says, is the faculty of rules. It is its function to reflect on the objects presented to it by sense-perception in order to find the rule or category according to which one part can be united to another. But its objects must always be given to it in sense-perception, and it can do nothing but unite one object as given in space and time with another according to some general rule. From the very nature of the case, then, it can never complete its task and rise to deal with and determine the nature of a real totality. Its concern is always with phenomena, with objects in space and time and their synthesis; and, as these extend indefinitely, the understanding, therefore, never can find rest in the establishment of a completed totality. Now for Kant the limits of the Understanding are the limits of valid knowledge. We cannot know anything but phenomena and the laws of their connection. But there is another theoretical faculty which he opposes to Understanding under the name of Reason (*die Vernunft*). This is the great source of illusion. Reason transcends the sphere of the Understanding and attempts to find for objects an unconditioned basis in the ideal or Idea of an absolute and non-phenomenal unity. In this it has a certain justification as affording an ideal of unity towards which the Understanding must always strive in its investigations; but it leads to illusion when this Idea of a unity is taken as a real object of knowledge and positive determinations are ascribed to it. Kant proceeds to apply this criticism in detail to the so-called sciences of the Rationalism (q. v.) of his day,—psychology, cosmology, and theology,—pointing out that all these are illusory, since they are based on concepts of objects (the soul, the world, God) that lie beyond the sphere of possible experience. The conclusions drawn by rational psychology regarding the simplicity and immortality of the soul Kant rejects as "paralogisms." For, as he shows, we have no valid concept of the soul as a thing or substance, upon which to base our conclusions. The 'transcendental ego' is not something which can be determined as a soul-substance or an object of a particular kind. It is always subject and never object,—the universal presupposition of experience, not an experienced thing; for an object can only be known when a sensation corresponding to it is given or may be given in experience. All the wisdom of rational psychology, which is based on the pure concept of the soul, Kant therefore rejects. In the same way he shows that over against the various theses demonstrated by rational cosmology regarding the nature of the world as a whole (that it is limited in time and space; is composed of simple parts; that in addition to natural causality it admits of free causality; that it has a necessary ground), the antithesis or direct contradictory of each proposition can be demonstrated with equal cogency. The inevitable contradictions which thus result in the field of cosmology when we attempt to go beyond possible experience and make assertions regarding the world as a whole, Kant names the "Antinomies of Pure Reason." Those regarding the extension and divisibility of the world disappear as soon as we remember that space and time do not belong to things-in-themselves, but are only forms of perceptive experience. With regard to the possibility of freedom Kant points out that although the principle of natural causation must hold without exception of phenomena, the question still remains open whether freedom may not find place in the intelligible world of things-in-themselves. This question cannot be answered on theoretical grounds but remains a mere possibility which can only be settled by appealing to practical

considerations. Kant's criticism of theology is still more famous. He finds that all the proofs for the existence of God may be classified as the Ontological, the Cosmological, and the Teleological. He shows that none of these proofs is valid from a logical point of view, and that the existence of God is therefore incapable of theoretical demonstration.

These negative conclusions are not, however, the goal of Kant's inquiry. As he himself said, he sought only to remove the false pretense of knowledge in order to prepare the way for rational faith. Knowledge, as we have seen, deals only with phenomena; regarding the nature of ultimate realty cognitive experience is silent. In the 'Critique of Practical Reason' Kant shows that our experience as practical and moral beings, which recognizes an absolute obligation to obey the moral law, has implicit in it certain presuppositions regarding our own nature and the nature of ultimate reality. In the first place, our recognition of the absolute authority of the moral law and our obligation to obey it, presupposes that we have the power to do so. Moral obligation would have no meaning for a being whose will was not free. In the same way, Kant shows that moral experience implies a belief in God as the moral governor of the universe, and in immortality as affording an opportunity for the demands of the moral law to be progressively realized. Thus these problems which cannot be demonstrated on theoretical grounds find their solution from the point of view of practical experience. God, Freedom, and Immorality are never matters of knowledge or science, but moral certainties or matters of faith. One constantly finds in Kant's writings a tendency to make sharp divisions, to separate experience into different spheres. He contrasts and opposes to each other a "phenomenal" and an "intelligible" world, and again, "knowledge" and "faith" without any effort to bring these divisions again into relation. It is true that in the 'Critique of Judgment,' (where he discusses the nature of æsthetic experience, and the question whether we can apply the conception of purpose to the interpretation of the organic world). Kant does at least suggest a synthesis of the two opposing points of view. The spirit of his philosophy really transcends the opposition between phenomena that can only be *known* through mechanical categories, and an unknowable ultimate realty where we may *believe* that freedom and the realization of ideals are possible. But, even in the third 'Critique' his formal treatment is unsatisfactory, and at least the letter of his treatment appears to maintain the opposition to the end.

In addition to the three Critiques, Kant's most important works are the 'General History of Nature and Theory of the Heavens' (1755), in which Laplace's mechanical account of the evolution of the planetary systems is anticipated; (translation by W. Hastie with an introduction under the title of 'Kant's Cosmogony' (1900); the 'Dissertation' of 1770, which inaugurates the critical movement; and the 'Prolegomena,' published in 1783, as a popular exposition and defence of the first 'Critique.'

There is an immense bibliography, largely German, of works on Kant, which is given in Ueberweg-Heinze's 'History of Philosophy.' The general reader may consult, in English, the standard histories of philosophy and the following works: F. Paulson, 'Kant's Life and Doctrine' (1902); E. Caird, 'The Critical Philosophy of Kant' (2 vols., 1889); W. Wallace, 'Kant' (in Blackwood's 'Philosophical Classics'); J. Watson, 'Kant and His English Critics' (1881). James E. Creighton,
Professor of Philosophy, Cornell University.

Kantemir, Antiokh Dmitrievich, Russian diplomat and author; b. Constantinople, 1708; d. Paris, France, 1744. He was the son of the Hospodar of Moldavia, who emigrated to Russia in 1711 after the Peace of Pruth. He was fully educated and while still young, through the favor of Peter the Great, became an officer in the Preobrazhenski Regiment. In 1733 he became minister-resident in London, and in 1738 ambassador to France at Paris, where he became associated with the leading thinkers and writers of the day. It was probably this association which led Kantemir to use the French style in his writings, as was also done by the majority of the Russian writers of the 18th century. He was one of the first writers of the pseudo-classical period of Russian literature and brought to it, particularly in his verses, a syllabic metre which contains stress-accents only and had no short or long vowels. As a youth he had become known as a brilliant satirist, and later reputation largely rests on nine satires, all of which were both fresh and vigorous. The most widely known of these satires is 'To My Intellect.' He was also well known as a translator of the odes of Horace, Juvenal, Anacreon and others. His works were published by Yefremoff, with biography (2 vols., Saint Petersburg 1867), and also translated into German by Spilcker (Berlin 1752), and into French (1749).

Kaolin, a hydrated silicate of alumina or clay, which burns to a pure white and is suitable for the manufacture of white earthenware and porcelain. It is formed as a residual deposit of the decomposition of feldspar. The chief deposits are in Cornwall, England. See Clay, China, Porcelain, Pottery, etc.

Kapnist, Vasilii Yakovlevitch, Russian poet, author, and satirist: b. Obukhovka, government of Poltava, 1756 or 1757; d. there 28 Oct. 1824. He was a member of the Russian Academy and was the author of several odes, epigrams and satirical poems. His chief and most successful work was the play 'Yabeda' ("Chicanery"), a satire on the prevalent corruption and abuse of justice. The play achieved an immediate success, but was suppressed by Czar Paul and nearly caused the author's exile to Siberia. It was subsequently translated into French (Ghent, 1886) but was not sold to any great extent. Of his other plays, only two, the tragedy, 'Antigone' and his rendering of Molière's 'Sqanarelle,' were of particular merit, but neither achieved a marked degree of success. There were three editions of Kapnist's works printed, two during his lifetime and the third in 1849.

Kapok', a kind of silk-cotton. See Silk-cotton Tree.

Kapp, Friedrich, frĕd'rĭh käp, German biographer and historian: b. in Hamm, West-

phalia, 13 April 1824; d. Berlin 27 Oct. 1884. He left Germany at the outbreak of the revolution of 1848, and settling in New York in 1850, took active part in American politics. In 1860 he was a presidential elector and in 1867 commissary of education. Returning to Germany in 1870, he entered the Reichstag in 1872. His works, which mainly refer to the United States, include 'American Soldier Traffic by German Princes' (1864); 'German Emigration to America' (1868); 'History of the German Migration into America' (1867); 'Frederick the Great and the United States' (1871); etc.

Kara (kä'rä) **Sea,** an arm of the Arctic Ocean indenting the north coast of Siberia, between Nova Zembla and Yalmal Peninsula. The Yenisei and Ob rivers flow into this sea. Since 1875 when Nordenskjöld made his voyage in the Vega, several navigators have sailed on this sea and found that it is not, as once supposed, ice-locked all the year; but is open in July and August. Consult: Hovgaard, an article in the 'Scottish Geographical Magazine' (January 1890) on a route to the North Pole.

Karadzic, kä-rä'jēch, **Vuk Stefánovic,** Servian author: b. Trschitsch, Servia, 7 Nov. 1787; d. Vienna 7 Feb. 1864. The two great works of his life were the reformation of the Servian literary language (which, up to his time has been a very debased medium, being either rude Slavonian or a hybrid jumble of Serb and Slavonian), and the publication of the 'Popular Serb Songs' (4 vols. 1814–33; 3d ed. 1841–46). His epoch-making Serbian-German-Latin 'Dictionary' appeared in 1818. The songs attracted widespread attention, and were translated into every European tongue. He was the founder of modern Servian literature.

Karageorgevitch, kä-rä-gā-org'a-vēch, Prince **Peter,** king of Servia: b. Belgrade 1846. He was educated at Belgrade, but when his father, Alexander Karageorgevitch, was driven from the throne in 1858, he became a soldier of fortune and pretender. After training in France at the St. Cyr school and the Military staff college, he fought in the foreign legion during the Franco-Prussian war. Later he took part in Herzegovina's struggle for liberty. Upon the assassination of Alexander I. Obrenovitch in 1903, Prince Peter was proclaimed king of Servia by the army. See Servia, *History.*

Ka'raites. See Jewish Sects; Judaism — The Karaites.

Karankawan, ka-răn'ka-wăn, an American Indian tribe, now extinct. They formerly lived along the Texas coast in the vicinity of Matagorda Bay, and originally came from Central America. They were first mentioned in 1687, by the French explorer Joutel, and were regarded as cannibals. They were uncompromisingly hostile to the whites. In 1843, fifty survivors of the race removed to Mexico, where in 1858 the last of them were exterminated by Mexican ranchers.

Karaveloff, kä-rä-vä'lŏf, **Petko** (Peter), Bulgarian statesman: b. Kalofer 1840; d. Sofia 7 Feb. 1903. He studied in Moscow, in 1878, became vice-governor of Vidin, in 1879 was a founder of the Liberal party, in 1880 was appointed minister of finance, and later in that year assumed the premiership. After the *coup d'état* of Prince Alexander, he retired to Eastern Rumelia, but on the restoration of the constitution in 1883 returned, and in 1884–6 was again premier. In 1886 he was appointed to the regency on the abdication of Alexander (7 Sept.), but after the election of Ferdinand (7 July 1887) his power waned; in 1892 he was sentenced to a five-years' imprisonment for conspiracy. Pardoned, however, he was elected to the Sobranye, or national assembly, and from 4 March 1901 to January 1902 he was premier, his resignation being compelled by opposition to his conclusion of a French loan.

Karawala. See Carawala.

Karli, kär'lē, a Buddhist cave-temple of India, rich in sculpture, and divided like a church into nave and aisles, with an apse. The temple probably belongs to the 1st century.

Karlowitz, kär'lō vīts, or **Carlovitz,** a town of the Austrian empire, on the frontier of Slavonia. The great vine mountain in the vicinity yields the best and strongest qualities of Hungarian wines. A peace was concluded here in 1699, between Austria, Poland, Russia, Venice, and Turkey. In 1848–9, Karlowitz was the focus of the Servian rebellion against Hungary, and the theatre of collision between the Servians and the Magyars, and at a later period between the Hungarians and the Austrians. The town contains a Greek cathedral and is the seat of the Greek archbishop of the Servian nationality. Pop. (1900) 5,643.

Karlstadt. See Carlstadt.

Kar'ma, (1) in Buddhism, the judgment at death which determines the future state of the deceased. It is also the fiat of the Buddhists on actions, pronouncing them to be meritorious, or otherwise. (2) In theosophy, Karma means the unbroken sequence of cause and effect, each effect being in its turn the cause of a subsequent effect. It is a Sanskrit word meaning "action" or "sequence." See Buddhism; Ego; Theosophy.

Karma'thians, a former Mohammedan sect, founded in Irak by Karmath during the 9th century. Missionaries were trained to spread his creed, and one of them, Abu Saïd, gained a strong hold on the people of the Persian Gulf. The caliph, afraid of the influence of the new sect, sent an army for its suppression, but he was defeated, and Abu Saïd took possession of the whole country.

Kar'nak. See Thebes.

Karr, Jean Baptiste Alphonse, zhŏn bäptēst āl-fônz kär, French novelist and satirist: b. Paris 24 Nov. 1808; d. Nice, France, 30 Sept. 1890. He was educated at the Collège Bourbon, where he subsequently taught, and began in 1832 to write for the 'Figaro,' becoming its editor-in-chief in 1839. In that year he established 'Les Guêpes' (the Wasps), a monthly journal of satire which aroused many enmities. His earliest books were novels, among them: 'Sous les Tilleuls' (1832); 'Vendredi Soir' (1835); 'Geneviève' (1838); 'Clotilde' (1839); among later works may be named: 'Voyage autour de mon Jardin' (1845): 'Gaitiés ro-

maines' (1870); 'Dieu et Diable: le Credo du Jardinier' (1875). The latter portion of his life was passed at Nice where he was a devoted gardener, several flowers having been named in honor of him.

Karroos, kä-rooz', the Hottentot name, now adopted by physical geographers, for the table-land or extensive plains between the mountain ranges of Cape Colony. They are fertile during the short rainy season, but during the dry season they assume the appearance of parched arid deserts, though even then flocks and herds find a certain amount of food on them. In recent times artificial methods of procuring water for these tracts have been adopted. In some places great reservoirs have been made to impound the water of permanent streams, or streams that exist only in time of rain; many wells have also been sunk, from which water may be pumped by means of windmills if it does not rise of itself. In this way large areas of the Karroos are now occupied as farms on which more or less grain is grown. Kloof, a sort of companion name to karroo, is applied to the longitudinal valleys extending between the ranges of the adjacent hills.

Kars, (1) a province of Russia, in the southwestern part of Transcaucasia; area, 7,188 square miles. It is mountainous, but the chief occupations are agriculture and stock-raising. Pop. estimated, 300,000. (2) Kars, the capital of the province of Kars, is about in the centre of the province, on a high plateau, barren in part but productive in the vicinity of the city. It was formerly a Turkish fortified city, and since it became a Russian possession (1878) the fortifications have been strengthened. The city has some manufactories, carpet-mills, cotton and woolen factories. Pop. about 22,000.

Karun, kä-roon', the only navigable river of Persia, and important as a route to the interior. About 117 miles from the mouth navigation is impeded by the rapids of Ahwaz. Formerly the Karun flowed direct to the sea, but now it traverses an artificial channel leading it into the Shat-el-Arab, which it joins at Mohammerah. It has recently been opened to foreign trade as far as Ahwaz.

Karyokinesis, kar''ĭ-ō-kĭ-nē'sĭs, the process of development of the ovum under the influence of fertilization. See CELL; EMBRYOLOGY.

Kasan. See KAZAN.

Kasbin, käs-bēn', or **Kazvin** (also spelled CASVEEN, CASBIN, and KAZBIN), Persia, a town in the province of Irak-Ajemi, about 90 miles west-northwest of Teheran. It is built of kiln-burned bricks, and had once a great number of elegant mosques and well-constructed bazaars, but a large proportion of the buildings are now ruinous and deserted, partly as the result of repeated earthquakes. The manufactures include tanning, weaving, etc., and there is a considerable transit trade. There are many vineyards and gardens in the neighborhood. Pop. estimated at 40,000.

Kashgar, käsh-gär'. See CASHGAR.

Kashmir. See CASHMERE.

Kaskas'kia, an American Indian tribe of the Algonquian family, formerly occupying a part of southern Illinois. In 1832, the survivors of the race, with the Peorias, removed to Kansas, and affiliated with the Weas and Piankishaws. The four tribes removed to Indian Territory in 1867, and in 1903 scarcely 100 members of the four tribes remained. See INDIANS.

Kaskaskia, Ill., a township in Randolph County, on both sides of the Kaskaskia or Okaw River, at its junction with the Mississippi opposite Ste. Genevieve, Mo. A part of it now obliterated was the oldest town in the West, the first permanent white settlement in the Mississippi Valley. Marquette in 1675 had established a mission among the Kaskaskia Indians near the present Utica, Ill., on the Illinois River; the Jesuits Marest and St. Cosme, guided by Tonty (q.v.), removed the mission in 1700 to the Mississippi bottoms three miles from the river, near the Kaskaskia. It throve greatly, and was not only a large Indian market, but sent produce and furs to New Orleans. Fort Chartres was built there in 1720; eminent French officers and adventurers came thither — as Vaudreuil and the commandant Chevalier de Bertel — and with its gay French life it was named "the Paris of the West." A noted Jesuit college and convent were maintained there. It formed one of the chain of posts by which France was to hem in English colonization; but in 1763 it fell into the hands of the English, who made it their capital in that region. On 4 July 1778 George Rogers Clark (q.v.), with a company of 200 Virginia militia, captured it for the United States by a night attack; this enabled us to claim and obtain possession of the Northwest Territory by the peace of 1783, and changed the destiny of this whole region. It remained a leading western town, and was the capital of Illinois as a Territory (1809) and a State (1818); but on removal of the seat of government to Vandalia in 1819, it began to decline. The river steadily encroached on the meadow; and in 1892 united its course with the Okaw, converting a large part of the old site, with most of the ancient buildings, into an island, which in 1899 crumbled into the river after several great floods. North of the junction still remains about a third of the town site, with the foundations of a church and of the capitol building. In 1891 the Illinois legislature appropriated $50,000 to remove the old cemetery to a point on the bluffs, and a large monument has been erected there. Consult: 'Kaskaskia: A Vanished Capital' (in 'Chautauquan,' Vol. XXX., 1900); 'Kaskaskia and its Parish Records' (in 'Magazine of American History,' Vol. VI., 1880).

Kaskaskia River, rises in Champaign County, Ill., and flows southwest through Moultrie, Shelby, Clinton, Fayette, and St. Clair counties, finally joining the Mississippi in Randolph County. It formerly entered at Chester, but in 1891 (see below) the great river cut away the neck of land at Kaskaskia and joined it there. It is nearly 300 miles long, and navigable to Vandalia, 150 miles. It flows through a fertile rolling country which is part of the Illinois coal field.

Kassai, kä-sī', a tributary of the Kongo, which it enters from the south a short distance above Stanley Pool, pouring into the Kongo a vast volume. It is navigable for hundreds of miles.

Kassala, kä-sä'lä, North Africa, a town at the southeastern extremity of the Egyptian Su-

dan, near the border of Abyssinia, formerly belonging to Egypt, and once a commercial centre. Before the Mahdi's uprising it had a population of perhaps 20,000. Italians captured it from the Mahdists in 1894, and in 1897 it was restored to Egypt. Its population is now supposed to be about 10,000.

Kas'son, John Adam, American lawyer and diplomatist: b. Charlotte, Vt., 11 Jan. 1822. He was graduated from the University of Vermont in 1842, studied law at Worcester, Mass.; was admitted to the bar, and in 1857 moved to Iowa and continued the practice of his profession. He became active in the Republican party, was a delegate to the national convention in 1860 and chairman of the State committee in the campaign; was assistant postmaster-general in 1861–2; and commissioner to the International Postal Congress at Paris in 1863. He was elected to Congress in 1863 and served until 1867; in the next year was elected to the Iowa State legislature, and from 1873 to 1877 was again a member of Congress. He was then appointed minister to Austria, which position he held till 1881. In 1881–4 he served again in Congress, and from 1884–5 was minister to Germany; in 1885 he was commissioner to the Kongo International Conference at Berlin, and special envoy to the Samoan International Conference in 1893. In 1897 he was appointed special commissioner plenipotentiary to negotiate reciprocity treaties as provided for by the Dingley Tariff Law, and in 1898 was a member of the American Canadian Joint High Commission. He has written 'History of the Monroe Doctrine' (in the 'North American Review' 1881); 'History of the Formation of the United States Constitution' (1889).

Kästner, kĕst'nĕr, **Abraham Gotthelf,** German mathematician and poet: b. Leipsic 27 Sept. 1719; d. Göttingen 20 June 1800. He received an appointment at Göttingen, where, in accordance with the reformatory spirit which animated that university in the latter part of the 18th century, he exerted a powerful influence in delivering mathematical and natural sciences from the bondage of antiquated text-books. His 'Anfangsgründe der Mathematik' (6th ed. 1800), and his various other writings, inaugurated a more enlightened era of scientific study in Germany. He took a conspicuous part in the formation of the celebrated union of Göttingen poets, and by his assistance the elder Boye succeeded in introducing, through the instrumentality of the 'Musenalmanach,' an entirely new generation of poets to the public. His general popularity was chiefly due to his 'Sinngedichte.' A portion of his epigrammatic poems were included in his 'Miscellaneous Writings' (1783).

Kastner, Johann Georg, yō'hän gā'ōrg käst'nĕr, German composer and writer on music: b. Strasburg 9 March 1810; d. Paris 19 Dec. 1867. He studied with Maurer and Romer; in 1832–5 composed four operas, of which 'Die Königin der Sarmaten' (1835) is chief; and then removed to Paris, where he wrote other operas, among them his best work, 'Le dernier Roi de Juda,' presented at the Conservatoire in 1844. From 1837 he also published a series of elementary treatises on music, a once authoritative work on instrumentation being perhaps the best. He was made an associate of the Académie Française.

Katab'olism, otherwise known as destructive metabolism; the chemical changes occurring within an organism and resulting in the formation of simpler products through the decomposition of more complex ones.

Katahdin, ka-tä'dĭn, or **Ktaadn,** the highest mountain in Maine, situated in Piscataquis County and in the central part of the State. The region is difficult of access, the Penobscot River being the only thoroughfare, and its course being interrupted by frequent shoals and falls. The mountain, which has an altitude of 5,385 feet, is entirely of granite, and stands in abrupt walls with acres of surface exposed in naked floors. Its sides which are marked by bare spots caused by sliding rock, present a striking appearance. On its summit are found only lichens and a few dwarfish plants; half-way down, the birch and other forest trees are stunted. Over the granite rocks, even to the summit, are found boulders of trap and of other rocks not belonging to the mountain, and among them pieces of sandstone containing fossil shells. The view of the country from the summit embraces scattered mountains rising in conical granitic peaks, among which are interspersed hundreds of lakes, many of them large, and innumerable streams.

Katatypy, a new method in photography. Over the finished negative is poured a solution of hydro superoxide. This leaves, after evaporation, a uniform layer of peroxide of hydrogen. Soon the silver of the plate works upon this peroxide and produces a catalytic dissolution wherever there is silver, while in the places free from silver the peroxide remains. By this means an invisible picture of hydro superoxide is produced upon the plate. This picture can be printed from the plate directly upon common paper, to which the image is transferred.

Ka'ter, Henry, English physicist: b. Bristol 16 April 1777; d. London 26 April 1835. In 1799 he went to India where he was engaged on the great trigonometrical survey, a work to which he rendered important service. In 1814 he retired on half-pay, and henceforth occupied himself exclusively with scientific studies. He was employed by the emperor of Russia to construct standards for the weights and measures of that country; determined the length of the seconds pendulum (see KATER'S PENDULUM), investigated the diminution of terrestrial gravity from the pole to the equator; and invented the "floating collimator," an instrument of great use to trigonometers. With Dr. Lardner he wrote the 'Treatise on Mechanics' in the 'Cabinet Cyclopedia.'

Kater's Pendulum, a contrivance for measuring the force of gravity, named from its inventor Henry Kater (q.v.). The principle governing its action is the fact that in the case of a physical (compound) pendulum the centres of oscillation and of suspension are interchangeable. It is a bar pendulum with two sets of knife edges, symmetrical in form, but not in the distribution of masses with reference to the geometrical centre; and, somewhat modified and improved, is now the standard for geodetic work.

Kat'ipo, the New Zealand name for alleged poisonous spiders of the genus *Latrodectus* (q.v.).

Katipunan (kä-tē-poo'nän) **Society,** a secret society in the Philippines, organized originally to oppose Spanish supremacy. At the adjournment of the Filipino Congress it was decreed that the supreme council of the Katipunan Society should assume control of native affairs. The society organization was purely military, with a chief or colonel assigned to each 100 members. Each member signs an oath written in his own blood, swearing under most revolting penalties to serve and obey the society. The membership in the organization has gradually decreased since the American occupation.

Katsura, käts-wē'ä, COUNT, Japanese soldier and statesman: b. Chosiu 1847. He received a military training in Prussia, entered the Japanese army in 1867, fought in the war of the Mikado's restoration, was vice-minister of the army in 1886–91, and in the Chino-Japanese war (1894–5) commanded the 3d division, with which 4 March 1895 he captured New-chwang. In 1896 he was governor-general of Formosa, in 1898–1900 minister of war, in 1901 became prime minister, but on 6 Jan. 1906 resigned.

Katte, Walter, American civil engineer: b. London, England, 14 Nov. 1830. Coming to the United States in 1850 he was resident engineer of the Pennsylvania State canals 1857–8, and subsequently held various engineering posts of responsibility. From 1865 to 1875 he was in the employ of the Keystone Bridge Company of Pittsburg, superintending at this time the building of the steel arch bridge at St. Louis. He was chief engineer of the New York elevated railroad 1877–80, and from 1880 to 1898 held similar posts on other important railroads, including the New York Central.

Ka'tydids, large neuropterous insects of the grasshopper family *Locustidæ,* remarkable for their loud and shrill call. The katydids belong to several allied genera which have the head obtuse in front, the wings and wing-covers large and leaf-like, and the color bright green. Highly developed striduling organs are found in the males in the form of transparent drum-like structures at the base of the wing-covers, by the friction of which, one against the other, as the wings are raised and lowered, the well-known call is produced. This is heard only at night (though some species have quite different day calls as well) and is so loud and shrill as to be distinctly audible at a distance of a quarter of a mile. The call of the males is answered by chirps from the females. The characteristic eggs are gummed to twigs in two contiguous over-lapping rows. Katydids are peculiarly American. The common species is *Cystophyllus concavus,* known by its very broad coarse-veined wing-covers and long ovipositor. In *Phylloptera oblongifolia* the wing-covers are narrower and the veins finer. Other related genera are *Phaneroptera* and *Microcentrum.*

Katzbach (käts'bäH) **River,** a small stream in Silesia, Prussia, falling into the Oder at Parchwitz. On its bank 26 Aug. 1813 a battle was fought between the French and the Prussians in which the latter under Blücher won a signal victory. The French lost 12,000, and 18,000 were taken prisoners.

Katz'er, Frederic Xavier, American Roman Catholic archbishop: b. Ebensee, Austria, 7 Feb. 1844; d. Fond du Lac, Wis., 20 July 1903. He came to this country in 1864, and was ordained to the priesthood in 1866. Until 1875 he was a professor in the Seminary of St. Francis in Milwaukee, when he became pastor of the cathedral at Green Bay and secretary of Bishop Krautbauer. After four years of labor in this capacity, he was appointed vicar-general of the diocese of Green Bay, and on the death of Bishop Krautbauer, in December 1885, became administrator, and in May 1886, bishop of Green Bay. In December 1900 he was chosen archbishop of Milwaukee.

Kauai, kow-ī', one of the Hawaiian Islands, the most northern of the group, in lat. 22° N. and long. 159° 30' W.; area, 590 square miles. It is of volcanic origin, its highest elevation reaching nearly 6,000 feet; but although mountainous in character the island has a soil of great fertility, a considerable portion of which, mainly in the northern part, is under cultivation. Sugar is the chief product, and tropical fruits are also largely grown. There is great extent of forest land, and the island is well supplied with streams, the largest of which is Hanalei. The principal harbors are Hanalei, Koloa, Nawiliwili, and Waimea. Pop. (1900) 20,734.

Kauffman, kowf'män, **Marie Angélique Catherine,** commonly known as ANGELICA KAUFFMAN, Swiss painter: b. Coire, Switzerland, 20 Oct. 1841; d. Rome 5 Nov. 1807. She was the pupil of her father, John Joseph Kauffman, a painter of little note. Her first work of importance was a portrait of the Duke of Modena and his duchess. She then collaborated with her father in the decoration of the parish church and castle of Schwarzenburg, his birthplace, painting many portraits in the meantime. Going to Florence, she was hindered in her artistic career by her passionate devotion to music and singing, but in 1763 finally abandoned all other pursuits for that of painting. She fell under the influence of Winckelmann at Rome, and produced the 'Mother of the Gracchi.' She also did some work in co-operation with the Venetian landscape painter Zucchi, whom she subsequently married. It was at this point in her life that she developed the particular sentimental style of her paintings as seen in 'Anna and Abra'; and 'Samma at the Grave of Bennoni,' which created a furore. In London (1765) she became the darling of court and aristocracy, and was loaded with wealth and honor; she was made member of the Royal Academy and was thought to have inspired Sir Joshua Reynolds with tender feelings. She was, however, unfortunate in marrying a Swede who called himself Count Hom, from whom she was later divorced. She eventually married Zucchi, and settled in Rome (1781). While her tenderness borders on mawkishness, and her designs are monotonous, her imaginative figures have an elevated charm which was not without its influence in circles where George Morland was typical of English art. Her personality cast a reflection which enhanced the impression which her pictures made on her contemporaries, and the 'Miss Angel' of Mrs. Thackeray Ritchie exhibits with tact and fidelity this interpretation of her somewhat remarkable career.

Kaufman, David S., American politician: b. Cumberland County, Pa., 1813; d. Washington, D. C., 13 Jan. 1851. A graduate of Princeton

University, he removed to Natchez, Miss., where he studied law. In 1837 he settled in Nacogdoches, Texas, and the next year was elected to the Texas Congress. He was twice re-elected and twice chosen speaker of the House. In 1843 he entered the Texan Senate, taking an active part in favor of annexation, and being elected one of the first members of the House of Representatives from Texas (1846–51).

Kaukauna, kâ-kâ'na, Wis., city, in Outagamie County; on the Fox River, and on two divisions of the Chicago and Northwestern railroad; about 21 miles southwest of the city of Green Bay and seven miles northeast of Appleton. At this point the Fox River has a fall of 50 feet within one mile, which gives the city excellent water power. A government ship canal has been built to overcome the obstruction to navigation caused by the rapids. The place was first settled in 1790 by Dominick Ducharme, and was incorporated as a town in 1850. It was chartered as a city 5 April 1885. The city has two banks with a combined capital of $160,000; and the bookings show a total of business of $800,000. The chief industrial wealth of the city is derived from railroad shops, employing 450 men; Union Bag and Paper Company works, 300 employees; Pulp and Paper Company works, 225; Outagamie Paper Company works, 175; Kaukauna Fibre Company, 80; Lindane Pulp Company, 80. The city has 10 churches, one high school, two graded public schools, and two graded parish schools. About one half the population are Germans. Pop. (1900) 5,115.

JAMES I. TOWER,
Editor of 'Sun.'

Kaulbach, Wilhelm von, vĭl'hĕlm fŏn kowl'bäH, German painter: b. Arolsen 15 Oct. 1805; d. Munich 7 April 1874. He learned the rudiments of his art from his father who was a goldsmith and engraver on copper. He was a good draftsman when he went to Düsseldorf in 1821 and entered the Art Academy where his chief teacher was Cornelius, already acknowledged as the head of the Düsseldorf school of historic painting. When Cornelius in 1825 removed to Munich, at the invitation of King Ludwig of Bavaria, he followed him and soon became his disciple in the art of ceiling decoration, examples of which are 'Apollo and the Muses' in the great hall of the Odeon, and the allegorical figures of the 'Four Chief Rivers of Bavaria,' and of 'Bavaria' in the portico of the royal palace. His pure and classic power of design is well exhibited in the 16 wall paintings, illustrating the story of 'Cupid and Psyche,' in the palace of Duke Maximilian at Munich. He was at this time attracted to the study of Hogarth's works, the fruit of which appeared in his illustration of books, including the works of Shakespeare, Goethe, and Schiller, and the Reineke Fuchs. He painted many great incidents in the history of Germany, including twelve scenes from Klopstock's 'Hermann's Fight,' and the 'Death of Hermann,' wall paintings in the queen's palace at Kingsbau. But his most ambitious and comprehensive works are those in which he endeavored to represent the progress of the human race by a series of typical historic tableaux. These comprise the 'Tower of Babel'; 'Age of Homer'; 'Destruction of Jerusalem'; 'Battle of the Huns and Romans'; 'The Crusaders'; 'The Reformation' (1847–63). The range of his intellectual ideas, his wonderful power of generalization, his mastery of every style of painting from caricature to the sublimity of the Italian cinquecentists, as represented by Michelangelo, have no parallel among modern painters. His coloring may be a little cold, sometimes a little crude, but his sense of form, his loftiness of conception and his genius for harmonious composition have won for him the first place among German artists of the transition period between the idealism of Cornelius and the realism of the modern historic school.

Kauri, kow'rĭ, the native name of a tree, and of the valuable gum derived from it. It is the most conspicuous species (*A. australis*) of the East Indian and Australian genus *Agathis* (formerly *Dammara*) of coniferous trees,—a native of New Zealand, where it grows only at the northern extremity of the North Island. It reaches the height of 150–200 feet, and its timber is much valued for building purposes, for making furniture, etc., and still more for masts and ship-building, but it is becoming very rare. The resin of this tree, the kauri gum, forms a valuable export, and is used in making fine varnish, etc. Most of it is obtained in a semi-fossil state, by digging in places where the tree no longer grows. See DAMMAR.

Kautz, kowtz, **Albert,** American naval officer: b. Georgetown, Ohio, 29 Jan. 1839; d. Florence, Italy, 1907. He was graduated at the United States Naval Academy in 1859, became a lieutenant in 1861 and rose through gradual promotion to the rank of rear-admiral in 1898. He was flag-lieutenant to Farragut in 1862, and when New Orleans was surrendered he entered the city and raised the national flag over the custom-house. He took command of the Pacific station and in the following March was prominent in the settlement of the Samoan troubles. He was retired in January 1901.

Kautz, August Valentine, American general: b. Ispringen, Germany, 5 Jan. 1828; d. Seattle, Washington, 4 Sept. 1895. He was a brother of Albert Kautz (q.v.), and his parents settling in Ohio in 1832, he was graduated from West Point in 1852. He served through the Civil War in the Federal army, distinguishing himself in several engagements, was promoted colonel in 1874, and brigadier-general in 1891. He published: 'The Company Clerk' (1863); 'Customs of Service for Non-Commissioned Officers and Soldiers' (1864); and 'Customs of Service for Officers' (1866).

Kautzsch, kowch, **Emil Friedrich,** German Protestant theologian: b. Plauen, Saxony, 4 Sept. 1841. He was educated at the University of Leipsic where he became tutor in Old Testament exegesis in 1869, and professor extraordinary in 1871. From 1872 to 1880 he was professor at Basel, at Tübingen 1880–8, and at Halle from the last named date. With Socin and Zimmerman he founded the Palestine Exploration Society of Germany in 1877, and among important works which he has edited are: the 22d to the 26th editions of Gesenius' 'Hebrew Grammar' (1878–96); and the 10th and 11th editions of Hagenbach's 'Encyklopädia und Methodologie der theologischen Wissenschaften' (1880–4).

Kava-Kava. See AVA.

Kavanagh, kav'a-na, **Julia,** Irish novelist: b. Thurles, Ireland, 7 Jan. 1824; d. Nice, France, 28 Oct. 1877. She wrote a large number of novels, the scenes of which were almost invariably laid in France, where her life was mainly spent until she began a literary career in London in 1844. Among her works are: 'Nathalie' (1851); 'Daisy Burns' (1853); 'Two Lilies' (1877); 'Woman in France During the 18th Century' (1850); 'A Summer and Winter in the Two Sicilies' (1858); 'French Women of Letters' (1861); 'English Women of Letters' (1862). Her novels and other works were popular both in this country and in England.

Kaveri, or Kavery. See CAUVERY.

Kaw (more correctly KANZA), a branch of the Osage division of the Siouan Indian stock, formerly living on the lower Kansas River, and early in the 19th century estimated at 1,300. In 1846 the government removed them to a reservation in the present Oklahoma, west of the Osage River; where they dwindled so rapidly that in 1900 there were only 217, over half of them of mixed blood.

Kay, John, English inventor: b. Walmersley, Lancashire, England, 16 July 1704; d. France, after 1764. In 1733 he invented the fly-shuttle, for which a patent was granted him, and in 1745 a power loom for the weaving of narrow goods, a patent for which was also granted. These inventions, however, so greatly aroused the anger of the working classes, who feared that the machines would entirely supersede hand labor, that they stole Kay's machines, wrecked his home, and obliged him to flee to France, where he died in poverty.

Kaye, SIR John William, English military historian: b. Acton, Middlesex, 1814; d. London 24 July 1876. He was for a number of years an officer in the Bengal artillery, but resigned in 1841. In 1856 he entered the East India Company, and upon the transfer of the government of India to the crown, succeeded John Stuart Mill in the political department of the India office. His works consist of histories and biographies relating to the East, among them being 'A History of Afghanistan' (1851–3); 'History of the Administration of the East India Company' (1853); 'A History of the Sepoy War in India' (1857–8; London 1864–75), a comprehensive narrative of the celebrated Mutiny down to the fall of Delhi; 'Lives of Indian Officers' (1867); 'Essays of an Optimist' (1870).

Kazaks'. See KIRGHIZ.

Kazan, kä-zän', Russia, a fortified city, capital of the government of the same name, on the Kazanka, about four miles above its junction with the Volga, 460 miles east of Moscow. It properly forms three towns — the kremlin or citadel, the middle town, and the lower town. Many Mohammedan Tartars still reside here, engaged in business. It is a bishop's see, and the seat of a small university, founded in 1803. It has also several other schools. Here are large soap-works and tanneries, also manufactures of woolen, cotton, lace, and earthenware. It carries on an extensive trade. The caravans to Bokhara and China pass through Kazan. At a little distance from Kazan is an admiralty establishment, with a navigation school, magazines, and a dock-yard, where vessels are constructed, and sent down the Volga to the Caspian Sea. Pop. about 135,000.

Ke'a, a large olive-green parrot of New Zealand (*Nestor notabilis*) with the hawk-like beak of its race, which in its former wild condition fed chiefly upon insects, but since the introduction of sheep into the South Island (to which it is confined) has become a meat eater. These birds haunt the vicinity of slaughtering pens, and feed with avidity upon offal, sheep-heads and the like. This led them to attack wounded sheep, or those with sores; and finally taught some of these parrots to alight upon the back of a sheep, pull out the wool and even tear away the living flesh. These injuries were usually upon the loins, and the fat about the kidneys seems to be the special attraction. So many keas have been killed by herdsmen that the species is now rare. Compare KAKA; and consult Buller, 'Birds of New Zealand' (1888).

Kean, kēn, **Charles John,** English actor: b. Waterford, Ireland, 18 Jan. 1811; d. Queensborough Terrace, Chelsea, London, 22 Jan. 1868. He was second son of Edmund Kean (q.v.), He made his first stage appearance 1 Oct. 1827 as Young Norval in 'Douglas.' In 1830 he visited the United States, where he was favorably received before he had made a London reputation. In 1850–9 he managed the Princess Theatre, where he introduced more elaborate machinery and setting than had yet been seen on the English stage, revived Byron's 'Sardanapalus,' and appeared (13 Jan. 1855) in his greatest role, Louis XI., in Boucicault's adaptation of de la Vigne's play of the name. His Hamlet was his chief tragic part, but he was best in melodrama. He withdrew from the stage 28 May 1867. Consult: Cole, 'Life and Theatrical Times of Charles Kean' (1859); Cook, 'Hours with the Players,' Vol. II. (1881).

Kean, Edmund, English tragedian: b. London 4 Nov. 1787; d. Richmond Surrey 15 May 1833. His supposed parents were connected in a low capacity with the theatrical profession. He was early on the stage, and for several years wandered about the provinces, now as reciter and singer, now as tumbler in a circus, and later as a member of itinerant companies. He married Miss Chambers, an actress in his company, in 1808. In 1814 he appeared at Drury Lane as Shylock. His triumph was decided and he at once commanded large salaries. Hazlitt and Lamb eulogized him. Coleridge said: "To see Kean act is like reading Shakespeare by flashes of lightning." At Kemble's retirement in 1817 Kean took the foremost place on the English stage. He appeared in several other tragic roles, among them Richard III., Hamlet, Lear, Sir Giles Overreach, and Othello. In these characters he has perhaps never been equaled. He first came to the United States in 1820, when he was seen with enthusiasm in New York, Boston, and Philadelphia. A second, but much less successful tour in 1825 was extended to Canada, where he was chosen a chief of the Huron Indians. His hold on the public remained uninterrupted until 1825, when he appeared in the character of co-respondent in an action of divorce. He never regained public favor; his dissolute habits also began to tell on him, and he made his last appearance in Othello, in company with his son Charles, in 1833, but

broke down during the performance, and his death took place some three months later. The biographies by Barry Cornwall (1835) and F. W. Hawkins (1869), although the best existing, contain much apocryphal material.

Keane, John Joseph, American Roman Catholic prelate: b. Ballyshannon, Ireland, 12 Sept. 1839. When seven years old he came to America with his parents, who settled in Baltimore, Md., pursued his classical studies at Saint Charles College, Baltimore, and later took a complete philosophical and theological course at Saint Mary's Seminary, where, on 2 July 1866, he was ordained priest. He was then appointed assistant pastor at Saint Patrick's Church, Washington, D. C., and about 12 years afterward, 25 Aug. 1878, was consecrated bishop of Richmond, Va. In this new field he labored indefatigably, much of his attention being bestowed upon the negroes, and when, in 1884, the American hierarchy decreed the foundation of the Catholic University, Bishop Keane was selected to devise plans for its organization. On 12 Aug. 1888 the University was formally opened, he being chosen its first rector, and under his efficient administration it attained most gratifying success. Its generous endowments and splendid equipment were the result of his tireless efforts, and when, in January 1897, his rectorship ceased, he left the institution established upon a solid basis. The next two years he spent in Rome, where his skill in oratory won due recognition and numerous favors were lavished on him by Leo XIII. In 1899 Bishop Keane returned to America at the earnest solicitation of the board of trustees of the University, and for two years labored to augment its endowments. In 1890 he delivered the Dudleian lecture at Harvard. On 24 July 1900 he was appointed to the archiepiscopal see of Dubuque, the pallium being conferred upon him by Cardinal Gibbons, 17 April 1901. He is likewise an ardent advocate of Catholic education. His diocese now (1905) boasts a Catholic population of 100,000; 218 priests; 202 churches; 82 parochial schools; 1 orphan asylum, and 6 hospitals, besides academies and charitable institutions.

Kearney, kär'nĭ, **Denis,** American labor agitator: b. Oakmont, County Cork, Ireland, 1847. He went to sea from 1858 to 1872; and in the latter year settled in San Francisco, becoming foreman of a gang of stevedores and later going into the draying business independently. In 1877 he began an agitation among the workingmen, his attacks being directed mostly against the rights of capital and the importation of Chinese labor. Large mass-meetings were held in the so-called "Sand Lots" near the city, and the movement grew rapidly in power and importance, but dominated entirely by Kearney. Finally he was able to pack a convention which adopted a new State constitution in the interests of his movement, and very detrimental to capital and property interests. In 1878 he visited the Eastern States, speaking in the large cities, but failed to gain an important following; on his return to California he gradually lost his influence and his party sank into obscurity.

Kearney, Neb., city, county-seat of Buffalo County; on the Burlington & M. R., the Union Pa., and the Kearney & B. H. R.R.'s; about 125 miles west of Lincoln and 175 miles, in direct line, southwest of Omaha. Kearney is midway between the eastern and western coasts of the United States. The first settlement was made in 1871; it was incorporated in 1872, and received its city charter in 1889. It is in the midst of a rich agricultural region noted for wheat and live-stock. The chief industrial establishments are a furniture factory, three cigar factories, and large brick yards. The city is the seat of a State Industrial School for Boys, a State Normal School (1903), a Military Academy under the auspices of the Episcopal Church, a high school, and a public library. It has three banks, the combined capital of which is $200,000. The government is vested in a mayor who holds office two years, and in a council of eight members, elected annually. Pop. (1900) 5,634; (1904) 7,000.

F. L. Whedon,
Editor 'The Kearney Democrat.'

Kearns, Thomas, American politician: b. near Woodstock, Ont., 11 April 1862. He attended the public schools until his father's removal to Holt County, Nebraska, in 1872, then worked on the home farm till he was 14. After several years spent as a freighter in Nebraska he removed to Utah in 1883, where he worked at first as a miner, becoming subsequently one of the owners of the Mayflower and Silver King mines. He was a member of the common council of Park City, Utah, in 1895, and was a delegate to the National Republican convention the next year. He was also a delegate to the Philadelphia convention in 1900, and was elected a member of the United States Senate in 1901. He is largely identified with the mining interests of Utah and is one of the owners and projectors of the Salt Lake, San Pedro and Los Angeles railroad which runs from Salt Lake City, Utah, to Los Angeles, Cal.

Kearny, Lawrence, American naval officer: b. Perth Amboy, N. J., 30 Nov. 1789; d. there 29 Nov. 1868. Having entered the navy in 1807, he was active in the defense of the coast of South Carolina and States adjacent during the War of 1812, and in 1826 in command of the Warren effectually put an end to the depredations of the Greek pirates in the Levant. Promoted captain (1832), he was assigned (1841) to the command of the East India squadron, and began the negotiations for a commercial treaty between China and the United States, later concluded by the special envoy, Cushing. On his return voyage to the United States, Kearny stopped at the Hawaiian Islands to protest against the contemplated transfer of the islands to Great Britain. In 1867 he was made commodore on the retired list.

Kearny, Philip, American soldier: b. New York 2 June 1815; d. near Chantilly, Va., 1 Sept. 1862. He was graduated from Columbia in 1833, studied law, but in 1837 entered the United States army as lieutenant of the 1st dragoons, and in 1830–40 was in Europe for the study of the cavalry service of the French army, with which he fought in the Algerine war. In 1841 he was on the staff of Gen. Scott, in 1846 resigned from the army, but soon afterward enlisted for the Mexican War, fought at Contreras and Churubusco, and at the close of the latter engagement charged and pursued into Mexico

City the retreating enemy. He again resigned from the army in 1851, in 1859 entered the French service, and participated in the war in Italy, where he fought at Solferino. On 17 May 1861, he was appointed brigadier-general in the Union service, and given command of the 1st New Jersey brigade in the Army of the Potomac. Later he was assigned to the command of the cavalry of that army, and served conspicuously in the Peninsula. He was commissioned major-general of volunteers 7 July 1862, took part in the second Bull Run, and subsequently at Chantilly was shot while reconnoitering. Kearny was a brilliant cavalry leader, termed by Scott "the most perfect soldier" he ever knew. Consult: De Peyster, 'Personal and Military History of Philip Kearny' (1869).

Kearny, Stephen Watts, American general: b Newark, N. J., 30 Aug. 1794; d. St. Louis, Mo., 31 Oct. 1848. He entered the United States army in 1812 as lieutenant, and distinguished himself in the action at Queenstown Heights in the same year. He served throughout the war, and became, in June 1846, a brigadier-general. At the commencement of the Mexican War he commanded the "Army of the West," which marched from Bent's Fort on the Arkansas westward, and conquered New Mexico. Having established a provisional civil government in Santa Fé, he proceeded to California, and participated with his command in the battle of San Pascual, in December 1846. For his services in this campaign he was appointed brevet major-general, his commission being dated from the battle of San Pascual. He was governor of California from March to June 1847, but subsequently joined the army in Mexico, where he continued until the close of the war. He wrote: 'Manual for the Exercise and Maneuvering of United States Dragoons' (1837); 'Organic Law'; 'Laws for the Government of New Mexico' (1846).

Kearny, N. J., town in Hudson County; on Newark Bay, between the Passaic and Hackensack rivers, and on the Pennsylvania, the Lehigh V., the Erie, and the Delaware, L. & W. R.R's; opposite the city of Newark. The first permanent settlement was made in 1765, by Germans, and the place was called New Barbadoes. Later it became a part of Harrison, but in 1871 it was incorporated and named in honor of Gen. Philip Kearny (q.v.) who once lived in the place, and whose residence still stands within the limits of the town. It has several manufacturing establishments, the chief of which are the Nairn Linoleum works with 1,200 employees; the Arlington Company Celluloid works, 1,000 employees; and the Marshall Thread Company, 2,000 employees. Other manufactures are golf balls, metal bedsteads, roofing material, and brass novelties. The town has a State Soldiers' Home, the Sacred Heart Industrial School for Boys, public and parish schools, and nine churches. In Arlington, or the third and fourth wards, there are many fine residences with large and well kept grounds. The government is vested in an alderman-at-large, practically a mayor without veto power, and a council of eight members, elected every two years. Pop. (1900) 10,896.

W. J. KEEGAN,
Editor of West Hudson 'Press.'

Kearsarge, kēr'särj, the name of two mountain peaks of the White Mountains. (1) Mount Kearsarge in Carroll County, N. H., is 3,260 feet in height. The Federal vessel which sank the Confederate cruiser Alabama was named after this mountain. (2) Kearsarge Mount, in Merrimac County, N. H., is 2,943 feet in height. This mountain was once called Kyar-Sarga.

Kearsarge, The, a ship of the United States navy which played a conspicuous part in the only sea-fight of the Civil War. See ALABAMA, THE.

Keary, kē'rĭ, **Annie,** English novelist: b. Bitton near Wetherby, Yorkshire, 3 March 1825; d. Eastbourne, Sussex, 3 March 1879. Beginning a literary career with books for children, she made her reputation with stories of Irish life and became very popular, 'Castle Daly' (1875) being her best work. Among other fictions by her are: 'Clemency Franklyn' (1866); and 'A Doubting Heart,' left unfinished at her death and completed by Mrs. Katharine Macquiod. She also published such historical works as 'Early Egyptian History'; and 'The Nations Around.'

Keary, Charles F., English novelist and antiquarian writer. He was educated at Cambridge University and beside the novels 'A Wanderer' (1888); 'A Mariage de Convenance' (1889); 'The Two Lancrofts' (1893); 'Herbert Vanlennert' (1895); 'The Journalist' (1898); 'High Policy' (1902); etc., has published 'The Dawn of History' (1879); 'Outlines of Primitive Belief' (1882); 'The Mythology of the Eddas' (1882); 'The Vikings in Western Christendom' (1890); 'Norway and the Norwegians' (1892); 'The Brothers,' a masque in verse (1902); 'Riegel: an Autumn Mystery' (1903).

Keasbey, kēz'bĭ, **Lindley Miller,** American political economist: b. Newark, N. J., 24 Feb. 1867. He was graduated from Harvard in 1888 and went abroad to study at Strassburg. He was appointed professor of political science at the University of Colorado in 1892, where he remained for two years, and in 1894 became professor in the same department at Bryn Mawr. He has written a number of monographs and magazine articles, also 'The Nicaragua Canal and the Monroe Doctrine' (1896); and has translated 'The Economic Foundations of Society,' from Loria.

Keats, kēts, **Gwendoline,** "ZACK." English novelist: b. Devonshire. She first attracted notice by a series of dialect tales appearing in 'Blackwood's Magazine,' and in 1898 acquired sudden fame by her volume, 'Life is Life,' consisting of 12 stories delineating with skill and vigor the more painful and hopeless side of existence. Later books by her include: 'On Trial' (1899); 'Tales of Dunstable Weir' (1900); 'The White Cottage' (1901); 'The Roman Road' (1903).

Keats, John, English poet: b. London 29 or 31 Oct. 1795; d. Rome 23 Feb. 1821. He was the eldest child of Thomas Keats, employee and son-in-law of a livery-stable keeper named Jennings, and was born at the stable in Finsbury Pavement. There were four other children, three of whom reached maturity, George, Thomas, and Frances (Mrs. Llanos). In 1804,

Thomas Keats, who like his wife, Frances, seems to have been a strong character, died from a fall from his horse. His widow soon remarried, but was speedily forced to leave her new husband and to reside with her mother at Edmonton, where she died, after a rapid decline, in 1810.

Meanwhile the boys had been placed at Mr. John Clarke's school at Enfield, where John distinguished himself by his manly pugnaciousness and, later, by his zeal for literary studies, particularly mythology. He formed a friendship with the master's son, Charles Cowden Clarke (q. v.), an under teacher, who encouraged his literary tastes; but unfortunately Keats's guardian, in 1810, took him from school before he had begun Greek, and apprenticed him for five years to a surgeon at Edmonton.

He was still near enough to young Clarke to profit from the latter's influence, and Elizabethan poetry, especially 'The Faerie Queene' awoke his poetic genius. His earliest known poem, 'Imitation of Spenser,' dates probably from 1813. The study of medicine became distasteful to him and a break with Hammond, the surgeon, followed in 1814. Keats went to London, studied fitfully in the hospitals, and more and more gave himself up to reading and writing verse. The best of his early poems, the 'On First Looking into Chapman's Homer,' seems to date from the summer of 1815, and was composed after a night of reading with Clarke. Besides this friend certain fellow students and his brothers formed Keats's chief society. In the winter of 1816 Clarke introduced him to Leigh Hunt (q. v.) whose influence upon him was at first very strong. Through Hunt Keats was led to widen his reading, especially in the direction of Italian poetry, and to develope an appreciation of the arts; but the elder poet also encouraged his new protege's luxuriant sentimentality and, through his own unpopularity, prepared the way for the critical hostility which Keats encountered as a member of the so-called "Cockney School."

The first of his poems to be printed was the sonnet 'O Solitude,' which appeared in Hunt's 'Examiner' for 5 May 1816. A little later Keats, who had previously been appointed a dresser at Guy's Hospital, passed his examination as licentiate at Apothecaries' Hall; but we hear more of literary plans and of acquaintances, such as Shelley and John Hamilton Reynolds, than of preparations for practice. He was much at Hunt's cottage at Hampstead, he visited the sea shore, he wrote epistles in verse and prose to friends and relatives. By the winter of 1816–17 he had become intimate with the painter, Haydon (q. v.), had published several sonnets in 'The Examiner,' and had made up his mind definitely to abandon medicine for poetry. His first volume 'Poems by John Keats,' with a dedication to Hunt, was published early in March 1817.

The book, naturally, fell flat. Keats was still immature in thought and feeling, he had reacted too far from the pseudo-classical taste of the majority of readers toward the unrestrained luxuriance of style of the later Elizabethans, and he had submitted too unreservedly to the mawkish and shallow æstheticism of Hunt. The young poet took his disappointment well and resolved to improve himself by study. In April 1817 he went alone to the Isle of Wight, then with his brother Tom he visited other places, and by midsummer he was domiciled with both his brothers at Hampstead, where he saw much of literary and artistic friends, including Charles Wentworth Dilke, Charles Armitage Brown, and the painter, Joseph Severn. More important for his poetical development, however, was the growing influence of Shakespeare and of the loftier, more spiritual portion of Wordsworth's verse, which may be seen in 'Endymion.' This ambitious poem was begun on the Isle of Wight, steadily labored upon during the summer and fall despite distractions such as a visit to Oxford, and finished at the end of November 1817, at Burford Bridge, near Dorking. Keats spent the winter of 1817–18 in London, seeing 'Endymion' through the press, frequenting theatres, and having a rather gay time with his friends. Before 'Endymion' was published in April 1817, he had begun with Reynolds the experiment of making metrical versions of tales from Boccaccio, and in 'Isabella, or the Pot of Basil' he had given evidence, not only of maturing thought and of increasing control of his emotions, but of a manly faculty of self-criticism that enabled him to perceive without flinching the faults that jostled the beauties of 'Endymion.'

The last-named poem received a few favorable reviews, but made little impression on the public. Still fascinated with Greek mythology, Keats chose another subject from it, that of the fall of the Titans; but, before beginning 'Hyperion' he wisely resolved to study a more restrained model than his beloved exuberant Elizabethans — to wit, Milton. Meanwhile his brother George married and removed to Kentucky, and Keats with Armitage Brown took a tour, partly on foot, through the Lake Region and a portion of Scotland. Exposure and strain undermined Keats's health so much that a physician at Inverness had to order him home. He reached London in August 1818, where the sad task awaited him of nursing without hope his consumptive brother Tom through more than three months of decline. Just at this time an ironical fate decreed that the 'Quarterly' and 'Blackwood's' should publish their now notorious diatribes upon 'Endymion,' (by John Wilson Croker (q. v.) and, probably, J. G. Lockhart (q. v.) respectively). Keats on the whole bore the attacks well; but unfortunately Byron and Shelley have made the world think otherwise.

During the fall of 1818 Keats began 'Hyperion,' and wrote long letters to George and his wife in America. He also made the acquaintance of a handsome girl of 17, Miss Fanny Brawne, and speedily falling in love, became engaged to her. Rarely at his best in his relations with women, owing partly perhaps to his antecedents, partly to his sensuousness, partly to the struggles of his spirit to escape from its actual environment to the ideal world of beauty and romance, Keats gave himself up to this passion with an abandonment that might be described as disgusting, did not one make allowances for his slowly failing health.

After the death of Tom Keats 1 Dec. 1818, the poet resided for a time with Armitage Brown at Wentworth Place. Here he not only worked at 'Hyperion,' but wrote many of the

poems that mark the zenith of his genius, such as 'The Eve of Saint Agnes,' the odes 'On a Grecian Urn,' 'To a Nightingale,' and 'To Psyche,' and the ballad 'La Belle Dame sans Merci.' It was an extraordinary six months' work (Dec. 1818–May 1819) for an ailing poet in his 24th year. And he was not merely sick in body but poor in purse, most of his patrimony having been tangled up by his guardian, or spent, or loaned to impecunious friends. Other friends, like Brown, stood by him, however, though this fact can scarcely have made the marriage he dreamed of seem much more possible. He took summer excursions, wrote on a tragedy, 'Otho the Great,' with Brown, and completed his own 'Lamia,' in some respects the most individual and promising of his narrative poems. He abandoned 'Hyperion,' rightly judging that it was too Miltonic, yet he did not cease to form literary plans and to face the present and the future bravely. But on his return to London, he came once more under the influence of Miss Brawne, and he lost ground in health, courage, and literary power. His work in the drama and in satire proved on the whole unavailing; he recast 'Hyperion' for the worse ('The Fall of Hyperion'); and he lost his cheerfulness, becoming moody, suspicious, and somewhat dissipated.

Early in February 1820 he had his first hemorrhage from the lungs and was confined for several weeks, Brown being his indefatigable nurse. With Fanny Brawne, who was living next door, he kept up a correspondence which many of his admirers could spare. When he was stronger, Brown having left for Scotland, Keats occupied himself by seeing through the press his third volume — one of the most memorable in the history of our literature, for it can scarcely be disputed that in color and form latter-day English poetry owes more to Keats than to any other writer among the moderns. It was entitled 'Lamia, Isabella, The Eve of Saint Agnes and Other Poems,' and was welcomed, not only by friends like Hunt, but by such a critic as Jeffrey, in the 'Edinburgh.' It appeared early in July 1820, just after two hemorrhages had shown that its author must be soon cut short in what promised to be nothing less than a marvellous career.

During his new illness, Keats was kindly nursed by the Hunts; then ungrounded suspicions of their friendship caused him to leave them, and he was welcomed by Mrs. Brawne and her daughter. Becoming more tranquil, he determined to see what the climate of Italy could do for him, and with Severn he sailed for Naples in September. On the voyage he wrote his last poem, the fine sonnet 'Bright star, would I were steadfast as thou art.' After reaching Rome about the middle of December, he suffered many violent attacks of fever and pain; then he lingered in a calmer state of mind and body until death took him from the arms of the faithful Severn, in the early morning of 23 Feb. 1821. He was buried three days later in the old Protestant cemetery at Rome, and on his tomb was placed at his desire the nonprophetic epitaph, "Here lies one whose name was writ in water." In 1881 Severn was laid by his side; long before (December 1822) the ashes of the author of 'Adonais' had been buried nearby.

In person Keats was small, but evidently in his early years, strong and well made. His features were clear cut and his eyes large, dark, and full of meditative depth. In character he seems to have been essentially open, kindly, and manly. That his social status and his exceptionally sensuous nature were without deleterious effects upon his life, as well as upon his poetry, it would be idle to assert; yet it would be equally beside the mark to think of him chiefly as a hyperæsthetic anomaly among the men of his day. He was far more than a lower middle-class Briton of the Regency; but he was also more than the neo-Greek, or the neo-Elizabethan, or the idolatrous priest of beauty that some have fancied him. He was a wonderfully endowed poet of strong human interests, keen intelligence, ever deepening moral sense, extraordinary sensitiveness to physical impressions — not only upon eye and ear, but upon taste and touch — growing appreciation of artistic form, and steadily developing power of self-control. He filled all the rôles his admirers have claimed for him; but he filled them, or was learning to fill them, in combination — a fact which makes him greater than even some warm admirers have fancied.

His rank among English poets is not easy to determine. In a sense Matthew Arnold was right when he declared that Keats "is with Shakespeare." It might be added that he is with Milton also; but he is with these supreme poets only in respect to certain qualities of genius. He is obviously not with them in sustained power, in unexcelled majestic achievements, in breadth and duration of popular appeal. Even when he is compared with his contemporaries he is found to lack, in a measure, Byron's passion and cosmopolitan influence, Wordsworth's power to calm and ennoble the spirit and quicken the vision, Coleridge's ineffable secret of casting glamour, and Shelley's gift of interpenetrating poetry and life with the radiance of a pure idealism. In quantity of approximately perfect work he falls short: of course, through no fault of his own. The juvenile volume of 1817 and 'Endymion,' though in a sense the latter confirms the truth of its first line that "a thing of beauty is a joy forever." are on the whole immature, and the posthumous poems and letters, though abounding in merits, are uneven in value and below the highest excellence. It is mainly on the magnificent volume of 1820 — on the impressive artistic mastery shown in 'Lamia,' on the romantic charm of 'The Eve of Saint Agnes,' on the tender pathos of 'Isabella,' on the matchless harmonies, the deep, subtle appeal to mind and heart, and the indescribable richness of the great odes, on what it is hardly rash to call the dewy felicity of some of the less elaborate lyrics that the claim of Keats to rank among the greater English poets rests, and rests securely. To lovers of poetry he has long been almost an idol; the public has scarcely yet realized the full significance of his noble, and in some respects unique genius.

Bibliography.— Keats's poems were first collected, with those of Coleridge and Shelley, in 1829. In 1848 R. M. Milnes (Lord Houghton) published the 'Life, Letters and Literary Remains' (revised 1867); biographical material then began to accumulate through such books as

Leigh Hunt's 'Autobiography. In 1876 Mr. H. B. Forman edited the letters to Fanny Brawne, an' in 1885 the works in prose and verse in four volumes (reissued and augmented in 1889). In 1883 J. G. Speed, of the American branch of the family issued a volume of 'Letters and Poems.' In 1887 brief lives of the poet appeared in 'Great Writers' and the 'English Men of Letters' by W. M. Rossetti and Sidney Colvin respectively. In 1891 Mr. Colvin edited 'Letters of John Keats to His Family and Friends.' In 1895 Mr. Forman issued the complete correspondence (1 vol.) and in 1901 what is the best edition of the entire works (5 vols.). The [American] Cambridge edition of the poems and letters is also good. There are numerous editions of the poems, including several by Lord Houghton (especially the Aldine, 5th edition, 1890), one by W. T. Arnold (1883), the 'Golden Treasury' by F. T. Palgrave (1884), and the latest and best by E. de Sélincourt (1905). Books dealing with Byron, Shelley, and Hunt usually touch on Keats, and the mass of criticism upon him is large. Among his chief critics are Matthew Arnold, Robert Bridges, DeQuincey, Dowden, Leigh Hunt (see 'Imagination and Fancy'), Lowell, Masson, J. M. Robertson, Swinburne, and Woodberry. Consult also Sharp's 'Life and Letters of Joseph Severn' (1892) and Marie Gotheim's 'John Keats, Leben und Werke' (1897). WILLIAM P. TRENT,

Professor of Literature, Columbia University.

Keble, kē'bl, **John,** English Anglican clergyman and poet: b. Fairfield, Gloucestershire, 25 April 1792; d. Bournemouth, Hampshire, 29 March 1866. He was educated at Corpus Christi College, Oxford, and took his degree in 1811 with high honors. Going to Oriel as a fellow, he became college tutor and public examiner, and in 1831–41 was professor of poetry. He took priest's orders in 1816 and was his father's curate for some time. He was appointed vicar of Hursley, near Winchester, in 1836, a position which he held until his death. To the world at large he is best known as the author of the famous volume of religious verse, 'The Christian Year' (q.v.). He also wrote the 'Lyra Innocentium,' and, with Newman and others, the 'Lyrica Apostolica.' He was a zealous High Churchman, and wrote several of the celebrated 'Tracts for the Times' (1833). Keble College, Oxford, was founded as a memorial of him. Consult: 'Lives' by J. T. Coleridge (1869), and Lock (1892); Yonge, 'Musings over the Christian Year' and 'Lyra Innocentium'; Shairp, 'Studies in Poetry and Philosophy' (1868); Newman, 'Apologia pro Vita sua' (1864); Yonge, 'John Keble's Two Parishes' (1898).

Keble College, one of the colleges of Oxford University, built by subscription as a memorial of the Rev. John Keble, and incorporated in 1870 by royal charter.

Ked'die, Henrietta, «SARAH TYTLER,» Scottish novelist: b. Cupar, Fifeshire, 4 March 1827. From 1848 to 1870 she was joint owner of a girls' school in her native place, and from 1870 to 1884 was engaged in literary work in London. She has since resided in Oxford. Her best work is 'Citoyenne Jacqueline' (1865), a well-told story of the French Revolution. Among other works of hers are: 'Papers for Thoughtful Girls' (1862); 'St. Mungo's City' (1885); 'Six Royal Ladies of the House of Hanover' (1898); 'Women Must Weep' (1901); 'Three Men of Mark' (1901).

Ked'ney, John Steinfort, American Episcopal clergyman: b. Essex County, N. J., 12 Feb. 1819. He was graduated from Union College in 1838 and from the General Theological Seminary, New York, in 1841. After taking orders in the Episcopal Church he was rector of several churches until 1871, when he became professor of divinity in Seabury Divinity School, Faribault, Minn. He has published: 'Catawba River and Other Poems' (1846); 'The Beautiful and the Sublime' (1884); 'Hegel's Æsthetics' (1886); 'Christian Doctrine Harmonized' (1888); 'Mens Christi' (1890); 'Problems in Ethics' (1899).

Keefer, kē'fẽr, **Samuel,** Canadian engineer: b. Thorold, Ontario, 22 Jan. 1811. He is a brother of T. C. Keefer (q.v.). In 1841–53 he was chief engineer of the government board of public works, in 1853 was appointed resident engineer of the Grand Trunk railway, and in 1857–64 was government inspector of railways and deputy commissioner of public works. He completed in 1869 the Niagara Falls suspension bridge, then the longest existing single-span structure. His design and description of the bridge received a gold medal at the Paris exposition of 1878.

Keefer, Thomas Coltrain, Canadian engineer: b. Thorold, Ontario, 4 Nov. 1821. He is a brother of Samuel Keefer (q.v.). He was educated at Upper Canada College (Toronto), began practice as a civil engineer in 1838, and in 1850 was appointed by the government to survey the rapids of the St. Lawrence and explore the region between the headwaters of the St. John and the St. Lawrence. In 1851 he became engineer-in-chief of the Toronto and Kingston section of the Grand Trunk railway, and made surveys at Montreal for the present Victoria bridge across the St. Lawrence. He was chief commissioner for Canada at the Paris exposition of 1878. He wrote: 'The Philosophy of Railways' (1849); and an essay on 'The Influence of the Canals of Canada on her Agriculture' (1850), which won a prize offered by the Earl of Elgin.

Keeler, kē'lẽr, **James Edward,** American astronomer: b. La Salle, Ill., 10 Sept. 1857; d. San Francisco, Cal., 12 Aug. 1900. He was graduated from the Johns Hopkins University in 1881, was appointed assistant to Prof. S. P. Langley (q.v.) in the Mount Whitney (Cal.) expedition (1881), was in 1881–3 at the Allegheny Observatory, and after study in Germany (1883–4), was appointed assistant at Lick Observatory (1886), and later astronomer there (1888). In 1891–8 he was active at the Allegheny Observatory as its director and professor of astrophysics in the Western University of Pennsylvania, and from 1898 until his death was director of the Lick Observatory. His spectroscopic work included valuable studies of the nebula in Orion and of Saturn's rings.

Keeley, kē'lĭ, **Leslie E.,** American physician: b. in 1842; d. Los Angeles, Cal., 21 Feb. 1900. He was graduated at Rush Medical Col-

lege (Chicago) in 1863, was a surgeon in the Federal army during the Civil War, practised medicine at Dwight, Ill., there opened (1880) a sanitarium for the cure of inebriety and the use of narcotics, and later established branches. His system was based on a secret compound said by him to contain bichloride of gold, and hence called the "gold" cure. He published 'The Morphine Eater' (1881).

Keely, John Ernest Worrell, American adventurer: b. Philadelphia, Pa., 3 Sept. 1837; d. there 18 Nov. 1898. In early life he was a carpenter. Prior to 1872 he became interested in music, and afterward claimed that the tuning-fork had suggested to him a new motive power. In 1874 a stock company was formed for the purpose of supplying funds for the perfection and promotion of the alleged discovery. Keely built and destroyed many models, gave exhibitions at which numerous remarkable and unexplained effects were produced, but never attained any important result. Upon his death it was found that the so-called Keely motor was operated by an invisible compressed-air apparatus, and that the entire scheme was fraudulent.

Keely Motor. See KEELY, J. E. W.

Keen, kēn, **William Williams,** American surgeon: b. Philadelphia 19 Jan. 1837. He was graduated at Brown University in 1859, and from Jefferson Medical College in 1862; and during the Civil War period was an assistant surgeon in the Federal army. He then studied in Europe 1864–6, was at the head of the Philadelphia School of Anatomy 1866–75; and at the same time lecturer on pathological anatomy at Jefferson Medical College. From 1875 to 1890 he was professor of artistic anatomy at the Pennsylvania Academy of Fine Arts and also of surgery at the Women's Medical College 1884–9, and of surgery at Jefferson Medical College till 4 Jan. 1907 when he became professor emeritus. In 1890 he published experiments with the injection of filtered air for determination of rupture of the bladder and in 1891 proposed relieving spasmodic wryneck by the exsection of the nerves supplying the posterior rotator muscles of the head. He has published: 'Keen's Clinical Charts' (1870); 'Early History of Practical Anatomy' (1870); etc., and became honorary fellow of the Royal College of Surgeons of England in 1900.

Keenan, kē'nan, **Henry Francis,** American novelist: b. Rochester, N. Y., 4 May 1850. He served in the Federal army during a portion of the Civil War, and was engaged in journalistic work 1868–82. He has published: 'The Money Makers: a Social Problem'; 'Trajan'; 'The Aliens'; 'The Iron Game'; 'The Players.'

Keene, James Robert, American stock speculator: b. London, England, 1838. He went to California in 1852, was a miner in that State and Nevada, later was a speculator in mining stock at San Francisco, during the so-called "bonanza" period acquired $6,000,000, and for a time was president of the San Francisco stock exchange. In 1877 he established himself in New York as a Wall Street operator, soon became known for his energetic manipulations on 'Change, and since then has lost and made several fortunes.

Keene, Laura, American actress and manager: b. England 1820; d. Montclair, N. J., 4 Nov. 1873. Her real name was Mary Moss, and as "LAURA KEENE" she had become famous in England in the role of Pauline in 'The Lady of Lyons' before coming to the United States in 1852, where she made her home the remainder of her life. She was for a time manager of the Varieties Theatre in New York, and 1855–63 was lessee of the Olympic, at first called "Laura Keene's Theatre." She was married to H. W. Taylor in 1847, and to J. Lutz ten years afterward. The most noted play produced by her was 'Our American Cousin,' brought out in 1858 with Jefferson and Sothern in the cast. While he was witnessing this play at Ford's Theatre in Washington, President Lincoln was assassinated.

Keene, N. H., city, county-seat of Cheshire County; on the Ashuelot River, and on the Boston & M. and the Fitchburg R.R.'s; about 45 miles southwest of Concord and 43 miles west of Manchester. Mount Monadnock is 10 miles from the city. The city, known as Upper Ashuelot, was settled in 1734 and incorporated in 1753 when it took the name of Keene. It received its city charter in 1874. The chief industrial establishments are the repair-shops of the Boston & Maine railroad, sash, door, and blind factories, furniture, pail and tub, and chair factories, glue works, pottery, woolen-mill and shoe factory. Nearly 2,000 persons are employed in the factories. The annual output of manufactured goods is about $2,000,000. The products of the fertile farms of the vicinity add to the wealth of the city. Pop. (1890) 7,446; (1900) 9,165.

Keener, kē'nėr, **John Christian,** American Methodist bishop: b. Baltimore 7 Feb. 1819. After entering the Methodist ministry in 1841 he preached in Alabama till 1848 and was pastor and presiding elder in New Orleans 1848–61. He edited the 'New Orleans Christian Advocate' (1865–70), and in the year last named was appointed a bishop of the Methodist Church, South. He has published: 'Studies of Bible Truths' (1899); 'The Garden of Eden and the Flood' (1900).

Keesoo, or **Teesoo,** the flowers of certain species of *Butea* (q.v.).

Keewatin, kē-wä'tĭn, a district of Canada lying west and south of Hudson Bay, and extending from Ontario and Manitoba north to the Arctic Ocean. Its area is 756,000 square miles. The greater part of the surface is hilly and somewhat mountainous, but there are no high peaks or ranges. The northern part of Lake Winnipeg and its outlet, Nelson River, are in Keewatin. There are a large number of small lakes, all of which belong in the basin of Hudson Bay. The Severn, Churchill, and Ferguson rivers cross the district and enter Hudson Bay. There is considerable fertile land, but the climate is too cold for luxuriant vegetation. In the south there are large forests of pine, spruce, and other trees. Some valuable minerals have been found, gold and copper, but the mines have not been developed. Hunting, lumbering, and fishing are the chief occupations. The inhabitants of the north are chiefly Eskimos. York Factory, at the mouth of the Nelson River, Fort Churchill, at the mouth of the

HELEN KELLER, HER INSTRUCTOR AND JOSEPH JEFFERSON.

Churchill River, Norway House, on Lake Winnipeg, and a number of other places in Keewatin are trading stations of the Hudson Bay Company and its successors in the fur business of Canada. All are small settlements. The fisheries at Lake Winnipeg attract a colony a part of the year.

The name of the district comes from the Indian word kewatin, which means "northwest wind." The lieutenant-governor of Manitoba is the chief executive of this territory, and has had control since the erection of the district, 12 April 1876.

Keifer, kī'fėr, **Joseph Warren,** American politician: b. Clark County, Ohio, 30 Jan. 1836. He was graduated from Antioch College; and in 1856 went to Springfield, Ohio, where he studied law, being admitted to the bar in 1858. At the outbreak of the Civil War he entered the volunteer service as major and rose to the rank of major-general; he was four times wounded; in 1866 he declined an appointment as lieutenant-colonel in the United States army. He was a member of the Ohio State senate in 1868–9; was delegate to the Republican national convention in 1876, and was elected to Congress in that year, serving till 1885; while from 1881 to 1883 he was speaker of the House. Since 1873 he has been president of the Lagonda National Bank in Springfield; he has also been prominent in the Grand Army, being department commander in Ohio (1868–70) and vice-commander-in-chief of the national organization in 1871–2. In 1898 he served as major-general of volunteers in the Spanish War, his command being located near Havana. He has written 'Slavery and Four Years of War' (1900).

Keith, kēth, **George,** Scottish Quaker: b. probably in Aberdeenshire about 1639; d. Edburton, Sussex, England, 27 March 1716. He was educated at Marischal College, Aberdeen; became a Quaker in 1662, and in 1677 he accompanied George Fox and William Penn to Holland on a missionary journey; came to Philadelphia in 1689; and was there accused of heresy and interdicted from preaching in 1692. He then held separate meetings of his followers, known first as Keithites and later as "Christian Quakers." Disowned by the yearly meeting of 1694, he established a congregation in which the Quaker externals were observed but the Lord's Supper and baptism were administered. In 1700 he conformed to the Anglican Church, in 1702–4 was a missionary in America for the Society for the Propagation of the Gospel, and from 1705 until his death was rector of Edburton, Sussex. Among his writings were: 'The Deism of William Penn and his Brethren' (1699); 'The Standard of the Quakers Examined' (1702); and 'A Journal of Travels' (1706).

Keller, kĕl'ler, **Gerard,** Dutch writer: b. Gouda, 13 Feb. 1829. His best works are his books of travel, including: 'A Summer in the North' (1861); 'A Summer in the South' (1864); 'Paris Besieged' (1871); 'Murdered Paris' (1872); 'Europe Sketched in All her Glory' (1877–80); 'America in Image and in Writing' (1887). Among his numerous novels may be named: 'Within and Without' (1860); 'From Home' (1867); 'Over-Perfect' (1871); 'The Privy Councillor'; 'In Our Days' (1880); 'Our Minister' (1883); 'Flickering Flames' (1884); 'Nemesis' (1885). He is the author also of books for the young, and several dramas.

Keller, Gottfried, German poet and novelist: b. Zürich 19 July 1819; d. there 16 July 1890. Original in execution, he was a keen observer, genuinely artistic, and with a strong sense of humor, sometimes extravagantly indulged. In his best vein he goes straight to the heart. To romanticism in *motifs,* processes, and characters, he joined realism in execution. Among his works may be cited: 'Der grüne Heinrich' (1854, 16th ed. 1897), his first novel; 'Seldwyla Folk,' a collection of short stories (1856); 'Romeo und Julie auf dem Dorfe' (1876); 'Martin Salander' (1886). His collected poems appeared in 1883. By critics Keller is ranked among the best of German novelists. Consult: Brahm, 'Gottfried Keller' (1883); Köster, 'Gottfried Keller' (1900).

Keller, Helen Adams, American blind, deaf and dumb girl who has been successfully educated: b. Tuscumbia, Ala., 27 June 1880. When about two years old, she was deprived of sight and hearing by a severe illness. Her education was not begun till she was seven, when Miss Anna Sullivan of the Perkins Institute of the Blind, went to her home to take charge of her. She learned the deaf and dumb language by touch, learned to read by the braille system, and to write, using a special typewriter; in 1890, she also learned to speak. When 12 years old, she went to Boston, where she has since lived; in 1896 she entered the Cambridge School for Young Ladies to prepare for college. Miss Sullivan went with her to all classes, and repeated the lectures and discussions by touch. In 1900 she entered Radcliffe College, and was graduated with honors in 1904. The work of her college course was done with aid of Miss Sullivan, as in the preparatory school; the textbooks were printed in braille; she wrote her examinations with her own typewriter; and had special conferences with her instructors instead of taking part in recitations. In addition to doing the full college work, she took part in the social life, and was very popular with her classmates. She has written her autobiography under the title of 'Story of My Life' (1903).

Kellermann, François Christophe, frăń swä krēs-tōf kĕl'lėr-măn (originally Georg Michael Kellermann), Duke of Valmy, French marshal: b. Wolfsbuchweiler-an-der Tauber, Bavaria, 28 May 1735; d. 12 Sept. 1820. He entered the Conflans Legion as a hussar in 1752, and engaged in the first campaigns of the Seven Years' War. In 1792 he received the command of the army of the Moselle, formed a junction in September with the main army under Dumouriez, and sustained 20 Sept. 1792 the celebrated attack of the Duke of Brunswick. In the following wars of France Kellermann received various general commands. He became marshal of France in 1804 and Duke of Valmy in 1809. After the Bourbon restoration he was appointed a member of the chamber of peers, where he espoused the Liberal side.

Kelley, kĕl'ī, **Benjamin Franklin,** American soldier: b. New Hampshire, N. H., 10 April

1807; d. Oakland, Md., 17 July 1891. In 1861 he recruited and became colonel of the first Virginia regiment enlisted in the Federal service, on 17 May became brigadier-general, captured Romney 26 October and was for a time, until January 1862, commander of the department of Harper's Ferry and Cumberland. In July 1863, he was appointed to command the department of West Virginia, in November 1863 destroyed the Confederate camp near Morefield, Va., and in August 1864 defeated the enemy at Cumberland, Md., and New Creek and Morefield, Va. He was brevetted major-general of volunteers in 1865, and subsequent to the war was from 1876 superintendent of the Hot Springs (Ark.) reservation, and from 1883 an examiner of pensions.

Kelley, Edgar Stillman, American composer: b. Sparta, Wis., 14 April 1857. He was graduated from the Stuttgart Conservatory of Music in 1880, and returning to this country settled in San Francisco, composing there incidental music to 'Macbeth.' He removed later to New York, where he became special instructor in composition in the New York College of Music, and where his opera, 'Puritana,' was produced in 1892. He has also composed an orchestral suite 'Aladdin' symphony; music to 'Prometheus Bound'; music for dramatic production of 'Ben Hur' (1899); etc.

Kelley, James Douglas Jerrold, American naval commander: b. New York 25 Dec. 1847. He was graduated from the United States Naval Academy in 1868; became lieutenant-commander in 1893 and commander in 1899. He has published: 'The Question of Ships'; 'Our Navy'; 'American Men-o'-War'; 'History of the Naval Experimental Battery'; 'The Navy of the United States'; and is the naval editor of the New York *Herald*.

Kelley, William Darragh, American legislator: b. Philadelphia, Pa., 12 April 1814; d. Washington, D. C., 9 Jan. 1890. He was apprenticed first to a jeweler and later to a printer, studied law at Philadelphia and in 1841 was admitted to the bar there, in 1845–6 was attorney-general of Pennsylvania, and in 1846–56 judge of the court of common pleas at Philadelphia. Previously a Democrat, he became a Republican in 1854, and in that year gave at Philadelphia a once well-known address on 'Slavery in the Territories.' In 1860 he was a delegate to the national Republican convention, and from that year until his death was a member of the House of Representatives, where he was chairman of the Committee on the Centennial Exposition and was known as "Pig-iron Kelley." For some years he was senior of the House. Among his publications are: 'Letters on Industrial and Financial Questions' (1872); 'Letters from Europe' (1880); 'The New South' (1887).

Kellogg, kĕl'ŏg, **Amas Monkham,** American educator: b. Utica, N. Y., 5 June 1832. He was graduated from the Albany (N. Y.) State Normal School in 1851 and was instructor there 1852–6. Since then he has held other educational posts and has edited the 'School Journal' from 1874. He has published: 'School Management': 'Life of Pestalozzi' (1891); 'How to be a Successful Teacher' (1901), etc.

Kellogg, Clara Louise, American opera singer: b. Sumterville, S. C., 12 July 1842. She obtained her musical education chiefly in New York, where her first appearance in opera was in 1861 at the Academy of Music, in the role of Gilda in 'Rigoletto.' Henceforward she was one of the most popular of American singers, and was also most cordially received in England, where she sang in opera 1867–8 and again in 1872 with Christine Nilsson. Her voice was a pure and flexible soprano and her execution brilliant. She had an extensive repertoire, including 45 operas. In 1874 she organized an English opera company and with it visited nearly every part of the United States. In 1876 she organized an Italian opera company and later appeared on the concert stage. In 1887 she married her manager, Carl Strakosch, and soon after retired from professional life.

Kellogg, Edgar Romeyn, American soldier: b. New York 25 March 1842. He served through the Civil War in the Federal army, and was distinguished for bravery at Murfreesboro, during the Atlanta campaign, and at Jonesboro. He commanded the 10th United States Infantry at the battle of San Juan Hill, Cuba, 1 July 1898, and was appointed brigadier-general, United States army in the following October.

Kellogg, Elijah, American Congregational minister and writer for the young: b. Portland Maine, 20 May 1813; d. Harpswell, Maine, 17 March 1901. He was graduated from Bowdoin College in 1840, from the Andover Theological Seminary in 1843, was pastor of the Congregational Church at Harpswell, Maine, in 1844–55, in 1855–65 was chaplain of the Boston (Mass.) Seamen's Friend Society, was later for a time in charge of a congregation at Rockport, Mass., but soon returned to Harpswell, and there devoted himself to literary work. He published over a score of juveniles, including 'The Elm Island Series' (1868–70); 'Pleasant Cove Series' (1870–4), and 'Good Old Times Series' (1877–82). But he is best known for his familiar blank verse addresses, 'Spartacus to the Gladiators,' 'Regulus to the Carthaginians,' and 'Pericles to the People.' Consult Mitchell, 'Elijah Kellogg: the Man and His Work' (1903).

Kellogg, George, American inventor: b. New Hartford, Conn., 19 June 1812; d. there 6 May 1901. Albert Kellogg, the botanist (q.v.), was his brother. He was graduated from Wesleyan University in 1837, in 1841 became a manufacturer in Birmingham, Conn., removed in 1855 to New York, was a United States revenue officer in 1863–6, and later was active in manufacturing and experimentation at Cold Spring, N. Y. Among his inventions were a machine for the manufacture of jack-chain, with a capacity of a yard per minute; a type-distributer; an adding apparatus; and a dovetailing machine.

Kellogg, Martin, American Latinist and educator: b. Vernon, Conn., 15 March 1828; d. San Francisco 26 Aug. 1903. He was graduated from Yale in 1850, from the Union Theological Seminary in 1854; having removed to California about 1855 there held a pastorate at Grass Valley, Nevada County; was professor of Latin and mathematics in the College of California (1860–9); and when the college was merged into

the university held the chair of Latin and Greek in the latter institution in 1869–76. In 1876–94 he was professor of Latin language and literature, in 1890–3 acting president, and in 1893–9 president of the university. He resumed his professional duties in 1900. He published: 'Ars Oratoria,' an edition of selections from Cicero and Quintilian (1872), and 'The Brutus of Cicero' (1889).

Kellogg, Samuel Henry, American Presbyterian missionary and scholar: b. Quogue, Long Island, N. Y., 6 Sept. 1839; d. Landour, India, 2 May 1899. He was graduated at Princeton College in 1861 and at the Theological Seminary in 1864, and after being ordained to the Presbyterian ministry, went as a missionary to India, where he remained till 1877. He was professor of systematic theology in Western Theological Seminary 1877–86, and pastor of St. James' Square Presbyterian Church, Toronto, 1886–92. He returned to India in 1892 and remained there till his death. His publications include 'A Grammar of the Hindi Language' (1876); 'The Jews: or, Prediction and Fulfilment' (1883); 'The Light of Asia and the Light of the World' (1885); 'The Genesis and Growth of Religion' (1892); 'From Death to Resurrection' (1885); etc.

Kellogg, William Pitt, American lawyer and politician: b. Orwell, Vt., 8 Dec. 1831. He was educated at the Norwich Military Institute and removed to Illinois, where he studied law. Being admitted to the bar in 1852 he began his practice at Canton. He became active in the Republican party, was a delegate to the national convention in 1860, and one of the presidential electors in the same year, voting for Lincoln. In 1861 the President appointed him chief justice of the Territory of Nebraska, but later granted him leave of absence that he might raise a regiment of cavalry in Illinois, of which he became colonel. He remained in the army two years, serving in the Missouri campaign with Pope, but was compelled to resign on account of ill health. He was collector of the port at New Orleans (1865–8); was elected senator from Louisiana in 1868; was then elected governor of the State in 1873, serving till 1876, when he was again elected senator. At the expiration of his term as senator he was elected to the House of Representatives, where he remained till 1885. He has been a delegate to every Republican national convention from 1860 to 1896.

Kel'ly, Edmond, American municipal reformer: b. Toulouse, France, 28 May 1852. He was educated in early years in England and after graduation at Columbia Law School in 1877, was called to the bar. In 1884 he was admitted to the French bar and practised in Paris till 1890, and was counsel for the American legation at Paris. He has been conspicuous in recent efforts to improve the municipal administration of New York. He is the author of 'Evolution and Effort, and their Relation to Religion and Politics' (1898); and 'Government; or, Human Evolution' (1901).

Kelly, James Edward, American sculptor: b. 30 July 1855. He studied at the National Academy of Design, and up to 1881 was known as an illustrator of books and magazines. Since that time he has successfully devoted himself to sculpture, and chosen subjects from American history for treatment by his patriotic chisel; so great has been his success that he has won the title of "Sculptor of American History." His well known works include 'Sheridan's Ride' (1878); 'Paul Revere,' a statuette (1882); 'Monmouth Battle Monument,' with five illustrative panels (1883–5); groups for the 'Saratoga Monument' (1887); 'Grant at Fort Donelson' (1886); 'General Devens' and the 'Sixth New York Cavalry Monument' at Gettysburg (1890); 'Call to Arms'; colossal figure for the Troy 'Soldiers' Monument' (1891); 'Buford Monument' at Gettysburg (1895); 'Battle of Harlem Heights' (executed for the Sons of the Revolution at Columbia University, 1897); and a colossal monument to commemorate the defense of New Haven. A remarkable series of military portraits has also been produced by him. Forty generals of the Civil War, including Grant, Sherman and Sheridan, gave sittings for the sculptor. A series illustrating the leading generals and admirals of the Spanish-American War has followed, witnessing to his skill and industry as a portrait sculptor. Wheeler, Dewey, and Sampson are included in this latter gallery of busts.

Kelly, John, American politician: b. New York 21 April 1821; d. there 1 June 1886. After a public school education, he was apprenticed to the mason's trade, in 1845 established a successful business of his own, was elected alderman in 1854, in 1855–9 was a Democratic representative from New York in the 34th and 35th Congresses, and in 1859–62 and 1865–7 was sheriff of New York County. In 1868 he was the candidate of the Democratic Union for mayor, but was defeated by Oakey Hall; and in 1871 assisted Charles O'Conor, Samuel J. Tilden and others in the reorganization of Tammany Hall which followed the Tweed "ring" troubles. He became comptroller of New York in 1876, but was removed in 1879 by Mayor Cooper. In 1878 he caused the city delegates to bolt the Democratic State convention of that year, and was himself nominated for governor by the bolters on an independent ticket in opposition to Robinson, the regular candidate. He received 77,566 votes, and thus caused the election of Alonzo B. Cornell, Republican. In 1885 and 1886 he was chairman of the Tammany Hall general committee. See TAMMANY HALL.

Kelly, William, American inventor: b. Pittsburg, Pa., 22 Aug. 1811; d. Louisville, Ky., 11 Feb. 1888. He early turned his attention to invention, engaged in the forwarding and commission business at Pittsburg, Pa., and from 1846 in the iron business in Kentucky. In 1851 he finally perfected his process in decarbonizing iron by means of a current of air, and thus by a converter directly transforming pig-iron into steel. This method, "Kelly's air-boiling process," was the same as that patented by Sir Henry Bessemer in England in 1856 (or 1857), and Kelly asserted that Bessemer had gained knowledge of it through American workmen. Bessemer's application in the United States was refused, and the patent awarded to Kelly. Kelly's interests were safeguarded by a syndicate, and steel was first manufactured under his patents in the foundry at Wyandotte, Mich. He is said to have introduced Chinese labor into the United States.

Kelly's Ford, Engagements at. This point on the Rappahannock River six miles above its junction with the Rapidan and about five miles below Rappahannock Station, was the scene of several engagements between the Federals and Confederates during the Civil War. In August 1862, the Union cavalry of the Army of Virginia had a spirited encounter with the Confederate cavalry, and 17 March 1863 Gen. Averell with 2,100 Union cavalry and a battery of six guns, crossed at the ford, after a sharp engagement, and moved on Culpeper Court House, under orders to rout and destroy Fitzhugh Lee's cavalry brigade, reported at that place. Lee was found in his immediate front with five regiments and a battery, and when about noon Averell advanced, a hard fight ensued, during which Lee was gradually forced back over a mile; then Averell was checked, finally driven back, and recrossed the river at dark. It was the first purely cavalry battle of the War, and was closely contested on both sides. The Union loss was 65 killed and wounded and 22 missing; the Confederate loss, 99 killed and wounded and 34 missing. Among the Confederate killed was Captain John Pelham, a young artillerist of much promise. A portion of Pleasanton's cavalry division crossed the ford and took part in the battle of Fleetwood (q.v.) 9 June 1863. When Gen. Meade began his Mine Run campaign (see Mine Run) two corps of the Army of the Potomac under Gen. Sedgwick forced the passage of the Rappahannock at the railroad crossing, 7 Nov. 1863, while Gen. French, with two corps, forced the passage at Kelly's Ford, five miles below. The advance of the Third corps crossed with a loss of 36 killed and wounded, the Confederate loss being 64 killed and wounded and 295 captured, and the Army of the Potomac was united at Brandy Station. Preceding and following these engagements the ford was the scene of many stirring events.

E. A. Carman

Kelp, any of several large broad-leaved fucoid seaweeds (q.v.), which are burned for making ash and used for other purposes. The ash is known as "kelp" (or in France as *varec*), and was formerly produced in large quantities by slowly charring several tons of the weed in a shallow pit. The yield in ash was about 5 per cent of the weight of the mass burned. This crude ash contains several salts, especially carbonates and sulphates of sodium and potassium, with other substances in smaller proportions. It used to be the principal source of soda and iodine, but these substances are now otherwise obtained, and the making of kelp-ash has ceased to be profitable.

Kelp-crab, a large squarish edible crab (*Epialtus productus*), numerous in rocky weed-covered places along the Pacific coast from Monterey to Puget Sound.

Kelp-fish, a large blenny (*Heterostichus rostratus*) of the Californian coast, which is sold for food in the local markets. It is reddish brown, much streaked and mottled, so that it is practically invisible among the sea-weeds (kelp) where it usually lurks. Many other more or less similar fishes are called kelp-fishes in other parts of the world.

Kel'tie, John Scott, Scottish geographer: b. Dundee, Scotland, 29 March 1840. He has been editor of the 'Statesman's Year Book' from 1880, is editor of the 'Geographical Journal,' and has writen extensively on geographical and scientific topics in newspapers and periodicals. He has published 'History of Scottish Highlands and Clans' (1874); 'Report on Geographical Education' (1886); 'Applied Geography' (1890); 'The Partition of Africa' (1894). He is a member of geographical societies all over the world.

Kel'ton, John Cunningham, American soldier: b. Delaware County, Pa., 1828. He was graduated at West Point in 1851, received the commission of lieutenant in the infantry and served for six years in the frontier garrisons of Minnesota, Kansas and Dakota. At the conclusion of that period he was ordered to West Point as instructor in the use of small arms. During the Civil War he returned to active service and in 1861 became purchasing agent for the Western Department. The same year he was put in command of the 9th Missouri volunteers, with the commission of colonel. In 1862 he was appointed to the staff of Major-General Halleck, as assistant adjutant-general, and in 1865 brevetted brigadier-general in the regular army. He was appointed after the war a staff colonel and assistant adjutant-general at Washington; and invented improvements in military firearms which met with the acceptance of the Ordnance Department. Among his works on military subjects may be mentioned a 'Manual of the Bayonet' (1861).

Kelts. See Celts.

Kel'vin, Lord. See Thomson, Sir William.

Kem'ble, Adelaide. See Sartoris, Adelaide Kemble.

Kemble, Charles, English actor, 11th child of Roger Kemble (q.v.), and younger brother of John Philip Kemble (q.v.): b. Brecon, South Wales, 25 Nov. 1775; d. London 12 Nov. 1854. He was educated at the English Roman Catholic College at Douay, France, and in 1794 made his first appearance at Drury Lane as Malcolm to his brother's Macbeth. In 1800 he produced at the Haymarket Theatre his adaptation of Mercier's 'Deserteur,' under the title of 'The Point of Honor,' which achieved considerable success. In 1807 his play of 'The Wanderer,' adapted from Kotzebue, and in 1808 his farce of 'Plot and Counterplot,' were both successfully brought on the stage. As an actor he gained special celebrity by the performance of such characters as Falconbridge, Edgar, Romeo, Charles Surface, Cassio, Don Felix, and Benedick. His impersonations were greatly heightened by the physical advantages which he possessed of a fine voice, handsome features, and a tall athletic figure. About 1840 he was appointed to the office of examiner of plays, and shortly afterward made his last appearance on the stage. He subsequently gave occasionally public readings from Shakespeare. He was the father of John Mitchell Kemble (q.v.), the philologist, and of Fanny and Adelaide Kemble (q.v.). Consult Fitzgerald, 'The Kembles' (1871).

Kemble, Elizabeth. See Whitlock, Elizabeth Kemble.

Kemble, Frances Anne, English actress and author, daughter of Charles Kemble (q.v.): b. London 27 Nov. 1809; d. there 16 Jan. 1893. She manifested no special predilection for the stage, but made her début at Covent Garden, then under the management of her father, in October 1829. On this occasion she played Juliet, her father taking the part of Romeo, and her mother that of the nurse, with complete success. For the three succeeding years she performed leading parts in tragedy and comedy with great applause, distinguishing herself particularly in Juliet, Portia, Bianca in Milman's 'Fazio,' Julia in the 'Hunchback' (the latter being originally personated by her), Belvidera, Isabella, Lady Teazle, and Louise de Savoy, in her own play of 'Francis the First,' written when she was 17, and received with approbation. In 1832 she accompanied her father to the United States, and met with an enthusiastic reception in the chief cities. In 1834 she was married to Pierce Butler, a Georgia planter, and retired from the stage. The union proving unhappy, a separation took place at the end of a few years, and Mrs. Butler fixed her residence in Lenox, Mass. In 1849 she secured a divorce and resumed the name of Kemble. Her first work in prose, 'A Journal of a Residence in America' (1835) was chiefly devoted to a description of her tour through the United States. It was followed in 1837 by a drama, 'The Star of Seville,' acted with success; and in 1844 appeared a collection of her poems. Later works were 'A Year of Consolation' (1847); 'Residence on a Georgia Plantation' (1863); 'Record of a Girlhood' (1878–9); 'Records of Later Life' (1882); 'Notes upon Some of Shakespeare's Plays' (1882); 'Poems' (1883); 'Far Away and Long Ago,' a story (1889); 'Further Records' (1891). In the winter of 1848–9 she commenced in Boston a series of Shakespearian readings which drew crowded audiences, and during the next two years repeated the course in some of the principal American cities. In 1851 she returned to England, reappeared for a brief period on the stage, and gave readings in London and other parts of the United Kingdom. In 1856 she returned to the United States, and continued for several years at intervals to give readings in Boston and elsewhere. Her grandson, Owen Wister (q.v.) is a well known American writer.

Kemble, George Stephen, English actor: b. Kington, Herefordshire, 3 May 1758; d. 5 June 1822. He was a son of Roger Kemble (q.v.) and in 1783 made his début in London at Covent Garden Theatre as Othello. In the latter part of his career his increasing bulk enabled him to play the part of Falstaff without resort to padding. He was at various times theatrical manager in London, Edinburgh, and Glasgow.

Kemble, John Mitchell, English Anglo-Saxon scholar: b. London 2 April 1807; d. Dublin 26 March 1857. He was educated at Trinity College, Cambridge, and having early directed his attention to Anglo-Saxon language and history, employed himself in the ancient MSS. in the libraries of the university. The first fruits of his researches appeared in 1833, in the publication of the Anglo-Saxon poem 'Beowulf,' in 1834, and issued a pamphlet on the 'History of the English Language, First or Anglo-Saxon Period.' He edited in seven octavo volumes, for the English Historical Society, a collection of all the known charters of the Anglo-Saxon period, under the title of 'Codex Diplomaticus Ævi Saxonici,' and in 1849 appeared his most valuable and best known work, 'The Saxons in England.' Kemble was for many years editor of the 'British and Foreign Review,' and in 1840 succeeded his father, Charles Kemble (q.v.), as censor of plays, which office he occupied till his death.

Kemble, John Philip, English tragedian, eldest son of Roger Kemble (q.v.): b. Prescott, Lancashire, 1 Feb. 1757; d. Lausanne, Switzerland, 26 Feb. 1823. He was educated at the Roman Catholic seminary of Sedgley Park, Staffordshire, and the College of Douay, France, where he early distinguished himself by his proficiency in elocution. On his return to England he entered immediately upon the profession of an actor, and appeared for the first time in London at Drury Lane, 30 Sept. 1783, in the part of Hamlet, and was received with great applause. It was not, however, till 1788 that he took a decided lead in tragedy. He afterward obtained the management of Drury Lane Theatre, where his sister, Mrs. Siddons (q.v.), was the leading actress. In 1794 he brought out a musical entertainment of his own, entitled 'Lodoiska,' which had a great run. In 1802 he became manager of the Covent Garden Theatre, where he continued his career with great success till the destruction of the theatre by fire in 1808. In the autumn of 1809 the new edifice which had been constructed opened with an increase of prices, which, with certain obnoxious arrangements in regard to the private boxes, created for a series of nights the disturbances known by the name of the O. P. riots. Kemble retired from the stage 23 June 1817. As an actor he was distinguished for dignity, precision, and studious preparation. His merits were differently appreciated, but by all he was regarded as a highly gifted actor, and the impressions made in characters more immediately adapted to his style of excellence, such as Cato, Coriolanus, Hamlet, John, Jaques, Penruddock, was very great. See Boaden, 'Memoirs of the Life of John Philip Kemble' (1825).

Kemble, Roger, English actor and theatrical manager: b. Hereford 1 March 1721; d. 6 Dec. 1802. John Philip Kemble (q.v.) and Mrs. Siddons (q.v.) were his children. He organized in 1753 a traveling company in which many members of his family appeared. In 1788 he appeared at the Haymarket as Falstaff and the Miller in 'The Miller of Mansfield,' when, although rated as a mediocre actor, he is said to have played "with very superior effect."

Kemeys, Edward, American sculptor: b. Savannah, Ga., 31 Jan. 1843; d. 11 May 1907. He was educated in New York and served in the Civil War as captain in the artillery. He resigned in 1866 and went west, where he saw something of Indian life, and became familiar with the habits and forms of big game. He returned to New York and worked as a civil engineer in the laying out of Central Park, but did not choose the profession of art until 1870, when he resolved to become a sculptor. He went abroad in 1877 and his exhibits in Paris and London attracted attention, especially his 'Fight between a Buffalo and Wolves' in the Salon of 1878. He made American wild animals his

specialty. He was in short the American Barye: his 'Panther and Deer,' his 'Coyote and Raven,' are noteworthy for their fidelity to nature and life-like expression, and he was also remarkably successful in his figures of the North American Indian.

Kem'nitz, Martin. See CHEMNITZ, MARTIN.

Kempe, Charles Eamer, English worker in stained glass: b. Ovingdeane, Sussex, 29 June 1837. He received his early education at Rugby, and was graduated at Oxford University. His principal works have been in stained glass of the 13th century style in which the color, drawing and expression are of a unique excellence. He is distinctly a religious painter, who choosing as his medium the most difficult and intractable of methods and materials, has achieved supreme artistic and devotional success. His principal production in this country is the remarkable Jesse window in the Church of the Advent, Boston, which bears comparison with the more famous Jesse window of Troyes, France. He has designed and executed many fine windows for the cathedrals of Lichfield and Durham, and the 'Jane Austen' window recently set up in Winchester Cathedral is one of his latest creations.

Kem'per, James Lawson, American soldier and politician: b. Madison County, Va., 11 June 1823; d. Orange County, Va., 7 April 1895. Graduated from Washington College (Lexington, Va.) in 1842, he studied law at Charlestown (Va.), served in the Mexican War as captain of volunteers, and for ten years was a representative in the Virginia legislature, during two of which he was speaker of the house. In 1861 he was appointed colonel of the 7th Virginia, C. S. A.; in 1862 fought at Fair Oaks (31 May–1 June), where he was commissioned brigadier-general; and later also at Frayser's Farm (30 June), South Mountain (14 September), Antietam (16–17 September); and Fredericksburg (13 December). He was severely wounded at Gettysburg, was subsequently detailed to command the forces in and about Richmond, and 1 March 1864 was promoted major-general. After the war he practised law in Madison County, was Democratic governor of the State in 1874–8 and at the close of his term became a planter in Orange County. He published a collection of messages to the State legislature (1876).

Kemper, Reuben, American soldier: b. Fauquier County, Va., 1770; d. Natchez, Miss., 10 Oct. 1826. He emigrated to Ohio in 1800, and subsequently removed with two of his brothers to the Territory of Mississippi, where they were leaders in the movement to rid West Florida of Spanish rule. The Spanish authorities caused the Kempers to be kidnapped, but they were rescued by the commander of the American fort at Point Coupee. The Kempers pursued with great ferocity all who were engaged in this wrong upon them, and Reuben devoted himself to the task of driving the Spaniards from the American continent. He was engaged in an attempt to capture Mobile, which failed; and on the fitting out of the formidable expedition of Gutierrez and Toledo, in 1812, against the Spanish authority in Mexico, was assigned the rank of major, and afterward chosen colonel of the force, which co-operated with the Mexican insurgents. The expedition advanced into Texas, fought several bloody battles, in which Kemper and his Americans performed extraordinary feats of valor, and won brilliant victories. Kemper was subsequently engaged under General Jackson in the defense of New Orleans, and added greatly to his reputation as a soldier by his activity and efficiency. At the conclusion of the war he became a planter in Mississippi.

Kempff, Louis, American rear-admiral: b. Belleville, Ill., 11 Oct. 1841. He was graduated at the United States Naval Academy in 1861 and served with distinction throughout the Civil War. He was promoted captain in 1891, and became rear-admiral in 1899. When the Boxer troubles began in China in 1900 he was placed in command of the United States naval forces in Chinese waters. On 29 May he sent 108 marines ashore, who co-operated with the men landed from the other foreign warships in the harbor at Taku. When the Chinese forts were shortly after bombarded by the allied naval forces he declined to participate in the attack, on the ground that his government was not at war with China. For the judgment displayed on that occasion a joint resolution was pending in the 57th Congress conferring on him the thanks of Congress. He was retired from active service in October 1903.

Kem'pis, Thomas à, German devotional writer: b. Kempen, near Cologne, 1380; d. Mount Saint Agnes, near Zwolle, Netherlands, 26 July 1471. He was educated at Deventer by the Brethren of the Common Life, a religious order of men who passed a contemplative existence in transcribing manuscripts, compiling and writing religious books of various sorts, and religious exercises. In 1399 he entered the monastery of Mount St. Agnes, near Zwolle, of which his brother was prior, took the monastic vows in 1406, was ordained priest six years afterward, and in 1425 was elected sub-prior. He excelled as a copyist, and delighted to transcribe the Scriptures, the church fathers, and works of ascetic piety, while the fame of his eloquence and zeal was widely extended. He owes his present renown to his treatise 'De Imitatione Christi,' which has been translated into every language in Christendom. It has been wrongly but somewhat naturally attributed to the renowned theologian Gerson, chancellor of the University of Paris, and the question was debated with a view to national honor and the interests of ecclesiastical orders. The evidence in favor of the authorship of à Kempis is overwhelming. Three writers nearly his contemporaries mention him as author. Moreover several copies written in his own hand are extant, and in one ancient copy he is expressly named as the author. Both the literary style and the tone of refined piety which characterize this work are also distinguishing features of the devotional works of which he is certainly the author. Consult Kettlewell, 'Thomas à Kempis and the Brothers of the Common Life' (1884); Wolfsgruber, 'Giovanni Gerson, sein Leben und sein Werk De Imitatione Christi' (1880).

Ken, or **Kenn, Thomas,** English bishop and hymnologist: b. Little Berkhamstead, Hertfordshire, 1 July 1637; d. Longleat, Wiltshire, 19 March 1711. He was educated at Winchester School, graduated from New College, Oxford,

and became successively domestic chaplain to Bishop Morley (1665); rector of Brightstone, Isle of Wight (1667); and prebend of Winchester (1669). He spent five years traveling on the continent with his nephew Izaak Walton, living principally at Rome (1675–80), and accompanied Mary, Princess of Orange, to Holland, as domestic chaplain. In 1680 he was appointed chaplain to Charles II., attended him in his last illness, and was nominated by him to the bishopric of Bath and Wells (1684). He suffered deprivation with other non-jurors (q.v.) on the accession of William of Orange, for maintaining allegiance to James II. (1691). He was one of the lights of the English Church in one of the darkest periods of English social life, and by his zeal and devotion did much to maintain the standard of Christian conduct, his personal example of goodness being backed by learning, taste, and breadth of sympathy. His theological and devotional writings are principally valuable for the personality with which they are connected, but his immortal 'Morning and Evening Hymns' have won for him imperishable fame as the guide and inspirer of Christian devotion. Consult: Plumptre, 'Life of Bishop Ken' (1888).

Kenai, kĕ-nī', a peninsula in the southern part of Alaska, with William Sound on the east, Gulf of Alaska east and south, and Cook Inlet on the west. It is about 160 miles long and 110 miles across the widest part. It has good harbors, valuable coal fields, and some gold has been discovered.

Ken'dal, Margaret Brunton Robertson (Grimston), English actress: b. Great Grimsby 15 March 1849. She was a sister of T. W. Robertson, the dramatist (q.v.); was known on the stage as "Madge Robertson" and made her first appearance in London, as Ophelia, in 1865. She soon gained a reputation as an excellent actress of high comedy. On her marriage to W. H. Grimston (q.v.) in 1869 she assumed with him the stage name of Kendal. The Kendals made several visits to America after 1889 and secured favorable notice wherever they were seen.

Kendal, William Hunter (William Hunter Grimston), English actor: b. London 16 Dec. 1843. After his marriage to Madge Robertson (see Kendal, M. B. R.) in 1869, he played leading parts with her. He commenced his career on the stage at Glasgow in 1862, where he remained till 1866, supporting such stars as Mr. and Mrs. Charles Kean, Helen Faucit, G. O. Brooks, etc.; made his first appearance in London at the Haymarket Theatre in 1866, in 'A Dangerous Friend,' played there such parts as Charles Surface, Captain Absolute, Romeo, Orlando, Pygmalion, and in 1879–88 was lessee and manager with John Hare of the St. James Theatre, where were produced 'The Queen's Shilling'; 'The Squire'; 'Impulse'; 'The Ironmaster'; 'A Scrap of Paper'; 'Lady of Lyons'; and 'As You Like It.' He toured with Mrs. Kendal in the United States and Canada in 1889–95.

Ken'dall, Amos, American journalist and statesman: b. Dunstable, Mass., 16 Aug. 1789; d. Washington, D. C., 11 Nov. 1869. He was graduated from Dartmouth in 1811, studied law at Groton, Mass., in 1811–14, was admitted to the bar at Frankfort, Ky., in 1814, was postmaster and editor of the 'Patriot' at Georgetown, Ky., in 1815–6, and in 1816–29 co-editor and part owner of the 'Argus of Western America' at Frankfort. In 1829 he was appointed fourth auditor of the United States treasury, and during the Jackson administration he was extremely influential. He aided in the formation of the President's anti-bank policy (see Jackson, Andrew), was a special treasury agent to conduct negotiations with State banks, and is thought to have written several of Jackson's state papers. Appointed postmaster-general by Jackson in 1835, he was retained by Van Buren, but in 1840 resigned because of ill health. He cleared the post-office department of debt, and introduced numerous reforms. He established 'Kendall's Expositor,' bi-weekly, in 1841, and the 'Union Democrat,' weekly, in 1842, but both journals shortly ceased publication. In 1845 he became associated with S. F. B. Morse (q.v.) in the ownership and management of the Morse electric telegraph patents, and by his able direction ensured their commercial success and a fortune for himself. He gave largely in Washington for philanthropic purposes. Though calling himself a Jackson Democrat, he strongly opposed secession. He wrote an incomplete 'Life of Andrew Jackson, Private, Military, and Civil' (1843); 'Full Exposure of Dr. C. T. Jackson's Pretensions to the Invention of the Electromagnetic Telegraph' (1867), and an 'Autobiography,' posthumously published (1872).

Kendall, George Wilkins, American journalist: b. Amherst (now Mount Vernon), N. H., 1809; d. Oak Springs, Texas, 22 Oct. 1867. Settling in New Orleans in 1835, he was one of the founders of the New Orleans *Picayune* in 1837, which became under his direction one of the leading journals of the South. He wrote 'Narrative of the Texas Santa Fe Expedition' (1844), an expedition in which he took part; and 'The War Between the United States and Mexico' (1851).

Kendall, Henry Clarence, Australian poet: b. Ulladalla district, New South Wales, 18 April 1841; d. Redfern, near Sydney, 1 Aug. 1882. He became a lawyer's clerk at Sydney in 1860, in 1863 a clerk in the lands department of the New South Wales public service; later was in the colonial secretary's office; in 1869–73 was active as a journalist at Melbourne; and for some time previous to his death was an inspector of forests. His chief volumes are: 'Leaves from an Australian Forest' (1869), and 'Songs from the Mountains' (1880). He has been called the "poet of the bush" because of his skilful delineation of the character of Australian landscape. In 1886 appeared a collected edition of his verse, with a memoir.

Kendall, William Sergeant, American painter: b. Spuyten Duyvil, N. Y., 20 Jan. 1869. He began as a member of the Art Students' League of New York, and subsequently was a pupil of Thomas Eakins of Philadelphia. He went to France and attended the Ecole des Beaux Arts, and also studied under Olivier Merson. He is equally successful in figure, portrait, and landscape, and has received several honors in acknowledgment of his merit as a fine colorist and powerful draftsman. One of his best pictures is 'The End of the Day,' in which tender sentiment is united with workmanship of excellence.

Ken'drick, Asahel Clark, American Baptist clergyman and scholar: b. Poultney, Vt., 7 Dec. 1809; d. Rochester, N. Y., 21 Oct. 1895. He was graduated from Hamilton College, Clinton, N. Y., in 1831, and was professor of Greek at Madison (now Colgate) University, Hamilton, N. Y., 1831–50; and held a similar post in the University of Rochester from 1850. Besides translations and several text-books, and revising and editing Olshausen's 'Old Testament Commentary' and Meyer's 'Commentary on John,' he published 'Our Poetical Favorites' (1880); 'The Moral Conflict of Humanity' (1894); etc. He was one of the American committee of New Testament revisers.

Kendrick, John, American navigator: b. Boston about 1745; d. Hawaii 1800. During the Revolution he sailed a privateer, and in 1787, while in command of the Columbia and the Washington, explored the northwestern coast of America and various Pacific islands. In 1791 he voyaged to the South Seas, and established the Chinese trade in sandalwood, which for a long time he successfully carried on. He was among the earliest American sailors to attempt voyages for discovery.

Kendrick, John Mills, American Protestant Episcopal bishop: b. Gambier, Ohio. He was educated in the university of his native town, and was ordained deacon 1864, and priest in the following year. After several years' experience as rector and missionary, in 1889 he was consecrated bishop of Arizona, a post he still occupies, with Phœnix, Arizona, as his see city.

Kenealy, kĕ-nēl'ĭ, **Arabella,** English novelist: b. Sussex. She is a daughter of Dr. Kenealy, the famous advocate of the Tichborne "Claimant," and after pursuing medical studies practised as a physician in London and at Watford 1886–94. She has published 'Dr. Janet of Harley Street' (1893); 'Such Men Are Such Gentlemen' (1894); 'Woman and the Shadow' (1898); 'A Semi-Detached Marriage' (1899); 'Charming Renée' (1900); etc.

Kenesaw (kĕn-ĕ-sâ') **Mountain,** a mountain in Georgia 25 miles northwest of Atlanta. It is famous as the scene of a battle in the Civil War between the Union troops under Sherman, and the Confederates under Johnston.

Kenesaw Mountain, Battle of. On the night of 18 June 1864 Gen. J. E. Johnston fell back before Gen. Sherman's persistent advance and took a new line with Kenesaw Mountain as its salient, his right wing thrown back so as to cover Marietta, and his left covering the railroad back to the Chattahoochee. Sherman worked to the right, threatening the railroad, and was attacked by Hood's corps at Kolb's Farm (q.v.), 22 June. After much study of the ground, Sherman concluded that he had no alternative but to assault Johnston's line or turn his position. Either course had its difficulties and dangers, but as the enemy and his own officers had settled down to the conviction that he would not assault fortified lines, but would execute flanking movements only, he considered that a successful assault would have a good moral effect and show that he could move against an enemy behind breastworks; so he resolved to attack the left centre of Johnston's position, and orders were given on the 24th that on the 27th McPherson should assault near Little Kenesaw and that Thomas should assault about a mile further south. Kenesaw was strongly intrenched and held by Loring's and Hardee's corps, Loring on the right, opposite McPherson, Hardee on the left, opposite Thomas. About 9 A.M. of the 27th the troops moved to the assault, and all along the lines for ten miles a furious fire of artillery and musketry was kept up. A part of Logan's Fifteenth corps, formed in two lines, fought its way up the slope of Little Kenesaw, carried the Confederate skirmish-pits, and tried to go further, but was checked by the rough nature of the ground and the fire of artillery and musketry delivered at short range from behind breastworks. Logan's assault failed, with a loss of 600 men, and his troops were withdrawn to the captured skirmish-pits. About a mile to the right Thomas assaulted with Newton's and Davis' divisions. The troops charged up the face of the mountain, drove in the skirmish-line, and reached the main works, but were unable to carry them under the heavy fire of canister and musketry at short range; after heroic effort and the loss of Gens. C. G. Harker and Daniel McCook, commanding brigades, and 1,580 killed, wounded, and missing, fell back and intrenched 75 yards from the enemy's works. The assault was over by 11.30 A.M., and was a failure. It was the most serious reverse sustained by Sherman in the campaign. The entire Union loss was nearly 2,500; Johnston admits a Confederate loss of 808 killed and wounded. Consult: 'Official Records,' Vol. XXXVIII.; Cox, 'Atlanta'; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Sherman, 'Personal Memoirs,' Vol. II.; Johnston, 'Narrative'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Kenia, kā'nę-ä, **Mount,** an isolated extinct volcano situated in British East Africa, a few miles south of the equator. Its summit is covered with perpetual snow, and for this reason it is known as Doenyo Ebor or White Mountain. Its height is from 18,000 to 19,000 feet. It was discovered by Krapf in 1849, and its summit was first reached (by Kolb) in 1895.

Kenilworth, kĕn'l-wėrth, a novel by Sir Walter Scott, published in 1819, when its author had long been distinguished both as poet and novelist. It was the second of his great romances drawn from English history; the central figure is that of Queen Elizabeth, surrounded by the brilliant and famous characters of the period — Burleigh, Edmund Spenser, Sir Walter Raleigh; and also by a host of petty sycophants.

Ken'ly, John Reese, American soldier: b. Baltimore 1822. He served in the American army during the Mexican War, attaining the rank of major, and during the Civil War commanded the 1st Maryland regiment, which was captured by Stonewall Jackson at the battle of Front Royal, 23 May 1862. He subsequently commanded a brigade and was brevetted major-general of volunteers at the close of the War. His experiences during the Mexican War are recounted in his 'Memoirs of a Maryland Volunteer' (1873).

Ken'nan, George, American traveler, author, and lecturer: b. Norwalk, Ohio, 16 Feb. 1845. He received a secondary education, became a telegraph operator, in 1865 went to north-

eastern Siberia as an explorer and telegraph engineer, and in 1866–8 superintended the construction of the middle division of the Russo-American telegraph line. In 1870–1 he explored the mountain region of eastern Caucasus and Daghestan, upon his return to America was active as lecturer and journalist, and in 1877–85 was night manager of the Associated Press at Washington, D. C. In 1885–6, with G. A. Frost, an artist, he accomplished a journey of 15,000 miles through Russia and Siberia in investigation of the Russian exile system. He visited all the mines and prisons between the Ural Mountains and the headwaters of the Amur, and published an account of his observations in 'Siberia and the Exile System' (1891), first printed in the 'Century Magazine' (1889–90). From 1886 he lectured in Great Britain and the United States on his Siberian experiences. In 1898, during the Spanish-American war, he visited Cuba with the Red Cross Society and as special commissioner of the 'Outlook' of New York, to which he contributed valuable articles. In 1902 in company with American scientists he explored Mt. Pelée, Martinique, and the scene of the St. Pierre disaster. He further published in book form: 'Tent Life in Siberia' (1870), and 'Campaigning in Cuba' (1890).

Kennebec (kĕn-e-bĕk') **River,** a river in Maine, next to the Penobscot the most important in the State. Its principal source is Moosehead Lake, on the boundary line between Somerset and Piscataquia counties. After a course of 20 miles it receives Dead River from the right. It enters the Atlantic in Sagadahoc County through Sheepscott Bay, an irregular indentation of the coast studded with many islands. The largest tributary of the Kennebec is the Androscoggin, which joins it 18 miles from the ocean at Merrymeeting Bay. The outlets of a number of small ponds, and Sebasticook and Sandy rivers, also flow into it. The most important towns on its banks are Bath, Richmond, Gardiner, Hallowell, Augusta, and Waterville. It has falls at Waterville and at three points above, which afford excellent motive power. Its whole length is about 150 miles, in which it has a descent of 1,000 feet. The influence of the tide extends to Augusta, 42 miles from the sea. A dam with locks was constructed at Augusta for the purpose of improving the navigation above that point, and increasing the water power. The structure is 584 feet long and 15 feet above ordinary high water mark, and cost $300,000. It forms a pond 16½ miles in extent, with an average depth of 16 feet. The river is closed by ice at Hallowell from the middle of December to about 1 April; below Bath it is open at all seasons except during winters of unusual severity.

Kennebunk, kĕn-e-bŭnk', Maine, town in York County, on the Kennebunk and Mousan rivers and the Boston & Maine railroad, 24 miles southwest of Portland. The ample water-power here is utilized for various manufacturing industries, among the articles produced being leatheroid, sample-cases, shoe-stiffenings, fibre-board, and lumber. The town has a free circulating library containing several thousand volumes. It is one of the old towns of Maine, its settlement dating from about 1650. Until 1820, the year in which Maine became a separate State, Kennebunk was a part of Wells. Pop. (1890), 3,172; (1900), 3,228.

Kennebunkport', Maine, town in York County, 25 miles southwest of Portland, on the Atlantic Ocean, at the mouth of the Kennebunk River, and on the Boston & Maine railroad. It is situated on a good harbor, has an excellent beach, fine boating facilities on the river, and is a favorite summer resort with superior hotel and boarding-house accommodations. Besides Talbot's Library, the town has public and circulating libraries. Its industries include the manufacture of lumber and the building of boats and canoes. The town was settled in 1629, and incorporated as Cape Porpoise in 1653. Having been nearly destroyed by Indians in 1703, it was reincorporated in 1717 as Arundel, and in 1821 took its present name. Pop. (1890), 2,196; (1900), 2,123.

Ken'nedy, John Pendleton, American novelist: b. Baltimore, Md., 25 Oct. 1795; d. Newport, R. I., 18 Aug. 1870. He was graduated at Baltimore College in 1812, and in 1814 served as a volunteer in the ranks, taking part in the battles of Bladensburg and North Point. In 1816 he was admitted to the practice of the law, which he followed successfully for 20 years. In 1818 he commenced authorship, by the publication, in connection with his friend Peter Hoffman Cruse, of the 'Red Book,' a serial of light character in prose and verse issued about once a fortnight, and continuing two years. In 1820 he was elected to the Maryland house of delegates, and re-chosen the two next years. In 1832 he published his first novel, 'Swallow Barn, or a Sojourn in the Old Dominion,' descriptive of the plantation life of Virginia. In 1835 appeared 'Horseshoe Robinson, a Tale of the Tory Ascendency,' the most successful of his writings. In 1838 he published 'Rob of the Bowl, a Legend of St. Inigoes,' relating to the Maryland province in the days of Cecilius Calvert, second Lord Baltimore. Kennedy was a member of Congress 1839–45, and was prominent among the Whig members. In 1849 appeared his 'Life of William Wirt, Attorney-General of the United States,' and in 1852 he became secretary of the navy. His works not previously named include: 'Annals of Quodlibet' (1840); 'Mr. Ambrose's Letters on the Rebellion' (1865). He was a friend of Thackeray, and wrote or sketched in outline the fourth chapter of the second volume of 'The Virginians.' Consult 'Life' by Tuckerman.

Ken'net River, a tributary of the Thames, in England. It rises in Wiltshire, flowing east through Berkshire, emptying into the Thames at Reading, after a course of 46 miles. It is a part of the waterway connecting the North Sea with Saint George's Channel.

Kenney, kĕn'ĭ, **Richard Rolland,** American politician: b. Little Creek Hundred, Sussex County, Del., 9 Sept. 1856. He was graduated was State librarian, 1879–83. In January 1887, was admitted to the Delaware bar in 1881, and was State librarian, 1879–83. In January, 1887, he was elected to the United States Senate as a Democrat and became a popular leader. His term expired in March 1901, and a deadlock occurring in the Delaware legislature, which was Republican, a successor to Kenney was not elected and Delaware is now (1903) unrepresented in the National Senate.

Ken'ny, Sir Edward, Canadian statesman: b. County Kerry, Ireland, 1800; d. Halifax, N. S., 16 May 1891. He removed to Halifax in 1824, where he engaged in business, and was mayor at one time. He was member for 26 years of the legislative council of Nova Scotia, during 11 of which he was president; served as receiver-general of Canada 1869–79; president of the privy council 1869–70; and senator 1867–70; being knighted in the year last named.

Kenosha, kĕ-nō'sha, Wis., city, county-seat of Kenosha County; on Lake Michigan, and on the Chicago & N. railroad; about 35 miles south of Milwaukee. It has steamer communication with many of the ports on the Great Lakes. It is a trade centre for quite an extent of country. Its chief manufactures are leather, typewriters, furniture, wagons, lamps, machinery, iron bedsteads, and flour. It is the seat of Kemper Hall School (P. E.). The Simmons Memorial Library contains about 6,000 volumes. The city owns and operates the waterworks; the water is obtained from the lake and artesian wells. Pop. (1890) 6,532; (1900), 11,606.

Ken'rick, Francis Patrick, American Roman Catholic bishop: b. Dublin, Ireland, 3 Dec. 1797; d. Baltimore 6 July 1863. After studying in Rome 1815–21, he was ordained priest in the latter year and sent to this country to take charge of a seminary at Bardstown, Ky. He remained at Bardstown nine years till his appointment as coadjutor bishop of Philadelphia in 1830. Twelve years later he became bishop of Philadelphia and there founded the seminary of St. Charles Borromeo. In 1851 he was installed archbishop of Baltimore and the next year presided over the first plenary council of American Roman Catholic prelates. He became honorary primate of the United States in 1859. He was prominent as a controversalist and a Biblical scholar, and published 'Dogmatic Theology' (1839–40); 'Moral Theology' (1841–3); a revision of the Douai English Bible, with notes, etc.

Kenrick, Peter Richard, American Roman Catholic archbishop: b. Dublin, Ireland, 17 Aug. 1806; d. St. Louis, Mo., 4 March 1896. After studying at Maynooth he was ordained priest in 1830, and came to the United States in 1833. He was professor of dogmatics in the seminary of the diocese of Philadelphia and subsequently became vicar-general. In 1841 he was appointed coadjutor to Bishop Rosati, of St. Louis, succeeded to that bishopric in 1843, and was created first archbishop of St. Louis in 1847. He opposed the dogma of papal infallibility but acquiesced in its final decree. He published 'The Holy House of Loretto'; 'Anglican Ordinations'; 'Vaticana'; etc. Consult O'Shea, 'The Two Archbishops Kenrick' (1904).

Kenrick, William, English miscellaneous writer: b. about 1725; d. London 10 June 1779. He believed himself a genius, and was for years active as a libeler of successful authors and actors. Among those whom he attacked were Goldsmith, Garrick, Johnson, Colman, and Fielding. He lectured, too, on subjects ranging "from Shakespeare to the perpetual motion, which he thought he had discovered."

Kenrick, William, American nurseryman: b. 1795; d. 1872. He was the son of a nurseryman, whose gardens occupied the locality where John Eliot first preached to the Indians, and at 28 he became a partner with his father. He is remembered as having introduced into America the culture of the mulberry tree in order to establish a native silk industry, his book, 'The American Silk Growers' Guide,' in reality a work on mulberry culture, being issued in 1835. Among other novelties he introduced into America was the Lombardy poplar.

Ken'sett, John Frederick, American painter: b. Cheshire, Conn., 22 March 1818; d. New York 14 Dec. 1872. His uncle, Alfred Daggett, an engraver, gave him his first lessons in art, but in 1840 he went abroad and for seven years traveled in England, Switzerland and Italy. The fruit of this student-ramble was a large number of sketches and paintings, out of which he exhibited in 1845 in the Royal Academy. On returning to America he lived chiefly in New York and in 1849 was elected a National academician. His landscapes are more remarkable for sweetness than for strength, but he maintains a uniform standard of merit in all of them. His technique is delicate and refined, especially in his small canvases. He delights in the scenery of the Hudson, and of the seacoast, and some of his effects are exquisitely charming. Among his landscapes the most interesting are 'Sunset on the Coast' (1858); 'October Afternoon' (1864); 'Noon on the Sea-Shore,' which has been engraved by Hunt. Several of his pictures are in the Metropolitan Museum of Art, New York, the finest of them being 'White Mountains,' a masterpiece of its class. He was for some years a member of the national art commission appointed to direct the decoration of the National Capitol.

Ken'sington Gardens, a celebrated public park in London four miles west of Saint Paul's, and well known for its royal palace. In former times Kensington Palace was a favorite royal residence; and King William III., Queen Mary, Queen Anne, and George II. died here. Kensington Gardens and Hyde Park are much frequented in summer, and form a great ornament to the metropolis. They cover about 350 acres, and contain the Albert Memorial. In South Kensington the chief attractions are the South Kensington or Victoria and Albert Museum, the Indian Museum, the Natural History Museum, and the Imperial Institute.

Kensington Palace. See Kensington Gardens.

Kensit, John, English anti-ritualist: b. London about 1852; d. Liverpool 8 Oct. 1902. He kept a small bookshop in Paternoster Row, London, but in 1896 began an attack upon the Roman Catholic Church and the ritualistic party in the Church of England. He organized bands of preachers, called Wicliffites, that disturbed public worship and frequently caused riots. At the public ceremony of the confirmation of Canon Gore as bishop of Worcester (22 Jan. 1902) he objected, and then and at the subsequent consecration disturbances occurred. Since his death the movement has had no prominence.

Kent, Charles Foster, American Biblical scholar: b. Palmyra, N. Y., 13 Aug. 1867. He was graduated at the universities of Yale (1889) and Berlin (1892), and the following year became an instructor in the University of Chicago.

In 1895 he was elected professor of Biblical literature and history at Brown University, a position which he held until 1901. He is at present Woolsey professor of Biblical literature at Yale University. Among his writings are: 'Outlines of Hebrew History' (1895); 'The Wise Men of Ancient Israel and Their Proverbs' (1895); 'History of the Hebrew People, the United Kingdom' (1896); 'History of the Hebrew People, the Divided Kingdom' (1899); 'Messages of the Earlier Prophets' (1899); 'Messages of the Later Prophets' (1900).

Kent, Jacob Ford, American general. b: Philadelphia, Pa., 14 Sept. 1835. He entered the army as 2d lieutenant 6 May 1861, became captain in January 1864; and was brevetted colonel of volunteers in October 1864, for faithful and meritorious services in the field during the campaign before Richmond. At the opening of the war with Spain he was colonel of the 24th infantry. He was made major-general of volunteers 8 July 1898, and served with distinction in Cuba, and afterward in the Philippines. He was retired in October 1898.

Kent, James, American jurist: b. Philippi, Putnam County, N. Y., 31 July 1763; d. New York 12 Dec. 1847. Kent was graduated at Yale College in 1781, studied law, was admitted in 1785 as an attorney, and in 1787 as a counsellor, and commenced the practice of his profession in Poughkeepsie. He soon became remarkable among his contemporaries for his legal learning and literary attainments. He was elected successively in 1790 and 1792 a member of the legislature for Dutchess County. Kent became an active and leading Federalist, attracting the notice and confidence of Hamilton and Jay. It was by Hamilton's counsel that the reading of the young lawyer was directed to the doctrines of the civil law, and the treatises of the jurists of continental Europe. In 1793 Kent removed to New York, was appointed one of the two masters in chancery for the city of New York. In 1796 he became a member of the legislature. He was also elected professor of law in Columbia College. The body of his lectures at Columbia formed in after years, in some degree, the basis of his celebrated 'Commentaries.' In 1797 he was appointed recorder of the city, and in 1798 judge of the supreme court. He continued a member of this tribunal till 1814, having been from 1804 chief justice. The supreme court at that time differed widely from the court as at present constituted. It was formed after the model of the English king's bench, being composed of five judges, who rode the circuits to try jury cases, and convened during the year at four appointed terms to decide reserved questions of law. There were no American law books, and no reports of American decisions, except those of Dallas, just commenced. The proceedings of the court were languid and dilatory; and resort was had for rules of procedure and principles of law almost exclusively to English precedents and decisions. The accession to the bench of a young, energetic, and able judge, produced a striking change. It was the task of the court to expound the principles of the common law, as applicable to American institutions; to define and limit our new constitutional provisions; to construe recent statutes; to bring the principles of commercial law to bear upon transactions of trade and commerce; to devise rules of practice; and in short to adapt to a young and rising nation a complicated yet practical code of laws. By the constitution of New York as it then existed an important political duty was imposed on the judiciary of the State. The judges of the supreme court and the chancellor formed with the governor a council of revision with a qualified veto on legislative acts. This council was abolished in 1822. In 1814 Kent became chancellor and the seven volumes of Johnson's 'Chancery Reports,' which contain Chancellor Kent's decisions, afford a profound exposition of the system of equity law. His term of office as chancellor expired in 1823, and returning to New York he resumed his professorship at Columbia and his lectures there were given to the world, in his 'Commentaries on American Law' (1826–30). This work has since passed through 14 editions, and acquired a world-wide celebrity. It has assumed in the United States the position which Blackstone in his own country has long filled by his 'Commentaries on the Laws of England.' It embraces not merely the jurisprudence of the Federal Union, but the municipal law, written and unwritten, of the several States. Consult William Kent, 'Memoirs and Letters of Chancellor Kent' (1898).

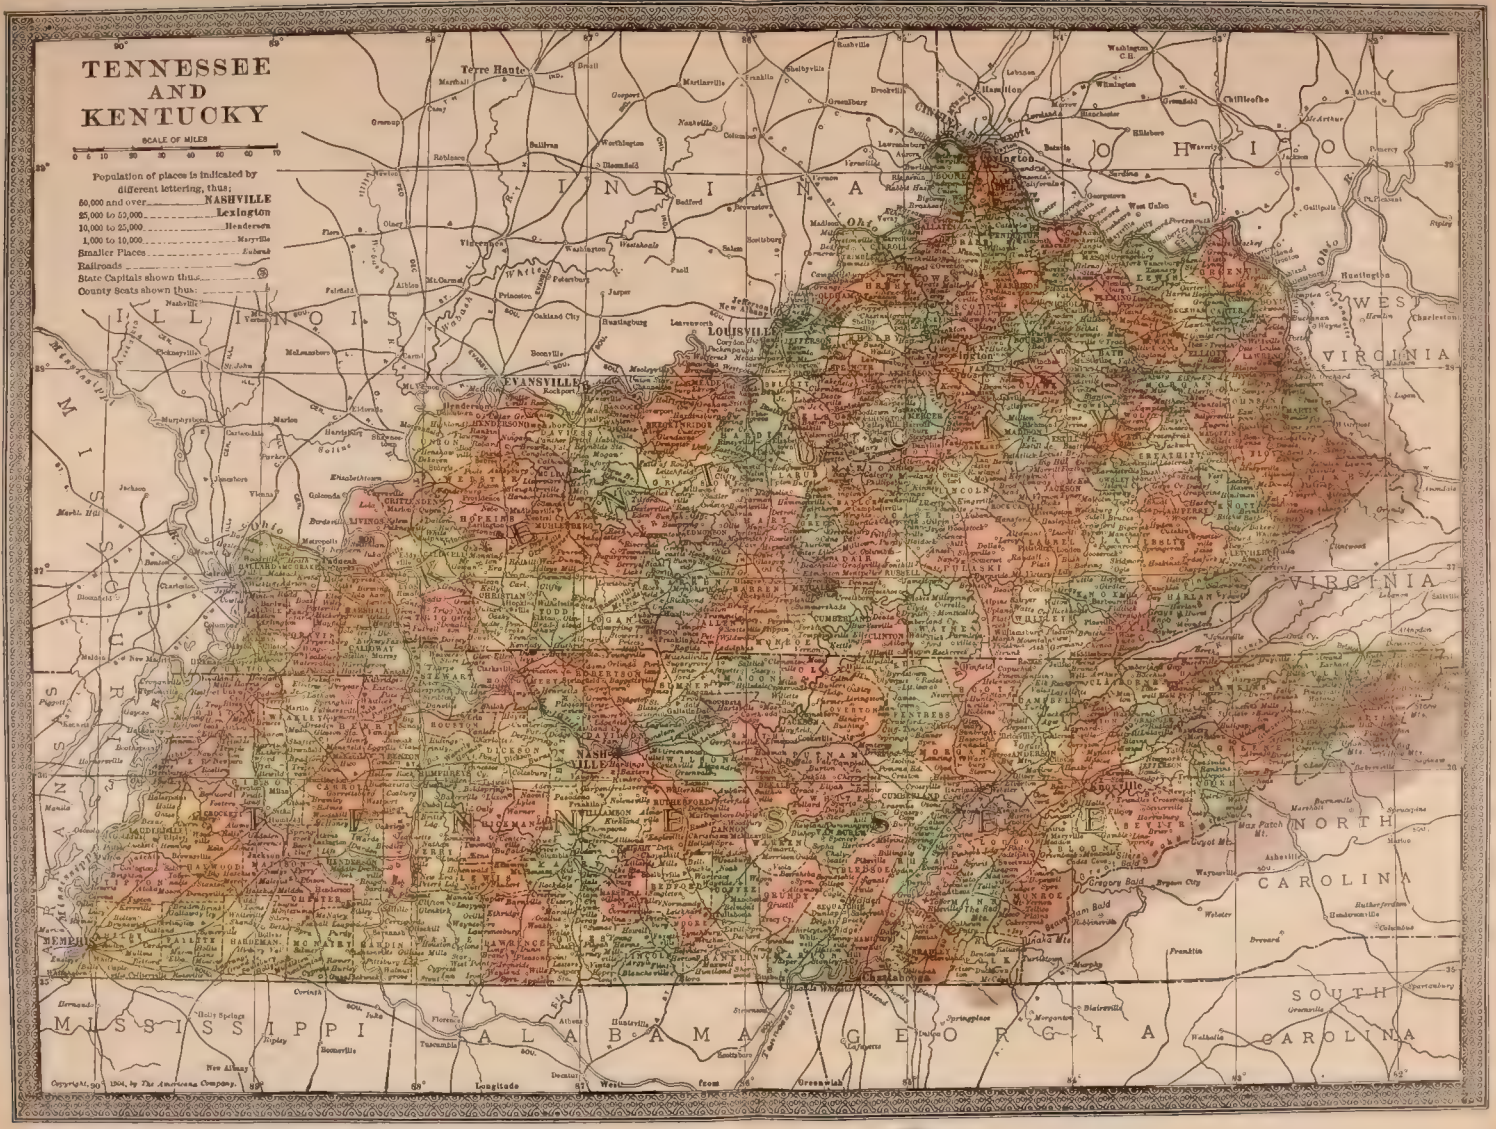
Kent, William, English artist, architect and landscape gardener: b. Yorkshire 1684; d. London 12 April 1748. He was apprenticed to a coachmaker in 1698, went to London in 1703, and there made some attempts at painting, and to Rome, where he was a pupil of the Cavalier Luti, and whence he was brought to England by the Earl of Burlington, his patron for the rest of his life. He was employed in portrait-painting and the decoration of walls and ceilings; but Hogarth said that "neither England nor Italy ever produced a more contemptible dauber." However, he did invent a less formal method of gardening and planting, and excelled as an architect. The Horse Guards and treasury buildings, and Devonshire House, Piccadilly, are his work. He published the 'Designs of Inigo Jones' (1727).

Kent Island, the largest island in Chesapeake Bay, Md., some 15 miles long, and situated 7 miles east of Annapolis. It was here the first settlement in Maryland was made by William Claiborne (q.v.) in 1631. Pop. (1900) 2,525.

Ken'ton, Simon, American pioneer: b. Fauquier County, Va., 3 April 1755; d. Logan County, Ohio, in 1836. At 16 he had an affray with a young man, and believing he had killed his adversary, fled beyond the Alleghanies and became a companion of Boone and the other early pioneers of Kentucky. For a time he acted as a spy of Governor Dunmore, and subsequently participated in the warfare waged against the British and the Indians west of the Alleghanies, showing remarkable courage, sagacity, and endurance. In 1782, learning that his former opponent was living, he returned to his native place, and soon after removed with his father's family to Kentucky. He was frequently engaged in Indian warfare, until the expedition under Wayne in 1793–4 restored tranquillity to the western frontier. As the country began to fill up with settlers, his lands, to which, in consequence of his ignorance of or

indifference to legal forms, he had never secured perfect titles, were taken from him, and by repeated lawsuits he was reduced to penury. He nevertheless in the War of 1812 fought with the Kentucky troops at the battle of the Thames. In 1824 he appeared in Frankfort in tattered garments to petition the legislature of Kentucky to release the claim of the State upon some mountain land owned by him. His appearance at first excited ridicule, but upon being recognized he was treated with much distinction by the legislature; his lands were released, and a pension of $240 was procured for him from Congress. He died near the spot where, 58 years previous, he had narrowly escaped death at the hands of the Indians.

Kenton, Ohio, city, county-seat of Hardin County; on the Scioto River, and on the Erie, the Toledo & O. C., and the Cleveland, C., C. & St. L. R.R.'s; about 54 miles northwest of Columbus and 67 miles south of Toledo. It is situated on the divide which separates the waters of the Ohio River from those of Lake Erie. It was settled in 1833 and incorporated in 1885. The surrounding country is a farming section, with some large forests. The chief manufactures of the city are hardware, agricultural implements, iron, lumber, and dairy products. Its principal public buildings are the armory, jail, court-house, and the municipal buildings. The mayor holds office two years. The waterworks plant is owned by the city. Pop. (1900) 6,852.



Kentucky (Cherokee, "prairie," "the Barrens," and not meaning "dark and bloody ground," as popularly supposed), one of the old "Border States" (q.v.), next south of the Ohio; the second district settled beyond the Alleghanies, and the first to become a State; second State admitted to the Union, next after Vermont. Capital, Frankfort. It is excessively irregular in shape, varying from 171 miles broad between Cincinnati and Cumberland Gap to 40 south of Paducah at the mouth of the Tennessee; and is 458 miles from east to west. Area 40,400 square miles. Lat. 36° 30′ to 39° 6′ N.; lon. 82° 2′ to 89° 40′ W. Pop. (1900) 2,147,174; (1903) government estimate about 2,250,000.

Topography and Hydrography.—Its northern and western boundaries are formed by the convolutions of the Ohio and Mississippi separating it successively from Ohio, Indiana, Illinois, and Missouri; the east end is a sharp angle, the north side formed by the Big Sandy flowing northwest, the south side against West Virginia by the main Cumberland range and Pine Mountain running northeast and southwest. On the south it is separated its entire length from Tennessee by a nearly straight boundary with a "jog" at the Tennessee. The surface is mainly a plateau averaging about 800 feet above sea-level, sloping in general northwestwardly from the southeastern mountains to the Ohio. Parallel with the Cumberland range within the State is Pine Mountain, along whose eastern flank the Cumberland River flows, breaking through at a point 960 feet above the sea. The Cumberland valley between is 15 miles wide by 75 long, and from 1,000 to 1,500 feet in elevation, buttressed by peaks sometimes 3,500 feet high, while the two ranges are 2,000 to 3,000, making the valley the finest scenic portion of the Appalachian system. Pine Mountain throws out spurs to the northwest as high as the main range, which sinks into the coal fields at an elevation of nearly 1,600 feet. The great north and central Blue Grass region (limestone) is an undulating plateau, circled by a continuous hill-ridge taking many different local names, as Big Hill, King's Mountain, Muldrow's Hill, and others, but extending in a great southern sweep from the mouth of Salt River to opposite the mouth of the Scioto, with rough escarpments at the east and fading into the upland at the west.

The drainage system is mainly (except for the immediate watersheds of the great rivers) by a series of rivers flowing northwestward into the Ohio, following the surface trend; the Big Sandy with its Louisa fork, the Licking, Kentucky, Salt and Green. Near the western end the last 60 or 70 miles of the widely eccentric course of the Cumberland and Tennessee, its greatest internal rivers, follow the same direction to the same goal 15 miles apart. The Cumberland, rising near the eastern edge, flows crookedly through the southern part, dips into Tennessee, and returns to the State; the Tennessee, rising near it in the Appalachians, takes a wider sweep southward into Alabama, and almost joins the Cumberland before it ends. These streams have nearly all deep rock channels, never overflowed; especially the Kentucky in its lower course has channeled a superb gorge through over 400 feet of limestones, with perpendicular walls like a cañon. Southwest from the centre only the larger stream channels show on the surface; the ground is full of depressions where the water sinks away and dissolves the soft limestones, finding subterranean paths; where this underground channel is stopped up a pond is formed. This is the district of the Mammoth Cave (q.v.), the largest in the world; as in all limestone districts, the waters have dissolved the stones irregularly and left fantastic channels and rock sculptures, huge chambers and narrow flumes, forming deep pools and cascades, and creating pendants and upright shafts; its immense size and length, and the navigable branches of a considerable subterranean stream, make it convenient for exploration and a fascinating spot for tourists.

Geology and Mineralogy.—This district was at one time the bed of a vast lake of the Lower Silurian period; on its floor were laid several sedimentary deposits. Upper Silurian, Devonian, Subcarboniferous, some 5,000 feet deep, and on these, Carboniferous (coal measures) to 3,000 feet more. The great Appalachian uplift raised this some 5,000 feet, the surface forming a dome in the centre; then forces of denudation acted planewise across the top, cutting away all the superincumbent strata down to the original Lower Silurian in the middle — whence the outcrop of blue limestone in the Blue Grass region — and others to different extents in other parts, leaving the coal measures exposed in two great patches 100 miles apart at the edges. The Subcarboniferous limestone is at the top in the southwest districts where are the great sinks and caves.

The great mineral product of Kentucky is coal. The eastern (Appalachian) field has some 9,000 square miles; the western but 4,000; but the latter at present yields more than the former. In 1902 the total production was 6,421,266 short tons against 2,972,640 in 1892, nearly all bituminous, though perhaps 100,000 tons were

cannel. Beds of high-grade iron ore are also found in the coal fields, and elsewhere to the extent of 32 counties in all; 71,562 tons of pig iron were turned out in 1900. Building and other stones are extensively quarried: limestone products (including Kentucky River marble), as well for fertilizers and charged waters as for building, were valued at $176,861 in 1900; sandstones, $130,557, besides $20,191 worth of clays. Extensive mining of fluor-spar is carried on in Crittenden and Livingston counties; valuable salt and other mineral springs are utilized; petroleum is found in the counties along the Cumberland and its affluents, formerly distilled from shales and now drilled for, its discovery in several counties in 1902 having caused considerable excitement. Its accompaniment, natural gas, is found in Meade County.

Climate and Rainfall.—The Mississippi bottom lowlands are malarious, but most of the State is mild and notably salubrious, the death rate being low and the army statistics placing Kentuckians at the very top in physical characteristics. The lowest recently recorded temperature is 8° F., and the summer heats are less than in the States to the north and west. The State is ideally watered for agriculture, the mean rainfall is about 47 inches per year, and there are no years of excessive drought.

Forests.—Over a third of the surface of the State is forested. The bottom lands are thick with densely timbered swamps; the western part is a heavily wooded region once open prairie ("the Barrens," where the Indians burnt off the undergrowth to make pasturage for the wild game, and the more tenacious roots grew under the soil); and in the east along the Alleghany slopes there is a great quantity of fine timber, most of it being hardwood of astonishing variety. Oaks of many different sorts — white, red, black, post, overcup, chestnut, and black-jack,— hickory, black walnut, blue and black ash, maple, elm, beech, chestnut, poplar, sweet gum, box-elder, wild cherry, yellow pine, cypress, sycamore, and hackberry, are only a portion of its wealth, still largely virgin, though now being rapidly opened up. The poplar and black walnut which are accessible have been already largely harvested.

Soil.—The soils are locally divided into three main grades — first, second, and third rate. The first is the deep alluvium of the river bottoms, estimated at 1,000 square miles. The second (such only by comparison with the first, being one of the finest farming soils known) is the upland Blue Grass soil, covering over 10,000 square miles in 32 counties self fertilized by the decomposition of limestones and phosphatic shales so that farms a century old show no signs of exhaustion, and with decent management need no artificial fertilizer. The third are the shaly lands with insufficient drainage. Besides these there are about 1,500 square miles in swamps and barrens and some thousands where the mineral wealth is worth more than the surface would be for farming land.

Agriculture.—Though Kentucky and Tennessee are apparently artificial divisions from the same body of land, the slight difference in latitude and soils works a complete change in the characteristic products of the two. Tennessee is preeminently a cotton State, raising in 1899 234,592 bales, valued at over $8,000,000; while Kentucky raised but 1,369 bales, in a few counties near the Mississippi bottoms. But the immense fertility and water supply of Kentucky have made it one of our leading agricultural States; the value of its crops in 1899 was $123,266,785, and its live stock was valued at $73,737,106. The leading farm products are corn, tobacco, wheat and hay; and it raises nearly all the hemp produced in the United States. Vegetable and orchard fruits are grown in large quantities in the region along the Ohio, between and near the two great cities of Cincinnati (with its Kentucky suburbs Covington and Newport) and Louisville, which furnish large markets. In 1900 85.9 per cent of the land surface was in farms, and of this 62.5 per cent was improved against 35.2 per cent in 1850. The number of farms had more than trebled in the meantime, it had increased 30.9 per cent. since 1890. The average size of farms decreased in the decade, under intensive cultivation, from 119.4 acres to 93.7; the size being smallest in the northeast, the region of tobacco and corn, and largest in the stock-raising counties, but in most counties the size keeps near the average. The difference in proportion of colored population from the States where cotton is a leading crop is strikingly shown by the statistics of farm ownership and tenure. Out of 234,667 farms only 11,238 were operated by colored farmers; and as their farms averaged only 39.9 acres, they farmed only two per cent. of the land. The most conspicuous change in the decade was that of tenure, the number of cash tenants remained about the same, that of share tenants doubled. But the owned farms were over two thirds of the whole.

The great specialty of Kentucky, and its principal sale crop (most of the cereals being used in the State), is tobacco. In 1900 it not only produced two and a half times the amount of any other State,— 314,288,050 pounds, valued at $18,541,982, against 127,000,000 and 122,000,000 for North Carolina and Virginia respectively,— but 36 per cent of the entire product of the United States. This was an increase of 41.6 per cent. over 1890, and the largest crop ever reported. The yield averaged 816.7 pounds per acre, and the price 5.9 cents per pound. The preeminence of Kentucky in this is due not only to the favorable constituents of the soil for the plant's growth, but to the sunny equable climate, free from those violent extremes which are death to the delicate plant. The leading section is the west: Christian and Daviess counties head the list. Hemp is a famous product as being almost peculiar to Kentucky; but other fibres have driven it out of the market very largely, and it is of minor practical importance, having steadily declined since 1859. In that year it reached its climax, 78,818,000 pounds; in 1899 it was only 10,303,560, valued at $468,454, a decrease of about 86.93 per cent since 1859; and was grown by 937 farmers in 17 counties, the chief being Fayette (Lexington), and the rest mainly to the south of it. The largest crop in value was corn, which has long been the great staple, not only for human food, but even more for provender and as a basis of the great distillery interest. Its acreage in 1900 was over half the total for all crops together, and more than double that for the next largest, wheat, and the crop was valued at nearly $30,000,000. Wheat, for a long time dropping off, gained nearly 60 per cent. in the decade,

with a total of 14,264,500 bushels, valued at $8,923,760. Hay and forage from grasses of several different kinds on the superb pasture of the State, came next, with a total of 776,534 tons, valued at $6,100,647; grass seed also had considerable importance. Oats and potatoes each came to the total of nearly a million and a quarter dollars: orchard fruits, nearly $2,000,000; sweet potatoes, onions and miscellaneous vegetables, nearly $5,000,000. Floriculture is an important industry, the receipts amounting to over $100,000.

Stock-raising.—The mild winter climate, in which cattle can remain out all winter with little feed, the superb pasture afforded by blue grass, which forms a thick fine turf, and grows to perfection in the shade of the forests, and the abundant and excellent water, have given Kentucky unsurpassed natural advantages for rearing live stock. But these would not have availed but for a succession of breeders of rare intelligence and perseverance, who have made it the centre of the Union for high-grade blooded stock. Especially is this the case with horses. The old Virginia stock, bred from choice imported English animals, themselves bred to combine speed and endurance, were taken by the Kentucky breeders, the strains carefully kept pure except to mix with equally good fresh blood; and they have developed the finest road horses in the country, Kentucky horses it has been estimated have made three fourths of all the winnings on the American turf. There were in the State in 1900 over 450,000 horses valued at about $23,500,000 besides some 200,000 mules and asses. Dairy products were also of high importance, furnishing nearly $10,000,000 of product, from 364,025 cows. There were nearly 2,000,000 swine and 1,300,000 sheep, but both have been falling off for many years. The animals sold live and dead, came to about $25,000,000; the poultry and eggs to nearly $8,500,000.

Manufactures.—Kentucky has great natural facilities for manufacturing; her immense hardwood forests, her large coal fields, and plentiful natural waterways, for half a century and more after her admission to the Union kept her abreast of her western neighbors. But since then, there has been a relative falling off. In part it is due to the change in distribution of industries; the development of steam navigation threw Lexington, for instance, which in 1810 had 114 manufactures, into the shade to build up the river towns. But other causes — tardiness in extending railroad facilities to the forests and coal fields is held partially accountable, but this was itself due to general business conditions, and has been mostly remedied — have retarded it relatively, though not absolutely. In 1850 the number of wage-earners was 21,476, in 1900 62,962, but the former was 2.2 per cent of the total population against Ohio's 2.6, the latter 2.9 against Ohio's 8.5. The largest growth was in the decade 1880–90, the wage-earners increasing over 50 per cent. Tobacco is the foremost manufacturing industry, as it is the foremost agricultural product, and steadily growing. In 1900 the 337 establishments employed nearly one ninth of all hands, and turned out one seventh of all the product of the State's manufactories, to a value of $21,922,111, nearly double that for 1890. Over two thirds of this was chewing and smoking tobacco and snuff; the cigar manufacture, though the chief early one, having declined relatively. The industry dates from the 18th century, when tobacco was legal-tender currency; every town in the State had its small cigar factories, and many of the farms worked up their own product. Louisville has been for many years a principal leaf-tobacco market of the world, from its great facilities for distribution by river and rail; and tobacco industries of other kinds have therefore tended to concentrate themselves there, though Owensboro and Henderson have extensive establishments which prepare leaf for shipment. Flouring and grist-milling rank next with a product in 1900 of $14,515,161, an increase of 50 per cent. since 1890. Louisville has large flouring mills with a considerable export trade. Cottonseed oil and cake are important.— $4,683,000 in 1900. One of the great specialties of Kentucky for over a century has been corn whiskey, known as "Bourbon" from the county of Kentucky to which a number of western Pennsylvania "moonshiners" removed after the suppression of the Whiskey Insurrection (q.v.) in 1794; but the manufacture had been already established at Louisville in 1783, in three other towns soon after, and a Maryland colony in 1787 set up a number of distilleries along Salt River. For the management of the stills, see Internal Revenue System. Since the Civil War the old farm and village distilleries, producing one or two barrels a day, have mostly given way to mammoth establishments. But the total product is heavily declining, having dropped from $15,159,648 in 1890 to $9,786,527 in 1900. The manufacture of malt liquors, on the contrary, increased about one fourth; and is mostly concentrated in Louisville. In May 1902 there were 339 distilleries. The internal revenue receipts from the State in that year, mostly from liquors and tobacco, were $21,096,013.

Pork packing was an early industry in Kentucky, and from the first centred in Louisville. Louisville and Cincinnati were long the rival heads of the slaughtering and meat packing business in the United States; but the great northwestern grain fields have taken it from the Ohio Valley. The use of artificial ice, permitting summer packing, has caused a great revival of it in Louisville. The fortunes of packing and of mere slaughtering, however, are singularly in reverse; the former dropped in the decade from $2,966,227 to $635,685; the latter increased from $405,784 to $5,081,482. From the hides of these cattle was made leather to the value of $3,757,016. The chief agent is the bark of the chestnut oak, which is not only excellent for tanning, but has the great advantage over hemlock that cutting down the tree does not necessarily kill it as it does the latter: shoots spring from the stump, if the tree is not too old, and in about 20 years are fit for another stripping. The first large custom tannery was started at Louisville in 1848; that city now has a number, and is the centre of the manufacture, the establishments outside having mostly been abandoned. Sole leather and harness leather are the principal products, although some sheepskins are tanned for the manufacture of shoes and saddles. The industry has declined somewhat since 1883, its climax, but is still one of the leading specialties.

The exploitation of the rich forests now

CONFEDERATE MONUMENT AT FRANKFORT.

going on is shown by the increase of lumber and timber products, from $7,904,428 in 1890 to $13,774,911 in 1900. Logging is an extensive industry on the upper waters of the Cumberland, Kentucky, and Licking Rivers; and the government improvements in the Kentucky, Green, and other rivers enable logs to be floated almost from their original home to the Ohio.

Of iron and steel, there were in 1900 eight establishments, employing 2,402 hands and turning out $6,676,093 worth of goods, an increase in the decade of over 150 per cent. The early furnaces were abandoned for lack of transportation facilities; in 1846 others were built at Eddyville on the lower Cumberland by William Kelly; and in 1851, five years before Bessemer patented his pneumatic process, Kelly began his "air-boiling" process, essentially the same, for turning iron into steel. During these years steamboats built at Cincinnati were using boiler plate practically the same as the Bessemer, but made by the Kelly process; and the latter finally secured a royalty.

Louisville is also one of the great centres of the manufacture of jeans clothing, from cloth made largely in the State mills; but of late years this has been partly replaced by the cassimeres. Louisville produces over half the total manufacturing product of the State, and its relative share is increasing.

Transportation.— Kentucky has 813 miles of navigable water on its boundary alone,— the Ohio 643 miles, the Mississippi west 50 miles, the Big Sandy east 120 miles. The Cumberland and Tennessee are navigated their entire course in the State; the Kentucky, Licking, Salt, and Green are more or less navigable for considerable portions of their lower courses, and some improvements have been made by dams and locks, but are little used. The great canal around the falls of the Ohio at Louisville has largely increased the value of that channel, which with the strip of the Mississippi is the creator of the State's commerce. The railroad system of the State has been greatly hampered by the difficulty of approach from the southeast over the mountains: several thousand square miles of this section, in a solid block, have not a mile of railroad track. This mountain district is a part of Appalachian America (q.v.) and presents, along with interesting Saxon survivals, grave problems in education and the enforcement of law. As the great transcontinental lines run mostly north of it, moreover, it has not been developed as other sections. The State has now about 3,300 miles of railroad in operation; the chief systems are the Louisville & Nashville, the Queen & Crescent, the Illinois Central, and the Chesapeake & Ohio.

Banks.— For the establishment of the banking system, see *History*. The great landmarks are the establishment of the Bank of Kentucky at Frankfort in 1806, and that of the Louisville clearing-house in 1875, which has more than once saved the more solid banks of the State from catastrophe. In 1902 there were 95 national banks in operation, with capital of $13,334,000, surplus of $4,015,000, cash and other items, $3,904,000, loans $37,976,000, deposits $30,577,000; 229 State banks, with $9,264,000 capital, $2,110,000 surplus, $3,805,000 cash, etc., $29,999,000 loans, $32,045,000 deposits; and 22 private banks, with $606,000 capital, $163,000 surplus, $297,000 cash, etc., $2,513,000 loans, $3,233,000 deposits. The exchanges of the United States clearing-house at Louisville and Lexington for the year ending 30 Sept. 1901 aggregated $480,595,304.

Education.— In 1901 there were 7,900 white and 1,157 colored teachers in the State, the males slightly in excess among the white teachers, females considerably so among the colored; average monthly salary of whites $40.60, of colored $29.95; of men $44.03, of women $37.18. The average length of school term was 115 days; this, however, does less than justice to the cities and much more than justice to the rural districts. Entering the Union at an early date, Kentucky failed to receive the land grants which have given rise to large school funds in some other States; and the sentiment for universal education could not become prevalent until after the abolition of slavery. In the cities and among the wealthy, private schools absorbed the interest of the people, so that public education languished until recent years. At present many of the cities and larger towns, as Louisville and Ashland, have very creditable public high schools. The condition of the rural schools is unsatisfactory. The unpaid local trustees prove inefficient, and the erection of school-houses is hindered by legal difficulties over the raising of taxes. School legislation has been wisely adapted to meet the conditions in which the State is placed. The local teachers are paid from a general State fund, so that the richer portions of the commonwealth assist the poorer parts. The election of a superintendent of public instruction in each county is an arrangement contributing to progress. The public instruction provided for the colored people is in separate schools under colored teachers. The difficulties of maintaining schools in the mountain counties, and the impossibility of at once bringing under instruction the negro population, formerly enslaved, gives the State a poor showing in the matter of illiteracy. However, Kentucky is in better condition than most southern commonwealths and shows gratifying evidences of progress: 13.9 per cent. of its white voters are illiterate, and 49.5 per cent. of its negro voters. The expenditures for school purposes in 1900 were $2,650,100.

For higher education there were in 1900, 69 public high schools, 82 private secondary schools, 6 public and 8 private normal schools, 13 colleges for men, or coeducational, and 11 colleges for women alone. The Kentucky University, which has had a long and varied history, is now controlled by the Disciple denomination. Center College at Danville (Presbyterian) has been the Alma Mater of many distinguished men, and recently, in combining with Central University, has taken that name. Other schools under religious auspices are, Georgetown College (Baptist) at Georgetown; and Wesleyan College (Methodist, South) at Winchester: Berea College (religious but not sectarian) at Berea, was founded by the anti-slavery element which existed in Kentucky before the War, and has in addition to the ordinary college courses, large normal and industrial departments with special adaptations to the needs of the mountain region. Receiving "all young people of good moral character" it has an attendance of colored students comprising about one seventh of the whole number. The "State College" at Lexington occupies the position of a State uni-

versity, enjoying the funds provided by the United States government for "instruction in Agriculture and the Mechanic Arts," and affording special opportunities for the study of the natural sciences. The medical schools of Louisville are attaining reputation and importance. And that city is also the seat of a Baptist and a Presbyterian Theological Seminary.

Churches.—No religious census has been taken since 1890; but no considerable changes have taken place since that date, when the Baptists were far in the ascendant, though divided into "missionary," "predestinarian," and other varieties. Methodist Episcopal South is next in size; then came in order the Disciples of Christ, the Methodist Episcopal, the Colored Baptist, the Roman Catholic, the Cumberland Presbyterian, the African M. E., the African M. E. Zion, and the Protestant Episcopal.

Charitable and Penal Institutions.—There are insane asylums at Lexington, Hopkinsville, and Anchorage; a notable institution for the education of the blind at Louisville; a State school for deaf-mutes at Danville; and an institution for feeble-minded children at Frankfort, which, however, restricts the ages to the period of six to 18, and requires that they shall not be too feeble-minded for training. The State penitentiaries are at Frankfort and Eddyville.

Government.—The State officers are elected for four years, on the November preceding the Presidential election; they cannot be re-elected. The governor has a veto by items, but a majority vote overrides it. If he dies in the first two years of his term, a new election is held; if later, the lieutenant-governor and the president of the senate succeed in order. The legislature consists of 38 senators chosen for four years, and 100 representatives for two years. Sessions are biennial, and limited to 60 days (legislative days). Provisions concerning revenue bills and impeachments follow the model of Congress. Women (by a law of 1902) can hold office on school boards. No State, county, city, or town officers except members of city legislative boards can be elected in the year of a Presidential election. The judiciary is headed by a Court of Appeals, consisting of not over seven or under five elective judges, with terms of eight years. There are no townships, only "magisterial districts," and the county, as in old Virginia is the political unit. Each county is entitled to three sittings of a circuit court each year. The circuit judges are elected for six years, in districts. There is a county judge, and a monthly court day. County officers are elected for four years, except a circuit court clerk for two years, and the sheriff is ineligible to re-election except in alternate terms. Counties must have a minimum area of 400 square miles, and the county-seat must be at least ten miles from the boundary. There are 11 representatives in Congress.

Finance.—The State's assessed valuation in 1902 was $667,056,375; the bonded debt, $1,171,394. The tax rate was $5 per $1,000. The State revenues are divided into "funds," for different departments; the "general expenditure" fund is unfortunately fixed too low and entirely inadequate to the needful expenses, so that the State expends about double the amount of the fund, giving an appearance of a large deficit which is not correct as to the resources or income as a whole. The financial world, however, takes note of this fact, and Kentucky has perfectly good credit.

Population.—The population of the State at the various censuses has been as follows: 1790, 73,677; 1800, 220,955; 1810, 406,511; 1820, 564,135; 1830, 687,917; 1840, 779,828; 1850, 982,405; 1860, 1,155,684, including 10,684 free negroes, and 210,981 slaves; 1870, 1,648,690; 1880, 1,858,635; 1900, 2,147,174. The foreign-born were but 50,249; considerably more than half Germans, about 10,000 Irish. The colored population was 284,865, not so large as in 10 other States, and not so large a percentage as in 17 others; nor are the colored people increasing so fast as the whites, there having been a relative decrease for the past two decades. The agricultural characteristics of the State have prevented the over-development of specially slave industries, and the mountain districts of course have very few. There seems also to have been some tendency among the negroes to emigrate, and a large emigration of whites is continually going on, so that natives of Kentucky form a notable element in Ohio, Indiana, Missouri and the West.

The one great independent city of Kentucky is Louisville (204,731) at the falls of the Ohio, the third in size on the river, excelled only by Cincinnati and Pittsburg. Covington (42,938), Newport (28,301), Bellevue (6,332) and Dayton (6,104) are virtually suburbs of Cincinnati, the first-named west of the Licking, the last three east of it. Other cities on the Ohio, which monopolizes much the greater part of the urban development and manufacturing of the State, are in the west, Paducah (19,446) at the mouth of the Tennessee, Owensboro (13,189) and Henderson (10,272); in the northeast, Maysville (6,423); on the east, Ashland (6,800), now the head of a rapidly growing iron district. Lexington (26,369), formerly the capital, once called "Athens of the West," is the head of the Blue Grass region. Frankfort (9,487), the capital, on a magnificent gorge of the Kentucky River; Bowling Green (8,226), the head of navigation on the Barren River, a tributary of the Green; Hopkinsville (7,280) in the southwest; and Winchester (5,964) in the north centre, are the only other places of over 5,000.

History.—The earliest explorers found this territory, though formerly inhabited by mound-building, agricultural Indians and presenting every advantage to such tribes, practically deserted, save at two points on the Mississippi and Ohio. It was a ground contested by powerful tribes, who slaughtered any others attempting to hunt there. Kentucky was originally a part of Fincastle County, Virginia, explored by Boone and his companions, as well as previous travelers, soon after 1760. The first settlement was at Harrodsburg in 1774. Boonesborough was founded the following year. With the exception of French settlements, these two towns are the oldest in the West. In the former year the victory at Point Pleasant forced the northwestern Indians to give up their claims, and the "Transylvania Company" (Richard Henderson and associates) bought about 2,500 square miles west of the Kentucky River, from the Cherokees, whose chief told Henderson he "had bought a fine territory but might have some little difficulty in occupying it"; in fact, the settlement was harassed by bloody Indian wars, and

Virginia refused to confirm the sale. In 1776 the district was organized as Kentucky County. As the scene of the principal exploits of Daniel Boone, and the birthplace of Kit Carson, Kentucky's early history was typical of American pioneer life. Its separation from Virginia cost seven different conventions, the last in 1790; besides an attempted Spanish intrigue for its withdrawal from the Union and the setting up of an independent government with a Spanish Protectorate. Kentucky was finally admitted to the Union 1 June 1792. Under the influence of Henry Clay and his associates, Kentucky was a strong Whig State with antislavery tendencies. With its diverse elements of mountains and Blue Grass, anti-slavery and pro-slavery sentiment, the State naturally hesitated at the opening of the Civil War, at first assuming an attitude of "strict neutrality," which was at last exchanged for a stand for the Union. It filled its full quota of Union soldiers under Lincoln's various calls, while half as many more went southward to join the armies of the Confederacy. The commonwealth had thus brilliant representatives in both armies, and suffered as a border State from the invasion of Bragg in '62, and the continual raids of Morgan. The State refused Lincoln's overture for compensating slave-holders if it would abolish slavery, and that institution was finally swept from existence by the amendments to the Federal Constitution. Disgust over this loss, and resentment at some of the acts of the Federal commanders in the State, alienated so many Union men that the State has since been largely Democratic. Since the Civil War the commonwealth has made steady if not rapid progress in education and wealth.

WM. GOODELL FROST, PH. D.,
President Berea College, Berea, Ky.

Kentucky, Agricultural and Mechanical College of, a coeducational institution at Lexington, Ky., founded in 1865. It has agricultural, engineering, scientific, and collegiate courses which lead to the bachelor's degree; it has also a preparatory department. The campus contains 52 acres, presented by the city of Lexington, and the experiment station farm contains 48 acres. The income for 1901 was, from the State, $42,810; from the Land Grant Fund of 1862, $12,967; from the Federal Government (act of 30 Aug. 1890), $21,375; tuitions, $1,582; miscellaneous, $31,552; incidental fees, $673; making a total of $110,959. The Federal appropriation for the experiment station was (1901) $15,000. The income in 1902, derived from the Land Grant Fund, the State and the Federal appropriations, was $106,252. The number of instructors in 1902 was 42, and the number of pupils in attendance was 611. The number of volumes in the library, about 6,000.

Kentucky Bluegrass. See GRASSES.

Kentucky Coffee-tree, a large tree (*Gymnocladus dioica*), allied to the locusts and redbuds of the family *Cæsalpinaceæ*, and growing rather sparsely throughout the middle region of the Mississippi Valley. It bears greenish-white flowers growing in terminal racemes; and these produce in early autumn legumes, broad and 6 to 10 inches long, containing several hard gray seeds. These seeds are locally called "coffee-nuts," because the early settlers of Kentucky tried to use them as a substitute for coffee. The timber is suitable for cabinet work; the bark is very bitter, and contains saponine. When bare of foliage in winter this tree presents such a forlorn appearance that it is called "stump tree."

Kentucky Resolutions, a famous series of nine resolutions introduced into the Kentucky legislature in 1798, by George Nicholas, though it was afterward known that Thomas Jefferson was the author of them. They were directed against the Alien and Sedition laws, and against acts passed to punish frauds on the Bank of the United States, and emphasized the rights of the several States. These resolutions were the outgrowth, together with a similar series known as the Virginia Resolutions, of a feeling that the Federal party was making a strained and illegitimate use of the powers granted to the Federal government by the Constitution. The Kentucky Resolutions were passed for the purpose of defining the strict-construction view of the relative powers of State and Government. They declared that the Union was not based on the "principle of unlimited submission to the General Government"; that the Constitution was a compact, to which each State was a party as over against its fellow States; and that, in all cases not specified in the compact, each party had a right to judge for itself, as well of infractions as of the mode and measure of redress. They proceeded to set forth the unconstitutionality of the Alien and Sedition Acts, and invited other States to join in declaring them void. No favorable response was evoked. In 1799 the Kentucky legislature went further, and declared a nullification of a Federal law by a State to be the rightful remedy in cases of Federal usurpation. Upon these resolutions the doctrines of nullification and secession were later founded.

Kentucky River, a river of Kentucky, formed by two forks which rise in the Cumberland Mountains, and, after a winding northwest course of about 250 miles, enters the Ohio, 12 miles above Madison, Ind., midway between Cincinnati and Louisville. The river runs through part of its course between perpendicular limestone walls. It is navigable by steamboat beyond Frankfort, a distance of 60 miles, and flatboats can ascend 100 miles farther.

Kentucky University, an educational institution at Lexington, Ky., under the control of the Christian Church. It was founded in 1836 under the name of Bacon College at Georgetown; the name was changed in 1858, and it was later consolidated with Transylvania University, which was situated at Lexington. Its present organization comprises the college of liberal arts, with classical, literary, and scientific courses, the commercial department, the college of the Bible, and the medical department; of these the first two are coeducational; the last is situated at Louisville. In 1903 the number of students was 1,200; instructors, 60; the annual income amounted to $27,000; the library of about 18,500 volumes had been consolidated with that of the city of Lexington.

Kentucky Warbler. See WARBLER.

Ken'yon, James Benjamin, American poet and Methodist clergyman: b. Frankfort, N. Y., 26 April 1858. After his graduation from Hungerford Collegiate Institute in 1875, he studied theology, entered the Methodist ministry and has since held several pastorates. He is well known among American verse writers of the present, his published collections of poems including: 'The Fallen and Other Poems' (1876); 'Out of the Shadows' (1880); 'Songs in All Seasons' (1885); 'In Realms of Gold' (1887); 'At the Gate of Dreams' (1892); 'A Little Book of Lullabies' (1898). In prose he has published 'Loiterings in Old Fields' (1901).

Kenyon College, founded in 1824, at Worthington, Ohio, under the auspices of the Protestant Episcopal Church. It was then called Theological Seminary of the Protestant Episcopal Church, in the Diocese of Ohio. In 1827 it was removed to Gambier, Ohio, where it is now. In 1891 the name was changed to Kenyon College. The school is now composed of a preparatory department, a college, and a theological seminary. In 1903 the endowment fund was $501,000. Marcus A. Hanna gave (1901) $60,000 to aid in the building of a new dormitory. The number of professors and instructors, in 1903, was 28, and the number of students, 203. On the graduate roll of this school are the names of many distinguished men, among them Rutherford B. Hayes and Edwin M. Stanton.

Keokuk, kē'ō-kŭk, Iowa, city, one of the county-seats of Lee County; on the Mississippi, near the mouth of the Des Moines River, and on the Toledo, P. & W., the Wabash, the Chicago, B. & Q., the St. Louis, K. & W., and the Keokuk & W. R.R.'s. The river at this point falls about 21 feet in 11 miles, thus furnishing great water-power. A ship canal has been built around the rapids at this place, at a cost to the Federal government of nearly $8,000,000. It was first used in 1877. The chief manufactures are stoves, tin cans, cereals, flour, boots and shoes, ready made clothing, gunpowder, lumber, canned fruits and pickles. It has a poultry-packing plant, wholesale stores, cold storage buildings for meat, vegetables, and fruits. Its excellent transportation facilities by land and water make it a trade centre for a large extent of country in Iowa, Missouri, and Illinois. The iron bridge which here spans the Mississippi is over 2,000 feet in length. Rand Park is noted for being the burial-place of the Indian chief, Keokuk. Keokuk has a medical college founded in 1849, a dental college, a government building, a public library which contains about 18,000 volumes; Saint Joseph's Hospital, Home for the Friendless, a high school, Saint Vincent's Academy, a Y. M. C. A. building, and an opera house. It is one of the four cities of the State which are governed by a special charter. The difference in the form of government is chiefly in the way of appointment of the subordinate officials. Some are appointed by the mayor, others by the council; and the park commissioners, city weigher, and library committee are appointed by the mayor, subject to confirmation by the council. Pop. (1900) 14,641. Consult 'Annals of Iowa.'

Keokuk Moses, an American Indian of the Sac and Fox tribe, after whom the city of Keokuk, Iowa, was named: b. 1818; d. near Kansas City, Mo., October 1903. Probably the best description of Keokuk's boyhood is contained in Drake's 'History of the North American Indians.' It tells of his visit to Washington after the Black Hawk war. Keokuk succeeded his father as chief of the Sac and Fox tribe, and removed with his people from Quenemo, Kan., to their reservation in what is now Oklahoma, in 1868.

Kepler, Johann, yō'hän kĕp'lĕr, German astronomer: b. Weil der Stadt, Würtemberg, 27 Dec. 1571; d. Ratisbon 15 Nov. 1630. He studied at the University of Tübingen, and in 1593 he was appointed a teacher of mathematics at Gratz (Styria). Here he devoted himself with much ardor to the study of astronomy; but in 1599 religious persecutions commenced in Styria, and Kepler, being a Protestant, gladly accepted Tycho Brahe's invitation to Prague, to assist in the preparation of the new astronomical tables, called the Rodolphine Tables. Tycho died in 1601, and Kepler continued the work alone, being appointed imperial mathematician and astronomer. After 25 years' incessant labor the tables were published in 1627 at Ulm. Kepler had become the possessor of all Tycho's papers, and the mass of observations made by that astronomer during 20 years, with a precision till then unsurpassed, enabled Kepler to establish the famous 'Kepler's Laws' (q.v.), which have proved so fruitful in the development of astronomical science. Kepler enjoyed the patronage of the emperors Rodolph and Ferdinand, the dukes of Würtemberg and Wallenstein, but his life was a continued struggle; he was exposed to much religious persecution, and his domestic relations were equally unfortunate. The latter part of his life was chiefly passed at Linz as professor of mathematics. He wrote much, but the work that has rendered him immortal is his 'Astronomia Nova, seu Physica Cœlestis tradita Commentariis de Motibus Stellæ Martis' (New Astronomy, or Celestial Physics delivered in Commentaries on the Motions of Mars) (1609). His 'Harmonice Mundi' appeared in 1619; and among other works may be cited: 'De Stella Nova in Pede Serpentarii' (1606); 'De Cometis' (1613); 'Chilias Logarithmorum' (1624). Consult: Breitschwert, 'Johann Keplers Leben und Wirken' (1831); Reitlinger, 'Johann Kepler' (1868); Reuschle, 'Kepler und die Astronomie' (1871); Hasner, 'Tycho Brahe und Kepler in Prag' (1872).

Kepler's Laws, in astronomy, three laws discovered by Johann Kepler (q.v.) on which were founded Newton's discoveries, as well as the whole modern theory of the planets: (1) Every planet describes an ellipse, the sun occupying its focus. (2) The radius vector (line joining the centre of the sun with the centre of the planet) of each planet sweeps over equal areas in equal times. (3) The squares of the periodic times (the periods of complete revolution round the sun) of two planets are proportional to the cubes of their mean distances from the sun. These laws enabled Newton to determine the laws of the attraction of gravitation.

Kep'pel, Augustus, British admiral: b. 25 April 1725; d. 2 Oct. 1786. He was the second son of the Earl of Albemarle, entered the sea service at an early age, and in 1755 commanded

the North American squadron in Hampton Roads. He was placed in command of the Channel fleet in 1778, and in July of that year engaged the French fleet off Ushant. Having become partly disabled he signaled for his van and rear divisions, but Palliser in command of the rear ignored the signal until too late. Palliser accused him of incapacity and cowardice, but Keppel was honorably acquitted. In 1782 he was raised to the peerage under the title of Viscount Keppel and Baron Eldon. He was first lord of the admiralty 1782–3.

Kepp'ler, Joseph, American caricaturist: b. Vienna, Austria, 1 Feb. 1838; d. New York 19 Feb. 1894. He early made his reputation as a satiric artist and the leading periodicals of his native city were publishing his witty sketches, almost before he had left the Academy of Fine Arts. But art was not then a serious business to him, and he took to the stage as a comedian and opera singer, and actually began to study medicine at St. Louis, Mo., where he made his residence in 1868. But it was in St. Louis that he found his real vocation. There he established the German 'Puck,' which, while it failed as a commercial enterprise, made his reputation. It was seen at once that a caricaturist of rare skill as a draftsman, of mental fertility and freshness, of witty and incisive satire, had appeared. He was engaged from 1872 to 1877 as caricaturist for 'Frank Leslie's Illustrated Newspaper' in New York, to which city he had removed, and in 1875 he started a New York German 'Puck' in association with Adolph Schwartzman. This was followed in 1877 by the English 'Puck.' He was the first to use colored cartoons in caricature, and drew upon a vast store of classical and historical incidents for adaptation in criticising modern social and political life.

Ker'atin (from Gr. *keras,* a horn), a substance obtained from claws, feathers, hair, horn, nails, wool, and other epidermal appendages. This tissue or substance is distinguished from gelatinous tissue by becoming soft when acted on by water for some time, but no glue is produced. It is insoluble in alcohol and in ether.

Kerguelen (kėrg'ĕ-lĕn) **Land,** or **Desolation Island,** an island in the Indian Ocean, intersected by lat. 49° 3′ S., lon. 68° 18′ E.; length about 100 miles; greatest breadth about 50 miles. It has a remarkably barren and desolate appearance, due to the fact that it consists of lofty masses of basalt and other volcanic rocks. These rise to the height of 2,500 feet, presenting numerous bold headlands and ranges of precipitous cliffs, and possessing a very scanty vegetation. Sea-fowl are numerous but no land animals are known to exist on it. Its indentations furnish several bays and inlets affording good harbors. It was annexed by France in 1893, and some settlers have made their abode there. Of the flora, which is arctic, the most noteworthy species is the Kerguelen cabbage (*Pringlea antiscorbutica*), a large edible plant, in many ways resembling common garden cabbage, and which has been valued on account of its antiscorbutic properties.

Kermes, kėr'mēz, dried female scale insects (*Coccus ilicis*) found in many parts of Asia and South Europe on the leaves of an oak (*Quercus coccifera*), supplying a durable red and scarlet dye. They have been utilized for dyeing purposes in the East from very ancient times, but since the introduction of cochineal (q.v.) their use is confined to the Eastern countries and Spain, where the collection of these insects still gives employment to a number of people, but is diminishing under the competition of the aniline dyes.

Kermes Mineral, a name given to amorphous antimony trisulphide. The native antimony trisulphide occurs in well-developed orthorhombic prisms. When this compound is fused for some time, and suddenly thrown into cold water, its crystalline structure is entirely destroyed. Kermes is a brown-red powder, becoming blackish-gray when washed with boiling water. By fusion it may be obtained as a solid mass, but it is totally devoid of crystalline structure. See ANTIMONY.

Kermess, kėr'mĕs, **Kirmess,** or **Kermis,** formerly a church festival held by the Dutch and in Flanders, and later in other parts of Europe, on the feast-day of the principal saint of a place or church. In the United States the word has come into general use for entertainments given for charitable purposes.

Kern (kėrn) **Lake,** a body of water in Kern County, in the southern part of California; one of a small group of basins in the midst of an almost arid part of the State. Part of the year there is no apparent outlet, but at the period of high water the lake overflows into Kern River. The country around this lake and in the vicinity is noted for its large amount of game.

Kern River, a stream in the southern part of California; almost its whole course is among the mountains of the southeast. The country in the vicinity is noted for game, and at one time valuable mining interests. In the western part of Kern County, the slough of the Kern River occupies an area of about 80 square miles. It flows into Tulare Lake. The Edison Company of Los Angeles are using the valuable water power of this river for their electric-power plant established on this river.

Kernahan, kėr'nā-ạn, **Coulson,** English novelist: b. Ilfracombe, Devonshire, 1 Aug. 1858. He was educated at St. Albans, and afterward privately by his father, a scientist and Biblical scholar. He has contributed to most of the principal English and American periodicals, and has written: 'A Dead Man's Diary'; 'A Book of Strange Sins'; 'Sorrow and Song'; 'God and the Ant'; 'The Child, the Wise Man and the Devil'; 'A Literary Gent'; etc. He has been for many years literary adviser to Ward, Lock, and Company.

Kernstown, Battle of. Gen. "Stonewall" Jackson abandoned Winchester, Va., 11 March 1862 and retreated up the Shenandoah Valley, followed by Shields' Union division beyond Strasburg. Shields was recalled to Winchester on the 20th, and Jackson followed him, his advance cavalry under Turner Ashby engaging Shields on the afternoon of the 22d, near Kernstown, in which Shields received a severe shell-wound. Jackson came up on the afternoon of the 23d and, being informed that Williams' division of Banks' corps had left Winchester and was moving through the Blue Ridge for Manassas Junction, and that Shields had but four regi-

ments in his front, determined to crush these and thus recall Williams and detain him in the valley. Shields had nearly 8,000 infantry and cavalry and 24 guns, two of his brigades on a ridge covering the road half a mile north of Kernstown, both under command of Col. N. Kimball. Jackson had about 3,000 infantry and 27 guns. Kimball was too well posted to be attacked in front, so leaving Ashby with the cavalry and a small brigade of infantry to hold the road and threaten Kimball's centre and left, Jackson seized a low ridge on Kimball's right, and placed on it his artillery and infantry. Tyler's brigade, which had been held in reserve, was brought up and made unsuccessful efforts to dislodge him, upon which Kimball, drawing from his left and centre, formed a column of seven regiments and, under a terrific fire of artillery and musketry, led it forward, came up on Tyler's left and after a fierce combat broke Jackson's line. Kimball pressed his advantage, and as night closed in, Jackson was in full retreat, leaving his dead and wounded and two guns on the field of his first defeat. He said that he considered the engagement "a fiercer fight during its continuance than any portion of the battle of Manassas." The Union loss was 118 killed, 450 wounded, and 22 missing; the Confederate loss, 80 killed, 375 wounded, and 263 missing. Consult: 'Official Records,' Vol. XII.; Allan, 'Jackson's Valley Campaign'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II. E. A. CARMAN.

Kernstown (Winchester), **Second Battle of.** On 22 July 1864 Gen. Crook, with four small divisions of infantry and cavalry, joined Gen. Averell's cavalry division at Winchester, Va., Crook assuming chief command of the united force of 11,000 men. On the 23d Crook advanced four miles south to Kernstown and skirmished with Confederate cavalry, and on the 24th went into position on the same ground held by the Union troops in the battle of 23 March 1862. The infantry divisions of Cols. Thoburn, Duval, and Mulligan covered the valley pike, with the cavalry of Duffié and Averell on either flank. Upon the approach of the enemy Averell was sent down the Front Royal road to turn his right. Gen. Early, who, after his raid on Washington, had recrossed the Potomac and taken position beyond Cedar Creek on the 21st, hearing of Crook's advance, put all his army in motion on the morning of the 24th to attack him. At Bartonsville Ramseur's division moved by a road to get around Crook's right, while the divisions of Gordon, Rodes, Breckinridge, and Wharton moved along the valley pike and on either side of it. The cavalry was divided and moved in two columns, one on the right along the Front Royal and Winchester road, the other on the left and west of Winchester, the two to unite in rear of Winchester and cut off Crook's retreat. At 10 A.M. Crook's skirmishers were driven in, and it was discovered that his left extended through Kernstown, and that Averell having left, that flank was exposed; whereupon Wharton's division was moved under cover of some ravines on the right to attack it. The movement was promptly executed, and Wharton struck the left flank and rear of Col. Rutherford B. Hayes' command as it was advancing and threw its left into some confusion. Hayes changed front and, forming behind a stone fence, held Wharton in temporary check. Almost simultaneously with Wharton's flank attack, Rodes, Gordon, and Ramseur advanced on Crook's centre and right, and the entire line gave way and retreated through Winchester, followed by Early's infantry and artillery beyond Winchester, and by Rodes' division as far as Stephenson's Depot. The retreat was continued on the 25th through Martinsburg to the Potomac, Crook crossing at Williamsport and marching down the north side of the river to Maryland Heights and Harper's Ferry. Early occupied Martinsburg and began the destruction of the Baltimore & Ohio railroad. The Union loss, 23–26 July, was 100 killed, 606 wounded, and 479 missing. Among the mortally wounded was Col. Mulligan, commanding division. The Confederate loss is not accurately known, but it was comparatively light. Consult: 'Official Records,' Vol. XXXVII.; Pond, 'The Shenandoah Valley in 1864'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. CARMAN.

Ker'osene, an illuminating oil; the principal product of the distillation of petroleum, the crude domestic oil yielding 70 per cent. of its weight. The oil is colorless, possessing a characteristic taste and smell; insoluble in water, moderately soluble in alcohol, but very soluble in ether, chloroform, and benzene. It dissolves camphor, iodine, phosphorus, sulphur, fats, wax, and many resins. The flashing point of a safe kerosene should not be less than 34°, and the igniting point 43°. The finest quality of illuminating oil is produced from distillates ranging in specific gravity from 0.775 to 0.780. It has a high flashing point, 48° to 60°, and contains none of the lighter parts of the crude oil. A good illuminating oil should neither be too viscous nor too volatile, and it should not take fire when a light is applied to it. See OIL; PETROLEUM.

Kerr, kêr, **Michael Crawford,** American politician: b. Titusville, Pa., 15 March 1827; d. Rockbridge, Alum Springs, Va., 19 Aug. 1876. He was graduated from the law school of Louisville University in 1851. The next year he moved to New Albany, Ind., and began the practice of his profession; in 1854 he was city attorney, and in 1855 prosecuting attorney for the county. In 1856 he was elected to the State legislature; in 1862 he was reporter for the supreme court of Indiana, and published five volumes of reports of unusual value. In 1864 he was elected to Congress as a War Democrat, and served till 1872. In that year he refused the nomination from his own district, but ran as congressman-at-large, and was defeated by a very small majority; in 1874 he was re-elected to Congress in spite of much opposition, and was made speaker on the organization of the House. He served however only during the first session of that Congress (the 44th), as he died four days after its adjournment. While a member of the House he served on several important committees, including the committee of ways and means; he opposed the reconstruction policy of the Republican party and was an advocate of free trade. He was also a close student of financial problems, favored the resumption of specie payment, and was strongly

against the Greenback movement in regard to which he opposed a large part of his constituency and many of the politicians of his State.

Kerr, Orpheus C. See NEWELL, ROBERT HENRY.

Ker'ril, a sea-snake (*Distira cyanocincta*), olive with blue-black bands, numerous along the coasts from Persia to Japan, and considered one of the most venomous of its race. See SEA-SNAKE.

Kerrville, kĕr'vĭl, Texas, town, county-seat of Kerr County; on the Guadalupe River, and on a branch of the San Antonio & A. P. railroad. It is situated in an excellent agricultural region in which cotton cultivation and sheep raising are the principal occupations. The altitude of the town is about 1,800 feet, which accounts for its agreeable climate. The chief industrial establishments are stock-yards, flour-mills, cotton gins and, in the vicinity, stone quarries. The town has considerable trade in lumber, and is one of the principal wool markets of the State. Pop. (1900) 1,423.

Kersey, kĕr'zĭ, a kind of woolen cloth, differing from broadcloth by being woven as a twill. A very thin fine variety of kersey is called cassimere.

Ker'shaw, Joseph Brevard, American soldier: b. Camden, S. C., 5 Jan. 1822; d. there 13 April 1894. He entered the Confederate army at the outbreak of the Civil War, and as brigadier-general commanded a brigade in the Peninsular campaign of 1862. He took part in the capture of Harper's Ferry, 15 Sept. 1862, and was active at Antietam, Fredericksburg, Chancellorsville, Gettysburg, and Chickamauga. After the War he became president of the South Carolina Senate, and was judge of the 5th circuit of South Carolina, 1877–93.

Kes'trel, one of the smaller of the European falcons (*Tinnunculus alaudarius*), resembling the sparrow-hawk, and formerly much used in falconry by the peasantry. The American sparrow-hawk and sharpshin (qq.v.) may be called kestrels.

Ketch, a vessel equipped with two masts, namely, the mainmast and the mizzenmast, and usually from 100 to 250 tons burden. Ketches were principally used in former times as yachts for conveying princes of the blood, ambassadors, or other great personages from one place to another. Ketches in use at the present day are chiefly coasters.

Ketones, kē'tōnz. See ACETONE.

Ketteler, kĕt'tĕl-ĕr, **Clemens August,** BARON VON, German diplomat: b. Potsdam 1853; d. Peking 20 June 1900. He served for a time in the army, but entered the diplomatic service, in 1882 as attaché at Peking drew up the first treaty between Germany and Korea, in 1883 was appointed acting consul at Canton, in 1892 became secretary of the German legation at Washington, and when in 1893 the legation was made an embassy was appointed first secretary to the embassy and councillor of state. In 1896 he became minister to Mexico, in 1899 minister to China. In 1900, at the time of the "Boxer" disturbance in northern China, he was selected, owing to his familiarity with the Chinese language, to represent the foreign diplomats in their communications with the government. While on such a mission he was shot in the street. Prince Chun, brother of the emperor, was sent to Germany to apologize for the murder, and 18 Jan. 1903 a memorial arch, set up at the expense of the Chinese government, was dedicated at Peking.

Kettle Drum, a musical instrument, formed of thin copper, and has a head of parchment or vellum. Kettle drums are used in pairs, slung on each side of the withers of a cavalry horse. One drum is tuned to the key note, and the other to the fifth of the key in which the piece in which they are to be used is written. The tuning is by a hoop and screws. Also a name for a tea party held by fashionable people in the afternoon before dinner.

Ketu'pa, the generic and vernacular name of a group of large owls of the East Indies, specifically the Javan one (*K. javanensis*), which subsist mainly on fish, crabs, and the like, which they are expert in catching along the shores of sea and rivers. Their legs and talons are long and not feathered.

Keuka (kē-u'ka) **Lake,** or **Crooked Lake,** a body of water in New York State extending from Steuben County to Yates County, a distance of 20 miles. It is about 2 miles wide and of irregular form. It has a depth of 200 feet and lies 718 feet above the sea. Steamboats navigate the lake in summer between Hammondsport and Penn Yan.

Keuka, College, N. Y., a college at Keuka Park; founded in 1892 under the auspices of the Free Baptists. It had in 1901: Professors and instructors, 15; students, 176; volumes in the library, 3,000; productive funds, $150,000; income, $11,000.

Kew, kū, England, a small village in the county of Surrey, on the right bank of the Thames, opposite Brentford, with which it is connected by a bridge. The royal botanic gardens and the connected pleasure-grounds, the former covering about 75 acres, the latter 250, are the chief attraction of visitors to Kew. They contain the finest collection of plants in the world, and are decorated with various ornamental buildings, including a Chinese pagoda 163 feet high. The botanical constructions here are really magnificent, and have been much augmented in recent years; they include a great conservatory for palms, tree-ferns, and other tropical plants, 362 feet long altogether, the centre portion being 137 feet 6 inches long, 100 feet wide, and 69 feet high, the wings 50 feet wide and 33 feet high; a house for succulent plants, such as cactuses, euphorbias, etc., 200 feet long and 30 wide; a great "temperate house" for trees and shrubs of temperate climates that require protection during the winter; a large orangery, hothouses, greenhouses, etc., of great size. The gardens are open to the public on Sundays as well as week days.

Kew Observatory, a celebrated astronomical structure in Richmond Park, between Kew and Richmond, Surrey, England. It was built by George III. as a private enterprise for the observation of the transit of Venus in 1769 and was then called the King's Observatory. It was transferred to the British Association as a physical observatory in 1841, and given its present name. In 1871 it was placed under the control of the Royal Society.

Kewanee, kē-wä'nē, Ill., city in Henry County; on the Chicago, B. & Q. railroad; about 100 miles north by west of Springfield and 122 miles southwest of Chicago. It is situated in an agricultural region, and coal-fields are in the vicinity. The chief manufactures are agricultural implements, boilers, pumps, steam-heating machinery, gloves, mittens, and carriages and wagons. The tube and boiler works employ about 3,520 men. The public library has about 10,000 volumes. The city owns and operates the waterworks. Pop. (1890) 4,569; (1900) 8,382.

Kewa'tin. See KEEWATIN.

Kewaunee, kē-wâ'nē, Wis., city, county-seat of Kewaunee County; on Lake Michigan at the mouth of the Kewaunee River, and on the Kewaunee, G. B. & W. railroad. The first permanent settlement was made in 1850, and the city received its charter in 1882. Its chief industrial establishments are foundries, machine-shops, pea-canning works and coffin factory. Pop. (1900) 1,773.

Keweenaw (kē'wē-nâ) **Bay,** an arm of Lake Superior, north of Michigan. It is 8 miles long, by 2 to 6 miles in length. The town of Baraga lies at the head of the bay.

Keweenaw Point, a peninsula in northern Michigan, projecting into Lake Superior. It is rich in copper mines, the maximum thickness of the strata here being 40,000 feet. The peninsula is as large as the State of Delaware, and includes Houghton and Keweenaw counties. Among the towns on the peninsula are Calumet, Houghton, Eagle Harbor, and Copper Harbor.

Keweenawan (kē'wē-nâ-an) **Series,** a great series of rocks, believed to be of Pre-Cambrian age, typically developed on Keweenaw Point, Mich., but found over a large area in Michigan, Wisconsin, and Minnesota. Rocks of the same age occur also in Canada, and possibly in the Adirondack Mountains in New York. The series on Keweenaw Point and southward has a maximum thickness of perhaps 50,000 feet; the lower part consists mostly of thick sheets of lava and intrusive rocks with some sandstone and conglomerate; the upper part is a mass of sedimentary rocks. In the series occur the famous Lake Superior copper deposits. The Keweenawan series is included in the Algonkian or Eozoic system.

Key, David McKendree, American jurist and cabinet officer: b. Greene County, Tenn., 1824; d. Chattanooga, Tenn., 3 Feb. 1900. After studying law he was admitted to the bar in 1849, and in 1853 took up his residence in Tennessee, establishing a successful law practice at Chattanooga. After vainly attempting to prevent the secession of Tennessee, when once that step was taken he joined the Confederate army and served through the War, but at its close joined the Republican party, succeeded Andrew Johnson in the United States Senate (1875); in 1877 was made postmaster-general; and in 1880 was appointed United States district judge for the Eastern and Middle Districts of Tennessee, a position he held till his death.

Key, Francis Scott, American lawyer and song writer: b. Frederick County, Md., 1 Aug. 1779; d. Baltimore 11 Jan. 1843. He was educated at St. John's College, Annapolis, and commenced the practice of the law in Frederic City. Subsequently he removed to Washington, where he was for many years district attorney of the District of Columbia. As a song writer he is chiefly known by his 'Star-Spangled Banner,' a popular national lyric, suggested and partially written while the author was detained in the British fleet during the bombardment of Fort McHenry, near Baltimore, of which he was an anxious and interested witness. A posthumous collection of his miscellaneous poems was published in 1856.

Key, in music: (1) A mechanical contrivance for closing or opening ventages, as in flutes, clarinets, ophicleides, etc. By means of keys on such instruments, apertures too remote to be reached by the outstretched fingers are brought under control of the player. (2) A lever which brings the pallets of an organ under the control of the hand or foot of an organist. (3) A lever which controls the striking apparatus of a key-stringed instrument. In the harpsichord it acted on the jack; in the pianoforte it acts on the hammer. (4) The wrest or key used for tuning instruments having metal pegs. Its end is hollowed out so as to fit over the four-sided end of the peg, and the cross-bar with which it is surmounted gives leverage to the hand of the tuner, so that he is enabled to tighten or loosen a string, or (in the case of a drum) slacken or strain a parchment. (5) The sign placed at the commencement of the musical stave which shows the pitch of the notes, was originally called a clavis or key. This sign is called in modern music a clef. (6) Key, in its modern sense, is the starting point of the definite series of sounds which form the recognized scale. Different starting points require the relative proportion of the steps of the scale to be maintained by means of sharps or flats in the signature. The key of C major requires no flats or sharps for this purpose, hence it is called the normal key.

Also a metallic instrument for shooting the lock-bolt of a door; an instrument formed with cavities or interstices corresponding to the wards of a lock, by which the bolt is moved backward or forward.

Key West, Fla., city, port of entry, county-seat of Monroe County; about 60 miles southwest of Cape Sable and nearly 100 miles north by east of Havana, Cuba. The city is on Key West Island, one of a group of coral islands, called Florida Keys. It is the farthest south of any city in the United States. The first permanent settlement was made in 1822 and the city received its charter in 1832. Key West Island is covered by only a thin layer of soil upon which vegetation grows luxuriantly. The island averages about 11 feet above the sea. The harbor is excellent; at the main entrance, on an artificial island, is located Fort Taylor. The city has regular steamer communication with the large cities on the Atlantic and Gulf coasts and with the West Indies and Central America. It is a United States naval station, and during the war with Spain, it was the rendezvous of the United States navy. The chief industries are manufacturing of cigars, gathering sponges, and fishing. There is a large trade in fish, fruit, vegetables, turtles, turtle-shell ornaments, salt, tobacco, both raw and manufactured. In connection with the naval

station there are barracks, machine-shops, marine hospital, docks, etc. Some of the chief public buildings are the government buildings, post-office and custom-house, county court-house, city-hall, and the Martello towers. The principal educational institutions are a Methodist Seminary and the Holy Name Academy. The convent of the Holy Name was used as a hospital for soldiers during the Spanish war. The free public library and the public and parish schools are excellent. There are two banks with a combined capital of $150,000. The government has erected two light-houses in the harbor and others among the islands; but still many wrecks occur each year. The city owns and operates the waterworks. Pop. (1900) 17,114.

Keyes, kēz, **Edward Laurence,** American surgeon: b. Charleston, S. C., 28 Aug. 1843. He is a son of Erasmus Keyes (q.v.) and was graduated from Yale in 1863 and from the medical department of the University of New York in 1866. He has practised his profession in New York from 1867, and is now (1903) consulting surgeon to Bellevue Hospital. He has published: 'The Venereal Diseases' (1880); 'Treatise on Surgical Diseases of the Genito-Urinary Organs' (1881); etc.

Keyes, Emerson Willard, American educator and financial writer: b. Jamestown, N. Y., 30 June 1828; d. 13 Oct. 1897. He graduated from the State Normal School, was deputy superintendent of public instruction in New York 1857–65, and acting superintendent 1861–2. In the latter year he was admitted to the bar, became deputy superintendent of the banking department of New York State in 1865, and was appointed bank examiner five years later. In 1882 he was appointed chief clerk of the Brooklyn (N. Y.) Board of Education, a position which he filled until his death. He published: 'New York Court of Appeals Reports' (1867–9); 'History of Savings Banks in the United States' (1878); 'New York Code of Public Instruction' (1879); etc.

Keyes, Erasmus Darwin, American general: b. Brimfield, Mass., 29 May 1810; d. Nice, France, 11 Oct. 1895. He was graduated from West Point in 1832, and served in Charleston in 1832–3. He was later placed on frontier duty in the Northwest during the Civil War, and won distinction at Fair Oaks and elsewhere. He was promoted major-general of volunteers 5 May 1862, and on 31 May of that year was brevetted brigadier-general United States army. He resigned in 1864 and settled in California. He published 'Fifty Years' Observation of Men and Events' (1884).

Keyes, the name given to coral and other reefs or slightly sunken rocks off the shores of Florida, Central America and the West India Islands. The term is derived from the Spanish *cayo* (an islet, rock).

Keyser, kī'zėr, **Ephraim,** American sculptor: b. Baltimore, Md., 6 Oct. 1850. On the completion of his academic course in his native city, he studied art at the Royal Academies in Munich and Berlin, where his success was marked. He has had studios in Rome, Italy, New York, and Baltimore, where he now resides, in charge of the sculpture and modeling classes at the Maryland Institute School of Art. His most important public works are the De Kalb statue at Annapolis, Md., and President Arthur's tomb at the Rural Cemetery, Albany, N. Y. He has made numerous portrait busts, among others those of Cardinal Gibbons, Daniel Coit Gilman, and Sidney Lanier. While abroad he received the Michael Beer scholarship.

Keyser, Leander Sylvester, American Lutheran clergyman and ornithologist: b. Tuscarawas County, Ohio, 13 March 1856. After graduation from Wittenberg Divinity School he filled various Lutheran pastorates in Indiana and Ohio, and has been pastor of Midland College Church, Atchison, Kan., from 1897. He has published: 'The Only Way Out' (1888); 'Birddom' (1892); 'In Bird Land' (1894); 'Birds of the Rockies' (1902).

Keystone State, a name given to Pennsylvania, because it was the seventh, or central of the original 13 States.

Khaki, kä'kī, a kind of light-brown, drab, or dust-colored cloth, originally used for making the uniforms of East Indian regiments. In the South African war of 1899–1901 the British troops wore khaki uniforms for purposes of protective coloration, and khaki was also worn by the United States troops in the Spanish-American war.

Khalifa, kä-lē'fä, **The** (Sayed Abdullah Ibu-Sayed Mohammed), Arab religious leader: b. Darfur 1846; d. battle of Om-Debrihat, Egypt, November, 1899. He fought against the Egyptian invasion of Darfur, and subsequently, having heard of the troubles of the Mad Mullah (q.v.), Mohammed Ahmed, with the Egyptian authorities, he visited Mohammed, and proclaimed that the latter was the divinely-sent Mahdi, or "director," appointed for the regeneration of Islam. It was by his councils that the Mahdi caused the troubles in Kordofar and Darfur. Ere long he was made "khalifa," or vice-gerent, his acts to be regarded as equivalent to the Mahdi's own. He was named by the Mahdi as successor, and from 1885 ruled over the Sudan and such adjacent districts as he brought within his sway. His capital was situated at Omdurman, near which, on 2 Sept. 1898, his army, though fighting with great bravery, was almost annihilated by the British and Egyptian forces under Sir Horatio (now Lord) Kitchener (q.v.). He escaped northward, but in November 1899 was slain at the combat of Om Debrihat. See also Egypt — *History;* Sudan.

Khammurabi. See Hammurabi, The Code of.

Khan, kän or kăn, or **Caravansary,** in Turkey and other Eastern countries. There are two kinds, those for poor travelers and pilgrims, where a lodging is furnished gratis; and those for traders, which are usually more convenient, a small charge being made for each chamber.

Khandesh, khän-dēsh', or **Candeish,** British India, an inland district in the presidency of Bombay, with an area of 10,907 square miles. The chief town is Dhulia (pop. 21,880). Pop. 1,460,851.

Khargeh, khär'gĕ, or **Kharga,** Egypt, town, in the oasis of the same name; 100 miles west of Thebes. Here are the ruins of the temple of Ammon. Pop. 4,000.

Kharkov, här-kŏf′, or **Charkov,** Russia, (1) a southern government bounded north by Kursk and Voronezh; west and southwest by Poltava; south by Ekaterinoslav; east by the Don Cossacks; area, 21,041 square miles. There are forests in a few parts, but the country generally is open, the soil dry and of a mixed loamy and sandy nature, but usually fertile. The climate is mild, though the winter is somewhat severe; the summer is frequently very hot. Agriculture and the rearing of sheep and other domestic animals form the chief employment of the inhabitants. Sugar and tobacco are manufactured. Pop. (1897) 2,509,811. The principal town is (2) Kharkov, the capital, at the confluence of the Kharkovka and Lopanj, 400 miles southwest of Moscow. The houses are mostly of wood, whitewashed, and have a cleanly appearance. The city is the see of an archbishop, contains a cathedral and other churches, a university with a library, a museum and botanical garden, a technological institute and a veterinary institute, several gymnasia, two theatres, etc. The inhabitants carry on a considerable trade in soap, candles, and leather; and among the chief industries are wool-washing and the manufacture of tobacco and cigars. Pop. (1897) 174,841.

Khartum, har-toom′, or **Khartoum,** capital of the Egyptian Sudan, on the left bank of the Blue Nile, near its junction with the White Nile. Founded under Mehemet Ali in 1823, it rapidly rose to be the chief town of the Egyptian Sudan, but after its conquest by the Mahdi it was abandoned for Omdurman, on the opposite bank of the river. In the latter part of 1898 it was again occupied by British and Egyptian troops, who found it in a ruined and neglected condition. It is a straggling place covering a wide area, with irregular streets, and houses mostly built of sun-dried bricks. The situation of Khartum made it the emporium of a large trade in ivory, gums, ostrich feathers, senna, etc., which is again developing under Anglo-Egyptian rule. It was the scene of Gordon's heroic defense against the insurgent Sudanese, and of his death in January 1885. The Gordon College, established here after the British occupation, was named in honor of him. Pop. 40,000.

Khayyám, Omar, ō′mär khī-yäm′. See Omar Khayyám.

Khedive, kĕ-dēv′ (*Khidîv*), a Persian word signifying lord, the title of the Pasha of Egypt, granted him by a firman from the sultan in 1866. In Persia it was at different eras adopted by provincial governors who were independent of the shah. The title, which had fallen into disuse both among Persian and Turkish governors, was revived in order to give additional honor to Ismail Pasha.

Khiva, hē′vä, or **Chiva,** a vassal state of Russia, in Central Asia. It formerly occupied a large extent of surface on both sides of the Amu-Daria or Oxus, but since the cession to Russia, in 1873, of its territory on the east of the Amu, is now confined to the west side of this river. It is of a triangular shape, each of its three sides — of which Amu forms one — being about 300 miles in length. One of its angles rests on the Sea of Aral. A great part of the surface consists of deserts, thinly inhabited or uninhabitable; but along the Amu the land is of a very different character, consisting of rich alluvial loam of the greatest natural fertility. Owing to the great dryness of the atmosphere, however, it soon becomes so stiff and hard that it cannot be penetrated by any ordinary implement. For this the obvious remedy is irrigation; and accordingly, from the earliest period, a mode of culture resembling that of Egypt has been practised. Large canals from the river, with numerous minor branches, intersect every part of the surface, supplying moisture where it is wanted, or removing it where it is in excess, and securing the most luxuriant crops of wheat, maize, rice, barley, and legumes. Cotton and madder are also generally cultivated. The vine thrives well, but requires to be defended against the winter cold by a covering of straw and earth; all the ordinary fruits, including apples, plums, cherries, apricots, figs, and pomegranates, are common. Trade is carried on chiefly with Russia. The principal exports are raw and spun cotton, in return for which are received various articles of European manufacture, as metals and ironware, woolen, cotton, and silk goods, etc. From Bokhara also are obtained cotton and silk goods, green tea, raw tobacco, Chinese porcelain, etc. These are sometimes paid for in money, but more frequently in Russian wares. The government of Khiva is an unmitigated despotism. The greater part of the inhabitants are Tajiks and Uzbeks, in nearly equal numbers. After these are Persians, Karakalpaks, Jamshids, and Turcomans. The designs of Russia on Khiva long caused disquietude in Britain, which has always been jealous of Russian advances in Asia, mainly from a dread of interference with her Indian empire. Accordingly Count Schouvaloff was despatched to England in January 1873, to give explanations respecting an intended expedition to Khiva. Its object was represented as simply the suppression of brigandage, the recovery of a few Russian prisoners, and to teach the khan to desist from acts of violence in the future. The emperor, it was said, had given positive instructions that Khiva should not be taken possession of. In spite of these protestations, however, Khiva was taken possession of on 10 June; and later in the year, though the nominal independence of the khan was stipulated for, it was decided to annex to the Russian dominions the Khivan territory on the right bank of the Amu. The khan also renounced all right of making wars or treaties without Russian sanction. The population is estimated at 700,000 to 1,000,000.

Khokand, hō-känd′. See Ferganah.

Khoozistan′. See Elam.

Khorasan, ho-rä-sän′, Persia, an extensive northeastern province; area, about 140,000 square miles. The surface is to a great extent uninhabitable. The mountainous region of the north has many well watered valleys with a fertile soil. The most valuable mineral is the turquoise. In many parts cotton, hemp, and tobacco grow freely, and aromatic plants and drugs are numerous and valuable. The principal manufactures are silk and woolen stuffs, carpets, firearms, and sword-blades. About two thirds of the inhabitants are Persians; the remainder are Turcomans, Kurds, and other tribes, who lead a nomadic life. The chief town is Meshed. Pop. estimated at 860,000.

Khorsabad, khōr-sä-bäd'. See NINEVEH.

Khyber (hī'bẽr) or **Khaibar Pass,** a mountain pass on the frontiers of India and Afghanistan, leading from Punjab to Jelalabad and Cabul. The pass winds northwest through a range of hills, called by the same name, for a distance of about 33 miles, and forms the bed of two streams, the one flowing northwest, the other south-southeast. It is at one part as narrow as 10 feet in width, and in many places the hills on either side are quite precipitous and inaccessible, rising at one point to the height of 1,300 feet. At 9½ miles distance from the Indian entrance of the pass is the fort of Ali Masjid, which has several times been taken by the British from the Afghans. The highest point of the pass is Lundi Kotal, 3,373 feet above sea-level. The pass forms the northern military route from India to Afghanistan, and is now under British control.

Kiang, kē-äng', **Dziggetai** or **Kulan,** the large wild ass (q.v.) of Tibet and Mongolia, characterized by its large size (11 to 12 hands high), dark reddish color and the narrowness of the black stripe along the spine; some have faintly barred legs. They dwell upon the lofty, sterile plateaus north of the Himalayas, moving about in bands which travel at amazing speed over the stony plains and up and down the steep hillsides, feeding mainly on twigs of woody desert plants, and acquiring great hardiness. They are hunted by the Mongols as game, yet are not shy as a rule, coming close to a traveling party or camp, apparently actuated by extreme curiosity, unless driven away. The voice has been described as like the neigh of a horse; but the general and truer opinion is that it is more nearly the shrieking bray of the ass. The animal is nowhere domesticated, except a few captive specimens in zoological gardens. See ONAGER.

Kiang-Si, kē-äng'sē, or **Kiangse,** one of the 18 provinces of China proper. It is bounded on the north by Hupeh and Ngan-Hui, on the east by Che-Kiang and Fu-Kien, on the south by Kwang-Tung, and on the west by Kwang-Si and Hunan. The area is 72,176 square miles. The province contains the treaty port of Kiu-Kiang on the Yang-tse-Kiang. The Nan-Ling or Southern Mountains traverse the eastern half of Kiang-Si, and in the north is the large inland lake of Po-Yang-Hu. Here are established famous manufactories of porcelain. The principal river aside from the Yang-tse-Kiang, is the Kin-Kiang. The province produces tea and silk, besides porcelain. The English have large railway concessions. There are telegraph lines connecting the treaty port with other centres of commerce.

Kiang-Su, kē-äng'soo, an important maritime province of China proper, bounded north by the province of Shan-Tung; east by the Yellow Sea; south by the province of Che-Kiang, and west by the provinces of Ngan-Hui and Ho-Nan. Kiang-Su has an area of 44,500 square miles (about that of Pennsylvania). The great commercial importance of this province is denoted by its possession of four treaty ports, Shanghai, Nankin, Su-Chau and Chin-Kiang. Kiang-Su was in fact the first province opened to foreign commerce by means of a treaty port. It is traversed almost its whole length by the Grand Canal, the ancient Chinese system of waterways. The British have valuable railway concessions and the Germans claim mining rights here. Half the foreign population of China is established in this province.

The Yang-tse-Kiang empties into the sea through this province and enables it to control the trade of all southern China. There are large cotton mills. The capital of the province is Nankin, which was formerly the capital of the Chinese empire. The Tai-Ping rebellion of 1853–4 had its headquarters in this province. Kiang-Su is rapidly becoming the centre of Chinese manufacturing industries, especially in textiles. Commercially, the province is controlled by the English, who have invested largely in railways, mills, and government concessions. Pop. (1900) estimated, 28,000,000.

Kianganes, a Philippine tribe. See QUIANGANES.

Kiao-Chau, kē-ä-ō-chow', or **Kiao-Chow,** a Chinese walled city and a protectorate of the German empire, around the shores of Kiao-Chau Bay on the east coast of the province of Shan-tung. The bay is some 15 miles across from east to west and north to south, and has deep-water anchorages suitable for foreign vessels in its southeastern portion. Kiao-Chau was seized by Germany in November 1897, and in March 1898 the town, harbor, and district were transferred to Germany by treaty on a lease for 99 years, the territory, which covers about 200 square miles, being then declared a protectorate of the German empire. It comprises 33 townships, with a population of 60,000. Around the leased territory is a neutral zone of 2,500 square miles in area. The protectorate is administered by the navy department, its governor being a naval officer. The German garrison, about 2,400 strong, consists of marines and marine artillery.

Kibit'ka, a carriage without springs used in Russia; also the name of a tent used by the nomad tribes of Kirghiz Tartars.

Kick'apoos, a tribe of Algonquian Indians, formerly occupying a portion of the Ohio Valley. They were a powerful nation in the early history of that region, and were constantly in arms against the whites until in 1819 they concluded the sale of most of their lands and removed to the Osage River Reservation in Kansas. In 1852 a considerable number of them went to Texas and from there to Mexico; some of these returned, however, and settled in the Indian Territory. In 1900 the total number of Kickapoos in the United States and Mexico was estimated at 1,000. See INDIANS.

Kidd, Benjamin, English sociologist: b. 9 Sept. 1858. He entered the inland revenue service of Great Britain in 1877 and rose to sudden fame by the publication of 'Social Evolution' in 1894. The volume was translated into most of the languages of Europe, and gave rise to considerable controversy, President Roosevelt publishing a series of papers in opposition of the views propounded in it. Its main proposition was that high moral and religious development in society was a process that ran exactly contrary to natural evolution and the Darwinian process of survival. He has also published: 'The Control of the Tropics' (1898); and 'Principles of Western Civilization' (1902).

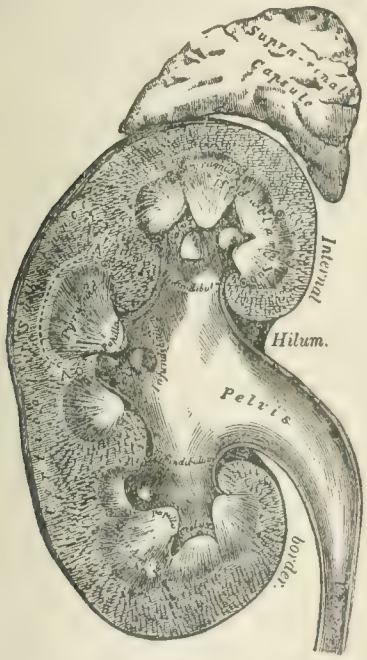
Kidd, William, American pirate: b. probably Greenock, Scotland, about the middle of the 17th century, executed London 24 May 1701. He appears to have followed the sea from his youth, and about 1695 was known as one of the boldest and most successful shipmasters that sailed from New York. At this time the depredations of pirates upon British commerce had become so extensive that a company was organized in England, in which William III. and several noblemen were shareholders, to fit out an armed vessel for the purpose of suppressing the practice, as well as of deriving a profit from recaptures. Kidd, who had obtained some experience as captain of a privateer against the French, received a commission signed by the king, and directed to "the trusty and well beloved Captain Kidd, commander of the ship Adventure Galley," a vessel of 30 guns. Sailing from Plymouth, England, in April 1696, he cruised off the American coast for some months, occasionally entering New York, and finally sailed for the East Indies and the east coast of Africa. Upon his way he resolved to turn pirate, and finding his crew not averse to the project, forthwith commenced a career of plunder and outrage among the shipping which frequented the coasts of Malabar and Madagascar, returning in 1698 with a large store of booty to New York. He took the precaution to bury a portion of his treasure on Gardiner's Island at the east end of Long Island, and subsequently went to Boston, where he boldly made his appearance in the streets, not doubting that under his commission he could clear himself from any charge of piracy. Such, however, had been the scandal which the report of Kidd's depredations had caused in England, that the Earl of Bellamont, governor of Massachusetts and New York, and one of the shareholders in the enterprise, caused him promptly to be arrested and conveyed to England for trial. The charge of piracy was difficult to prove; but having been arraigned for killing one of his crew, named Moore, in an altercation, he was convicted after a grossly unfair trial, and hanged at Execution dock. His name and deeds have been interwoven into popular romance, and form the subject of the well-known ballad commencing: "My name is Captain Kidd, as I sailed, as I sailed," many of the incidents of which, however, are apocryphal. The treasures he had left, consisting of 738 ounces of gold, 847 ounces of silver, and several bags of silver ornaments and precious stones, were secured by Bellamont. But according to popular belief this inconsiderable amount constituted but a tithe of all he had collected, and down to the present time the shores of Long Island Sound and various parts of the banks of the Hudson River continue occasionally to be explored in the hope of discovering the abandoned wealth of the great pirate.

Kid'der, Frank Eugene, American architect: b. Bangor, Maine, 3 Nov. 1859. He was graduated from the University of Maine in 1819, studied at the Massachusetts Institute of Technology 1880–1, and has published 'Architects' and Builders' Pocket Book' (1885); 'History of the Kidder Family' (1886); 'Churches and Chapels' (1895); 'Building Construction and Superintendence' (1896).

Kidder, Frederic, American historical writer: b. New Ipswich, N. H., 1804; d. Melrose, Mass., 1885. He gave much attention to the language and religion of the New England Indians, and published 'The Expeditions of Capt. John Lovewell' (1865); 'History of the First New Hampshire Regiment in the War of the Revolution' (1868); 'History of the Boston Massacre' (1870); etc.

Kid'derminster Carpet, so called from being made in the town of that name in England. Another of its names, ingrain, signifies that it is made of wool or worsted dyed in the grain; that is, before manufacture. Its names two-ply or three-ply indicate the number of webs which go to the making of the fabric.

Kidnapped, a romance by Robert Louis Stevenson, published in 1886, when the author was 36. In his own opinion, it was his best novel; and it is generally regarded as one of his finest performances in romantic story-telling. The full title reads: 'Kidnapped: Being Memoirs of the Adventures of David Balfour in the Year 1751'; and the contents of the tale are further indicated on the title-page, thus: "How he was Kidnapped and Cast away; his Sufferings in a Desert Isle; his Journey in the Wild Highlands; his acquaintance with Alan Breck Stewart and other notorious Highland Jacobites; with all that he Suffered at the hands of his Uncle, Ebenezer Balfour of Shaws, falsely so called."



Kid'napping, is not a legal term, but is frequently applied as such in popular language, both in Great Britain and the United States, to the offense of stealing or carrying off by force a child or adult. In its more limited sense, it is applied to the obtaining of slaves or native labor by force, as practised by the Arabs in Africa. This barbarous traffic existed in very recent years in the South Seas, carried on by Europeans, but now happily suppressed by the appointment of government labor agents. In Great Britain this term was formerly also applied to the illegitimate recruiting for the army and navy. See ABDUCTION.

Kid'ney Bean, a bean of the genus *Phaseolus,* of which European species and varieties have been cultivated from a time immemorial (see BEAN). The wild kidney bean of the United States is a high-climbing vine (*P. perennis*), bearing small purple flowers. The so-called "kidney-bean tree" is *wistaria* (q.v.)

Kidney-root, the purple boneset (q.v.).

Kidneys, the principal excreting organs of the body. They are two in number, fixed in position at the back of the abdominal cavity by a thick layer of fat and the peritoneum which passes in front of them; their lower border is slightly below the last ribs; their shape is characteristic; they have an outer, upper, and lower convex margin, and an inner margin deeply indented, allowing the entrance of the renal artery and exit for the veins and ureter. This indentation corresponds to a considerable hollowing of the interior, which is occupied by the funnel-like origin of the ureter (the pelvis). The kidney is surrounded by a firm membrane called the capsule; inside of this is the substance proper, made up of a connective-tissue groundwork in which are embedded the blood-vessels and the secreting glands called the uriniferous tubules. These tubules start in

tiny rounded bodies (Malpighian bodies), and after an orderly arrangement of windings a number of the tubules form slightly larger tubules (collecting tubules), so grouped together as to form striated pyramids which have their apices projecting into the pelvis of the kidney. A Malpighian body is made up of a tuft of blood-vessels, a glomerulus, surrounded by a dilated end of the tube (capsule of Bowman), so that the endothelial lining of the capillary and the epithelium of the end of the tubule are in apposition. By a process similar to filtration the excess of water in the blood passes through these walls and out of the body. There is a similar arrangement of the blood-vessels around the winding tubules, but through these the solids in solution in the blood that are of no further use to the body are taken up by the

Vertical Section of Kidney.

epithelium of the tubules and added to the watery element inside the tubes. This mixed fluid, called the urine, is then passed out into the ureter, whence it is conveyed to the bladder and stored until passed. The ureters are about 16 inches long, with the diameter of a goose-quill; they are lined by a mucous membrane, outside of which there are thin muscular and fibrous layers of tissue.

Urine.— The urine is an amber or yellowish fluid containing about 95 per cent of water, having a specific gravity of 1.018 to 1.025, an acid reaction, and rather characteristic ammoniacal odor. The inorganic solids held in solution are the chlorides, phosphates, and sulphates of sodium, magnesium, potassium, calcium, and iron. More important than these is a group of substances elaborated in the body during metabolism (q.v.), some of which may act as poisons if not properly discharged; the principal ones being urea, uric acid, creatinine, hippuric acid, and the xanthin bases. That of most importance is urea, which should in normal adults be excreted to the amount of 500 grains daily. In kidney disease the deficiency of this substance is taken as an index of the organ's impairment.

Visible Abnormalities of the Urine.— While the average amount of urine passed by a healthy adult in 24 hours is 50 ounces (3 pints), there are constant variations from this rule, depending on the amount of water ingested and the amount lost through the skin and bowels: so also do the amount of solids vary with the diet and amount of exertion. White cloudiness of the urine may be caused by the presence of pus, phosphates, mucus, or bacterial growths. Reddish or "brick-dust" deposit is caused by an excess of urates, a condition ordinarily of no importance and never an indication of kidney disease. There is apt to be a diminution of the amount of urine in nephritis, and a great increase in diabetes.

Albumen in the urine is the serum albumen of the blood. In health the kidneys may allow the passage of faint traces of this substance, but the presence of amounts large enough to be discovered by the "heat and nitric acid" test usually indicates some abnormality of the epithelium of the tubules — congestion of these organs, inflammation of the ureter, bladder, or urethra, or an admixture of blood with the urine. Albumen may appear in the urine after severe exertion without apparent congestion of the kidneys. Certain individuals go on for years showing albumen in the urine at certain times of the day and never develop any further evidence of Bright's disease. In some persons certain articles of food, particularly those rich in albumen, cause a temporary albuminuria. Although these forms are called "functional," there is always a possibility that they may indicate some slight kidney impairment, and it is the custom of the insurance companies to refuse applicants with albuminous urine.

Urinary casts are tiny cylinders or plugs formed in the uriniferous tubules under abnormal conditions. They are formed of coagulated albumen blood and epithelial cells, granular matter the result of epithelial cell degeneration, and so-called waxy matter. The clear "hyaline casts" may sometimes be found in small numbers in the urine from normal kidneys, but the constant presence of casts indicates a disease of the kidneys. These bodies are entirely invisible to the naked eye.

Uræmia.— This term denotes a group of symptoms that may appear in the course of diseases of the kidneys and during pregnancy. (See PUERPERAL ECLAMPSIA.) Some toxic substance is held in the blood and causes one or more of such symptoms, which may not be characteristic of uræmia but to which, because of the general complex of symptoms and the known condition of the urine, the term uræmic is applied. The various symptoms which it is customary to include in the category are headache and sleeplessness, hemiplegia and aphasia, general convulsions and spasms of groups of muscles, blindness, delirium and coma, vomiting, dyspnœa, and increased arterial tension. This last condition is due to spasm of the smaller arteries and to hypertrophy of the heart.

Diseases of the Kidneys.— Acute congestion may result from sudden obstruction of the

veins, certain irritant poisons, exposure to cold, severe surgical operations, overexertion, or from the infectious diseases. Besides the changes seen in the urine, albuminuria and casts, if the congestion be severe there may be fever, abdominal pain, nausea and vomiting, and partial or complete suppression of urine. The treatment consists in the removal of the cause and the relief of congestion by the hot pack over the lower half of the body. In its severe forms the conditions may be fatal.

Chronic Congestion.— This condition results from obstruction to the venous outflow, as seen in disease of the lungs, heart, and liver, and from the pressure of tumors: it leads to actual change of structure.

Acute Nephritis, Acute Bright's Disease.— This is an inflammation of the vital part of the kidney structure, the secreting membrane of the uriniferous tubules and of the structures around them. In such an inflammation there is congestion of the whole organ, degeneration of the epithelial lining of the tubes, exudation of serum from the blood-vessels into the tubes, and consequent disturbance of the function of the organ. The most common causes of this condition are exposure to cold and wet, the poisons of scarlet fever, pregnancy, etc., certain causes being undiscoverable. The condition may also be due to other infectious diseases, to the ingestion of poisons, or to the presence of large burns of the body surface.

Some cases are so mild that the kidneys are not suspected, the patient having a slight fever, headache, loss of appetite, and general malaise. The ordinary cases show considerable diminution of urine, which is loaded with albumen and casts; there is considerable fever; nausea and vomiting are usual; and these are accompanied by more or less of dropsy, headache, and the other manifestations referred to under the name of uræmia, and by a rapidly developing waxy pallor. These various symptoms are not constant, but the picture is sufficient when the condition of the urine is investigated. As a rule, when this condition lasts only a few weeks these cases recover completely, and the kidneys are as good as before, but the cases of longer duration and of great severity may be fatal, or may leave permanent changes in the organ. This last effect is particularly liable to follow when nephritis begins late in the course of scarlet fever, because of the permanent changes of structure induced by some particular poison generated at that time.

The treatment of these conditions consists in absolute rest, diet of the simplest sort, preferably milk, opening of the various emunctories (the bowels and skin), and attending to such symptoms as threaten the life of the patient.

Chronic Bright's, Chronic Nephritis.— This disorder is characterized by a permanent change in the tissue of the kidney, which may follow acute inflammation, or may come on insidiously as a result of poisoning by alcohol, of syphilis, of prolonged nervous strain, with consequent disturbance of digestion and metabolism, of suppurative inflammations in other parts of the body, and of many undiscoverable causes. The changes in the kidneys consist in growth of connective tissue around the glomeruli and tubules, more or less degeneration of the epithelium lining the tubes, and arteritis. The disease may be very insidious in development, albumen and casts being discovered on routine examination of the urine. Loss of nutrition may be noticed, or a disturbance of the gastro-intestinal tract may first call attention to the disease. The urine may be increased in amount or diminished, but as the disease progresses the specific gravity grows less from the decrease of urea. Dropsy appears around the ankles and spreads usually as the disease advances. Anæmia is fairly constant, but not severe. Sooner or later that general condition of poisoning known as uræmia is apt to develop because of the inability of the kidneys to excrete the toxic substances. Some cases suddenly develop one or more of the various symptoms, either dyspnœa, dropsy, failure of the hearts' action, coma, convulsions, or hemiplegia, without the nephritis having occasioned distinct symptoms previously.

Prognosis in Chronic Nephritis.— The prognosis is not necessarily bad, although as a rule the disease progresses and causes the death of the patient. Intercurrent diseases throw extra strain on the kidneys, and may hasten a fatal termination. Many cases live for years in comparative health, and are carried off by another affection. The actual prognosis of a case is determined by the work the kidneys are able to do on a known diet and under stated conditions of work. This is best determined by an estimation of the excretion of urea in a 24-hour collection of urine.

Treatment.— No treatment of the disease, so far as cure is concerned, is possible, but the progress of the affection can be stayed and the patient kept in comparative good health by careful attention to mode of life, diet, and regulation of the bodily functions. At the time of the more acute exacerbations symptoms are relieved as they arise, and the skin and bowels are called upon to assist the kidneys in the work of excretion by diaphoresis (by the hot pack) and catharsis. When the output of urine becomes small, some benefit may result from the administration of diuretics. For the disturbance of the circulation arterial dilators and cardiac stimulants are employed, and sometimes bloodletting, with the greatest benefits.

Renal Calculi or Kidney-Stones.— See CALCULUS.

Tuberculosis of the Kidney.— This malady occurs in the form of tiny miliary tubercles scattered through the kidney, usually as a part of a general tuberculosis, and in the form of a tubercular pyonephrosis due to extension from the bladder; more rarely the process may be primary in the kidney and then extend to the bladder. The symptoms are frequent micturition, pyuria, hematuria, and occasionally the presence of a tumor. The diagnosis is difficult unless there be tuberculosis of the bladder, testes, or seminal vesicles. Although the prognosis is always grave, cases have recovered where the kidney has been inspected but not removed. Nephrectomy is not performed unless the other kidney can be proven sound.

Injuries of the Kidney.— Severe contusions of the abdomen or loins may cause laceration of the kidney substance and the capsule, or the

kidney may be perforated by stab or gunshot wounds. Slight contusions cause pain and transient hematuria, but the more severe contusions and wounds allow the urine to flow out into the surrounding tissue, sometimes with inflammation following. The wound may require sutures, or the kidney may have to be removed.

Suppuration in and around the Kidney.— This condition is due to the infection of the part with micro-organisms, which may reach the part in three ways — through the blood, from the bladder, and through perforating wounds. It is now commonly noticed that persons in health may pass bacteria through their kidneys without resulting suppuration; and it seems that some injury must take place to allow them to grow there and cause actual damage. Such damage may be made by calculi or contusions. Pylitis is an inflammation of the pelvis of the kidney, and this part is first involved when the inflammation travels up from the bladder. Pyelonephritis is an inflammation of both pelvis and kidney structure. Pyonephrosis is the name used to describe the condition of dilatation of the pelvis and the kidneys with pus: the organ may be entirely destroyed. Perinephritis is an inflammation of the cellular tissue and fat around the kidney. In pyæmia there may be many small abscesses in the kidney substance.

The symptoms of these various forms depend on the severity and site of the inflammation: there are the changes in the urine (the presence of pus, blood, and epithelium from the various parts), the local signs (pain, and possibly swelling), and the general signs of poisoning (fever, rigors, septic look, nausea, vomiting, etc.). An abscess in the kidney may burrow through to the surface; it may drain sufficiently through the normal channels and become chronic; or the patient may die of acute sepsis.

In the treatment of the milder forms it may be sufficient to remove the cause; the bladder may be cleansed by irrigation; or if a penetrating wound be the cause it may be enlarged and cleansed. If there be a perinephritis or a severe pyelonephritis, the abscess-cavity must be drained. The kidney is removed (nephrectomy) if destruction has gone too far.

Movable or Floating Kidneys.— By this phrase is meant a condition in which the kidneys leave their fatty bed and travel downward or otherwise through the abdomen. In the milder grades of this condition the kidney is displaced downward during inspiration, but in the more severe grades one or both are constantly low, even down to the pelvis. No symptoms whatever may arise from this condition; but on the other hand the dragging on the vessels and nerves may give rise to pain in the back and sides, minor disturbances of digestion, or nausea and vomiting. The nervous system is so deranged that it is common to have most confusing symptoms. Occasionally the ureter becomes twisted and dams back the urine, causing marked distention of the pelvis of that organ, a condition called hydronephrosis. When such an obstruction persists, the kidney structure is gradually thinned until its function is lost. It is customary to have the sufferer from a floating kidney wear a support around the abdomen; at times the operation of fixation of the kidney in its normal place may be advisable.

D. D. Roberts, M.D.
Brooklyn, N. Y.

Kieffer, kēf'ėr, **Henry Martyn,** American German Reformed clergyman and author: b. Mifflinburg, Pa., 5 Oct. 1845. He was graduated from Franklin and Marshall College, Lancaster, Pa., 1870, and from the Theological Seminary there in 1873. Enlisting at 16 as a drummer in a Pennsylvania regiment he served three years, his experiences in that capacity appearing in his popular 'Recollections of a Drummer Boy' (1883). He was pastor of a German Reformed Church at Norristown, Pa., 1873–84 and has held a similar pastorate at Easton, Pa., from the date last named. His 'College Chapel Sermons' was issued in 1891.

Kieft, kēft, **Willem,** Dutch administrator in America: b. Holland about 1600; d. off the Welsh coast 1647. He came as the fifth governor of New Netherlands, and arrived in the colony 28 March 1638. He was greedy, choleric, and tyrannous; began his administration by concentrating the executive power; and was soon involved in troubles with the Indians. In 1640 he despatched a force to murder the Raritan tribe. He was not wholly successful; the act was avenged, and when in 1643 he arranged for the destruction of the River tribe, which had sought the protection of the colony against the Mohawks, he deemed it wise to obtain sanction for the proceeding through the signatures of three citizens. A desolating war ensued, almost to the extinction of the colony. Public sentiment was strong against him, and he finally conceded the selection of a "Council of Twelve," who stood for the beginning of representative government in New Netherlands, but practically were figure-heads quite disregarded by the governor. The Puritans at the east and the Swedes at the west were making encroachments upon Dutch territory, and Kieft was finally recalled and succeeded by Peter Stuyvesant. On 16 Aug. 1647 he sailed for Holland with his enemy, Dominie Bogardus, who had denounced his tyranny, and whose services he had revengefully disturbed by having soldiers make noises under the meeting-house windows. The vessel was wrecked on the coast of Wales, and Kieft, Bogardus, and nearly all the rest on board were drowned. Kieft rebuilt Fort Amsterdam, improved the appearance of the settlement, and effected several administrative reforms.

Kiel, kēl, town of Prussia, in Holstein, situated on a deep bay of the Baltic, which presents all the appearance of a lake, and has finely wooded banks, 54 miles north by east from Hamburg, with which it is connected by railway. It was formerly the place of meeting for the Schleswig and Holstein states, and the seat of a superior appeal court for the duchies. It possesses a university, founded in 1665, with an attendance of about 900 students, a library of 200,000 volumes, museums for antiquities and ethnology, and a zoological institute. Kiel is admirably situated for trade, the whole bay on which it stands forming a safe roadstead, and the town being provided with spacious quays. Since the construction of the railway connecting it with Hamburg it has entered into formidable com-

petition with Lübeck, and as a fortified naval port of Germany, and the station of the greater part of the imperial fleet, is rapidly rising in importance. The Kaiser-Wilhelm Ship Canal from the mouth of the Elbe joins Kiel Bay at Holtenau, somewhat north of Kiel proper. Kiel has works for sugar, soap, machinery; woolen factories, iron foundries, tan-works, tobacco works, ship-building yards, etc. Pop. (1890), 69,172; (1900), 121,824.

K'ien-Lung, kē-ĕn-loong', emperor of China: b. 1710; d. Peking 7 Feb. 1799. He succeeded his father, Yung-Ching, in 1735. He favored the Christian religion in private, but in 1753 interdicted its exercise by a formal order; and the missionaries were, in consequence, obliged to proceed with great caution, although several of them were in the emperor's service, and treated with great respect as men of science and learning. On the suppression of the Jesuits in 1774 China was less visited by scientific persons than formerly, which induced K'ien-Lung to send to Canton and invite artists and learned men of all the European nations, and particularly astronomers. Resolving to immortalize the remembrance of his victories by the graver, he engaged French artists to copy some Chinese paintings in which they were represented; but Louis XV. had them engraved for him at his own expense. The larger Chinese collection on agriculture contains several poems of this monarch on rural occupations and incidents; and he established a library of 600,000 volumes, containing copies of all the most interesting works in China. In 1795 he abdicated in favor of his son.

Kieserite, kē'zėr-īt, a hydrated magnesium sulphate found at Stassfurt, Germany, and elsewhere, and employed as a source of epsom salts and in the manufacture of manures. Mixed with quicklime and water it hardens into a mass which, after heating, pulverizing, and again mixing with water, becomes of a marble-like consistency, and may be made into ornamental articles, etc.

Kiev, kē'ĕv, or **Kief,** a government of Russia; length, 210 miles; average breadth, about 170 miles; area, 19,691 square miles. The surface is in general flat or undulating. The Dnieper and its affluent the Pripet are the only navigable streams. There are no lakes of any extent. The climate is remarkably mild and dry. The rivers freeze in December, and are again open in February. In summer the heat is so great and the quantity of rain so small that the channels of many streams become dry. Large crops of all kinds of grain are raised, and much attention is paid, especially in the south, both to the rearing of cattle and the dairy. Sugar, tobacco, spirits, and beer are manufactured, and there is a large export of grain, cattle, honey, wax, and tobacco. Pop. (1897) 3,576,125.

Kilauea, kē-low-ā'ä, an active volcano in Hawaii. It has an oval crater, 9 miles in circumference, with a lake of red and boiling lava at the bottom over 1,000 feet below the crater's mouth. The volcano lies 10 miles from the sea, and 30 miles from Hilo, on the eastern slope of Mauna Loa, 4,000 feet above the sea. Kilauea crater forms a great cavity on the side of the mountain, 3 miles long, 2 miles wide and 800 feet deep. At the southwestern end is a small lake of boiling lava called Halemanman, or House of Everlasting Fire. Great eruptions occurred here in 1789, 1823, 1832, 1840, and 1868.

Kilbourne, kĭl'bėrn, **James,** American pioneer: b. New Britain, Conn., 19 Oct. 1770; d. Worthington, Ohio, 9 April 1850. He was successively employed as an apprentice, clerk, merchant, and manufacturer, and having secured a competence, presented himself as a candidate for orders in the Protestant Episcopal Church, and was ordained about 1800. In 1801–2 he organized the Scioto Company, under whose auspices a colony of about 100 persons, under the lead of Kilbourne, was in 1803 established in what is now the township of Worthington, Ohio. Having organized here the Episcopal parish of St. John's, as well as others in the neighborhood, and procured the establishment of a western diocese by the general convention of the Protestant Episcopal Church, he retired from the ministry in 1804, and was soon after appointed a civil magistrate, an officer of militia, frontier, and surveyor of a large portion of the public lands. In 1812 he was one of the commissioners to settle the boundary between the public lands and the great Virginia reservation, and also commissioned as a colonel in the frontier regiment; and in the succeeding year he entered Congress, of which he remained a member until 1817. He was the first to propose donations of lands to actual settlers in the northwest territory, and afterward served for some years in the Ohio legislature.

Kil'deer. See KILLDEE, or KILLDEER.

Kilham, kĭl'ăm, **Alexander,** founder of the Kilhamites or New Connection Methodists: b. Epworth, Lincolnshire, 10 July 1762; d. Nottingham 20 Dec. 1798. He professed conversion at 18, became a preacher in 1783 and two years later was enrolled by Wesley as a regular itinerant. He was strongly in favor of complete separation from the Established Church, a step to which Wesley had always been opposed. On the death of the latter this subject came under discussion. He at once urged separation and sought moreover for the distribution of administrative power between the ministry and the lay members. For several offensive passages in his 'Progress of Liberty' (1795) the pamphlet in which these views were expounded, he was tried at a conference held in 1796 and expelled from the denomination, upon which he immediately organized the "New Connection Methodists, or Kilhamites."

Kil'ian, or **Kuln, Saint,** the apostle of Franconia. He was of noble Scottish extraction and had entered a monastery in Ireland when hearing of the spiritual destitution of German Franconia, he asked and received from the pope a commission to preach the Gospel to the German idolators, and with Colman his priest, and Totnan his deacon was instrumental in converting great numbers at Würzburg, and among them Duke Gosbert. On being rebuked by Kilian for marrying Geilana, his brother's widow, Duke Gosbert promised to put her away, and hearing this, Geilana caused the three missionaries to be secretly assassinated (690) without her husband's knowledge. Kilian is honored as the first bishop of Würzburg, and his festival is 8 July.

Kilimanjaro, kĭl-ē-män-jä'rō (the Great Mountain), a double-peaked, snow-clad mountain of Africa, in German East Africa, about 100 miles inland from the port of Mombasa. The highest peak, estimated at 19,270 feet, is the highest known in the African continent.

Killarney, kĭ-lär'nĭ, market town in Ireland, in the county of Kerry, on the Great Southern and Western railway. In summer, Killarney is thronged with visitors to the lakes and the delightful scenery in the neighborhood. Fancy articles of wood, particularly of arbutus, which attains to great perfection in the environs, are made to a considerable extent, and are in great request by tourists. Pop. (1900) 5,500.

Killarney, Lakes of, three connected bodies of water, the lowermost of which is within 1½ miles of the town of Killarney, Ireland. These famous lakes are situated in a basin in the midst of the mountains of Kerry, some of which rise abruptly from the water's edge densely clothed with trees from base to summit. Between the lower and the middle lakes is the fine ruin of Muckross Abbey.

Kill'dee, or **Killdeer,** the most common and best-known species of American plover (*Ægialitis vocifera*). It is found throughout temperate North America, especially in the western United States, breeding northward to Newfoundland and in winter migrating to South and Central America. It is nine or ten inches long and the sexes are similarly colored — brown above with a chestnut tinge on the rump; around the neck is a white ring bounded in front by a complete, and behind by an incomplete black ring; the lower parts are white and there is a white stripe through the eye; the wing-quills and tail are variegated black and white. The killdee is distinctively a bird of the interior, spreading over the prairie lands and fields, and frequenting the seashore chiefly during the winter. During the summer it is usually found in pairs, breeding in corn and hay fields or along water courses. The four, clay-colored, spotted, pyriform eggs are deposited in a slight depression in the ground. Though always noisy birds, the cry or whistle, from which their name is derived, is heard in its perfection when the nest is approached, and the frightened hen endeavors by various devices to lead the intruder away. Like that of other plovers, the food is chiefly of an animal nature. In the late summer and early autumn the killdee is sought by gunners, but much less so than related migratory species of the same genus. Consult: Baird, Brewer and Ridgeway, 'Water-birds of North America'; and Elliot, 'North American Shore Birds.'

Killebrew, kĭl'ĭ-broo, **Joseph Buckner,** American railway official: b. Montgomery County, Tenn., 29 May 1831. He was graduated from the University of North Carolina, was Tennessee commissioner of agriculture and mining in 1871–81, acting superintendent of public instruction there in 1871–3, and in 1880 was appointed by Gen. F. A. Walker special expert for the 10th census on the culture of tobacco in the United States, his report (1881) being an acknowledged authority. In 1893 he became a railway official in the South. He was appointed editor-in-chief of the 'Rural Sun,' and published 'The Resources of Tennessee' (with J. M. Safford, 1874–5); 'Geology of Tennessee' (with Safford, 1876); 'Tobacco Leaf' (with H. Myrick, 1897); and other works.

Killer, a kind of whale, or large porpoise, also called orca or grampus, of the family *Delphinidæ,* and constituting the genus *Orcinus.* It reaches a length of about 25 feet. The head is rounded and the lower jaw is a little shorter than the upper. The dorsal fin is extraordinarily high in the adult males, like a broadsword, nearly vertical and about six feet in length from base to tip; in the female it is prominent but much lower. The pectoral fins are large, broad, and rounded, and the flukes, or tail-fin, also broad and thick. The color is peculiar, being black above and on the fins, and white below; the margins of the two colors sharply defined. The white of the belly extends forward to the end of the lower jaw, and upward on each side where it forms a large, oblong, white area. Above and somewhat behind the eye is a conspicuous oblong, white spot. In the young the white areas are tinged with yellow. The upper and lower jaws are armed with thick, powerful, somewhat curved teeth, numbering in all from 40 to 56.

The killer is the largest and most powerful representative of the dolphin family. It hunts in packs and is rapacious and exceedingly voracious. Unlike all other cetaceans it feeds upon warm-blooded aquatic animals, and chiefly on young seals, porpoises and whales. It attacks the larger whales without hesitation, biting them on the lips and throat, sometimes in order to force them to surrender their young, which are torn to pieces and devoured. In one instance the stomach of a killer was found to contain the bodies of thirteen porpoises and fourteen seals. The best known species (*Orcinus orca*) inhabits all seas. A second species is found in the South Pacific. Others have been described, but their validity is doubtful.

F. W. True,
Curator of Mammals, U. S. National Museum.

Killiecrankie, kĭl-ĭ-krăng'kĭ, a pass of Scotland, in the Grampians of northern Perthshire, on the Highland Railway, three miles southeast of Blair-Athole. A viaduct of ten arches carries the railway over the pass. Here Claverhouse, Viscount Dundee, defeated the forces of William III. under Mackay on 7 July 1689, but was killed in the moment of victory.

Kil'lifish, one of a group of small fishes of the family *Cyprinodontidæ.* They have broad, depressed, scaly heads, large cycloid scales, no lateral line, small very protractile mouths with several rows of pointed teeth, and a well-developed air-bladder which possesses somewhat of a pulmonary function. The common killifish, mud-fish, or mummichog (*Fundulus heteroclitus*) seldom exceeds three inches in length, and is exceedingly abundant in shallow waters along the shores of bays and estuaries, in brackish pools, and tidal rivers from Maine to Mexico. It is extremely hardy and is important economically as food for larger fishes. The sexes differ in color. The large killifish (*F. majalis*) reaches a length of six inches, and is found in shallow salt and brackish bays from Florida to Cape Cod. The males have transverse and the females longitudinal black bars. The species of *Fundulus* are oviparous, but some

genera of the family are viviparous and strongly dimorphic, sexually.

Killingly, kĭl'ĭng-lĭ, Conn., town, including several villages in Windham County, on the Quinebang and Five Mile rivers, 25 miles northeast of Norwich; on the New England railroad. It has the Danielson Public Library, Danielson High School, churches and town-hall, and manufactures of cotton and woolen goods, boots and shoes, etc. It was settled in 1693, and until 1708 was known as Aspinock. Pop. (1890) 7,027; (1900) 6,835.

Killington (kĭl'ĭng-tŏn) **Peak,** an elevation of the Green Mountains, in the State of Vermont; about 10 miles southeast of Rutland. It is 4,241 feet high, and the view from its summit is most beautiful; a large number of pretty villages and charming valley may be seen on a clear day.

Kiln Pottery. After centuries of gradual development kilns as used in the clay industries have become fixed, so far as may be, in three general types, up-draft, down-draft and muffle kilns. The last named stands alone as its distinctive feature lies not in the method of firing or the direction of the draft but in the fact that the kiln consists of a single laboratory closed to the direct entrance of flame and heated by radiation through the walls. This type of kiln is used in all cases where it is necessary that the contained wares should be protected from dust and smoke but where it is not convenient to enclose them in saggers. Large ware such as porcelain bath-tubs and sinks, heavy pieces of terra-cotta, etc., cannot be set in saggers as pottery is on account of weight and size. They are therefore burned in a muffle kiln being set directly upon the brick floor. Muffle kilns are also used for burning painted wares. These are smaller than the kilns for heavy goods and are burned to a much lower temperature. Such kilns can be set, burned, cooled and drawn in 24 hours, while the large muffles cannot be turned in less than 10 days.

General kilns for pottery burning are of the open type. The wares are enclosed in saggers which are set over one another in tiers (bungs). Saggers are cases made of refractory clay and suited as to size to the wares they are to contain. The flames and kiln gases pass freely round the saggers and the whole chamber is uniformly heated.

The usual form of kiln is cylindrical with a slightly domed crown. Outside this is the "hovel" or conical top familiar to the inhabitants of pottery towns. The hovel serves the purpose of a chimney and collects the smoke from a number of apertures in the kiln crown. The fire mouths range in number from six to ten according to the size of the kiln. In the up-draft kiln the gases simply pass up between the bungs of saggers and find a free vent at the top. In the down-draft type the top of the crown is closed and the gases after passing up the walls and under the crown are led down a centre stack and up again through flues arranged for the purpose. The structure of the down-draft kiln is more complicated than the up-draft, but a considerable economy of fuel is effected. The kiln also cools more rapidly.

Kilns for burning brick follow the same general lines but vary in form. For this purpose the square kiln is among the most popular, being usually operated on the down-draft principle.

Many plans have been devised for the perfect utilization of heat, but none that is entirely satisfactory One of the best is that of the continuous kiln. This has been applied in Germany to the burning of porcelain, but nothing better than brick has been entrusted to it in America. The continuous kiln is a long low tunnel built in the form of a parallelogram with rounded ends. This is divided into as many chambers as may be necessary, each chamber having an entrance at each side and two fire mouths. Paper partitions are used in order to secure the correct movement of the draft, and as each successive chamber is filled with ware and the proper dampers opened the heat from the burning chambers is drawn through the unburned brick bringing them up to a high temperature without any additional fuel. Meanwhile the chambers in which the firing has been completed are beginning to cool and so the work goes on continuously. The economy of the method is very great, but a considerable output is necessary in order to avoid stoppage. Kilns are, for the most part, burned with coal, both hard and soft coals being used. Those in the gas belt are successfully burned with natural gas and in some places oil is used. The temperatures at which different wares are burned are about as follows:

Roofing tile and paving brick	1030°–1070°C
Common brick and drain tile	1090°–1170°C
Faience art pottery — glaze	1150°C
Faience art pottery — body	1230°C
Sewer-pipe and stoneware	1250°–1290°C
Earthenware dishes	1290°–1310°C
Hotel china	1330°C
Bone china	1330°C
Hard porcelain	1390°–1410°C

Kil'o. See METRIC SYSTEM.

Kil'ogramme, or **Kilogram,** a French measure of weight = 1,000 grammes. See METRIC SYSTEM.

Kil'oliter, kĭl'ō-lē-tėr, or **Kilolitre,** a French measure of capacity for fluids, 1,000 liters. See METRIC SYSTEM.

Kil'owatt. See UNITS; WATT.

Kilpat'rick, Hugh Judson, American soldier: b. Deckertown, N. J., 14 Jan. 1836; d. Valparaiso, Chile, 4 Dec. 1881. He was graduated at West Point in 1861, and in the autumn of that year became a lieutenant-colonel of cavalry. He was appointed a brigadier-general of volunteers in May 1863, and in the following March was active in a raid to Richmond for the release of Federal prisoners. He commanded the cavalry of Sherman's army in its march from Atlanta to Savannah, in 1864, and in June 1865 was promoted major-general of volunteers. After the War he was prominent as a lecturer and a Republican political speaker. He was minister to Chile from 1865 to 1870, and was reappointed in 1881. In 1887 his remains were removed from Chile and interred at West Point. Consult: Moore, 'Kilpatrick and our Cavalry' (1865).

Kim'ball, Hannah Parker, American poet: b. Boston, Mass., 25 April 1861. She has published: 'Soul and Sense' (1890); 'Victory and Other Verses' (1897).

Kimball, Harriet McEwen, American religious poet: b. Portsmouth, N. H. November 1834. Although she has written much verse of a secular nature, it is as a religious poet that she is best known, and several of her lyrics have found an honored place in hymnals. She was the principal founder of the cottage hospital in her native city. Her published works include: 'Hymns'; 'Swallow Flights'; 'The Blessed Company of All Faithful People'; 'Complete Poems' (1889).

Kimball, Heber Chase, American Mormon leader: b. Sheldon, Franklin County, Vt., 14 June 1801; d. Salt Lake City, Utah, 22 June 1868. In 1832 he was baptized into the Church of Latter-Day Saints, in the same year was ordained an elder of the church by Joseph Smith, and in 1835 became one of the 12 Mormon apostles. In 1838 with Brigham Young he led the Mormons from Missouri into Illinois, where they finally settled at Nauvoo, and in 1847 was a pioneer in the exodus to the valley of Great Salt Lake. He was successively chief priest of the order of Melchizidek (1846), a councillor to Young (1847), and chief justice and lieutenant-governor of Deseret.

Kimball, Richard Burleigh, American author: b. Plainfield, N. H., 11 Oct. 1816; d. New York 28 Dec. 1892. He was graduated at Dartmouth College in 1834 and later admitted to the bar; practised his profession at first in Waterford, N. Y., and afterward in New York. He founded the town of Kimball, Texas, and constructed the first railroad in that State, extending from Galveston to and beyond Houston. His publications include: 'Letters from England' (1842); 'Cuba and the Cubans' (1850); 'Saint Leger' (1850); 'Romance of Student Life Abroad' (1853); 'Under-Currents of Wall Street' (1862); 'Henry Powers, Banker' (1868); 'Today in New York' (1870); 'Stories of Exceptional Life' (1887).

Kimball, Sumner Increase, organizer and superintendent of the United States Life Saving Service: b. Lebanon, York County, Maine, 2 Sept. 1834. He was graduated from Bowdoin in 1855; studied law, and was admitted to the bar in 1858. In 1859 he served in the State legislature, and was a member of the committee on judiciary. In 1862 he became a clerk in the second auditor's office in the Treasury Department at Washington, and in 1871 was made chief of the revenue marine service. In that position he had occasion to investigate the condition of the government stations on the New Jersey and Long Island coast where surf boats and other apparatus were stored under the charge of a keeper for use in case of shipwreck; he found the property badly cared for, and the service inefficient. Obtaining an appropriation from Congress he entirely reorganized the service, and so successfully that it was soon extended to Cape Cod and other points on the Atlantic coast. In 1878 the life saving service was organized as a separate bureau and was extended to the Pacific coast and the Great Lakes. He was made the head of the bureau and has introduced many improved methods, including the patrol system, and telephonic connection between adjacent stations; he also obtained the passage of the law, to the effect that inspectors, keepers and crews in the service should be appointed on a strictly non-partisan basis "with reference solely to their fitness." He has also been acting register, acting comptroller, and acting solicitor of the Treasury; and in 1889 he was the United States delegate to the International Marine Conference. He has written 'Organization and Methods of the United States Life Saving Service' (1889), the most complete monograph on the subject.

Kimberley, kĭm'bẽr-lĭ, **Lewis Ashfield,** American rear-admiral: b. Troy, N. Y., 2 April 1830. He was appointed to the navy in 1846 and was graduated from the Naval Academy in 1852. In the Civil War as executive officer of the Hartford, Farragut's flagship, he took part in the contests at Port Hudson, Grand Gulf, Warrington, and Mobile Bay; and in 1871 accompanied the United States expedition to Korea. In 1882–3 he commanded the navy-yard at New York, in 1884–5 was a member of the examining and retiring board, in 1885–6 was in command of the Boston navy-yard, in 1887 was promoted to rear-admiral, and in 1892 was retired.

Kimberley, Australia, a northern district of Western Australia, brought into notice by the discovery of gold fields in 1886. It contains immense tracts of splendid pasture and much land suitable for cultivation. The chief port for the district is Derby, on the Fitzroy River, near King Sound. The district, which has an area of 144,000 square miles, is divided into East and West Kimberley. It is separated from the more populous parts of the colony by a stretch of sandy desert.

Kimberley, South Africa, town of Cape Colony, the capital of Griqualand West and of the South African diamond fields, is situated at a distance of 647 miles by rail from Cape Town, and close to the western boundary of the Orange River Colony. Kimberley owes its existence and prosperity to the mining of diamonds, an industry that began in 1870. It stands on an open plain, has wide straight streets, good public and other buildings, and receives a supply of water from the Vaal, 17 miles distant. Some of the most important buildings are the High Court of Griqualand West; the public library; the Kimberley Club, rebuilt in 1895 after destruction by fire; the Masonic Temple; a municipal sanatorium; theatres; several churches and a synagogue, etc. The most important diamond mines are those called Kimberley, De Beers, Bultfontein, Du Toit's Pan, and Wesselton. During the South African war Kimberley was invested by the Boers for 123 days, from 15 Oct. 1899, till its relief by General French on 15 Feb. 1900. Diamonds to the value of over £60,000,000 have been obtained here. Pop. 28,718.

Kimchi, kĭm'kē, **David,** or **Rdak** (Rabbi David Kimchi), Hebrew philologist: b. Narbonne 1160; d. 1240. He was the most learned member of a learned family, and maintains to-day his reputation as grammarian, lexicographer, and exegete. Besides his commentary on Genesis, Chronicles, the Prophets, and the Psalms, he wrote a grammar, 'Michlol' (Venice 1545); a Hebrew dictionary, 'Sefer Haschoraschin,' which was practically a list of roots (Naples 1490). He also wrote a tract under the title 'El Sofer,' which treated of the Massora and the Hebrew Accents and was published for the first time in 1864.

Kinah, ki'nä, **The,** a Hebrew metrical form, usually employed in dirges and songs of mourning, such as the Lamentations of Jeremiah. Each verse member is divided by a cæsura into two unequal parts, of which the first is the longer. The shorter clause simply enforces the thought expressed in the longer; as in the following example:

"He was unto me as a bear lying in wait || a lion in secret places."

"And thou hast removed my soul far off from peace || I forgot prosperity."

The kinah, with its long drawn out clause, and its short abrupt closing phrase, is still employed in Oriental countries. It has the effect of a cry, followed by a sob. It seems to halt like the metre which in classic times was called the halting iambus, and it might fittingly be styled the Semitic choliambus.

Kindergarten in America. The kindergarten is a form of education for children too young to enter the regular schools. The principles and methods of the kindergarten were worked out by Friedrich Froebel (q.v.). Its ideal is to develop the child's mental and moral powers through a wise direction of the child's natural self-activity or "play." Mental development is attained through a connected series of simple objects, called "gifts," from which the children learn the facts of form, color, size, weight, measure, and general relationship; and through a series of simple occupations in plaiting, weaving, modeling, etc., in which the knowledge gained is used and the powers of observation and attention developed. Games, music and story-telling are also important parts of the work; and much emphasis is laid on the development of the social instincts and sympathies of the children.

The history of the kindergarten in America is the record of four sharply defined movements; the pioneer movement, whose point of departure was the city of Boston; the philanthropic movement, whose initial effort was made in the village of Florence, Mass., and whose greatest triumphs have been achieved in San Francisco; the national movement, which emanated from St. Louis; and the maternal movement which, radiating from Chicago, is now spreading throughout the United States. The first of these movements called public attention to the several most important aspects of the Froebelian ideal; the second demonstrated the efficiency of the new education as a redemptive force; the third is making the kindergarten an integral part of the national school system; the fourth is evolving a more enlightened and consecrated motherhood and thereby strengthening the foundations and elevating the ideals of American family life.

Pioneer Movement.— In 1840 the first kindergarten was established by Friedrich Froebel at Blankenburg, Germany. Nineteen years later Miss Elizabeth Peabody of Boston became interested in Froebel's writings. In 1867 she went to Germany to study the kindergarten system. Returning to America in 1868 she devoted the remainder of her life to the propagation of Froebel's educational principles. Through her labors parents were inspired to seek the help of the kindergarten in the education of their children; philanthropists were incited to establish charity kindergartens; the Boston school board was persuaded to open an experimental kindergarten in one of its public schools and a periodical devoted to the elucidation and dissemination of Froebelian ideals was founded and sustained for four years. The pioneer movement, therefore, broke paths in the four directions of private, public, philanthropic and literary work. Above all through the contagious power of devout enthusiasm it created the consecrated endeavor without which the kindergarten as Froebel conceived it can have no actual embodiment.

In 1872 an independent pioneer movement was begun in New York by Miss Henrietta Haines who invited Miss Boelte to conduct a kindergarten in her school for young ladies. Miss Boelte had studied three years with Froebel's widow, had won a high reputation in Germany, and later had done efficient work in England. About a year after her arrival in America she married Prof. John Kraus and established an independent kindergarten and normal class. Her normal work still continues and she is to-day the leading representative in America of the Froebel tradition. The power of her work results from her resolute adherence to all the details of the original Froebelian method. By this unswerving conformity she has kept alive, through their practical application, ideas which are of the highest importance to the theoretic development of the kindergarten system.

Philanthropic Movement.— In 1874 Mr. S. H. Hill, of Florence, Mass., contributed funds to open the first charity kindergarten in the United States and later put in trust a sum sufficient to sustain and extend the work. Four years later a philanthropic movement was initiated in Boston by Mrs. Quincy A. Shaw, who for the ensuing 14 years supported free kindergartens for poor children, these beneficent institutions reaching at one time to 30 in number. The influence of her example has doubtless conspired with other causes to create the numerous local associations which are now rendering efficient service to the Froebelian cause in different sections of the United States. Of such philanthropic associations the wealthiest and best organized is the Golden Gate association of San Francisco. At the time of its greatest prosperity this organization supported 41 kindergartens, had given training to more than 30,000 children, and had received contributions amounting to $500,000; unfortunately the financial depression of 1893 reduced its subscription list, and the number of its kindergartens dwindled to 23; it conducts a training school for kindergartners. Other associations deserving special mention are the New York Kindergarten association, whose aim is to provide for the children against whom the overcrowded public schools still close their doors; the Brooklyn association, under whose auspices many mothers' meetings are conducted; the Pittsburg and Allegheny association; the Cincinnati association; the Free Kindergarten association of Chicago, which has a flourishing normal school; the Chicago Froebel association, which organized the first charity kindergarten in that city; the Louisville association, which has parents, nurses, Sunday school, boarding and normal departments. Kindergarten work has also been taken up by many churches, kindergarten methods being introduced in the Sunday school, and day kindergartens established under church

management; All Souls' church of New York city was the first to open a day kindergarten. The total number of private kindergartens in the United States in 1901 was 2,996, with 93,737 children enrolled.

National Movement.— Valuable as is the work accomplished by private kindergartens and kindergarten associations, it is necessarily a restricted work; and had the Froebelian movement developed only upon these lines the kindergarten must have remained forever the privilege of the wealthy few, and the occasional gift of charity to the abject poor. The public kindergarten opened in Boston, though carried on for several years, was finally given up upon the plea that the city could not afford to appropriate funds to extend the system, and a second public kindergarten, which was opened in Brighton, Mass., in January 1873, was abolished when Brighton was annexed to Boston in 1874. Meantime, however, Hon. William T. Harris, who was then superintendent of schools in St. Louis, had called attention to the kindergarten and suggested that experiments be made with a view to introducing into the public school such features of the system as might prove helpful in the education of children between the ages of four and six. The outcome of this suggestion was the opening of an experimental kindergarten in the fall of 1873. The work was approved by the school board; new kindergartens were opened as rapidly as competent directors could be prepared to take charge of them, and when Dr. Harris resigned his position as superintendent in 1880 the St. Louis kindergartens had an enrolment of 7,828 children and the system was so firmly established that it has since that time proved itself impregnable to all attack.

The experiment in St. Louis was a crucial one, and had it failed it would have been difficult to prevail upon other cities to introduce the kindergarten into their public schools. There were many ready arguments against such an innovation: the argument from expense; the argument based on the age of kindergarten children; the argument that kindergartens would spoil the children and fill the primary grade with intractable pupils; the argument that only rarely endowed and, therefore, rarely to be found persons could successfully conduct a kindergarten. These arguments would have acquired irresistible force when confirmed by an abortive experiment. Dr. Harris steered the kindergarten cause through stormy waters to a safe harbor. He proved that the kindergarten could be made an integral part of the public school system. He reduced the annual expense to less than five dollars for each child. He called attention to the fact that the years between four and six were critical ones and that the needs of the child at this period were not provided for either by the family or the school. He convinced himself that children who had attended kindergartens conducted by competent directors did better on entering school than those who had received no such training, and the weight of his authoritative statement gave other educators faith in the possibilities of the system. Finally, he proved that with wise training young women of average ability made satisfactory kindergartners. It was impossible to go on repeating that a thing could not be done in the face of the fact that it had been done, and with the success of the experiment in St. Louis recognition of the kindergarten as the first stage of all public education became simply a matter of time.

In a report entitled 'Early History of the Kindergarten in St. Louis' Dr. Harris reduced his argument in favor of the kindergarten to a brief statement which no one could dispute and whose force everyone could appreciate; and immediately upon the publication of his report the movement in favor of public kindergartens showed an increased momentum. In the years which have elapsed since the successful experiment in St. Louis the kindergarten has been made part of the public school system in 293 cities; the total number of public kindergartens has increased to 2,111 with 3,611 teachers and 149,710 pupils. The cities which have the most fully developed systems of public kindergartens are Boston, Chicago, St. Louis, Philadelphia, New York, Brooklyn, Newark, Milwaukee, and Los Angeles. Philadelphia, which reports 142 kindergartens, leads in number all the cities of the United States. New York follows with 135 kindergartens, St. Louis with 125, Chicago with 89 and Boston with 78. An estimate, based on the sale of kindergarten material, fixes the total number of kindergartens in New York at over 600, so that, including private work and association work, this city has presumably a more extensive provision of kindergartens than any other in the United States.

The following 10 States have the most extensive provision of kindergartens, public and private. The order of the names indicates the relative extent of the provision:

1. New York	6. New Jersey
2. Pennsylvania	7. California
3. Massachusetts	8. Ohio
4. Illinois	9. Wisconsin
5. Michigan	10. Missouri

In the year 1873 the National bureau of education began collecting statistics with regard to the total number of kindergartens in the United States. The results are necessarily imperfect, but they enable us to form an approximate idea of the growth of the system. Taking public and private work together, the advance of the kindergarten is shown in the following table:

	1873	1882	1892	1902
Kindergartens	42	348	1,311	5,107
Teachers	73	814	2,535	9,926
Pupils	1,252	16,916	65,296	243,447

Results of Kindergarten Instruction.—Since the aim of the kindergarten is not instruction, but development, its results cannot be tested by examinations or expressed in statistical tables, but must be gathered from the testimony of experts who have had time and opportunity to study its influence. In other words, kindergarten children must be judged by elementary teachers and principals of schools, and unless, upon entering the primary grade, they show superiority to children coming direct from the home, the kindergarten cannot be said to have justified its adoption into our national system of education. Conversely, if the mental and moral superiority of kindergarten children prove to have converted primary teachers and school principals from enemies into warm friends of the Froebelian method, this fact should be accepted as convincing evidence of the merit of the work.

Before presenting the testimony which has been collected, it is necessary to call attention to the fact that, in the kindergarten talking is not forbidden, but, on the contrary, children are encouraged to share with the kindergartner and with each other all their happy experience of effort and success. It is, therefore, natural that pupils promoted from the kindergarten should not at first understand the law of silence imposed by the character of the work in the elementary grades, and hence that, without any bad motive on their own part, they should prove troublesome pupils during the first weeks of school life. The failure to understand this fact has caused some unjust criticism of kindergarten children. It will, however, be apparent to all who read carefully the testimony submitted that the adjustment of the kindergarten child to the school environment is a problem which is at present rapidly progressing toward a happy solution.

The more complete the testimony offered, the more certainly should we expect to find some differences of opinion as to the characteristics of kindergarten children. In any large city there will probably be a few incompetent kindergartners and some unintelligent or reactionary primary teachers. That the kindergarten fails to commend itself to teachers who are themselves mere martinets should be accounted a merit rather than a defect. The condemnation of incompetent kindergartners by wise primary teachers is a cause of rejoicing to all true friends of the Froebelian method. The influence of the kindergarten should be determined by the majority report. Variations of opinion should be explained by the occasional defect of the kindergartens and the occasional incapacity or prejudice of the judge.

The most extensive and carefully collected information comes from Boston, and consists of 163 letters from teachers of the first grade in reply to a number of questions sent out by the superintendent of schools.

Of the 163 letters those reporting that less than 10 per cent of the children attending the given primary room had received kindergarten training have been eliminated; also several letters based upon experience with children who had been only a few weeks or months in the kindergarten. The total number of letters omitted was 36. Of the remaining 127 letters 102 are favorable and 25 unfavorable to the kindergarten. Among the letters which are classed as unfavorable one only is unqualified in its disapprobation. All the others admit some distinctive merits in kindergarten children, those most frequently specified being increased power of observation and linguistic expression, greater manual skill, and more general information. The most frequent criticisms are that kindergarten children are talkative and not easily amenable to school discipline. Contrasting the 102 favorable with the 25 unfavorable letters, the first fact which thrusts itself upon the notice of the reader is that the majority of their writers seem to have had little difficulty in solving the problem of discipline. A large proportion of these letters make no direct reference to this question, while the account given of the moral characteristics of kindergarten children precludes the thought that they have been found difficult to control.

Replying to the questions with regard to the relative progress of kindergarten children and the character of their work 38 teachers report both a progress quicker in point of time and improvement in the quality of work; 13 teachers report increased rapidity without change in the character of work, and 28 improvement in the character of work without increased rapidity of progress. Thus 51 report greater rapidity, 66 improvement in quality of work, and 79 a decided gain either in speed or quality or in both. The remaining 23 teachers seem to consider that kindergarten training increases the child's general intelligence but does not noticeably affect the ordinary routine of school work.

To the disciple of Froebel the most interesting paragraphs of the Boston letters are those which answer the question, "What, if anything, have you observed as to the characteristics of kindergarten children as compared with other children?" The specific gains mentioned are clearer ideas of number, form and color; greater knowledge of and interest in nature, improved singing, better expression in reading, improved articulation, more orderly and careful arrangement of material in busy work, and greater manual skill shown especially in writing and drawing. The intellectual characteristics of kindergarten children as compared with others are said to be a greater general activity of mind, quicker comprehension, a more receptive mental attitude, greater logical power, greater concentration, more imagination, greatly increased powers of observation and expression, quicker recognition of likenesses, differences and relations, greater love for the beautiful, and visibly increased originality and creative power. Of their moral characteristics it is said that as compared with others kindergarten children are neater, cleaner, more orderly, more industrious and more persevering. They are also more self-reliant, more painstaking and more self-helpful. They are less self-conscious and more polite. They obey more quickly and are more gentle toward each other. They have a more developed spirit of helpfulness. They are more eager, alert, enthusiastic and responsive. They are interested in a wider range of subjects. They have finer sensibilities, manifest love for and confidence in their teachers, and show special interest in everything pertaining to home and family life.

In regard to the St. Louis kindergartens 13 letters, written by teachers of the first grade, reported the progress of kindergarten children in each of the several districts of the city. Two of the letters were eliminated in condensing the reports, because, while kindly in feeling, they were not precise in statement. Of the remaining 11 letters 9 reported that kindergarten children were proficient in arithmetic, and affirmed the conviction that the training of the kindergarten facilitated progress in learning to write, and was of marked value in learning to read. The other two recognized no difference in these respects between kindergarten children and children who came to school direct from the home. The unanimous verdict was that kindergarten children were superior to others in drawing. All the letters concurred likewise in the statement that kindergarten culture developed the æsthetic sense. The intellectual characteristics specified were accurate observations; correct expression; power to make numerical combina-

tions; familiarity with geometric forms; quick recognition of magnitude and relation; a generally increased perceptive power, and signal ability in illustrating poems and stories. With regard to manners and morals 9 teachers recognized the good influence of the kindergarten. Of the remaining two one found "few causes for complaint," and the other referred merely to a possible good effect upon order and punctuality. The moral characteristics which were said to distinguish kindergarten children were order, cleanliness, courtesy, consideration, kindness, a perceptible development of the ideal of social dependence and "a love for the beautiful in character."

Dr. E. Benj. Andrews, when superintendent of schools in Chicago, wrote: "Our best first grade pupils are from the kindergarten, and the influence of kindergarten teaching is more and more felt in all the grades. Its ethical and social value is equal to its intellectual value"; and principals of schools in that city gave equally favorable testimony. Since the kindergarten system has been more highly developed in Boston, Chicago and St. Louis than in other places, testimony from these cities is of the highest importance; similar results are however, showing themselves in many smaller cities and towns.

Dangers of Kindergarten Education.—In view of the attacks so freely and insistently made upon what is called the "sentimentalism" of the kindergarten, it may be well to call attention to the fact that none of the expert witnesses whose testimony has been quoted seem to have detected its existence. Undoubtedly among kindergartners there are some sentimentalists; but that sentimentalism is inherent in the Froebelian ideal or tolerated in the best training schools for kindergartners may be unhesitatingly denied. There is greater danger of its appearance in private than in public work, because any person calling herself a kindergartner may be accepted as such by ignorant or thoughtless parents. In public kindergartens under competent supervision its persistence is impossible.

It is greatly to be desired that all cities establishing kindergartens in connection with their public schools, should insist upon having a specially qualified supervisor. Without watchful and intelligent guidance the kindergarten tends either to relapse into a mere play school or to become too closely conformed to the primary school. The ideal supervisor stands to the individual kindergartner in a relation similar to that which the latter occupies toward her children. She quickens their intellectual and moral aspiration, deepens in them the complementary impulses of self-culture and child-nurture, points out practical errors and suggests the ways and means of overcoming them. She must thoroughly understand the method of the kindergarten, its psychologic implications and its relationship to education as a whole. She must unite intellectual insight with moral earnestness and practical sagacity. Hence only the most gifted and illuminated kindergartners are adequate to the work of supervision.

Two great dangers assail the kindergarten and threaten to impede its progress toward the realization of Froebel's ideal. The first of these dangers is reversion to instinctive games and traditional toys. In some kindergartens, children are taught to play street games, while it has recently been urged that peg boards, tops, bean bags, kites, dolls, jackstraws, hoops, spool, chalk and wire games and the whole toy world" should be added to the Froebelian instrumentalities. Tendencies such as these indicate a complete failure to comprehend what Froebel has done. He recognized in traditional games the deposit of unconscious reason; preserved what was good and omitted what was crude and coarse in these products of instinct; supplied missing links and presented a series of games wherein each is related to all the others and which, by means of dramatic and graphic representation, poetry and music, win for the ideals they embody a controlling power over the imagination. In like manner, from among traditional toys he selected those which possessed most educative value, ordered them into a related series and suggested a method by which they might be consciously used to interpret the child's experiences and develop his creative power. If this transfiguration of traditional games and toys is valueless, then the kindergarten has no *raison d'être*. But if Froebel has translated the hieroglyphic of instinctive play and found means which, without detriment to the child's spontaneity, influence the growth of character and the trend of thought, then the clamor for street games and promiscuous toys is educational atavism.

The second danger which threatens the integrity of the kindergarten is the substitution of exercises which attempt to wind thought around some arbitrarily chosen centre for those Froebelian exercises whose confessed aim is to assist thought to unwind itself. Too many kindergartners have allowed themselves to be betrayed into selecting some object such as a pine tree or a potato, and making all songs, games, stories and gift exercises revolve around it. Between these so-called cores of interest and the exercises clustered around them there is no valid connection. The clustering like the subject depends wholly upon the caprice of the teacher. Could such exercises succeed in their object the pupils of different teachers would have their thoughts set to revolving around different centres and more than this around arbitrary and contingent centres. That such a procedure directly contradicts Froebel's ideal will be apparent to all who have understood his writings. That it likewise contradicts every true ideal of education will be evident to all who understand that the function of education is to substitute objective and universal for subjective and contingent associations. The discovery of related qualities in nature, the disclosure of their causes and the reduction of these causes to a system is the great work of science. The discovery of the related activities of mind and their genetic evolution is the work of psychology. The portrayal of the universal and divine man latent in each individual is the supreme achievement of literature and art. To lead pupils away from what is capricious, arbitrary and accidental, and thus capacitate them to receive and augment their scientific, æsthetic, literary and psychologic inheritance is the great duty of education. The substitution of arbitrary for necessary cores of thought wherever attempted is, therefore, the parody of education.

Normal Schools.— The future of the kindergarten in the United States is largely dependent upon the work of the normal schools for kindergartners. The friends of the system must, therefore, view with disapprobation and even with dismay the rapid multiplication of schools with low standards of admission and a low conception of the training they should give. Inexperienced students are attracted to such schools, and the result is that the whole country is flooded with so-called kindergartners who are ignorant of the first principles of true education.

In the early days of the Froebelian movement it was believed that in a single year young girls could be prepared to conduct a kindergarten. In most reputable training schools the course has now been extended to cover two years. The requirements for admission into these schools are, generally, graduation from a high school, or an education equivalent thereto. The courses of study include theory of the kindergarten gifts and occupations, study of the Mother Play, practice in songs and games, physical culture, lessons in singing, drawing, modeling and color, lectures on the art of story telling, and more or less observation of the practical work of the kindergarten. Finally, some trainers insist that their normal pupils shall not only observe but assist in actual work with the children. In addition to this specific training, the best normal schools offer courses in science, literature, psychology, and the history of education.

Besides private normal schools and training schools connected with kindergarten associations, kindergarten departments have been established in several great *quasi*-public institutions. Among the most notable of these are the kindergarten department of Pratt institute, Brooklyn, and of Teachers college, Columbia university, and of Workingman's institute, New York. A number of the public normal schools in the United States provide some kind of kindergarten training, the courses varying in length from about two years to six months. These kindergarten departments are found in the normal schools of the following States: New York, Michigan, Pennsylvania, California, Massachusetts, New Jersey, Connecticut, Wisconsin, Illinois, Colorado, Kansas, Rhode Island, Georgia, Nebraska, Ohio, Minnesota.

Kindergartners are admitted to surpass all other teachers as students of educational literature. They are also distinguishing themselves by zealous and persistent attendance upon post-graduate courses in pedagogics, science, literature, history and psychology. Through the efforts of the Chicago kindergarten college post-graduate work of a high order has become a feature of Froebelian activity in that city; in Boston, during successive winters post-graduate classes have been organized in the study of Mother Play, and the pedagogics of the kindergarten; and courses in literature and psychology have also been given. Similar work has been developed in New York, Baltimore, Washington, and other cities.

Maternal Movement.— The power of the kindergarten over the minds of its students arises from the fact that it connects the ideal of self-culture with the ideal of child-nurture. And the true woman responds with whole heart to the appeal to learn all she can, be all she can, and devote all she is and all she knows to the service of childhood. Rooted in maternal impulses it would be strange indeed if the kindergarten did not appeal to mothers. That classes for mothers should come into existence was a predestined phase of the Froebelian movement. Whoever has studied the writings of Froebel knows that the education of mothers was one of the most important features of his endeavor. Practically, however, the work in this direction amounted to very little until a mothers' department was established in that unique institution, the Chicago kindergarten college. This institution has consciously attempted the transformation of a girls' college into a school for motherhood; while giving general culture its supreme aim is to fit women for motherhood, and it gives instruction to mothers as well as to young girls; in a single year over 700 women attended its mothers' department; recently the work of this department has been extended by holding convocations for the discussion of all phases of child-nurture. Radiating from the kindergarten college as its centre the maternal movement is spreading throughout the United States. It is the highest reach of the Froebelian ideal and means nothing less than the attempted regeneration of all human life through the regeneration of the family. In connection with this movement mothers' clubs have been formed, whose work is usually done on three main lines: (1) kindergarten classes for the children; (2) training and study classes for mothers; (3) lecture courses in literature, science, music, etc.

Froebel's supreme claim to our grateful remembrance rests upon the fact that consciously repeating the unconscious process of social evolution he set the little child in front of the great army of advancing humanity. Science affirms that the feebleness of infancy created the family and that from the family have been evolved the higher institutions. In his cry, "Come, let us live for the children," Froebel utters in articulate speech the ideal whose unconscious impulsion set in motion the drama of human history. The little child was pioneer of the process which created human institutions. We must make him the pioneer of their perfection.

SUSAN E. BLOW.

Kinemat'ics, a branch of mathematics which treats of the motions of bodies independently of the forces which produce these motions; it is usually treated of in the introductory parts

of works on kinetics (popularly termed dynamics).

Kinet'ic Theory of Gases. On any kinetic theory the molecules of a gas are conceived to be in motion in paths long compared with their own size, the average length of path being called the "mean free path." See MATTER.

Kinetogenesis. The mechanics of evolution (q.v.). This is a term suggested by E. D. Cope, meaning development by motion, or the exercise of parts or organs, and is nearly the equivalent of use (q.v.). The examples given by Cope are the development by use of muscles of any hard parts or bone. He claims that muscular tissue is highly plastic, and since it is directly controlled by nervous or equivalent stimuli, "the effect of the latter in building structure is evident." Another example, overlooked by late students, is the beautiful study on the mechanical genesis of bone structure published by Wyman in 1857. This anatomist shows that the cancellated structure of the bone (see BONE) in the lumbar vertebræ, the thigh-bone, tibia, astragalus, and os calcis of man is peculiar to him, and has "a definite relation to the erect position which is naturally assumed by man alone."

The fibres or cancelli of such bones as assist in supporting the weight "are arranged either in the direction of that weight, or in such a manner as to support and brace those cancelli which are in that direction. In a mechanical point of view they may be regarded in nearly all these bones as a series of studs and braces." Wyman dealing with the individual bones shows in what direction force or weight is applied to them, and the corresponding direction the cancelli assume. On the lumbar vertebræ there is vertical pressure, and the principal bone fibres within are also vertical. On the neck of the thigh bone the weight of the body is applied obliquely to the end of an arm, "within it there is a combination of fibres giving strength with lightness, which forms a frame mechanically adapted for resisting the weight which rests upon it," and so with the astragalus. "A certain direction of fibres in all these instances co-exists with a certain direction, or certain directions, of the transmission of pressure. From this constant association of structures and function the inference seems unavoidable, that they are means and ends."

Comparing the bones in question with those of the gorilla and chimpanzee, only "slight traces of the trusswork described in man exist." As they practically exist in man alone, Wyman maintains that "they relate to the kind of locomotion which he alone of the whole animal series can be said to possess, namely, that of walking erect, and which requires in the passive and resisting organs subservient to it, in order that it may be effected with ease and grace, a nice combination of lightness with strength in the materials. His attitude more than any other, in consequence of the pillars of support being arranged in vertical planes, requires the most effectual means for counteracting shocks."

Cope's contributions to this subject in the way of materials drawn from fossil vertebrates are extensive and weighty. He, and also Ryder, have discussed the molding of the limb-joints as the result of mechanical strains; also the origin of the teeth, through mechanical strains and impacts. Thus the origin of the canine, pseudo-canine and canine-like incisor teeth "is due to the strains sustained by them on account of their position in the jaws at points which are naturally utilized in the seizing of prey, or the fighting of enemies." For example the greatly increased size of the canine teeth of the walrus is due to the use of these teeth in the breaking of ice, and in climbing from the water upon the edge of the floe ice. It is so, adds Cope, with the straight incisors of the hippopotamus, "use as diggers has straightened them to a horizontal from their primitive vertical direction, a change which is also partially accomplished in the true pigs (*Sus*)."

The molar teeth owe their increased diameters to much more severe direct irritation and impact. The origin of the sectorial or shear-like molar teeth of the cat, lion, and other carnivora is thus explained by Cope: "The specialization of one tooth to the exclusion of others as a sectorial, appears to be due to the following causes: It is to be observed in the first place that when a carnivore devours a carcass, it cuts off masses with its sectorials, using them as shears. In so doing it brings the part to be divided to the angle or canthus of the soft walls of the mouth, which is at the front of the masseter muscle. At this point the greatest amount of force is gained, since the weight is thus brought immediately to the power, which would not be the case were the sectorial situated much in front of the masseter. On the other hand, the sectorial could not be situated farther back, since it would then be inaccessible to a carcass or mass too large to be taken into the mouth."

The great length and chisel-like incisor teeth of the squirrel and other rodents also illustrate this subject. Their progressive lengthening through exercise has been explained by Ryder, who shows that the mechanical action involving backward pressure is precisely the opposite of that which has occurred to the carnivora, where the pressure has always been forward owing to the development of the canines.

The direct evidence in favor of the kinetogenetic mode of evolution is greatly strengthened by the discovery of Ameghino in the Tertiary beds of the Argentine republic of one-toed ungulates with two splint bones, and with teeth strikingly like those of the horse, though the animal belongs to a quite different order. The similarity or divergence in shape of the parts is due to the action of similar mechanical conditions in two quite unrelated groups. The same results of strains involved in digging are seen in the fore legs of the fossorial edentates, in the mole, as well as in the mole cricket. Thus as Cope concludes, "in biologic evolution, as in ordinary mechanics, identical causes produce identical results."

ALPHEUS S. PACKARD,
Late Professor of Zoology, Brown University.

Kine'tograph, a machine, invented by Thos. A. Edison, for taking pictures of moving objects in their changing positions. By means of peculiar mechanism a series of photographs, about 40 to the second, can be taken. So rapidly does this machine work that every motion of a dancer's feet, every twist or turn of an athlete's wrists and arms are reproduced. The impressions are taken on a long strip of gelatine film with such rapidity and accuracy that not the faintest motion is missed.

Kine'topho'nograph, an electro-photographic apparatus combining the principles of the kinetograph, the vitascope, and the phonograph, invented by Thomas A. Edison. It is a combination of electricity and photography. A man can sit in his own parlor and see reproduced on a screen the forms of the players in an opera produced on a distant stage, and, as he sees their movements, he will hear the sound of their voices as they talk or sing or laugh.

Kine'toscope, an apparatus invented by Thomas A. Edison for exhibiting the pictures taken by the kinetograph. The kinetoscope displays the pictures to the eye, one after another, so rapidly that they all seem like one scene, with the figures moving about as they do in actual life. Also an instrument invented by Perigal, for illustrating the result of the combination of circular movements of different radii in the production of curves.

The Smithsonian Institution, in Washington, has afforded an excellent example of accelerated speed in its use of the kinetoscope in studying the growth of a plant. Kinetoscopic pictures were taken steadily and systematically as the plant grew; a delicate piece of work which required several months before the film was complete, and involved the use of an automatic flash-light and other contrivances in order that the hourly growth of the plant could be observed from first to last. When the film was finished, however, it could be run through the kinetoscope as fast as the operator wished. As a result the plant could be seen, in the compass of a few minutes, actually growing from seed to maturity, each stage of growth being in the same proportion to all others as in the original development of the plant itself.

King, Albert Freeman Africanus, American physician: b. England 18 Jan. 1841. He was graduated in medicine from Columbian University in 1861, and from the University of Pennsylvania in 1865, was appointed a professor in the medical department of Columbian and later in that of the University of Vermont, and held various posts in professional organizations. He became best known as an advocate of the theory of the transmission of malaria by the mosquito, now generally accepted by experts. He published a 'Manual of Obstetrics' (1882; 8th ed. 1900).

King, Anna Eichberg. See LANE, ANNA EICHBERG KING.

King, Basil. See KING, WILLIAM BASIL.

King, Charles, American journalist, president of Columbia College: b. New York 16 March 1789; d. Frascati, Italy, 27 Sept. 1867. He was the second son of Rufus King (q.v.), and during the residence of his father as American minister at St. James he was sent with his brother to Harrow school. Upon the breaking out of hostilities with Great Britain, King, though a Federalist, deemed it right that the war should be prosecuted to an honorable and successful result; and as a member of the legislature of his native State in 1813, and as a volunteer in the autumn of 1814, he acted upon those sentiments. In 1823 he became associated with Johnston Verplanck in the publication of the 'New York American,' a conservative newspaper, of much political influence and a high literary character, until 1827, when Verplanck retired and Mr. King continued sole editor. After its publication was discontinued Mr. King was associated in the conduct of the New York 'Courier and Enquirer' 1845–9, when he was chosen president of Columbia College, which office he occupied until 1864.

King, Charles, American soldier and novelist: b. Albany, N. Y., 12 Oct. 1844. He was graduated from West Point in 1866 and was in active service in the United States army till his resignation in 1879. In the war with Spain he was a brigadier-general of volunteers and later served in the Philippines under Gen. Lawton. In 1901 he became commandant at Orchard Lake Military Academy. He has published a long series of popular novels treating of army and frontier life and people, among the best of which are: 'The Colonel's Daughter' (1883); 'Kitty's Conquest' (1884); 'Captain Close and Sergeant Crœus' (1895); and also 'Campaigning with Crook' (1890); 'Trials of a Staff Officer' (1901); and lately, 'The Medal of Honor' (1904).

King, Clarence, American geologist: b. Newport, R. I., 6 Jan. 1842; d. Phœnix, Ariz., 24 Dec. 1901. He was graduated from the Sheffield Scientific School of Yale University in 1862, in 1863–6 was a member of the California geological survey under the direction of Prof. J. D. Whitney (q.v.), discovered Mounts Whitney and Tyndall, the highest group in California, and with J. T. Gardiner executed the first survey of the Yosemite Valley. In 1866 he originated the plan for a survey of the western Cordilleran region at its widest point. This plan was finally sanctioned by the government and under the auspices of the army engineering department and King's direction, was executed as the "survey of the 40th parallel" and completed in 1872. The survey has been characterized as a "signal contribution to the material of science." The volume on 'Systematic Geology' (1878), the first of six constituting the report, was written by King and has been highly esteemed. In 1872 certain swindlers sowed a tract in Arizona broadcast with rough gems; the discovery of valuable diamond fields was announced, and companies were organized for the exploration of the find. The "fields" proved to be within the official limits of the 40th parallel survey, and were thereupon examined by King, who detected and proclaimed the fraud. In 1878 King organized the various surveys then active into the United States Geological Survey under the general direction of the secretary of the interior, and was appointed director of the survey. He resigned in 1881, attained a large practice as a mining expert, and undertook an uncompleted series of experiments to determine the action of the primal constituents of the earth under the conditions assumed as existing at the time of its separation from the sun. Partial results were published by him in Silliman's 'Journal' (January 1893) in an article on 'The Age of the Earth.' He wrote also, 'Mountaineering in the Sierra Nevada' (1871), a description of his explorations, and a work of literary as well as scientific value.

King, Edward, American writer: b. Middlefield, Mass., 31 July 1848; d. Brooklyn, N. Y., 27 March 1896. He lived in Paris 20 years as

correspondent of American journals. Among his works were: 'My Paris, or French Character Sketches' (1868); 'Kentucky's Love, or Roughing It Around Paris' (1872); 'The Great South' (1875); 'The Golden Spike' (1886); 'A Venetian Lover' (1887), a poem; 'The Gentle Savage' (1888), a popular novel.

King, Grace Elizabeth, American writer: b. New Orleans 1852. She was educated in New Orleans, contributed much to periodicals, and published in the 'New Princeton Review' in 1886–8 Creole sketches which won considerable reputation and constituted the story 'Monsieur Motte' (1888). Among her further works are: 'Tales of Time and Place' (1888); 'Earthlings' (1889); 'Chevalier Alain de Triton' (1889); 'Jean Baptiste Lemoine, Founder of New Orleans' (1892); 'Balcony Stories' (1893); 'New Orleans: The Place and the People' (1896); and 'De Soto and his Men in the Land of Florida' (1898).

King, Henry Churchill, American theologian: b. Hillsdale, Mich., 18 Sept. 1858. He was graduated from Oberlin in 1879, from the Oberlin Theological Seminary in 1882, studied also at Harvard and Berlin, was associate professor of mathematics at Oberlin in 1884–90, associate professor of philosophy in 1890–1, and professor of philosophy in 1891–7. In 1897 he was appointed professor of theology, and in 1902 president. In 1893 he was a member of the National Educational Association's committee of ten. His works are 'Outline of Erdmann's History of Philosophy' (1892); 'Outline of the Microcosmus of Hermann Lotze' (1895); 'The Appeal of the Child' (1900); and 'Reconstruction of Theology' (1901).

King, Horatio, American statesman: b. Paris, Maine, 21 June 1811; d. Washington, D. C., 20 May 1897. He learned the printer's trade and published 'The Jeffersonian' in his native town, and subsequently in Portland, 1831–8. The next year he was appointed clerk in the post-office department in Washington; became first assistant postmaster-general in 1854; was postmaster-general January–March 1861; and was the first man in public office to deny the power of a State to withdraw from the Union. He published: 'An Oration before the Union Literary Society of Washington' (1841); 'Sketches of Travel; or Twelve Months in Europe' (1878).

King, John, American eclectic physician and author: b. near New York city, 1 Jan. 1813; d. North Bend, Ohio, 19 June 1893. Received a liberal education and graduated in medicine at the Reformed Medical College of the City of New York, in 1838, under the celebrated Dr. Wooster Beach. In 1848, he was the first secretary of the National Eclectic Medical Association, and, in 1878, president of that body as reorganized in 1870. From 1849 to 1851 he was professor of materia medica, therapeutics and medical jurisprudence in the Memphis Medical Institute at Memphis, Tenn., from 1851 to 1856 and 1859 to 1890, professor of obstetrics and diseases of women and children in the Eclectic Medical Institute of Cincinnati, Ohio. From 1856 to 1859 he taught obstetrics in the Cincinnati College of Eclectic Medicine and Surgery. Dr. King discovered the resins of podophyllum (podophyllin) and macrotys, and the oleo-resins of capsicum and iris. He wrote: 'Urological Dictionary,' 'American Dispensatory' (1853); 'American Obstetrics' (1855); 'Women: Their Diseases and Treatment' (1858); 'The Microscopist's Companion' (1859); 'The American Family Physician' (1860); 'Chronic Diseases' (1866), and the 'Coming Freeman' (1886), the last named in behalf of the laboring classes and dedicated to the Knights of Labor. He is regarded as the father of American Materia Medica.

King, John Alsop, American politician: b. New York city 1788; d. 1867. He was the son of Rufus King (q.v.); was educated at Harrow, England, then returned to New York to study law, and was admitted to the bar. In 1812 he served as lieutenant of cavalry, was elected to the State assembly in 1819, and several times re-elected till 1823, when he was elected to the Senate. Though an opponent of Clinton, he strongly favored the building of the Erie Canal. In 1825 he went with his father to England as secretary of the legation, and on his father's return to the United States on account of ill health, he remained as *chargé d'affaires.* In 1838 he was again a member of the New York legislature for several terms; and in 1849 he was elected to Congress as a Whig and there opposed all compromise measures, especially the Fugitive Slave Law. He was one of those active in the founding of the Republican party, presided at the Syracuse convention of 1855; and was a delegate to the Philadelphia convention of 1856. In 1857 he became governor of New York State and in that office gave special attention to educational matters and internal improvements; he declined a renomination in 1860. He was one of the presidential electors in 1860, voting for Lincoln, and in 1861 was a member of the Peace Convention.

King, John Crookshanks, merican sculptor: b. Kilwinning, Ayrshire, Scotland, 11 Oct. 1806; d. 18—. He was educated as a practical machinist, and emigrating to the United States in 1829 was employed for several years in Cincinnati and Louisville as superintendent of a factory. In 1834, at the suggestion of Hiram Powers, he made a model in clay of the head of his wife, and the success with which the work was accomplished encouraged him to adopt the profession of a sculptor. From 1837 to 1840 he resided in New Orleans, and modeled a number of busts of public men and made cameo likenesses, but subsequently removed to Boston. He executed several busts of Daniel Webster, also busts of John Quincy Adams, Agassiz, Ralph Waldo Emerson, and other Americans.

King, Rufus, American statesman: b. Scarboro, Maine, 24 March 1755; d. Jamaica, L. I., 29 April 1827. He was graduated from Harvard in 1777 and admitted to the bar in 1778. In 1782 he entered the Massachusetts legislature, and Congress in 1784. He took an active part in convention which framed the Federal Constitution, and removing to New York in 1788 became a Senator from that State the next year, serving 1789–96. He was United States minister to Great Britain 1796–1803, and after some years spent in partial retirement was sent for the third time to the Senate in 1813, and won renown as an orator by the brilliant speech he made on the burning of Washington by the

British. In 1819 he was again elected to the Senate, serving till 1825, when he was appointed the second time minister to the court of St. James. He was the Federalist candidate for the vice-presidency in 1804 and 1808. In collaboration with Hamilton, he wrote the 'Camillus Letters.'

King, Rufus, American journalist and soldier: b. New York 26 Jan. 1814; d. there 13 Oct. 1876. He was graduated from West Point in 1833, entered the engineer corps, resigned from the army in 1836, became assistant engineer of the New York & Erie Railway, and was adjutant-general of New York State 1839–43. He was associate editor of the Albany *Evening Journal*, and in 1841–5 editor of the Albany *Advertiser*. Having then removed to Wisconsin, he was editor of the Milwaukee *Sentinel and Gazette* in 1845–61, and in 1847–8 a member of the State constitutional convention. In May 1861 he was commissioned brigadier-general of Wisconsin volunteers. He commanded the 1st division of the 3d army corps in the department of the Rappahannock in March–August 1862, was a member of the court-martial for the trial of Maj.-Gen. Fitz-John Porter (1862–3), resigned 20 Oct. 1863, and was minister at Rome in 1863–7. In 1867–9 he was deputy customs collector of New York port. He was a son of Charles King (q.v. 1789–1867).

King, Stanton Henry, American sailors' missionary: b. Paynes Bay, Barbados, 1 May 1867. He went to sea at 12 years old and in his books 'Dog Watches at Sea' (1900); and 'A Bunch of Rope Yarns' (1902); he has related many of his personal experiences. He became superintendent of the Sailors' Haven, Charlestown, Boston, Mass., in 1898.

King, Thomas Starr, American Unitarian clergyman and lecturer, generally known as Starr King: b. New York 17 Dec. 1824; d. San Francisco 4 March 1864. He was a clerk in a dry goods store at Charlestown, Mass., in 1836–40, a teacher at Boston and Medford in 1840–2, studied theology with Hosea Ballou at Medford, preached for a time to a Universalist congregation of Boston, and in 1846–8 was pastor of the Universalist Church at Charlestown. In 1848–60 he was pastor of the Hollis Street Unitarian Church of Boston, and during this period gained great popularity as a lyceum lecturer in the northern States. Best-known was his 'Substance and Show': but other familiar subjects were 'Goethe,' 'Sight and Insight,' 'The Laws of Disorder,' 'Socrates.' He became pastor of the First Unitarian Society of San Francisco in 1860; was among the first, by newspaper article and lecture, to call attention to the Yosemite Valley; and when, in the presidential campaign of 1860, the idea of the establishment of California as an independent Pacific republic was discussed, denounced the project from the lecture platform and preserved the State to the Union. During the Civil War he was active in obtaining in California large and necessary funds for the Sanitary Commission. His name was at one time associated with the White Mountains, which he thoroughly explored, and which became known chiefly through his writings, particularly 'The White Hills: Their Legends, Landscape, and Poetry' (1859; new ed. 1887). A memorial to him was set up in Golden Gate Park, San Francisco, Cal., in 1889. King was one of the leading figures of the American lyceum in the most flourishing days of that institution. 'Patriotism, and other Papers' appeared posthumously (1865); as did the sermon 'Christianity and Humanity' (1877), with a memoir by E. P. Whipple, and the collection of lectures, 'Substance and Show' (1877). Consult also: Frothingham, 'A Tribute to Thomas Starr King' (1865).

King, William, American politician, first governor of the State of Maine: b. Scarboro, Maine, 1768; d. Bath, Maine, 17 June 1852. He was, during the greater part of his life, the last 50 years of which were passed in Bath, an active and successful merchant, but is better known by his public services in his native State. At an early period of his career he became a member of the Massachusetts legislature, and in that capacity was distinguished by his efforts in behalf of religious freedom, and of securing to original settlers upon wild lands the benefit of their improvements. He was an early and ardent advocate of the separation of Maine from Massachusetts, and upon the consummation of that act presided over the convention which met in 1819 to frame the constitution of the new State. He was subsequently elected the first governor of Maine, and, after holding office a little more than a year, became one of the United States commissioners for the adjustment of Spanish claims. He also held other offices of importance under the general and State governments, including that of collector of the port of Bath.

King, William Basil, American Episcopal clergyman and novelist: b. Charlottetown, P. E. I., 1857. After taking orders in the Episcopal Church he was for some years rector of St. Luke's Church, Halifax, N. S., and from 1871 to 1899 was rector of Christ Church, Cambridge, Mass. He is the author of 'Griselda' (1899); 'Let Not Man Put Asunder' (1902); etc.

King, William Rufus, American statesman, 13th Vice-President of the United States: b. Sampson County, N. C., 6 April 1786; d. in Dallas County, Ala., 17 April 1853. He entered the University of North Carolina at 12, and was graduated in 1803. He then commenced the study of law and was admitted to the bar in 1806. In 1806 he was elected to the legislature from his native county, and again in 1809. In 1810 he was elected to Congress, and was twice re-elected. In Congress he united himself with Clay, Calhoun, and others, who advocated the war policy of Mr. Madison's administration, and voted for the declaration of war in June 1812. In the spring of 1816 he resigned his seat to become secretary of legation to Naples under William Pinckney. The latter was afterward transferred to St. Petersburg, and was accompanied to that court also by King as secretary. Having removed to Alabama, he was elected in 1819 one of the United States senators from the new State, and was successively re-elected in 1823, 1828, 1834, and 1840. In April 1844, he was appointed minister to France. The proposition for the annexation of Texas was then pending. England was known to be decidedly opposed to the scheme, and there was a general belief that her government was urging France to join in a protest against it. King was an active advocate of the annexation, and upon reaching Paris directed his ef-

forts to prevent this joint protest, in which he was successful. He returned to the United States in November 1846. In 1848 Senator Arthur P. Bagby was sent as minister to Russia, and King was appointed to fill the vacancy thus created. In 1849, the term for which he was appointed having expired, he was elected for a full term of six years. In 1850, on the accession of Vice-President Fillmore to the presidency, King was unanimously elected president of the Senate. In 1852 he was elected Vice-President of the United States, at the time Franklin Pierce was elected President.

King, a person vested with supreme power in a foreign state, territory or nation. According to feudal usages the king was the source from which all command, honor and authority flowed; and he delegated to his followers the power by which they exercise subordinate rule or authority. There is now no very clearly marked distinction between a king and an emperor. A queen-regent, or a princess who has inherited the sovereign power in countries where female succession to the throne is recognized, possesses all the political rights of a king.

King-at-arms, an officer of great antiquity, whose business it is to direct the heralds, preside at their chapters, and have the jurisdiction of armory. There are three kings-at-arms in England, Garter, Clarencieux and Norroy. The first is called the principal king-at-arms, the other two provincial kings-at-arms.

King Charles Spaniel. See Dog; Spaniel.

King Conch, the great wing-shells of the genus *Strombus,* especially *S. gigas* of the West Indies and *S. pugilis* of Florida. The large helmet-shells (*Cassis*) of the same region are often called "queen conchs."

King Cotton, a popular name given the cotton plant in the United States. "Cotton is king" was a frequent declaration before the Civil War, when the supremacy of cotton in commerce and politics was strongly asserted by public men, especially in the South.

King-crab. See Horsefoot Crab.

King-crow. See Drongo.

King-dory, a bird-dealers' name for the Australian parrots of the genus *Aspromictus.*

King Duck, the spectacled eider. See Eider Duck.

King George's Sound, an inlet in western Australia; five miles broad; it is an excellent roadstead, and contains two landlocked recesses, Princess Royal and Oyster Harbors. Albany, on Princess Royal Harbor, is a port of call for mail steamers.

King George's War, a war of Great Britain and its American colonies, against France and its Indian allies (1743–8), so named from King George II. See Colonial Wars.

King Henry the Fourth, a historical play by Shakespeare in two five-act parts. Part I., published in 1598, stands at the head of all of Shakespeare's historical comedies. Part II. forms a dramatic whole with the preceding. It was published in 1600.

King Henry the Fifth, a historical drama by Shakespeare, first printed in 1600, the materials being derived from Holinshed and an earlier drama play on the same subject.

King Henry the Sixth, a historical drama by Shakespeare in three five-act parts. Of the eight closely-linked Shakespearian historical plays, these three are the last but one. The eight cover nearly all of the 15th century in this order: 'Richard II.'; 'Henry IV.,' parts i. and ii.; 'Henry V.'; 'Henry VI.' (three parts); and 'Richard III.'. The three parts of 'Henry VI.,' like 'Richard II.,' present a picture of a king too weak-willed to properly defend the dignity of the throne.

King Henry the Eighth, a historical drama by Shakespeare, based on Edward Hall's 'Union of the Families of Lancaster and York,' Holinshed's 'Chronicles,' and Fox's 'Acts and Monuments of the Church.' The action covers a period of sixteen years, from the Field of the Cloth of Gold, in 1520, to the death of Queen Katharine in 1536.

King John, a drama based upon an older play published in 1591. The date of the action is 1200 A.D. John is on the throne of England, but without right; his brother, Richard the Lion-Hearted, had made his nephew Arthur of Bretagne his heir. Arthur, a lad of 14, is the pride of his mother Constance. The maternal affection and the sorrows of this lady form a central feature of the drama. Arthur's father, Geoffrey, has long been dead, but his mother has enlisted in his behalf the kings of Austria and of France. Their forces engage King John's army under the walls of Angiers. While the day is still undecided, peace is made, and a match formed between Lewis, dauphin of France, and John's niece Blanche. The young couple are scarcely married when the pope's legate causes the league to be broken. The armies again clash, and John is victorious, and carries off Prince Arthur to England, where he is confined in a castle and confided to one Hubert. John secretly gives a written warrant to Hubert to put him to death. The scene in which the executioners appear with red-hot irons to put out the boy's eyes, and his innocent prattle with Hubert is one of the most famous and pathetic in all the Shakespearian historical dramas. Hubert relents; but the frightened boy disguises himself as a sailor lad, and leaping down from the walls of the castle, is killed. Many of the powerful lords of England are so infuriated that they join the Dauphin, who has landed to claim England's crown in the name of his wife. King John meets him on the battlefield, but is taken ill, and forced to retire to Swinstead Abbey. He has been poisoned by a monk, and dies in the orchard of the abbey in great agony.

King Lear, by Shakespeare. See Lear.

King-monkey, a monkey of the African semnopithecine genus *Colobus,* of which there are several species, one of which is the guereza (q.v.).

King-nut, the shag-bark hickory (q.v.).

King Penguin. See Penguin.

King Philip's War. See Colonial Wars in America.

King Rail. See Rail.

King Salmon or **Quinnat,** the most important of the several species of salmon found

on the Pacific coast of the United States; called also Chinook or Columbia River salmon (*Oncorhynchus tschawytscha*). It is especially abundant in the Columbia and Sacramento rivers, and its great economic importance is due to the fact that it enters the rivers in large numbers in the spring. See SALMON OF THE PACIFIC.

King Snake, a large colubrine snake of the southern part of the United States (*Osceola doliata*, of which the northern house-snake is a variety), so called on account of the belief in its power and prowess, especially in overcoming rattlesnakes. It is grayish white, marked by a series of black rings in a manner so variable that many color-varieties have been named. It sometimes reaches a length of ten feet, is extremely muscular and swift, and preys upon frogs, toads and upon snakes, including poisonous ones. Hence this serpent is much respected and rarely killed in the less settled parts of the Southern States. Several other species are known, one of which (*O. coccinea*) is red with black bands, and called the red king snake. These snakes are reproduced by eggs buried in sandy soil or loose dust, like that of a rotting stump. The chain-snakes (q.v.) of the allied genus *Ophiobolus* have an equal right to the name "king snake," and frequently receive it. Consult: Holbrook, 'North American Herpetology,' Vol. III. (142).

King Vulture. See CONDOR.

King William's War, a war waged by Great Britain and its colonies in America against France and its Indian allies in 1689–1697. See COLONIAL WARS.

King of the Herrings, a fanciful name applied to various sea-fishes. One so called is the moonfish (*Lampris luna*). Another is the rare deep-sea ribbon-fish (*Trachypterus arcticus*) of the North Atlantic. A species of the same family (*Trachypteridæ*) occurs occasionally on the northwestern American coast, and was called by the Indians about the Straits of Fuca 'King of the Salmon,' in reference to their belief that the killing of this fish would be followed by a failure of the salmon supply.

King of the Mackerels, a strange oceanic fish of the genus *Ranzania*, allied to the ocean sunfish (*Mola*), various species of which are superstitiously so called in various parts of the world. One kind (*R. truncata*) is now and then taken in the North Atlantic; and a Hawaiian and Japanese species is *R. makua*. Consult Goode and Bean, 'Oceanic Ichthyology' (1895).

King of the Mullets. See CARDINAL-FISH.

King of the Salmon. See KING OF THE HERRINGS.

Kingbird, one of the most familiar representatives in the United States of the tyrant flycatchers (*Tyrannidæ*). The typical genus is distinguished by the concealed flame-colored crest, attenuate outer primaries and square tail, and contains many species. The eastern kingbird (*Tyrannus carolinensis*) is found throughout the United States, but rarely in the Southwest or west of the Rocky Mountains; it also enters the British provinces and breeds throughout this range; in winter it migrates into Mexico, Central and South America. It is a plain little bird about eight inches long, nearly black above and quite so on the head, this color there contrasting greatly with the brilliant flame color of the crest, which can be concealed or erected at will; the tail is tipped with white, and the under parts are wholly white. The young lack the highly colored crown. The most distinctive trait of the kingbird is pugnacity, and during the nesting season no bird may come near its home without being attacked and almost invariably routed. Even crows, hawks, and eagles fly before its fearless and vigorous onslaughts. On account of the large gape of the mouth, the spreading bristles at its sides, and the flat, broad bill, the kingbird, in common with related species, is an adept in capturing flying insects, which constitute its almost exclusive food. In some localities it is known as the bee-martin, and has gained a bad reputation as a destroyer of honey-bees, but it destroys a thousand noxious insects for every bee it eats. The nest is a bulky structure saddled in a conspicuous position on a limb or fork usually of an apple-tree, and the eggs are usually rosy white, boldly spotted with brown and lilac. Two additional species of kingbirds are found in the West and two in the South. Consult: Wilson, 'American Ornithology' (1834); Baird, Brewer and Ridgway, 'History of North American Birds' (1874); Coues, 'Birds of the Northwest (1874).

Kingfish, the name of verious fishes of notable power or superior excellence; especially certain "Spanish mackerels" of the genus *Scomberomorus*. One, the cavalla or "King cero" is a favorite game fish in Florida (see CERO). The kingfish of New York waters (*Menticirrhus saxatilis*) is one of the whitings, of the family *Sciænidæ*, closely allied to the drums (see WHITING). It is a moderately large migratory marine fish, "dusky gray above, sometimes blackish, the back and sides with distinct dark oblique cross-bands running down and forward," and a V-shaped blotch on each side of the nape. It is also known as "sea-mink," and is an excellent food-fish, but has become rare, although formerly ascending the Hudson River in schools, in early spring, for 40 miles or so. Other fishes so called are the little roncador (q.v.) of California, and the opah (q.v.). Consult: Jordan and Evermann, 'American Food and Game Fishes' (New York, 1902).

Kingfisher, a bird of the family *Alcedinidæ*, characterized by the short, compact body and large head, with a large, straight, acute bill; the somewhat usually short, square tail of twelve rectrices, the short rounded wings having ten primary quills; the short, weak legs and nearly unique cohesion of the middle and outer toes. Two sub-families are commonly recognized, the *Daceloninæ*, or "Kinghunters," with a broader, depressed, sometimes curved bill and usually insectivorous habits; and the *Alcedinidæ*, or true kingfishers, with a compressed, carinated bill, and usually piscivorous. About twenty genera and 125 species have been described, half of which are confined to the Australian region. About five genera and 50 species are distributed between tropical Africa and Asia, one species alone, the brilliantly colored *Alcedo ispida*, is found in Europe; while all of America has only eight species of *Ceryle*, three of which extend their range into the United States. Of these three, two (*Ceryle*

torquata and *C. americana*), are really Mexican and Central American, but the third, the belted kingfisher (*C. Alcyon*), is a widely distributed and highly characteristic member of the North American avifauna. Throughout North America, from the shores of the Arctic Ocean to the Gulf of Mexico, and from the Atlantic to the Pacific, is the summer breeding-home of the belted kingfisher, which in winter retreats south of the limit of freezing. The large, crested head, very large bill, and deep blue color, with black and white markings and largely white under parts, give to this bird a very characteristic aspect, which is heightened by its peculiar habits. Each pair selects a hunting-ground somewhere in the vicinity of water, and other pairs seldom intrude upon this preserve. There the kingfisher perches on a tree overhanging the water and watches for the passage of a fish, when it plunges headlong and usually emerges with a small fish held firmly in the beak. As it rises a spasmodic shake dispels the water from its compact oily plumage, and on returning to its perch, the fish is usually tossed into the air and swallowed head first. Sometimes the kingfisher hunts more in the manner of a tern and plunges from a suspended position in mid-air. The only call is a peculiarly loud, harsh, rattling cry. A burrow six to nine feet long, dug horizontally into a bank, serves as a nesting place, in the slightly enlarged end of which the six or eight pure white eggs are laid on a bed of regurgitated fish bones.

The dacelonine kingfishers have very different habits, and might more properly be called kinghunters. They are usually woodland birds, caring little for the neighborhood of water, since their food consists of insects caught mainly on the wing, or else of tree-frogs, lizards and other small reptiles found on the ground or about trees. The jackass kingfisher (q.v.) of Australia is a prominent example. A peculiar group of the Papuan Islands (genus *Tanysiptera*) has long, racket-shaped tail-feathers and other peculiarities of plumage. The small East Indian species of *Ceyx* have only three toes. Those of Africa are inhabitants of deep woods, but when hard pressed for food will resort to streams and pick up small fishes. All these breed in holes in trees and not in earth-burrows.

Consult: Sharpe, 'Monograph of the Alcedinidæ'; Evans, 'Birds' (Cambridge Natural History, Vol. IX.); and American and European ornithologies.

Kinghunter, a kingfisher of the sub-family *Daceloninæ;* specifically the jackass kingfisher (q.v.).

King'lake, Alexander William, English historian: b. Taunton, Somerset, 5 Aug. 1809; d. 2 Jan. 1891. He was educated at Eton and Cambridge, was called to the bar in 1837, but ceased to practise in 1856. He represented Bridgewater in the Liberal interest in Parliament from 1857 to 1868, when Bridgewater was disfranchised. His distinction as a writer rests upon two books: 'Eothen, or Traces of Travel Brought Home From the East' (1844); and 'The Invasion of the Crimea,' in eight volumes, (1863–87). The former is marked by truth to nature, poetry, humor, and imagination; the latter (which is partly the result of personal observation) is an equally brilliant performance in its own way, almost exhaustive in its details, picturesque and telling in description and narrative, but open to the charge of prejudice in some points, his great dislike of Napoleon III. frequently appearing. Consult: Tuckwell, 'Alexander William Kinglake' (1901).

Kinglet, a very small bird of the thrush family dwelling in northern forests and visiting southern Europe and the United States only in winter. These smallest of songsters, hardly more than 4 inches in total length, are olive-green and gray in color, with a half-concealed yellow crest in one of the two species, the gold-crest (*Regulus Satrapa*), and a flame-colored one in the other (*R. calendula*), called ruby-crown. These tiny birds go about in small lively flocks, and have no hesitation in attacking a crow, jay or hawk with the spiteful fury that long ago won them the name "kinglet" among European peasants. Both, especially the ruby-crown, sing sweetly in the spring before going to some mountain-top or northern forest to make their cup-like nests in some evergreen tree. See GOLD-CREST.

King's Bench, Court of. See COURT.

Kings, Books of, I. and II., canonical books of the Old Testament, forming one book in the Hebrew canon. In the Septuagint version there are various omissions, additions, transpositions, and glosses, which do not in general appear to rest on any authentic authority, and sometimes bear evident traces of later invention. Besides their internal unity the books of Kings are closely connected with those which precede them in the canon, I. and II. Samuel, and even Judges and Ruth, so that some authorities suppose the whole of these books to be a single compilation. Taking the books of Kings alone there is internal evidence throughout that their compilation was subsequent to the destruction of the Jewish monarchy, and in the later chapters much to corroborate the Jewish tradition that Jeremiah, with whose book of prophecies they present many points of agreement, was the compiler. By whomsoever they were compiled, these books, as well as Judges, Ruth and Samuel, are evidently taken from a series of contemporary authorities, being, as shown by citation, the official annals as well as the prophetical writers of the successive periods. These authorities are often followed so literally that when a comment is introduced it is uncertain whether it is that of the original writer or of the compiler; thus the expression which frequently occurs in reference to memorials of occurrences that they remain to this day sometimes implies the existence of the monarchy, the temple, or something else known not to exist in the time of the compiler. The books of Kings thus contain authentic accounts of contemporary history during the whole period of the Jewish monarchy. They begin with the close of the reign of King David, and the history is carried down consecutively to a period subsequent to the capture of Jerusalem and the destruction of the temple, embracing, according to the received chronology, a period of upward of 400 years (1015–588 B.C.), and including the history of both the kingdoms of Judah and Israel. The facts recorded in regard to the foreign relations of these kingdoms from the conquest of Rehoboam by Shishak, king of Egypt, to the

captivity in Babylon, have been remarkably confirmed by modern discoveries. The outline of events recorded in Kings is also frequently supplemented by much fuller details in the prophetic books, particularly Isaiah and Jeremiah. The text of the books of Kings is not considered by critics to be very pure. The chronology is in a very unsatisfactory state, being difficult to reconcile with other authorities, and in many passages inconsistent with itself. The books of Kings differ from the Chronicles in comprising the history of the separate kingdoms of Israel and Judah, while the Chronicles are occupied almost exclusively with that of Judah. It is also to be observed that the Kings contain much fuller notices of the contemporary prophets, while the Chronicles are more full in describing the temple worship and the ceremonials of the Levitical law. This may, perhaps, be regarded as confirming the hypothesis which ascribes the authorship of the former to Jeremiah the prophet, while the reputed author of the Chronicles was Ezra the priest.

King's Chapel, a religious edifice in Tremont Street, Boston, Mass., built in 1745 on the site of an older church. During the War of the Revolution it was for a time forsaken by its loyalist congregation. In the burial ground adjoining which has been in use since 1630, many of the early Puritans, including Gov. Winthrop, are interred.

King's College, a college of Cambridge University, England, founded by Henry VI. in 1441, as the College of Saint Nicholas, with Eton College as a preparatory school. Exemption from the jurisdiction of the Archbishop of Canterbury, the Bishop of Ely, and even of the University in matters scholastic, were some of its unusual privileges, and until 1857 members of King's College could take a degree without passing the University examinations, a course which did not conduce to a high standard of scholarship. In its roll of celebrated alumni are Archbishop Sumner, Bishop Pearson, Richard Croke, the Greek scholar, the first Sir William Temple, Sir Robert Walpole, and Lord Stratford de Redcliffe. The college had in 1902 a provost, 46 fellows, 48 scholars, 120 undergraduates. The college chapel is the finest in the world in size, form and decoration. It contains some of the best glass and wood carving examples in England.

King's College, London, a college established by private subscription and incorporated in 1820, its constitution being amended by an act of Parliament in 1882. The buildings are adjacent to those of Somerset House. It was established for the purpose of providing an education in accordance with the principles of the Established Church. Education is imparted in the departments of theology, general literature and science, applied sciences and engineering, and medicine. The department of general literature and science is intended to prepare students for the universities, for the army, and the Indian and home civil service; and there are also special classes for civil service candidates. There is a department for women. The college possesses a library and a museum, the latter containing Babbage's calculating machine, and King George the Third's collection of philosophical instruments and mechanical models. It is now a constituent college of London University. Among its celebrated scholars are Professors Thorold Rogers and Cayley, Sir James Fitzjames Stephen, Dean Farrer, Dante Gabriel Rossetti and his brother William.

King's College, Windsor, is the oldest university in what is now the Dominion of Canada, and, with the exception of the French foundation of Laval (q.v.) at Quebec, is the oldest college. Its establishment was the work of British Loyalists, chiefly from the State of New York, after the close of the War of the Revolution. Of these about 18,000 settled in the Nova Scotia Peninsula. As early as 8 March 1783 a meeting of Loyalists was held in New York, and "A Plan of Religious and Literary Institution for the Province of Nova Scotia" was drawn up and forwarded to the colonial secretary; and when Dr. Charles Inglis, who had formerly been rector of Trinity Church, New York, was consecrated first bishop of Nova Scotia in 1787, one of his first cares was to carry the scheme into effect. First, a grant was obtained from the Provincial Legislature for an academy at Windsor. This academy (now known as the Collegiate School) was opened 1 Nov. 1788, and the following year an Act was passed for "the permanent establishment and effectual support of a college at Windsor," and the sum of £400 sterling per annum granted toward its maintenance. Under this Act King's College was opened in 1790 in temporary quarters, and the erection of a building of wood was begun the following year.

The first president of the college was Rev. William Cochran, a graduate of Trinity College, Dublin, who had been professor of Greek and Latin in King's (now Columbia) College, New York, but who, on account of his Loyalist sympathies, resigned and came to Nova Scotia in 1788.

A royal charter, giving to King's College full university powers, was granted by George III. in 1802, and was accompanied by an imperial grant of £1,000 a year, which was continued until 1834. The board of governors under this charter was a political body, consisting of the lieutenant-governor, the bishop, and six members of the government. The task of framing statutes for the college was entrusted to a committee of three, two of whom were uncompromising Tories, and by their rigid adherence to the Oxford model in the matter of religious tests inflicted a lasting injury upon the college and almost effected its ruin. The requirement was made that all students, on matriculation, must subscribe to the Thirty-nine Articles. To this the bishop strenuously objected, and sent his protest to the archbishop of Canterbury, who was, under the charter, patron of the college. The archbishop compromised by withdrawing the test at matriculation, but requiring it of all those who were admitted to degrees. Instead of at once publishing this amendment, the governors kept the matter quiet, and Lord Dalhousie, who became governor of the province in 1816, seems not to have heard of it until after he had arranged for the establishment of another institution (Dalhousie College) (q.v.) in Halifax.

Although the religious tests were finally removed in 1829, in spite of repeated attempts to secularize it and amalgamate it with Dalhousie College, Halifax, King's College still retained its connection with the Church of Eng-

KING'S COLLEGE, WINDSOR, N. S.

1. Convocation Hall.

2. King's College.

land, and indeed the requirement that the president should be a clergyman was only abolished in 1902. Of the three King's Colleges established at Windsor, N. S., Fredericton, N. B., and Toronto, it is the only one which has maintained its original status, the others having relinquished their charters and become secularized.

In 1846 a meeting of alumni of the College was held, and it was determined to form an association for furthering the interests of the College. Accordingly a provincial act incorporating "The Alumni of King's College, Windsor," was obtained in 1847, and six years later another act abolished the old political board of governors and constituted a new board, the members of which were, for the most part, to be elected by the alumni. The provincial grant of £400 was discontinued in 1849, and for some years the smaller grant of $1,000 a year was continued, but this ceased in 1881, and since that time the College has been thrown upon its own resources. The progress of the College was rapid under the new régime. The number of students increased. A beautiful stone convocation hall and library was erected in 1861 and a chapel in 1877.

The library of the college, which owes its inception to John Inglis, who went to England in 1802 to collect books, contains some of the most valuable bibliographical treasures in Canada. There are no less than 18 volumes from the famous Aldine Press including the Aristotle of 1495–8. Then there are 20 volumes from the Elzevir Press and 16 from that of Stephens of Paris. One of the treasures is a copy of the Coberger Bible of 1475, of which there is perhaps not another copy in America. Among the valuable books of a later date may be mentioned the Boydell edition of Shakespeare and Milton, and a presentation copy of the Marquis of Buckingham's 'Homer.'

The present teaching staff of the college consists of a president, who is also professor of English literature, history and economics, two divinity professors, one of classics, one of chemistry and geology, one of mathematics and physics, one of engineering, and one of modern languages. Degrees are given in arts, divinity, engineering, and science, and a school of law, established at Saint John, N. B., in connection with the University of King's College, in 1892, is doing good work. The Engineering School, which is the oldest in Nova Scotia, is now (1904) being removed to the Sydneys to take advantage of the splendid plant in operation in the Cape Breton metropolis. F. W. Vroom,

Registrar of the College.

Kings' Daughters and Sons, International Order of the, an organization of men, women and children of all religious denominations, whose object is to minister to the sick and needy wherever found, and to do good to all with whom they come in contact. The original circle (of women) was formed in New York in 1886, and its members are found in almost every State in the Union. There are also branches in several foreign countries. The badge is a small silver Maltese cross, generally suspended by a purple ribbon and bearing the initials "I. H. N." (In His name). The society publishes a weekly paper, 'The Silver Cross.' The membership in 1903 was over 500,000.

King's (or **Queen's**) **Evidence,** the British equivalent of State's evidence. See Informer.

King's Evil. See Scrofula.

King's Mountain, N. C., a village in York County, 80 miles northeast of Columbia. In the vicinity is a high hill where a battle took place 7 Oct. 1780, between the Americans, under Levier, Shelby, Campbell and William, and the British, under Ferguson. The latter were defeated with a loss of 456 killed and wounded, among whom was the commander, and 648 taken prisoners after an hour's fighting. Ferguson, shouting to his men: "Crush the damned rebels to the earth," prepared for one final charge, and fell at the head of his regulars pierced by seven bullets, dying, according to tradition, by the hand of Col. Williams, who was also slain. His men, disheartened by his fall, surrendered. The Americans lost only 20 men killed, although a large number were wounded. After the battle 10 of the prisoners notorious for their crimes were hanged, having first been regularly tried and condemned by their captors. This was one of the most brilliant victories of the war, and exercised an important influence in precipitating the downfall of British power in the South. The 75th anniversary of the battle was commemorated by a celebration on the ground.

Kings'ford, William, Canadian historian: b. London, England, 12 Dec. 1819; d. Ottawa, Ont., 29 Sept. 1898. He entered the army and came to Canada in an English regiment in 1841. He then took up surveying and engineering, and was at various times employed upon the construction of the Hudson River, Panama, Grand Trunk, and Canadian Pacific railways. He made his home in Canada and published 'The History, Structure, and Statistics of Plank Roads in the United States and Canada' (1851); 'The Canals: Their History and Cost' (1865); and 'The History of Canada' (1880), a well-known work; etc.

Kingsley, kĭngz'lĭ, **Charles,** English clergyman, novelist, and poet: b. Holne Vicarage, near Dartmouth, Devonshire, 12 June 1819; d. Eversley, Hampshire, 23 Jan. 1875. He was a pupil of Derwent Coleridge (q.v.) from whose care he passed to King's College, London, and thence to Magdalen College, Cambridge, where he was graduated with high honors in 1842. Soon after graduation he took orders in the Established Church and obtained the curacy of Eversley, and became its rector in 1844. This living he retained till his death, but he also held in succession two canonries, one in the cathedral of Chester 1869–73, and one in the chapter of Westminster from 1873 till his death. From 1860 to 1869 he was professor of modern history at Cambridge. Early in his career as a clergyman of the Church of England he associated himself with F. D. Maurice, Julius Hare, and others, both in their religious views and in their social aims. With them he considered it the peculiar duty of the Church to improve the condition of the working-classes, not only by inspiring them with Christian feeling and Christian principle, but also by encouraging and aiding them in bettering their material position. With the latter object he was a strong advocate of co-operative association. His first literary works of importance, 'Alton Locke, Tailor and Poet' (1850), and 'Yeast, a Problem' (1851), gave expression to his sentiments on social ques-

tions, and both of them, but especially the first, made a great impression when they appeared. The principal of his later novels are 'Hypatia' (1853), 'Westward Ho!' (1855), perhaps the most popular of his stories, and 'Hereward the Wake,' 'Last of the English' (1866). Other works of his are 'Glaucus, or The Wonders of the Shore'; 'Town Geology'; 'The Roman and the Teuton,' historical lectures; 'The Water Babies,' a fairy-tale of science; and 'At Last,' a visit to the West Indies. He was also the author of numerous sermons, lectures, and essays, and of various poems, the chief of which are 'The Saint's Tragedy,' and 'Andromeda,' the latter one of the most successful experiments in English hexameter. Consult: 'Letters and Memories of Charles Kingsley,' by his wife (1877).

Kingsley, Elbridge, American artist and engraver: b. Carthage, Ohio, 17 Sept. 1842. He was graduated at Hopkins Academy, Hadley, Mass., and proceeded to New York where he studied art at Cooper Union. He began engraving for the Century Company in 1878, and started the School of Painter Engraving in 1880 with original work. He is one of the artists who have been instrumental in raising the school of American engraving to the high rank in the art world which it now enjoys.

Kingsley, Florence Morse, American novelist: b. Medina, Ohio, 14 July 1859. She was educated at Wellesley College and was married in 1882 to Charles R. Kingsley. She has published 'Titus: a Comrade of the Cross' (1894); 'Stephen' (1896); 'Paul' (1897); 'Prisoners of the Sea' (1897); 'The Cross Triumphant' (1899); 'The Transfiguration of Miss Philura' (1901); 'Through a Needle's Eye' (1902); 'Wings and Fetters' (1902).

Kingsley, Henry, English novelist, brother of C. Kingsley (q.v.): b. Barnack, Northamptonshire, 1830; d. 24 May 1876. After being educated at King's College, London, and Worcester College, Oxford, he went to Australia, where he spent five years, returning to England in 1858. He was editor of the *Daily Review*, Edinburgh, 1870–1, was its war correspondent during the Franco-Prussian War, and as such was present at the battle of Sedan. In 1859 he published 'Recollections of Geoffrey Hamlyn,' a vigorous novel of Australian life, and this was succeeded by 'Ravenshoe' (1861); and 'The Hillyars and the Burtons' (1865).

Kingsley, John Sterling, American zoölgist: b. Cincinnatus, N. Y., 7 April 1854. He was graduated from Williams College in 1875, was professor of zoology at the University of Indiana 1887–9; and at the University of Nebraska 1889–91, and has filled a similar position at Tufts College from 1892. He edited 'The American Naturalist' (1886–96) and has published 'Elements of Comparative Zoology'; 'Vertebrate Zoology'; 'Popular Natural History' (1890).

Kings'mill Group. See GILBERT ISLANDS.

Kingston, kĭng'stŏn, **William Henry Giles,** English novelist: b. London 28 Feb. 1814; d. Willesden, Middlesex, 5 Aug. 1880. His youth was spent in Oporto, Portugal, and having aided in arranging a commercial treaty between England and Portugal he was knighted by the Queen of Portugal in 1842. He wrote almost though not quite exclusively for boys, producing 130 stories in 30 years; mostly of sea voyage and adventure, which were very popular.

Kingston, Canada, city, port of entry, capital of Frontenac County, in the Province of Ontario. Situated at the mouth of the Cataraqui River and at the outflow of the Saint Lawrence from Lake Ontario. At Kingston the Rideau Canal from the Ottawa River at Ottawa City, connects with the Saint Lawrence River and the system of the Great Lakes.

It is on the main line of the Grand Trunk Railway, between Montreal and Toronto, and is connected with the Canadian Pacific Railway, east, west and north, by means of the Kingston and Pembroke Railway. During the season of navigation, the Richelieu and Ontario and other lines of steamers connect it with Montreal and other points on the Saint Lawrence River, and with Rochester, Toronto, Bay of Quinte and intermediate points, in the West. Kingston is midway between Montreal and Toronto, being 170 miles to the west of the former, and 163 miles to the east of the latter.

The harbor, sheltered from Lake Ontario by Amherst, Simcoe and Wolfe islands, is considered one of the best on the lake. The fortifications of Kingston are third in importance in Canada, those of Quebec and Halifax taking precedence.

In July 1673, the site of Kingston was first visited by Frontenac, the French governor of Canada, accompanied by La Salle. There the Indians were assembled for a conference, and during his stay the governor erected a fort built of wood and surrounded by palisades. Thus originated Fort Frontenac at Cataraqui, the first fort on the lower lakes west of Montreal. In 1675, La Salle obtained from Louis XIV. a grant of Fort Frontenac and the seigniory of Cataraqui, with the adjoining islands, and two years later he partially completed a new stone fort replacing the wooden one. The fort and the mainland subsequently reverted to the French Crown, but a large part of Wolfe Island is still held by titles originally derived from La Salle. Owing to Indian incursions Fort Frontenac was abandoned and partly destroyed in 1689. In 1695, however, during Frontenac's second term as governor, the fort was rebuilt, and, until the time of the English conquest, was maintained as one of the chief French centres of authority, communication and trade for the West. From there, in 1756, Montcalm launched his successful attack upon the British post of Oswego. But in 1758 Bradstreet captured and partly destroyed Fort Frontenac.

After the British conquest of Canada, Cataraqui was practically deserted until the arrival of the Loyalist refugees during the Revolutionary War. When Carleton Island was ceded to the United States by the treaty of 1783, Cataraqui was again occupied by the British government as a military and naval station; and in 1784 it was made the centre of the Loyalist settlements in the West, the place being renamed Kingston in honor of George III. Kingston was the chief naval and military post in Upper Canada during the War of 1812–15. A new fort was constructed on Point Henry, in 1815–16, which was rebuilt in its present form in

1. Military College and City

2. The Fort

1832–6, the advance battery being added in 1842. The four martello towers which, with the fort on Point Frederick, complete the present fortifications of the city, were built between 1846 and 1848. After the convention of 1817, by which the United States and Great Britain agreed not to maintain naval establishments upon the Great Lakes, the naval depot at Kingston was given up.

Kingston was for many years the most important commercial and shipping centre in Upper Canada. There the first mill was built in 1784, the first regular newspaper established in 1810; in the neighborhood the first steamboat was built in 1816, and others soon followed.

In 1838 Kingston received the charter of a city, though still called a town. In 1841, on the reunion of the Provinces of Upper and Lower Canada, it was selected by Lord Sydenham as the capital of the new Province of Canada. In 1844 the capital was transferred to Montreal. From Kingston have come many of the leading statesmen of the Canadian Dominion, such as Sir John Macdonald, Sir Oliver Mowat, Sir Richard Cartwright, Sir Archibald Campbell and Sir George Kirkpatrick.

The city contains three large grain elevators and is an important point for the transshipment of grain coming down from the western lakes. Some of the chief manufactures of the city are locomotives, cotton, hosiery, leather, flour and cereals.

The leading educational institutions are Queen's University (q.v.), with which is affiliated the Kingston School of Mines; the Royal Military College, the Dairy School, Regiopolis College, the Kingston Business College and the Collegiate Institute. The city has a General Hospital, the Hotel Dieu Hospital, an Orphans' Home and House of Providence, while just outside the city limits are the Provincial Penitentiary and Rockwood Hospital for the Insane. The Anglican and Roman Catholic cathedrals, and the city, county and university buildings are handsome stone edifices, adding to the attractions of the city. A bronze statue of Sir John A. Macdonald stands at the main entrance to the city park, while the Sir George A. Kirkpatrick memorial fountain faces the park in front of the county buildings. Pop. (1901) 18,043.

ADAM SHORTT,
Queen's University, Kingston.

Kingston, Jamaica, the capital of the island. See JAMAICA.

Kingston, N. Y., city, county-seat of Ulster County; on the Hudson River, and on the West Shore, the Wallkill Valley, and the Ulster & Delaware R.R.'s; and is connected by ferry with the main line of the New York Central & Hudson River railroad on the east side of the Hudson; about 100 miles north of the city of New York and 55 miles south of Albany. The Wallkill River and Rondout Creek enter the Hudson at Kingston. The first settlement was made here in 1652 by the Dutch. They named the place Esopus. In 1661 they were granted a charter, but as a dependency of Fort Orange (now Albany), the place was called Wilturick. The British obtained possession in 1664 and in 1669 they changed the name to Kingston. On 19 Feb. 1777 the first State convention of the State of New York adjourned from Fishkill to Kingston, and the first State Constitution was proclaimed in front of the court-house, on 22 April 1777. On 9 September of the same year, Chief Justice Jay opened in Kingston the first State court. The State legislature met here in September of the same year, but was dispersed by the approach of the British, who entered the place on 7 October and destroyed nearly the whole town by fire. It was rebuilt, and was incorporated as a village in 1805 and chartered as a city in 1872. The city now comprises the former villages of Kingston, Rondout, and Wilbur. The chief manufactures are bricks, motor-trucks, and Rosendale cement. It is the commercial centre for a large extent of country, and has an extensive trade in farm products, coal, cement, lime, lumber, grain, brick, and bluestone. It has the Kingston and Ulster academies, a business college, Our Lady of Victory's Sanatorium, libraries, an armory, a city-hall, court-house, and several fine churches. The bridge owned by the West Shore Railroad is about 150 feet above tidewater. The "Senate House," the first home of the New York legislature, contains a collection of relics connected with the early settlement of the country. Kingston Point Park, about 50 acres in extent, and on the Hudson, is being made more attractive each year. The large steamers now land at this park. The government of the city is vested in a mayor, who holds office two years, and a council. The executive appoints the subordinate officials, subject to approval by the council, except the city judge and the recorder, who are elected by the people. Pop. (1890) 21,261; (1900) 24,535.

Kingston, Pa., borough in Luzerne County, on the Susquehanna River, opposite Wilkes-Barre; on the Lehigh Valley and the Delaware & Lackawanna R.R.'s. Here is the seat of the Wyoming Methodist Seminary. The principal industry is coal mining. The repair shops of the Lackawanna Railroad are located here. Kingston was incorporated as a borough in 1858. In the near vicinity in 1778 occurred the famous Wyoming Massacre. Pop. (1890) 2,381; (1900) 3,846.

Kinkajou, kĭng'kạ-joo. See POTTO.

Kinney, Coates, American writer: b. Kinney's Corners, N. Y., 24 Nov. 1826. He studied law, was admitted to the bar in 1856 and subsequently edited several Ohio journals. He served in the Federal army during the Civil War, being mustered out in 1865 with brevet rank of lieutenant colonel, and sat in the Ohio Senate, 1881–2. He has published 'Keuka' (1855); 'Lyrics' (1888); 'Mists of Fire and Some Eclogues' (1899), but is best known by the familiar lyric 'Rain Upon the Roof.'

Kino, kē'nō, a kind of gum which exudes from certain trees when an incision is made, and is dried without artificial heat. The East Indian or Malabar kino comes from a leguminous tree (*Pterocarpus marsupium*); Bengal or Palas kino from *Butea frondosa;* and Australian or Botany Bay kino from *Eucalyptus rostrata*; West Indian from a third plant (*Coccoloba uvifera*). It consists of dark red angular fragments, rarely larger than a pea, and

easily splitting into still smaller pieces. It is very soluble in spirits of wine, and in general behavior closely resembles catechu, and yields by similar treatment the same products. In medicine it is an astringent and tonic.

Kinsol'ving, George Herbert, American Protestant Episcopal bishop: b. Bedford County, Va., 28 April 1849. He was graduated from the Theological Seminary at Alexandria, Va., and was ordained to the priesthood in 1875. He was successively rector of churches in Baltimore, Cincinnati, and Philadelphia, and in 1892 was consecrated bishop of Texas.

Kin'ston, N. C., town, county-seat of Lenoir County; on the Neuse River, and on the Atlantic & North Carolina and the Atlantic Coast Line R.R.'s; about 78 miles southeast of Raleigh and about 60 miles from Pamlico Sound. It is situated in a fertile agricultural region in which tobacco and cotton are the chief productive crops. Kinston is an important trade centre and contains a number of large warehouses. Its chief industrial establishments are stemmeries, packing houses, cotton-mills, machine-shops, foundry, wagon works, turpentine distillery, box and barrel factories, shingle-mills, and knitting mills. It is the seat of the Rhodes Military Institute. The city owns the electric light plant. Pop. (1890) 1,726; (1900) 4,106.

Kinston, Battle of. On 1 March 1865 Gen. Cox, with three divisions of infantry, pushed forward from Newbern, N. C., toward Goldsboro to open communication with Gen. Sherman, who was marching northward from Savannah, and on the 7th two of his divisions were at Wise's Forks, near Southwest Creek, a tributary of the Neuse River, with one division three miles in rear. A brigade was advanced to a cross-road about midway between the main line and the creek. Gen. Hoke, with his Confederate division, crossed the creek on the night and early morning of the 7th and 8th, flanked, surprised, and routed the advance brigade, taking over 900 prisoners and, pressing on, fell upon the left of Cox's line, but was repulsed. He renewed the attack and was again repulsed. On the 9th there was sharp skirmishing and the Confederates made repeated efforts to turn Cox's right, which were foiled. On the morning of the 10th Hoke and D. H. Hill made vigorous and successive attacks first upon the left and then on the right of Cox's line, but were repulsed, and Gen. Bragg, who was in supreme command, made no further effort, retreated across Neuse River during the night, burning all bridges behind him, left a small guard at Kinston and, with the rest of his command, hastened through Goldsboro to join J. E. Johnston, who was concentrating everything available to oppose Sherman. Gen. Schofield joined Cox with troops from Wilmington, and reached Goldsboro on the 21st, Sherman joining him two days later. The Union loss at Kinston was 65 killed, 319 wounded, and 930 missing; the Confederate loss is not known. D. H. Hill reports a loss in five brigades of 118 killed and wounded and 16 missing. Schofield estimated the entire Confederate loss at 1,500, which is probably excessive. Consult: 'Official Records,' Vol. XLVII.; Cox, 'The March to the Sea,' and 'Military Reminiscences of the Civil War,' Vol. II.

E. A. Carman.

Kintyre, kĭn-tīr', a peninsula of Scotland, between the Firth of Clyde and the Atlantic, forming the division of Argyleshire. It is 40 miles long from the Isthmus of Tarbet to the Mull of Cantyre, and has an average breadth of about 7 miles.

Kin'zie, John, American pioneer: b. Quebec, Canada, 1763; d. Chicago, Ill., 6 Jan. 1828. His name was originally McKenzie. For a time he was a jeweler in Quebec, but later became a trader in the western United States, and in 1804 established a post on the site of the present Chicago, of which he was the earliest white settler. He also set up stations on the Illinois, Kankakee, and Rock rivers.

Kiosk', a Turkish word meaning pavilion. It has a tent-shaped roof, open on all sides and is supported by pillars, round the foot of which is a balustrade. It is built of wood, roofed with straw or similar materials, and is chiefly erected to afford a free prospect in the shade, but it also serves to embellish a rural or garden view. This kind of pavilion has been introduced from the Turks and Persians into the English, French, and German gardens.

Kioto, kē-ō'tō, or **Kyoto,** one of the great cities of Japan, and for over 1,000 years the capital; situated on a flat plain about 26 miles inland from Osaka. A high range of hills to the east separates this plain from Lake Biwa, and on these some of the finest temples connected with the city are built. The city is rectangular in form, the longer streets running north and south parallel to the Kamo River, which flows along the base of the ridge. At the north end are situated in an enclosure the plain wooden buildings where the emperors of Japan dwelt so long in seclusion. The Honganji temples of the Monto sect of Buddhists, fine structures of their kind and the centre of the Buddhist faith in Japan, rise at the south end of the city. The streets, though narrow, are clean and attractive, and the whole city has an air of refinement. The singing girls of Kioto are noted for their graceful dances. The pottery, porcelain, crapes, velvets, and brocades of Kioto are highly esteemed; its embroideries, enamels, and inlaid bronze-works are marvels of skilful handicraft. The capital was not removed from Kioto until 1868, when the Mikado and his court took up residence at Tokio (Yeddo). Pop. (1900) 353,139.

Kiowa, kī'o-wą (properly kāī-gwŭ), a considerable Indian tribe now in Oklahoma, whose language forms a distinct stock, who have resisted with unusual virility the physical decay so common among the tribes, and whose pictograph calendar from about 1830 is of scientific interest. In dress and dwellings they are civilized, but otherwise tenacious of their old customs; of which the most prominent were the sun dance, and devotion to a stone image called the Taimé, a sort of guardian deity. They had a military order of six degrees, and were organized in six bands; one of which, inaccurately called the Kiowa-Apache (by themselves "Nadiishañ-dina"), is an Athapascan tribe immemorially confederated with them. First living (according to their and other tribes' traditions) in the Montana Rockies along the head waters of the Missouri and Columbia, they followed the retreating buffalo herds southward along the plains, allying themselves with the Crows and

assailed by the Cheyenne and Sioux; halted for a while successively in the Black Hills and along the Platte and Arkansas; at first warring with the Comanches, but since 1790 in confederacy with them, and finally making peace with the Cheyennes and Arapahoes. They became one of the most formidable scourges of the plains, harrying the frontiers of the United States and Mexico. The treaty of Medicine Lodge, Kan., in 1867, enforced (after their disobedience) by Custer's troops during the next winter, placed them, with the Comanches, Cheyennes, and Arapahoes, upon reservations in Oklahoma; they broke loose in 1874, and Mackenzie was obliged to kill their horses and deport their leaders and chief men to Florida. Thenceforth they remained on the reservation. This was thrown open to settlement in 1901, and they accepted American citizenship. Their number, about 1,100, is not very much less than at any time for a century. 'Mooney's Calendar History of the Kiowa Indians'; '17th Report Bureau of American Ethnology' 1898.

Kip, William Ingraham, American Protestant Episcopal bishop: b. New York 3 Oct. 1811; d. San Francisco, Cal., 7 April 1893. He was graduated at Yale College in 1831, entered the General Theological Seminary of the Episcopal Church in New York, and was ordained deacon in 1835. In 1838 he was called to the rectorship of St. Peter's Church, Albany, N. Y., which position he retained until his consecration in 1853 as missionary bishop of California. He published several religious treatises, including 'The Lenten Feast' (1843); 'The Double Witness of the Church' (1844); etc.; and also 'Early Jesuit Missions in North America' (1846); 'Early Conflicts of Christianity' (1850); 'The Catacombs of Rome' (1864); 'Olden Times in New York' (1872); 'Early Days of My Episcopate' (1892).

Kipling, Rudyard, English novelist and poet: b. Bombay, India, 30 Dec. 1865. His father, John Lockwood Kipling, known as the author of 'Beast and Man in India,' was at that time a professor of sculpture in the school of art at Bombay. The novelist's mother, Alice Macdonald, a woman of beauty and talent, was a daughter of a Methodist preacher at Endon, in Staffordshire. The boy was named, it is said, from Rudyard Lake in Staffordshire, where his parents first met. Taught to read by his mother, he was taken to England, at the age of five, and placed, with a younger sister, in the care of a relative at Southsea, a suburb of Portsmouth, where he remained for seven years, subject, it has been inferred from the opening chapter of 'The Light That Failed,' to narrow and irksome discipline. In 1878, he was sent to the United Service College of Westward Ho, near Bideford, in Devonshire. It was a school managed by civil and military officers for young men who intended to enter the Indian service. The rough life passed there is described in 'Stalky and Co.' (1899), wherein Kipling, who edited for two years the *College Chronicle*, figures as Beetle, the clever verse-maker. In 1882 Kipling went out to India and obtained, by the aid of his father, a position on the editorial staff of the Lahore *Civil and Military Gazette*. After five years of this, he became assistant editor of the *Pioneer* at Allahabad, a position which he held until 1889. While on these papers he gained his wide and intimate knowledge of Indian life and affairs at first hand. The newspaper office of his time, he has said, attracted "every conceivable sort of person" from respectable army-officers and missionaries down to inventors of "unbreakable swords" and "every dissolute ruffian that ever tramped the Grand Trunk Road." Out of these motley people, what they told him, and what he saw and divined of them, he built up his tales. By 1886, when appeared 'Departmental Ditties and Other Verses' in a buff paper wrapper, he was known to a large circle of readers in India by short-stories, local verse-satires, and parodies, which he was contributing to his own and other newspapers. Then came 1888, the *annus mirabilis*. In that year Kipling published seven volumes of stories: 'Plain Tales from the Hills'; 'Soldiers Three'; 'The Story of the Gadsbys'; 'In Black and White'; 'Under the Deodars'; 'The Phantom Rickshaw and Other Tales'; and 'Wee Willie Winkie and Other Child Stories.' In 1889, he made a tour of the world, with his stories and manuscripts, hoping especially to find a publisher in the United States. In this aim he was immediately disappointed. His severe strictures on America, contributed to the *Pioneer*, were afterwards published in New York, and are now included in his works as a part of 'From Sea to Sea.' After a hard struggle, recognition in the western world came to him in 1890, while he was staying in London. To this and the next year belong 'The Courting of Dinah Shadd and Other Stories'; 'The City of Dreadful Night and Other Sketches'; 'Life's Handicap'; and 'The Light that Failed.' While in London, Kipling met Mr. Wolcott Balestier, an American author, with whom he collaborated on 'The Naulahka.' In 1892, he married his friend's sister, Caroline Starr Balestier, and settled near the Balestier estate at Brattleboro, Vermont, eventually building on the hillside a long, low bungalow, called the Naulahka. There he wrote many of his best poems and stories. For verse may be cited some of the 'Ballads and Barrack Room Ballads' (1892-93) and 'The Seven Seas' (1896); and for fiction, 'Many Inventions' (1893), 'The Jungle Books' (1894-95), and 'Captains Courageous' (1897). Leaving Vermont in 1896, Kipling went out to South Africa in 1898, and paid a brief visit to New York in 1899, where he barely escaped death from pneumonia. He had already made his home in a little English village near Brighton, in Sussex. To this later period belong 'The Day's Work' (1898); 'Kim' (1901); 'Just-So Stories' (1902); 'The Five Nations' (1903), a volume of verse; 'Traffics and Discoveries' (1904), and 'Puck of Pook's Hill' (1906).

Kipling has been one of the most striking figures in English literature since he first came to his own in 1890. It is now a commonplace to say that he revealed India to the western world, not after the romantic manner of Scott's dealing with Scotland, but in a wonderfully direct and realistic way. Of rare perceptive powers, he sees the import of things and is able to convey it to his reader exactly. Perhaps

there was no set plan about it, but his early tales comprehended nearly every phase of the English government in India so far as it came under his eyes. In them jostle the English soldier, the English civilian, and the native man and woman. He kept most closely to Punjaub, which he best knew; to its sweltering heat under which the mercury climbs slowly to the top of the glass and the printing-presses grow red hot; to its drenching rains, fever, and cholera, in other seasons; its blinding sand storms, and the picnics and intrigues they interfere with; the immense perspective of a star-lit heaven; the filth and superstition of the natives; the hap-hazard process of law-making; villages invaded and blotted out by the jungle; and barrack room yarns in which Tommy Atkins tells of his practical jokes, adventures and death grapples on the battle-field with giant Afghans.

The conditions under which he first worked demanded great concentration of incident and style. Engaged to sort telegrams and clippings or to write editorials for his newspaper, he had little time for developing his stories at length. They were dashed off rapidly from first impressions and made to fit into the scant space that was left for them. Merely the sketch or the outline was given in short jerky sentences, and the salient points in character were suggested by the epithet that comes only under the intense pressure of the moment. No other story-teller was ever able to put so much as Kipling into so little space. When more at his ease, he developed a type of his own running from twenty-five to fifty pages. Taken all in all, considering matter and treatment, the best story Kipling ever wrote is 'The Man Who Would be King.' What happens to one or the other when the Englishman involves himself with the affairs of the Hindoo woman is told in 'Without Benefit of Clergy,' and 'Beyond the Pale.' For the uncanny and ghastly may stand 'At the Pit's Mouth' and 'The Gates of a Hundred Sorrows,' and for ludicrous extravaganza 'My Lord the Elephant' and 'The Incarnation of Krishna Mulvaney.' Among superb battle pieces are 'The Taking of Lungtungpen,' 'The Lost Legion,' 'With the Main Guard,' and 'Drums of the Fore and Aft.' In the 'Jungle Books' Kipling gave fresh life and meaning to the ancient beast-fables of India.

Trained from the beginning in the short story, Kipling seems unable to break from its limitations. 'The Light that Failed,' and 'Captains Courageous' are most readable, but in neither case was the theme thoroughly grasped or the treatment adequate. 'Kim' is not so much a novel as a short story long drawn out. But within the province of the short story Kipling may be classed with Stevenson. A tendency to obscure symbolism, apparent now and then in his early work, has grown upon him, to the harm, it would seem, of his art. 'They,' for example, beautiful as it is, was difficult to understand, and some of the other stories in 'Traffics and Discoveries' were clearly an attempt to transfer to prose the dramatic monologue of Browning. Combined with this endeavor is also a fondness for coincidences, which, though cleverly managed, are unnecessary and unconvincing. The romancing of machinery in '.007,' and 'The Ship that Found Herself,' so striking and novel at the time of their appearance, have since ceased to interest. Much of Kipling's later work has, however, its own grace and beauty. 'An Habitation Enforced' is certainly a fine story, and 'Puck of Pook's Hill' is a notable experiment in English folk-lore and legend.

It should be remembered that Kipling was a verse-maker before he wrote tales. As early as 1881 appeared for private circulation his 'School Boy Lyrics.' 'The Departmental Ditties' were humorous and satirical jingles, which were originally thrown off without effort to fill in the blank spaces of his newspaper when other copy was wanting. His first great success was with 'Barrack Room Ballads,' mostly in the Anglo-Indian dialect. They are not narrative ballads of the traditional type; they are rather songs with choruses and refrains, easily lending themselves to memory. In their kind there is nothing better than 'Tommy,' 'Danny Deever,' 'Fuzzy-Wuzzy,' 'Soldier, Soldier,' and 'Mandalay,' wherein "the very refuse of language" is made poetical. Kipling's theme has broadened with time until it has come to include the imperialistic aspirations of his race. No poems of the present generation are better known than 'The Recessional' (1897), composed for Queen Victoria's jubilee, and 'The White Man's Burden' (1899), an appeal to the spirit of imperialism in the United States.

Bibliography.—Among the collected editions of Kipling's works in verse and prose are the 'Outward Bound' and the 'Swastika.' 'A Kipling Primer,' by F. L. Knowles (Boston 1899) contains a brief biography, and a bibliography to date. Richard Le Gallienne's 'Rudyard Kipling' (London and New York 1900) is the most complete estimate. Consult also: 'Rudyard Kipling, the Man and His Work' (London 1899) by G. F. Monkshood (the pen-name of W. J. Clarke).

Wilbur L. Cross,
Professor of English, Yale University.

Kip'per, a kippered herring, that is one preserved by smoking or pickling. Anciently in Scotland the word signified a salmon taken after the spawning season, and split, salted, and dried, because of its inutility when fresh.

Kiral'fy, Imre, organizer and manager of spectacular exhibitions: b. Budapest, Hungary, 1 Jan. 1845. He commenced the composition of music at the age of 12; introduced many grand spectacular compositions in the United States 1869-94. His many productions include 'Venice'; 'Paris' (1902); 'Columbus'; 'Nero'; 'India'; 'America' (1893); 'Our Naval Victories' (1868); 'Women of All Nations' (1900); 'China, or the Relief of the Legations' (1901). Some of these tableaux and panoramas have had a success unexampled in the history of such undertakings.

Kirby, kėr'bĭ, **William,** Canadian author; b. Kingston-upon-Hull, England, 13 Oct. 1817. He removed to Canada in 1832, but was educated in Cincinnati, Ohio. In 1839 he removed to Niagara, Ont., where he was editor and publisher of the 'Mail' for 20 years, and from 1871 to 1895 collector of customs there. He published 'U. E., a Tale of Upper Canada,' a poem

1860); 'Le Chien d'Or,' a novel (1877); 'Pontiac' (1887); 'Annals of Niagara' (1896); etc.

Kirchbach, Wolfgang, vōlf'gäng kirh'bäh, German critic and poet: b. London, England, 18 Sept. 1857. He was the son of a German artist and studied in Dresden and Leipsic. Settling in the former city in 1888 he was editor of the 'Magazin für Litteratur des In und Auslandes,' but from 1896 has lived in Berlin. Among his works may be cited: 'Märchen' (1879); 'Salvator Rosa,' a romance (1880); 'Gedichte' (1883); 'Das Leben auf der Waltz' (1892); 'Die letzten Menschen,' a drama (1892).

Kirghiz, kir-gēz', **Kirghis,** or **Kirghiz-Kazaks,** a widely-spread nomadic people of Asia, of Turkish-Tartar race, who inhabit the steppes that extend from the lower Volga and the Caspian Sea in the west to the Altai and Thian-Shan Mountains in the east, and from the Sea of Aral in the south to the Tobol on the north. The term Kirghiz, though applied by Europeans to the whole of these peoples, properly belongs only to the Kara-Kirghiz (Black Kirghiz, called also Burúts or Pruts). Those to whom Europeans give the name Kirghiz are called by the Asiatics Kazaks. The Kirghiz-Kazaks speak the Turkish dialect of the Uzbeks. In their physical type they belong to the Mongolian race. They profess the Mohammedan faith, though they do not practise polygamy. They are below the general average of European stature, and are remarkably healthy and vigorous. Their food is chiefly mutton and horse-flesh, with koumiss or fermented mare's milk, from which they extract an intoxicating spirit. Their dwellings consist of a hemispherical tent, the frame of which is of boughs, the covering of felt. Their manufactures are exclusively domestic, and consist of woolen cloths, felt, carpets, hair-ropes, leather, metal ornaments for horse-trappings, knives, etc. They carry on a trade by barter with the Chinese and Russians, exchanging sheep, horses, camels, cattle, wool, skins, etc., for tea, cutlery, silks, and other manufactured goods. A considerable portion of the Kirghiz dwell in Chinese territory, for the most part in Turkestan, but the greater number of them are nominally under Russian dominion. Of these European Russia contains 150,000.

Kirk, kėrk, **Edward Norris,** American Congregational clergyman: b. New York 14 Aug. 1802; d. Boston 27 March 1874. He was graduated at Princeton (then the College of New Jersey), in 1820, studied law in New York, was graduated from the Princeton Theological Seminary in 1824, was agent for the Board of Foreign Missions in the Southern States, was ordained in 1827, in 1828–37 was pastor of the Fourth Presbyterian Church of Albany, N. Y., and there established with N. S. S. Beman a school of theology. From 1842 until his resignation in 1871 he was pastor of the Mount Vernon Congregational Church of Boston. In 1856 at the request of the American and Foreign Christian Union he inaugurated regular worship for American Protestants in Paris. He was president of the American Missionary Association, and published 'Sermons' (1840; 1860); 'Lectures on Christ's Parables' (1856); and other writings.

Kirk, Ellen Warner Olney, American novelist: b. Southington, Conn. 6 Nov. 1842. She was educated in Stratford, Conn., and was married to John Foster Kirk (q.v.) in 1879. Her novels have been popular, and among them are: 'Lost in Idleness' (1877); 'A Midsummer Madness' (1884); 'The Story of Margaret Kent' (1886); 'Sons and Daughters' (1887); 'A Daughter of Eve' (1889); 'Walford' (1890); 'The Story of Laurence Garthe' (1895); 'Dorothy Deane' (1899).

Kirk, John Foster, American historian: b. Frederickton, N. B., 22 March 1824. He removed to the United States in 1842 and settled in Boston, where he was for 11 years secretary to the historian Prescott, whose complete works he has edited. In 1870 he removed to Philadelphia, where he was editor of 'Lippincott's Magazine' till 1886; and lecturer on history in the University of Pennsylvania, 1885–8. He is the author of 'History of Charles the Bold' (1863–8); and editor of the 'Supplement' to 'Allibone's Dictionary of Authors' (1891).

Kirk'bride, Thomas Story, American physician: b. near Morrisville, Bucks County, Pa., 31 July 1809; d. Philadelphia 16 Dec. 1883. He received the degree of M.D. from the University of Pennsylvania in 1832, and was appointed resident physician of the Friends' lunatic asylum at Frankford, Pa. A year later he was elected resident physician of the Pennsylvania hospital, in which he continued two years, when he began general practice in Philadelphia. In January 1841 he became superintendent of the Pennsylvania Hospital for the Insane, then first opened, and continued in that office till his death. He published 'Rules and Regulations of the Pennsylvania Hospital for the Insane' (1850), which has been a text-book and guide in the regulations of new hospitals; and a work 'On the Construction, Organization, and General Management of Hospitals for the Insane' (1854, enlarged 1880). In 1853 he proposed the erection of a new hospital, and the separation of the sexes in two distinct buildings, and was the first superintendent in the United States to carry such an arrangement into effect.

Kirk'dale Cave, in Yorkshire, England, 28 miles west of Scarborough, is famous for the numerous remains of Tertiary mammals. It was discovered in 1821, in the cutting back of an oolitic limestone rock in which it is situated. Its greatest length is 245 feet. The fossil bones are contained in a deposit of mud that lies on the floor of the cave. The remains of the following animals have been discovered: hyena, tiger, bear, wolf, weasel, elephant, rhinoceros, hippopotamus, horse, ox, deer, hare, rabbit, water-rat, raven, pigeon, lark, and duck.

Kirke, Sir **David,** English adventurer: b. Dieppe, France, 1596; d. Ferryland, Newfoundland, 1656. The "merchant adventurers" of London were at the beginning of his life a powerful body of associated privateers, and his father, Gervase Kirke, a dealer in French wine, who had left France to escape from the perils of the religious wars, joined the adventurers and projected with Sir William Alexander a plan for capturing New France and colonizing Nova Scotia. They obtained letters of marque and a monopoly of the fur trade, and David Kirke sailed in 1627 as commodore of three privateers, his brothers, Lewis and Thomas, being each in command of one. Off Quebec, they captured 20

French ships with cargoes and passengers. In 1629 he captured another vessel and compelled Champlain to surrender Quebec. In the meantime peace had been made with France, the captured territory was restored, but Kirke was knighted for his services. He seemed doomed to disappointed ambition to the end, for Cromwell's council revoked, after the execution of Charles I., the grant of all Newfoundland made to Kirke by the king, although the adventurer eventually recovered some portion of the lands thus confiscated.

Kirk'land, Caroline Matilda Stansbury, American author: b. New York 12 Jan. 1801; d. there 6 April 1864. In 1827 she married William Kirkland, a professor in Hamilton College, Clinton, N. Y., removing with him to Michigan in 1839. She lived for a few years a pioneer life and her experiences furnished the basis of her earlier books published under the pseudonym, "Mary Clavers." These include: 'A New Home; Who'll Follow?' her best work (1839); 'Forest Life' (1844); and 'Western Clearings' (1846). In 1842 she made her home in New York, where she established a boarding school for girls and contributed frequently to periodicals. Among her later works are: 'The Helping Hand' (1853); 'Memoirs of Washington' (1857); 'The Destiny of Our Country' (1864).

Kirk'land, James Hampton, American educator: b. Spartanburg, S. C., 9 Sept. 1859. He was graduated from Wofford College (Spartanburg, S. C.) in 1877, was assistant professor of Latin and Greek there in 1881–2, and professor of Latin and German in 1882–3. After European study (1883–6), he was professor of Latin in Vanderbilt University (Nashville, Tenn.) in 1886–93, and in 1893 became chancellor and professor of Latin language and literature. He wrote several monographs, and published a 'Study of the Anglo-Saxon Poem called by Grein "Die Höllenfahrt Christi"' (1885), and an edition of the 'Satires and Epistles of Horace' (1893).

Kirkland, John Thornton, American Unitarian clergyman and college president: b. Little Falls, N. Y., 1770; d. Boston 26 April 1840. He was the son of Samuel Kirkland (q.v.), was graduated at Harvard College in 1789, and ordained pastor of the Congregational (Unitarian) Church in Summer Street, Boston, in 1794, where he remained till elected president of Harvard College in 1810. He held this office until 1828. His 'Life of Fisher Ames' (1809) is perhaps the most valuable of the several biographies of which he was the author, and his 'Eulogy of General Washington' was much admired. He exerted a very great influence during his life, by the force of his intellect and character, and during his presidency the college flourished, both in its internal condition and in its external relations.

Kirkland, Joseph, American novelist: b. Geneva, N. Y., 7 Jan. 1830; d. Chicago 1894. He was a son of Caroline Kirkland (q.v.) and made his home in Illinois after 1856. During the Civil War he served in the Federal army, attaining the rank of major, and after engaging in coal mining for a time, practised law in Chicago. He published: 'Zury, the Meanest Man in Spring County' (1887), a faithful story of the beginning of pioneer life in Illinois; 'The McVeys' (1888); 'The Captain of Company K' appeared in 1891; 'The Chicago Massacre of 1812' (1893); 'The Story of Chicago' (1892–4).

Kirkland, Samuel, American missionary to the Indians: b. Norwich, Conn., 1741; d. 1808. He was graduated at Princeton 1765. He had previously visited the Senecas, for the purpose of studying their language. In 1766 he was ordained, and sent by the Congregational Church to preach to the Indians. After living among the Senecas for a year and a half he went to the Oneidas, whom he considered to be the highest type of the Iroquois. During the Revolution he persuaded the Oneidas and Tuscaroras, who were bent on taking one side or other, to join the Americans, instead of the British. He saw considerable war service as military chaplain, especially with General Sullivan on the Susquehanna, in 1779. In 1793 he founded the Hamilton Oneida Academy for the education of Indian boys. This is now known as Hamilton College. In 1894 the Indians made complaints concerning his administration, and he published a vindication, which with his letters and journals, furnishes a unique picture of life among the Iroquois. Consult: Lothrop, 'Life of Samuel Kirkland' (1848).

Kirk'man, Marshall Monroe, American railway official: b. Illinois 10 July 1842. He entered the railway service of the Chicago & Northwestern line in 1856, held various posts in different departments, was comptroller in 1881–9, and in 1889 became second vice-president. His chief works are: 'The Science of Railways' (1894); 'The Classical Portfolio of Primitive Carriers' (1896); 'The Air Brake' (1901); 'Building and Repairing Railways' (1901); 'The Romance of Gilbert Holmes' (1900).

Kirkpat'rick, Sir **George Airey,** Canadian statesman: b. Kingston, Ontario, 13 Sept. 1841. He was graduated with honors at Trinity College, Dublin, in 1861, studied law and was called to the bar in 1865. He succeeded his father as representative of Frontenac in the Dominion Parliament and sat from 1870 to 1891, when he was made lieutenant-governor of Ontario. He retired from this office in 1897.

Kirksville, kėrks'vĭl, Mo., city and county-seat of Adair County, on the Omaha, K. C. & E., and the Wabash R.R.'s; 204 miles northwest of Saint Louis. It was first settled in 1840, and under a charter of 1893 is governed by a mayor and city council elected biennially. There is a normal school here, court-house, public library and numerous churches. It lies in the centre of an extensive agricultural district and has manufactures of iron, wagons, carriages, etc. Pop. (1890) 3,510; (1900) 5,960.

Kir'kus, William, American Episcopal clergyman: b. Yorkshire, England, 9 May 1830; d. Brooklyn, N. Y., 10 July 1907. After 16 years spent in the Congregational ministry in London he came to this country and entered the Episcopal ministry in 1871. He was many years rector of St. Michael and All Angels Church, Baltimore. He published: 'Christianity, Theoretical and Practical' (1854); 'Miscellaneous Essays, Critical and Theological' (1863); 'Orthodoxy, Scripture and Reason' (1865); 'Religion: a Revelation and a Rule of Life' (1886).

Kirkwood, kėrk'wŭd, **Daniel,** American educator: b. Bladensburg, Md., 27 Sept. 1814;

d. Riverside, Cal., 11 June 1895. In 1851 he became professor of mathematics in Delaware College, of which he was president in 1854–6; and in 1856–86 was professor of mathematics in Indiana University, save for the interval 1865–7, when he was professor of mathematics and astronomy in Washington and Jefferson College. He contributed largely to scientific journals, and published the volumes: 'Meteoric Astronomy' (1867); 'Comets and Meteors' (1873); and 'The Asteroids or Minor Planets between Mars and Jupiter' (1887).

Kirkwood, Samuel Jordan, American statesman: b. Harford County, Md., 20 Dec. 1813; d. Iowa City, Iowa, 1 Sept. 1894. Having removed to Richland County, Ohio, in 1835, he studied law, was admitted to the bar in 1843, in 1845–9 was prosecuting attorney of the county, and in 1850–1 a member of the State Constitutional convention. In 1855 he established himself in milling and farming in Iowa, the next year was a member of the State senate, and in 1860–4 Republican governor of Iowa. During the Civil War he levied 48 regiments of volunteers and equipped them at $500,000 less than the usual cost. He was United States Senator in 1865–7 (completing the unexpired term of James Harlan, resigned), was again elected governor of Iowa in 1875, in 1877–81 was a member of the Senate, and from 5 March 1881 to 6 April 1882, when he resigned, was secretary of the interior in Garfield's cabinet. He then withdrew from political life.

Kir'mess. See KERMESS.

Kirtland, kĕrt'land, **Jared Potter,** American physician and educator: b. Wallingford, Conn., 10 Nov. 1793; d. Cleveland, Ohio, 10 Dec. 1877. He studied in the medical department of the University of Pennsylvania and was graduated from that of Yale in 1815; practised at Wallingford (1815–18) and Durham (1818–23), Conn., from 1823 at Poland, Ohio; in 1829–32 and 1834–5 was a member of the Ohio legislature; and was professor of the theory and practice of medicine in the Ohio Medical College (Cincinnati) in 1837–42. In 1843 he assisted in founding the medical department of the Western Reserve University, where he was professor of the theory and practice of medicine in 1843–64. He assisted in founding and became president (1845) of the Cincinnati Academy of Sciences, from 1865 the Kirtland Society of Natural History.

Kiser, Samuel Ellsworth, American journalist: b. Shippensville, Pa., 2 Feb. 1862. He engaged in journalism as a reporter, in 1896 contributed special sketches to the Cleveland *Leader,* and is now (1903) on the editorial staff of the Chicago *Record-Herald.* He is the author of 'Budd Wilkins at the Show and Other Verses' (1898); 'Georgie' (1890); 'Love Sonnets of an Office Boy' (1902).

Kishineff, kĕsh-e-nĕf', Russia, the capital of the government of Bessarabia, 86 miles northwest of Odessa, on the Byk, an affluent of the Dniester. It is a bishop's see, is well laid out on a picturesque site, and among its educational institutions are a seminary for priests, two gymnasia, a public library, and botanic garden. The grapevine and tobacco are cultivated in the vicinity; it has extensive manufactures of woollens, and a considerable commerce with the East. Kishineff arose around the monastery of Kishnosaref in the 15th century. During the 18th century it was subjected to attacks from the Turks, and in 1812 was annexed by Russia. It came into world-wide prominence in 1903 owing to a shocking massacre of Jews on the Russian Easter and succeeding days. Pop. (1897) 108,796, consisting of Russians, Moldavians, Jews, Bulgarians, Wallachians and Tartars.

Kishon, kī'shŏn, the biblical name of a river in Palestine. It is called El-Mukatta by the modern Arabs. Here Elijah slaughtered the priests of Baal, and Deborah and Barak defeated Sisera. The French and Turks fought a battle on its banks in 1799.

Kiss, an affectionate salute by contact of the lips. This is one of the most natural expressions of human affection, although often objected to now on sanitary grounds. The child expresses its love by a kiss, and men in all stages of refinement do the same. The word in Hebrew for 'kissing' is the usual expression to signify adoration; and the Latin *adoratio* literally means touching with the mouth. With some nations, as the Germans and French, it is customary for men to kiss each other after a long absence, etc. Kissing the hand of the sovereign forms part of the ceremonial of some European courts. Kissing the foot is a common oriental sign of respect. The later Roman emperors, whose court ceremonial was mixed with so many servile customs, first introduced this practice into the West. The popes of the Roman Catholic Church have required it as a sign of respect from the secular power since the 8th century. Pope Constantine I. first had his foot kissed by the Emperor Justinian II. on his entry into Constantinople in 710. Valentine I., about 827, required every one to kiss his foot; and from that time this mark of reverence appears to have been expected by all popes. When this ceremony takes place the pope wears a slipper with a cross, which is kissed. In recent times non-Catholics have not been obliged to kiss the pope's foot, but merely to bend the knee slightly. Even Roman Catholic princes sometimes perform only the genuflexion. When the pope is elected he is placed on the altar, and the cardinals, first of all, perform the adoration. Each approaches the newly-elected pope and kisses his foot, then his knee, and is then embraced by the pope, and saluted on the cheek.

Kissimmee', Fla., city and county-seat of Osceola County, on Tohopekaliga Lake; on the Florida Midland and the Plant system, 18 miles south of Orlando. It has extensive fruit and vegetable interests and is well known as a hunting and fishing resort. The headquarters of the cattle raising industry of the State are here. Pop. (1890) 1,080; (1900) 1,132.

Kissing-bug. See CONE-NOSE.

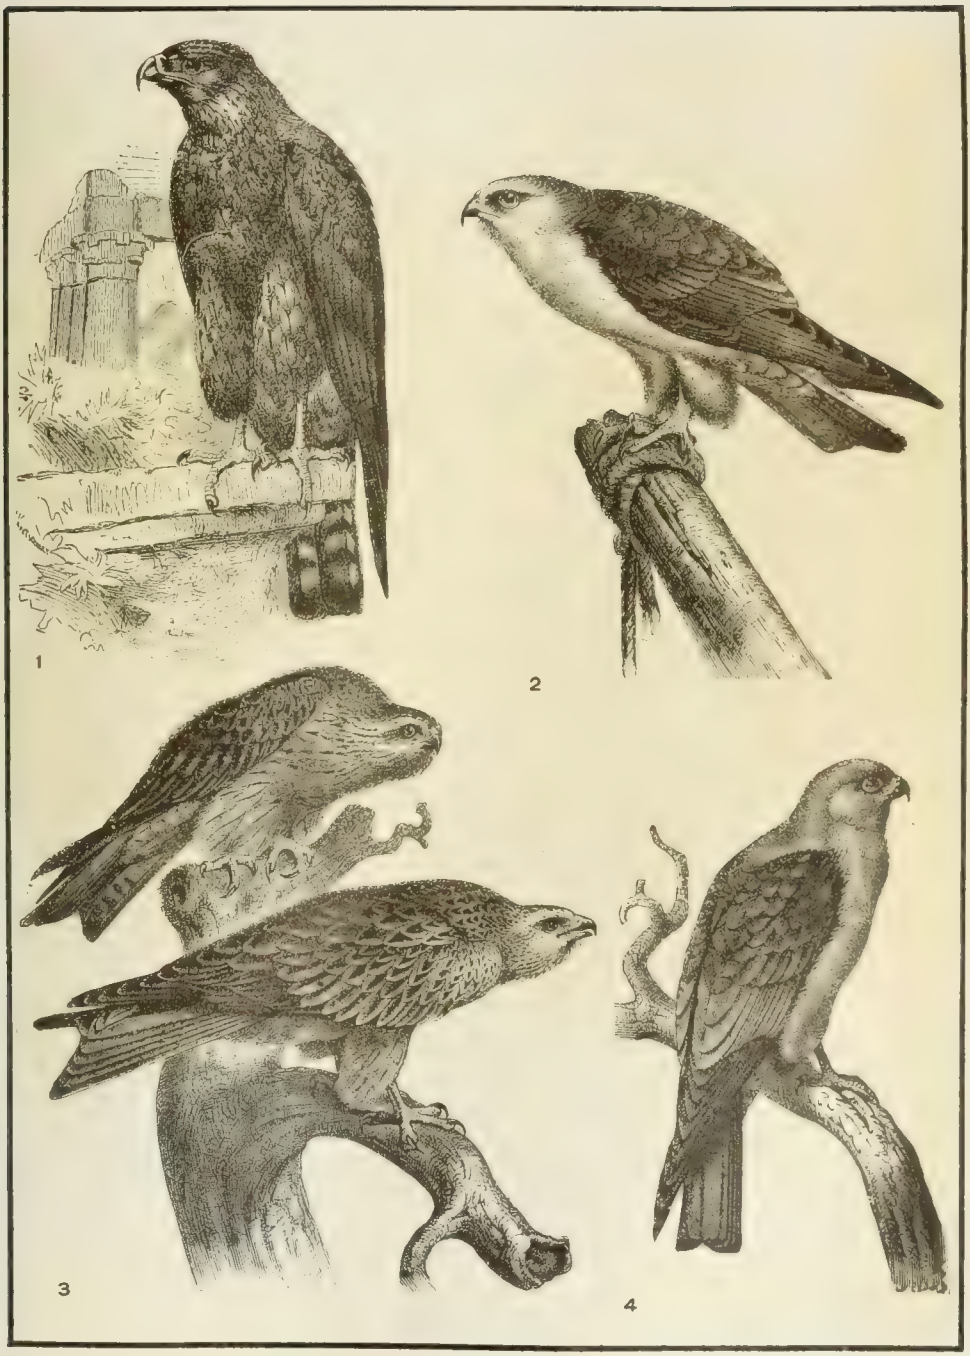
Kis'singen, a celebrated watering-place in Bavaria, on the Saale, 30 miles north of Würzburg. It is surrounded by walls flanked with towers, and has a magnificent bathing establishment. The springs, five in number, and all saline, contain a large quantity of carbonic acid gas, are used both internally and as baths, and are considered efficacious in gout and affections of the stomach and chest. Besides 10,000 visitors annually attracted by the baths, about 500,000

bottles of water are annually exported. Pop. (1895), 4,306; (1900), 4,757.

Kist'na, a river of India, which separates the Deccan from southern India. It rises among the Western Ghâts, in the province of Bijapur, 42 miles from the Malabar coast, passes through Haidarabad, where it receives the Bhema on its left, and the Tungabudra on its right bank, both flowing, like it, from the Western Ghâts. Previous to the junction it is commonly called the Krishna, a name which is frequently given to the whole river. The united river falls into the Bay of Bengal. Its course is estimated at 700 miles. The Kistna is, perhaps, richer in gems than any other river of India. In the dry season diamonds, cat's-eyes, onyxes, and chalcedonies are said to be found, as well as a minute portion of gold.

Kit-Cat Club, a club formed in London about 1688, originally for convivial purposes, but which soon assumed a political character, having in the reign of Queen Anne become the resort of Marlborough, Walpole, Addison, Steele, and other leading Whigs. Its name was derived from that of Christopher Cat, who supplied the club with mutton-pies. The portraits (about three-quarters length) of the members were painted by Sir Godfrey Kneller, and hence a portrait of this length is called a "kit-cat." The club was dissolved about 1720.

Kit-fox, or **Swift-fox,** a small fox (*Vulpes velox*) found in the central and northwestern parts of the United States, and especially common in the upper Columbia River region. It is about 20 inches long, with a broad, short face, and has the soles of the feet densely hairy. In summer its fur is of a brownish gray color, tinged with orange on the flanks and white below; in winter it becomes much paler. It is especially noted for its activity, and for the deep burrows which it digs, and in which its young are born and nurtured. It feeds mainly on ground squirrels and small birds.



Kitchen Cabinet, a popular name applied to certain intimate political friends of President Andrew Jackson, who were supposed to have more influence over his actions than his official advisers. They were: General Duff Green, editor of the *United States Telegraph* at Washington, the confidential organ of the administration; Major William B. Lewis, of Nashville, Tenn., second auditor of the treasury; Isaac Hill, editor of the *New Hampshire Patriot,* and Amos Kendall (q.v.) of Kentucky. He was leader of the kitchen cabinet; worked for the Jackson "second choice" movement in Kentucky; and received the office of fourth auditor of the treasury. He was a man of exceeding ability, but of low moral perceptions, and, as a politician, was the incarnation of the worst evils of the American system. Harriet Martineau wrote of him, "I was fortunate enough once to catch a glimpse of the invisible Amos Kendall, one of the most remarkable men in America. He is supposed to be the moving spring of the whole administration."

Kitchen-middens, or **Kjökkenmöddings,** mounds of shells, bones, charcoal, and refuse, remaining upon the site of prehistoric settlements along the coasts of seas, lakes, and rivers in many parts of the world. The exploration of them has brought to light many relics of the Palæolithic and Neolithic men who formed them, and contributed greatly to the knowledge of prehistoric archæology. Extensive deposits of this kind occur in various parts of the United States, where they are known as shell-heaps (q.v.); and their formation is going on wherever savage conditions still exist.

Kitchener, kĭch'ĕ-nẽr, **Horatio Herbert,** 1ST VISCOUNT KITCHENER OF KHARTUM, English general: b. near Ballylongford, County Kerry, Ireland, 22 Sept. 1850. He was educated at the Royal Military Academy, Woolwich, and entered the Royal Engineers as a lieutenant in 1871, having already seen some active service on the French side in the Franco-Prussian war. In 1874–8 he was engaged on the survey of Palestine under the auspices of the Palestine Exploration Fund Committee, and in 1878–82, except for a short period as vice-consul in Anatolia, carried out a survey of Cyprus. In 1882 he was appointed to a cavalry command in Egypt, served in the Nile expedition of 1884–5, and for his services was made a brevet lieutenant-colonel and received the Khedive's star and the second class Medjidie. He was governor of Suakin 1886–8, and distinguished himself in the latter year by the bravery and skill with which he led the Egyptian troops against Osman Digna at Handoub. In 1889 he was in command of mounted troops on the Sudan frontier, and for his bravery, was created a Companion of the Bath. From 1888 till 1892 he was adjutant-general and second in command of the Egyptian army, and in 1892 became Sirdar. He commanded the Anglo-Egyptian force which recovered Dongola for Egypt in 1896, and his services were rewarded by promotion to the rank of major-general. He was also made K.C.B. and awarded the first-class Osmanieh order. He utterly destroyed the power of the Khalifa by the battle of Omdurman on 2 Sept. 1898, and for this crowning triumph was raised to the peerage (1898) as Baron Kitchener of Khartum and of Aspall, in the county of Suffolk, receiving also the formal thanks of Parliament and a grant of £30,000. He was appointed governor-general and commander-in-chief of the Egyptian Sudan in 1899, but resigned this post and that of Sirdar of the Egyptian army in the latter part of the same year, in order to accompany Lord Roberts to South Africa as chief of his staff in the war with the Boers. When Lord Roberts left South Africa to become commander-in-chief at home, Kitchener succeeded him as commander-in-chief of the forces in South Africa, and carried on the war to its successful conclusion with the acceptance of peace conditions by the Boers on 31 May 1902. He was now created viscount and appointed commander-in-chief in India in the same year. Consult: Steevens, 'With Kitchener to Khartum' (1898).

Kitch'in, George William, English historian and clergyman: b. Hadleigh, Suffolk, 7 Dec. 1827. He was educated at Oxford, took orders in the English Church, and was prominent as tutor and lecturer at the university for many years. He became dean of Winchester in 1883 and in 1894 was translated to the deanery of Durham. He is widely known by his 'History of France,' a standard work (1873–7); but has also published 'Winchester' in the 'Historic Towns' series (1890); 'Life of Harold

KITES.

1. Black-winged Kite.
2. Egyptian Kite.
3. Black Kite and Common Kite.
4. Mississippi Kite.

Browne, Bishop of Winchester' (1895); 'Life of Pope Pius II.' (1881); etc.

Kitch'iner, William, English physician and author: b. London 1775; d. there 1827. He inherited a handsome fortune, was educated at Eton, obtained the degree of M.D. from Glasgow, and settled in London. He treated eating and drinking as the only serious business of life; and having caught the attention of the public by singularity of conduct, proceeded to promulgate, under the title of 'The Cook's Oracle,' the laws of the culinary art, professedly founded on his own practice. Besides his 'Cook's Oracle' (or 'Apicius Redivivus'), Kitchener wrote 'Practical Observations on Telescopes,' etc. (1815); 'Peptic Precepts' (1821); 'Art of Invigorating and Prolonging Life' (1822); 'Brief Memoir of Charles Dibdin' (1823); 'The Economy of the Eyes' (on spectacles, telescopes, etc., 1824–5); 'Traveler's Oracle' (1827); etc.

Kite, a small or medium sized bird of prey, of the falconine subfamily *Milvinæ*, distinguished from the other hawks by the more or less forked tail, long, pointed wings, absence of facial ruff, generally weak build and certain skeletal peculiarities. Four species occur in the United States, their proper homes being southward and in the interior; but owing to their great powers of flight they occasionally stray to other parts or rarely cross the ocean to Europe. The swallow-tailed kite (*Elanoides forficatus*) is a beautiful bird, with all the grace, figure, and capacity for flight of a gigantic swallow, and is especially prone to wander widely from its home in the lower Mississippi Valley. The remaining three are the white-tailed kite (*Elanus leucurus*), the Mississippi kite (*Ictinia mississippiensis*), and the everglade kite (*Rostrhamus sociabilis*). The last is common in Florida and southward, and has the habits of a marsh-hawk. All of the kites feed largely upon insects and small reptiles, but capture weak birds and mammals also. They nest in trees and bushes. In common with other small hawks the kites have the habit of pausing during flight suspended in mid air, in imitation of which the common paper toy is said to have been constructed and named. When falconry was in vogue in Europe the native species of kite served as the quarry in the most highly developed branch of that sport. The group is more familiar in the warm parts of the Old World than in America.

Kite, a common aerial toy in the form of two crossed sticks covered with paper, and balanced with a tail of string, on which are tied bits of cloth or paper. Kites were first employed in aid of science in 1749, by Dr. Alexander Wilson and Thomas Mellville, of Scotland, who by means of a thermometer attached to a kite were able to take temperatures above the earth's surface. Franklin's experiments with electricity by means of a kite and key are familiar to everyone. Among the men who have given much thought and labor to improve kite making are W. A. Eddy, S. P. Langley, Octave Chanute, Lawrence Hargrave, J. B. Millet, J. W. Davis, C. F. Lamson, H. D. Wise, Captain Baden-Powell, and others The first improvement was to make a tailless kite, and this was perfected by Mr. Eddy. (See AERODROME; FLYING MACHINE.)

In 1895 Captain Baden-Powell, of England, weighing 150 pounds, was enabled to hoist himself 100 feet in the air by a tandem of five kites. Mr. Hargrave, with three kites, raised a total weight of 208 pounds to the height of 16 feet, as far as he cared to go. Lieutenant Wise, in 1897, with four kites, rose to 42 feet, the entire weight raised being 229 pounds. Mr. Eddy has done much to develop tandem kite flying. In 1897 he made a tandem of nine Eddy-Malay kites on a cord two miles long, with an elevation of 5,595 feet, the same being kept up for 15 hours. At Blue Hill Observatory, near Boston, this height was exceeded, the tandem of seven Malay and two Hargrave kites, with an area of 170 feet, rising 8,740 feet above Blue Hill, or 9,375 feet above sea-level. It took three miles of piano-wire and the work of three men for 12 hours to accomplish this feat. Piano wire has been found preferable to cord, having greater tensile strength and presenting less surface to the wind.

In the United States weather bureau parakites are used for the purpose of recording the velocity of the wind, and the humidity and temperature at high altitudes, by the meteorograph. These can be obtained at a single observation and several hours before the effects are known in the lower atmosphere. Photographs have been taken by means of a camera fastened on the frame of a kite and operated by a cord, and Mr. Eddy has an arrangement of eight cameras strapped together in which all the shutters can be opened at once, and by this means a complete view of the horizon can be taken. Inventors of flying and soaring machines have made extensive use of kites in planning the construction of their various contrivances.

The first permanent station for kite flying in Europe, and the first in the world established under governmental auspices, is that at Viborg, in the extreme northern part of Denmark, the governments of Denmark, Sweden and France co-operating in the scheme. The most important building at the station is a tower 33 feet high, mounted on circular rails, so that it can be rotated easily, and left open on one side. No matter from which direction the wind blows, the tower is turned with this gap to leeward. Thus the operator can sit within, where the windlasses are, and watch his kites. The latter, of course, naturally take their lines down the wind. There are two windlasses, controlled by electric motors, one being held in reserve for immediate use in case the wire on the other breaks while in service.

Kites in War. Scientific kite flying has become a part of military tactics among European nations. Since kites have been modified and improved, their use has been continually extended, until now they are employed for quite a number of purposes, such as for signaling to a long distance or for locating the position of a camp; for obtaining a photograph of hostile country or of an enemy's fort by suspending a camera from the kite line and operating it by electric wire or clockwork; for making meteorological observations with self-recording instruments, and for lifting men for making reconnoissances. Kites offer great advantages over captive balloons in that they are more easily transported, are less expensive, and can be used in a strong wind.

Kit'son, Henry Hudson, American sculptor: b. Huddersfield, England, 1865. At Paris, he studied at the Ecole des Beaux Arts, under Bounaissieux. He was awarded three gold medals, by the Massachusetts Charitable Mechanics' Association; a gold medal of honor by the American Art Association of New York. He received a medal at the Universal Exposition, Paris, 1889, as well as that in 1900.

Kittan'ning, Pa., borough and county-seat of Armstrong County, on the Allegheny River and the Allegheny Valley railroad, 43 miles north of Pittsburg. There is natural gas here and coal and iron ore are found in large quantities in the neighborhood. It has extensive iron and steel mills, foundries, lumber and flour-mills, potteries, brick and clay works, and other industries. Pop. (1890) 3,090; (1900) 4,000.

Kittatinny (kit'ą-tĭn-ĭ) **Mountains,** a range which extends from Ulster County south and southwest, through the northwestern part of New Jersey and into Pennsylvania. The names by which the range is generally known are in New York, the Shawangunk, in New Jersey, the Kittatinny, and in Pennsylvania the Blue Mountains. The range varies in height from 500 to 1,800 feet. The mountains belong to the Appalachians, and form the eastern ridge of the main part of the system.

Kittery, kĭt'ĕ-rĭ, Maine, town in York County, on the Piscataqua River and the Boston & Maine railroad; 4 miles from the Atlantic Ocean, opposite Portsmouth, N. H. The United States Naval Station and Ship-building Yards are located here on Corifincutal Island, but are known as the Portsmouth Navy Yard. The town is one of the oldest in New England. It was settled in 1624 and incorporated in 1647. It was the birthplace and former home of Sir William Pepperell. There are numerous hotels and churches here, public schools and the Rice Public Library containing 5,000 volumes. Pop. (1890) 2,864; (1900) 2,872.

Kittim, or **Chittim,** a term of Biblical origin for the inhabitants of the island of Cyprus, derived from the important town of Kition or Cition, the modern Lanarca. The "isles of Kittim" are mentioned in Jeremiah ii. 10, and Ezekiel xxvii. 6.

Kit'tiwake. See GULLS.

Kit'to, John, English Bible student: b. Plymouth, England, 4 Dec. 1804; d. Cannstadt, near Stuttgart, Germany, 25 November 1854. He was the son of a mason at Plymouth, and after obtaining a very scanty education began to assist his father, but met with a fall which deprived him of the sense of hearing. Sent to the workhouse he was presently apprenticed to a shoemaker, who used him so cruelly that the magistrates canceled his indentures. He therefore returned to the workhouse, and there, notwithstanding his physical defect, turned his talents to such account that in 1825 he published 'Essays and Letters,' which attracted no little attention. Shortly afterward he went abroad in the suite of the British envoy at the Persian court, and from 1829–33 acquired that familiar acquaintance with the East which he afterward employed in his writing. He founded and edited the 'Journal of Sacred Literature' (1848–53), and although a layman of the English Church received in 1844 the degree of D.D. from Giessen. He published 'The Pictorial Bible' (1835–8); 'Pictorial History of Palestine' (1841); 'Gallery of Scripture Engravings' (1841–3); 'Cyclopædia of Biblical Literature' (edited 1843–5); 'The Lost Senses: Deafness and Blindness' (1845); 'Physical Geography of the Holy Land' (1848); 'Daily Bible Illustrations: Morning Readings' (1849–51); 'Evening Readings'; etc. In his latter years he enjoyed a pension of £100 a year from the crown.

Kit'ton, Frederic George, English author and artist. After receiving his education at a private school in Norwich, he was put under the training of W. L. Thomas, managing director of the 'Graphic,' and became an expert draftsman and wood engraver. In 1882 he added literature to his profession of book illustration. Among his delightful appreciations of artists, illustrators and authors of his time may be mentioned 'Phiz (Hablot Knight Browne)' a memoir (1882); 'John Leech, Artist and Humorist' (1883); 'Charles Dickens by Pen and Pencil' (1890); 'Dickens and his Illustrators' (1898).

Kitt's, Saint. See CHRISTOPHER, SAINT.

Kittul, kĭ-tool, or **Kittool.** See FIBRE.

Kiushiu, kyoo'syoo', or **Kyushu,** Japan, one of five large islands of the empire; area 13,788 square miles. It contains nine provinces but for administrative purposes is divided into seven *Ken* or prefectures. The island is mountainous and volcanic. The principal harbor is the treaty port, Nagasaki, but in 1889 five special ports of EXPORT were opened. Pop. 6,637,551.

Kiwi-kiwi, kē'wĭ-kē'wĭ. See APTERYX.

Kizil-Irmak, kĭz'ĭl-ĭr-mäk' (the Turkish for Red River) a river known to the ancients as the Halys, the principal river of Asia Minor. Rising in the east of the peninsula, it flows in a circuitous route for over 500 miles, and enters the Black Sea near Sinope.

Klamath, klä-măt, a name applied to several tribes of American Indians formerly living along the Klamath River in Oregon and California, but now settled on a reservation at Klamath Lake. Their present lands were given them by treaty in 1864, the reservation containing 1,360 square miles. The Klamaths who now number about 800 are fairly civilized and are expert stock-raisers.

Klamath Lake, a small lake in Klamath County, Oregon, at the base of the Cascade Range. It is 44 miles long by 6 to 14 miles wide. It consists of two considerable bodies of water, connected by a narrow strait less than two miles wide. Klamath River is the outlet, and issues from the south end, or Lower Klamath Lake, and flows thence into California.

Klapka, klŏp'kŏ, **Gyorgy** (GEORGE), Hungarian general: b. Temesvar 7 April 1820; d. Budapest 17 May 1892. He entered the Austrian army in 1838 and rose to high rank, but in 1848, at the beginning of the revolution, joined the Hungarians and distinguished himself in nearly all the battles with the Austrians; in more than one the misfortune of the day was decided by the troops under his command. His most noted exploit was his defense of Komorn, which he continued to hold for some weeks after all the rest of Hungary had submitted.

He lived in exile till the amnesty of 1867 permitted him to return home, and then became a member of the Hungarian Diet. He published 'The National War in Hungary and Transylvania' (1851), one of the best works on the subject; 'The War in the East' (1855); 'Memoirs' (1869); 'Recollections' (1887).

Kléber, Jean Baptiste, zhŏñ bäp-tēst klā-bār, French general: b. Strasburg 9 March 1753; d. Cairo, Egypt, 14 June 1800. He first studied architecture in Paris, then entered the military school at Munich; and having joined the Revolutionary army was appointed brigadier-general and sent to La Vendée. He afterward commanded the left wing of the army of Jourdan, directed both the passage of the Rhine at Düsseldorf and the subsequent retreat; defeated the Prince of Würtemberg, and subsequently Prince Charles. Bonaparte entrusted the command of the army in Egypt to Kléber, who, deeming resistance useless, concluded the convention of El Arish with the British, by which the French were to be conveyed home with arms and baggage. This being disowned by the English government, Kléber determined upon the resubjugation of the country, in which he was successfully engaged when he was assassinated.

Klein, klīn, **Bruno Oscar,** American composer and pianist: b. Osnabrück, Germany, 6 June 1858. He was graduated from the Gymnasium Carolinium in his native town and studied music at the Royal Music School at Munich. He came to the United States in 1878 and has since made his home in New York, where he is professor of music at the Convent of the Sacred Heart. He has published many songs and motets, a large number of compositions for the piano, and various other works. In 1895 his grand opera, 'Kenilworth,' was produced at Hamburg.

Klein, Felix, German mathematician: b. Düsseldorf 25 April 1849. He was educated at Bonn, became Plücker's assistant in the physical institute in 1866, was appointed lecturer at Göttingen in 1871, professor at Erlangen in 1872, and held chairs from 1875 in the Technical Highschool of Munich, from 1880 at Leipsic, and from 1886 at Göttingen. In 1893 he represented Göttingen at the World's Columbian Exposition at Chicago. He exercised large influence on American mathematics, having taught many instructors in institutions in this country. Among his works are 'Ueber Riemanns Theorie der algebräischen Funktionen' (1882); 'Vorlesungen über das Ikosaëder und die Auflösung der Gleichungen vom fünften Grad' (1884); 'Einleitung in die höhere Geometrie' (1893), and 'Evanston Colloquium' (1893).

Kleist, Heinrich Bernt Wilhelm von, hīn'rĭH bĕrnt vĭl'hĕlm fōn klīst, German dramatist: b. Frankfort-on-the-Oder 18 Oct. 1777; d. Wannansee, near Potsdam, 21 Nov. 1811. He entered the army in 1795, but left it in 1799 to study at Frankfort and Berlin, and later engaged in journalism in Dresden and Berlin. His first drama, 'Die Familie Schroffenstein,' was published in 1803, and was followed by 'Amphitryon' (1807); 'Penthisilea,' a tragedy (1808); 'Kätchen von Heinbronn' (1810); 'Der zerbrochene Krug' (The Broken Jug) (1811). A volume of 'Tales' appeared (1810–11); and posthumously, 'The Battle of Hermann,' and 'Der Prinz Von Homburg.' He exhibits some of the worst faults of the Romantic school, to which he belongs, but nevertheless his best plays, such as 'The Prince of Homburg' and 'The Broken Pitcher' possess sufficient vigor and fidelity to life to make them popular even at the present day. The best of his tales is 'Michael Kohlhaas,' a story of Brandenburg in the Middle Ages. He failed to gain recognition and shot himself, after first shooting a woman whom he loved, and who like him was weary of life. His works did not receive notice till after his death, when they were made known by Tieck.

Klephtes, klĕfts (Greek, "thieves"), Greek bandits who kept themselves free in the mountains, and carried on a perpetual war against Turkish rule, considering everything belonging to a Turk a lawful prize. During the war of independence these Klephtes furnished the Greeks with some of their best soldiers and leaders. Whole tribes, as the Suliotes and Chimariots in Epirus, and the Sphakiots in Crete, are to be numbered among them.

Kleptoma'nia (from Greek *κλέπτειν*, steal, and *μανία*, madness), a mania for stealing, a propensity often regarded as being irresistible and involving a kind of moral insanity. It is frequently pleaded in law courts as an excuse for theft, although the act constitutes a legal offense. See INSANITY.

Klinger, Max, German painter, etcher and sculptor: b. Leipsic 18 Feb. 1857. He was a pupil of Gussow at Karlsruhe and later at Berlin; studied also at the Berlin Academy; was active at Rome in 1888–92; and from 1893 in Leipsic. He was at first chiefly an etcher (1879–86), perhaps the best of his work in this sort being the 'Brahms-Phantasien' (1894), deriving their subjects from various music of that composer. Then he directed his attention to painting in oils, and executed heroic canvases of 'The Crucifixion' and 'Christ on Olympus.' One of the best of his plastic works is his polychromatic statue of Beethoven (Leipsic Museum), in which onyx, bronze, and differently colored marbles are combined. He published 'Malerei und Zeichnung' (3d ed. 1899).

Klip'springer, a small, robust antelope (*Oreotragus saltator*), about equal in size to the chamois, and resembling it in habits, found in the mountainous districts of South Africa. It is yellowish-gray, and the hair is long, and makes a rough fur. The flesh of the klipspringer is particularly esteemed; the hair is also valued for stuffing saddles; and it has therefore become rare in localities where it was once common. The pinnacles and precipices in which it delights make hunting it with dogs impossible, but to get within rifle shot of it is not difficult. Many interesting habits are given by writers on South African zoology and natural history.

Kloet, a volcano on the island of Java. Although among the smaller of the numerous volcanoes there, it came prominently into notice on account of its eruption in May 1901, in connection with which, besides its destructive effects, there were peculiar atmospheric phenomena.

Klon'dike, The, a famous gold-bearing stream which enters the Yukon, the principal

river of the Northwest Territory, Canada, 45 miles below the mouth of Sixty Mile Creek. In recent years the term Klondike is applied to the region surrounding the river and its tributaries, which lies between Alaska and the British possessions. As early as 1862 gold was discovered in Alaska, but no special notice was taken of it; 13 years later gold was found at the head of the Stikine River. In 1880, Juneau, a Frenchman, with a companion started out from Sitka and traveling north discovered gold in a creek which they named Gold Creek, and at the mouth of this creek founded a town first called Harrisburg and later Juneau and which soon became the centre of mining supplies and a considerable fur trade. In 1886 a rich find was reported on Stewart River, in the Yukon district, and the following year an expedition was sent out by the Canadian government, headed by George M. Dawson, which explored the Upper Yukon and reported the existence of an abundance of gold. The difficulties and hardships to be encountered in reaching the location were so great that but a few hundred miners attempted to seek their fortunes there. These, however, persevered and established Circle City on the Alaska side of the boundary and by 1892 were taking out an annual total of about $300,000.

It was not till 1897 that the wonderful riches of the Klondike region were made known through George McCormick, who went from Illinois to Alaska in 1890 and there married an Indian squaw. In 1897 he located at the mouth of the Klondike River for the purpose of salmon fishing, but this not proving profitable that season he in company with some Indians moved up the river till they came to Bonanza Creek, which they began to explore for gold. They found large quantities of paying dust and located an extensive claim. Going to the Indian village from which they came for supplies, the news of their find quickly spread, other claims were forsaken, some of the prosperous towns were deserted and miners from every direction poured into the newly found gold fields. Joseph Ladue, an old prospector and well-known miner, was one of the first to explore the country, and his statements gave an impetus to the steadily increasing stream of gold hunters.

Clarence Berry, a miner, returned to Juneau in the fall of 1897 on his way home to San Francisco with $130,000 in dust which had been thawed and sluiced out of 30 box lengths of soil in a few weeks' time. And this is but one of many similar experiences, which aroused the wildest excitement all over the United States, with which the Californian "gold fever" of 1849 stands no comparison. All through the fall and winter of 1897 the mad rush for the Klondike region continued. The almost unknown towns of Juneau, Dyea and Skaguay sprang into sudden prominence and rapidly added to their population, while Dawson City in which the first hut was built in September 1896, six months later had 500 houses, and in 1901 had grown to a prosperous city with handsome residences, hotels, banks, schools, churches and many modern improvements.

The Klondike is not far from the arctic regions, and for seven months of the year intense cold prevails, varied by furious snow storms which begin in September and occur at intervals till May. By 20 October ice is formed over all the rivers. The ground for the better part of the year is frozen to the depth of from 3 to 10 feet, and the only way to get at the gold is to thaw the earth by building a fire and afterward break up the soil with a pick. When the warmer weather comes this is washed in running water which carries away the dirt and pebbles, leaving the gold at the bottom of the pan or sieve. Many nuggets of fine gold have been found varying in value from a few dollars up to a hundred. The amount of gold dust and nuggets taken out of the Klondike region within two months after the discovery was $5,000,000, and up to the close of 1902 the entire output was estimated at $30,000,000. See ALASKA.

Klopsch, klŏpsh, **Louis,** American journalist and philanthropist: b. Germany 26 March 1852. As proprietor of the New York 'Christian Herald' he has instituted several extensive international charities. Since 1892 he has raised through his paper and distributed for the relief of human suffering over $2,000,000. In 1892, during the Russian famine, he was received by the present Czar Nicholas II., and in 1898 President McKinley appointed him one of the commissioners to relieve the reconcentrados of Cuba. In 1900 he visited the famine fields of India; in 1901 Li Hung Chang by cable interested him in behalf of the starving people of Shensi, and in 1903 he visited the famine districts of the north of Europe, where he had audiences with the King and Queen of Sweden, Queen Alexandra of England, the Empress of Russia, and the King of Denmark. Since 1900 he is supporting and educating 5,400 famine orphans in India.

Klopstock, Friedrich Gottlieb, frēd'rĭH gŏt'lēb klop'stok, German poet: b. Quedlinburg, Prussia, 2 July 1724; d. Hamburg 14 March 1803. He is widely famous as the author of the sacred epic, 'The Messiah,' the first three cantos of which were published in 1748. They excited general attention, and in consequence Klopstock was invited to Copenhagen by the minister Bernstorff, and offered a small pension. In 1764 he wrote his drama 'Hermanns Schlacht' (Battle of Arminius), and in 1771 left Copenhagen for Hamburg, under the character of Danish secretary of legation and counsellor of the margraviate of Baden. In Hamburg he finished his 'Messiah' (1773). He also wrote 'Die Gelehrtenrepublik' (The Scholar's Republic) (1744), his chief work in prose; 'Geistliche Lieder' (1758); 'Oden' (1771); and several dramas, in addition to the one already named. His reputation was greater in his own day than has since been the case, but he is admitted to have done great service to German literature in assisting to free it from foreign, especially French influence. Consult: Lyon, 'Ueber Klopstocks Verhältniss zu Goethe' (1879); Lappenberg, 'Briefe von und an Klopstock' (1867).

Klotz, klōts, or **Clotz, Matthias,** Tyrolese violin-maker: b. about 1640; d. about 1696. He was a pupil of Jakob Stainer at Absom near Innsbruck, there established himself, and made violins much in Stainer's manner, so that only the less metallic tone of Klotz's instruments offers a distinguishing feature. His violins range in date from 1675 to 1696.

Knapp, năp, **William Ireland,** American educator: b. New York 10 March 1835. He

was graduated from Colgate University, Hamilton, N. Y., and was professor of modern languages there, 1860–5. He held similar positions at Vassar College 1865–7; Yale 1879–92; and the University of Chicago 1892–5. He has since lived in Europe and has published 'Life of George Borrow' (1883); and several Spanish and French text-books; and has edited several Spanish authors as well as Borrow's 'Lavengro,' and 'Romany Rye' (1900).

Knap'sack, a bag or case of leather or strong cloth, used by soldiers, tourists, and other travelers for carrying light personal baggage. Knapsacks are made in various styles, and are usually strapped to the back.

Knap'weed. See CENTAUREA.

Knaus, Ludwig, lood'vĭg knows, German painter: b. Wiesbaden 5 Oct. 1829. From 1845 to 1852 he studied art at Düsseldorf under Sohn and Schadow, but soon shook himself free from their influence and started on a path of his own. He chose scenes from country life and in 1850 painted 'The Country Dance'; 'The Players,' now in the gallery at Düsseldorf, a replica being in the gallery of Leipsic. His early pictures in this style were received with favor, although characterized by the dark, dull coloring of the Düsseldorf school. In 1852 he went to Paris, and resided there for eight years, which were fruitful in many well-known pictures of his early style, 'The Golden Wedding' (1858); 'The Baptism' (1859); and 'Starting for the Dance.' Returning to Düsseldorf in 1866, he remained there for eight years, during which period he produced the pictures on which his reputation as a genre painter is chiefly founded. Amongst these is 'The Child's Party' (1869), in the Berlin National Gallery; 'Funeral in a Hessian Village' (1871); 'The Goose-Girl' (1872). These works are distinguished by naturalness and naïveté, by delicate humor, mastery of detail, lifelike coloring and vivid expression. After his appointment to the direction of a studio in the Art Academy at Berlin he reached his latest manner, which was formed largely by his study of the Dutch school, from which he acquired his final skill as a colorist. His pictures, however, no longer showed the naïveté, the directness of his earlier productions; which were replaced by thoughtfulness and a striving after the didactic or admonitory. The most remarkable paintings of this period are 'The Holy Family' (1876); 'Tavern Scene — Bad Ways' (1876); 'The Refractory Model' (1877); etc. He has also painted many portraits combining the picturesqueness of genre with lifelike expression. Among his miscellaneous works are his designs in Watteau style for room decorations, his lead pencil sketches and aquarelles. Very many of his works have been reproduced by photography or engraving.

Kneeland, nē'land, **Samuel,** American naturalist: b. Boston, Mass., 1 Aug. 1821; d. Hamburg, Germany, 27 Sept. 1888. He was graduated from Harvard in 1840, practised medicine in Boston 1845–50, and was an army surgeon during the Civil War. In 1866 he became professor of zoology and physiology in the Massachusetts Institute of Technology. He was a member of numerous scientific societies, and in addition to editing 'The Annual of Scientific Discovery' (1886–9), a translation of 'Andry's Diseases of the Heart' (1847), and Smith's 'History of the Human Species,' wrote 'Science and Mechanism' (1854); 'The Wonders of the Yosemite Valley and of California' (1871); 'An American in Iceland' (1876).

Kneipp, knīp, **Sebastian,** German clergyman: b. Stefansried, Bavaria, 17 May 1821; d. Worishofen, Swabia, 17 June 1897. He studied theology at Dillingen and Munich, became a Roman Catholic priest in 1852, and pastor at Worishofen in 1881. He became known for the "Kneipp cure," which he advocated for years. This method was based on water, fresh air, sunshine, and a scheme of regular activity, and included walking barefoot in dew-moistened grass and on snow. Kneipp wrote: 'Meine Wasserkur' (1887; Eng. trans. 1891); 'Mein Testament' (1894); 'Vorträge in Wörishofen' (1894–8); and other works.

Kneisel, nī'zĕl or knī'zĕl, **Franz,** German-American musician: b. Rumania 1865. He was a pupil in violin-method of Grün and Hellmesberger, became concert-master of the orchestra at the Hofburg Theatre of Vienna, of Bilse's orchestra at Berlin, and later of the Boston Symphony Orchestra. He appeared prominently with the Symphony as solo violinist, and organized under his leadership the Kneisel quartette for chamber-music, in which he played the first violin part. This quartette, all of whom were also members of the Symphony, withdrew from the latter in 1903 to undertake an extensive tour.

Kneller, nĕl'ĕr, SIR **Godfrey,** originally GOTTFRIED KNILLER, Anglo-German portrait painter: b. Lübeck 8 Aug. 1646; d. Twickenham, England, 19 Oct. 1723. He studied under Bol and Rembrandt at Amsterdam. He visited Italy in 1672, and painted several historical pieces and portraits both at Rome and Venice. On his return he visited England, in 1675, and was introduced to Charles II., by whom he was much patronized. He was equally favored by James II. and William III., for the latter of whom he painted the "beauties" at Hampton Court, and several of the portraits in the Gallery of Admirals. He also painted the portrait of the Czar Peter for the same sovereign, who in 1691 knighted him, and made him gentleman of the privy chamber. Queen Anne continued him in the same office, and George I., in 1715, made him a baronet. He continued to practise his art to an advanced age. He left money and instructions for a splendid monument to himself in Westminster Abbey, erected by Rysbrack in 1729, which bears an epitaph by Pope. His coloring is true and harmonious, and his drawing correct, but he displays a great want of imagination in his pictures, the attitudes, action, and drapery being insipid, unvarying, and ungraceful. Many of the portraits bearing his name were only partly painted by himself, the less important portions being done by assistants.

Kniazhnin, Jakov Borisovich, Russian littérateur and dramatic author: b. Pskov 3 Oct. 1743; d. 14 Jan. 1791. He was educated in the University of Saint Petersburg, entered the army, where however he stayed only a short time, and for a number of years was connected with the civil service. In 1783 he became a member of the Russian Academy at Saint Petersburg. Of his tragedies the majority are but imitations of French plays, containing with the exception of one or two nothing original. His

comedies are replete with bright passages and full of spirit. The tragedies most worthy of mention are: 'Didon' (1769); 'Vladimir i Iaropolh' (1779); 'Vladisan' (1786); 'Roslav' (1784); 'Vadim Novgorodskii' (1789). The two last were patriotic plays, some of the passages of the 'Vadim' being of such a character as to alarm Catharine II. and cause its suppression, but it was published in 1793, two years after the death of the author. Of his comedies the most noteworthy are: 'Khvastun'; 'Chudakhi'; and the light opera 'Neschastie ot Karety.' A complete edition of his works, in four volumes, was published in 1787, several subsequent editions being published in two volumes in 1847–8.

Knickerbocker, nĭk'ẽr-bŏk-ẽr, **Herman,** American lawyer and legislator: b. Albany, N. Y., 27 July 1782; d. Williamsburg, N. Y., 30 Jan. 1855. He studied law at Albany, N. Y., was admitted to the bar in 1803, and entered practice in Albany. In 1809–11 he was a Federalist representative from New York in the 11th Congress, in 1816 was elected to the New York State assembly from Rensselaer County, and for some time also held the office of county judge. He became a Democrat during Jackson's administration. Through his hospitality he was known as "Prince Knickerbocker."

Knickerbocker's History of New York, a celebrated work written by Washington Irving (q.v.). It gives picturesque description of the early burgomasters, the patroon Killian Van Rensselaer, Stoffel Brinkerhoff, William Kieft, called "William the Testy," Antony Van Corlear the trumpeter, Peter Stuyvesant with his silver leg, and a complement of Indians, Dutch, and Yankee settlers. "Before the appearance of my work," says Irving, "the popular traditions of our city were unrecorded; the peculiar and racy customs and usages derived from our Dutch progenitors were unnoticed or regarded with indifference, or adverted to with a sneer."

Knigge, Adolphus Francis Frederic Louis, Baron de, German author: b. Brendenbeck, near Hanover, 16 Oct. 1752; d. Bremen 6 May 1796. In 1769 he went to the University of Göttingen, where he studied law, later became assessor at Cassel, in 1777 was made a chamberlain at Weimar, and finally in 1791, after leading a very unsettled life, became a resident of Bremen. Here he joined the Illuminati and later became implicated in the disputes relating to that secret order. Of his writings by far the most important is his 'Ueber den Umgang mit Menschen' (On Intercourse with Men), which contains much good advice and a collection of upright methods of living so as to get the greatest joy and happiness at the same time being useful. Of his other works those most read were: 'Der Roman meines Lebens' (1781–7); and 'Die Reise nach Braunschweig' (1792).

Knight, nīt, **Charles,** English editor and publisher: b. Windsor 19 March 1791; d. Addlestone 9 May 1873. He succeeded his father as a bookseller in Windsor, and for several years edited a Windsor newspaper. Having removed to London in 1823, he established 'Knight's Quarterly Magazine,' in 1827 undertook the superintendence of the publications of the Useful Knowledge Society, for which he superintended and published the 'Library of Entertaining Knowledge'; the 'Penny Magazine' and the 'Penny Cyclopædia,' afterward remodeled as the 'English Cyclopædia'; etc. Other publications of his were the 'Pictorial Bible,' the 'Pictorial Prayer-book,' 'Pictorial Shakespeare,' and many others. The Shakespeare was edited by Knight himself, and has, both for its text and notes, taken a high place among editions of the great dramatist. The most important of his own writings, the 'Popular History of England,' appeared 1854–61. His autobiography, 'Passages of a Working Life During Half a Century,' was issued 1863–5.

Knight, Daniel Ridgeway, American painter: b. Philadelphia, Pa., 1850. He has been a pupil of Gleyre and a student at the Ecole des Beaux Arts, at Paris (1872), and four years later was in the studio of Meissonier, from whom he learned many of the secrets of brilliant technique. He has received honors from Paris, Munich, and Antwerp for his exhibited works, and has also been awarded medals in his own country. He is a painter, rather French than American, and he has idealized the French peasantry in more than one of his refined and delicately designed pictures, among which we may mention as especially characteristic of his charming qualities 'The Veteran' (1870); 'The Old Beau' (1873); 'Washerwoman' (1875); 'Harvest Scene' (1877); and 'Sans Dot' (1883).

Knight, Edward Frederick, English journalist and author: b. 23 April 1852. He was graduated from Cambridge and in 1891 became a member of the staff of the London *Times* as a correspondent, being with the armies in the Sudan campaign of 1896, and in Greece in 1897. He has written: 'Albania and Montenegro'; 'The Cruise of the Falcon'; 'The Threatening Eye'; 'Sailing'; 'The Falcon on the Baltic'; 'The Cruise of the Alerte'; 'Save Me from My Friends'; 'Madagascar in War Time'; 'Rhodesia of To-day'; etc.

Knight, Edward Henry, American mechanical expert: b. London, England, 1 June 1824; d. Bellefontaine, Ohio, 22 Jan. 1883. After studying both surgery and steel engraving he came to this country in 1845 and settling in Cincinnati was a patent attorney for several years. In 1863 he entered the civil service in Washington, D. C., where he prepared the annual reports of the Patent Office and established the 'Official Gazette of the United States Patent Office' in 1871. He served on the international juries of world's fairs at Philadelphia (1876), Paris (1878), Atlanta (1881), and was made a chevalier of the Legion of Honor in 1878. He published 'The American Mechanical Dictionary' (1872–6); 'The New Mechanical Dictionary' (1876–80).

Knight, Richard Payne, English numismatist and archæologist: b. Wormsley Grange, near Ludlow, Herefordshire, 1750; d. London 24 April 1824. Having been bequeathed a fortune, he traveled extensively, wherever he went, and especially in Italy, where he went in 1767, 1777, and 1785, making a specialty of collecting ancient coins, bronzes, gems, drawings, and other antiques. From 1780 to 1806 he was a member of Parliament, and for 10 years, 1814–24, served as one of the trustees of the British Museum, to which, upon his death, he left his mag-

nificent archæological collection. His works, which were numerous, included: 'An Account of the Remains of the Worship of Priapus lately existing at Isernia in the Kingdom of Naples' (1786); 'Analytical Essay on the Greek Alphabet' (1791); 'An Inquiry into the Symbolic Language of Ancient Art and Mythology'; 'Principles of Taste' (1805); etc. He also published several volumes of poems and an edition of Homer (1816).

Knight, Sarah Kemble, American author: b. Boston 19 April 1666; d. near Norwalk, Conn., 25 Dec. 1727. In 1706–13 she conducted at Boston a school in which Samuel Mather and Benjamin Franklin were at one time pupils. By New England custom she was styled "Madam" Knight as a token of respect. Her 'Journal Kept on a Journey from Boston to New York in the Year 1704' (1825) is a diary record evidently compiled from daily notes made on the way. It is valuable for its account of customs and manners and its descriptions of the settlements, being at the same time interesting for its original orthography and interspersed rhymes.

Knight, Thomas Andrew, English horticulturist: b. Wormsley Grange, near London, Herefordshire, 10 Oct. 1758; d. London 11 May 1838. After graduating from Baliol College, Oxford, he took up the study of horticulture. He first brought himself before the public in 1795 by the publication of the results of his researches into the propagation of fruit-trees and the diseases prevalent among them. Beside the papers, 46 in number, which he contributed to the 'Transactions' of the Royal Society, he wrote: 'A Treatise on the Culture of the Apple and the Pear' (1797); 'Pomona Herefordiensis, or Natural History of the Old Cider and Perry Fruits of the County of Hereford' (1809). His 'Physiological and Horticultural Papers' were published in 1841 together with a biographical sketch of his life.

Knight, William Angus, Scottish philosopher and author: b. Mordington, Scotland, 22 Feb. 1836. He was educated at the University of Edinburgh and since 1876 has been professor of moral philosophy at the University of St. Andrews. He is widely known as a student of Wordsworth, whose works he has edited in 12 volumes (1896–7). Among his own writings may be cited 'Studies in Philosophy and Literature' (1879); 'Essays in Philosophy, Old and New' (1890); 'The English Lake District as Interpreted in the Poems of Wordsworth' (1878–91); 'Through the Wordsworth Country' (1892); 'Varia' (1901); 'Some 19th Century Scotsmen' (1902).

Knights of Columbus. The Knights of Columbus is a fraternal and beneficial order exclusively for Catholics, instituted in New Haven, Conn., 2 Feb. 1882, and incorporated under the laws of the State of Connecticut 29 March 1882. While the primary object of the founders was to provide insurance for its members at nominal rates, the scope of the order expanded with its growth, and the social strength of the order is now as pronounced as was its object of insurance during the first 10 years of its existence.

Rev. M. J. McGivney, then curate of Saint Mary's Church, New Haven, was the moving spirit in bringing the order into existence, and in his efforts he was assisted by the following named as incorporators in the charter granted by the State of Connecticut: M. C. O'Connor, M.D., James T. Mullen, John T. Kerrigan, William M. Geary, C. T. Driscoll.

From Connecticut the order spread into Rhode Island, Massachusetts, New York, and New Hampshire. After its introduction into Massachusetts its growth became phenomenal, and each succeeding year since 1892 has witnessed marked accretions to its membership and to its financial strength.

The Knights of Columbus issue insurance policies for $1,000, $2,000, and $3,000 to desirable risks between the ages of 18 and 60. The rate of each member increases once in five years, until the age of 60 is reached, when the member pays a level rate for the rest of his life, this level premium being based upon his age at initiation.

The Knights of Columbus operate in every State and Territory of the United States, and also in the provinces of Quebec, Ontario, Prince Edward Island, and New Brunswick. On 9 Jan. 1904 a charter was granted for an associate council in Manila, P. I. The total membership on 1 Jan. 1905 was 127,206, comprising 43,537 insured and 83,669 associate members. There are 33 State councils and 940 subordinate councils.

The total net assets of the society on 1 Jan. 1905 were $1,290,196.31, and of this amount $1,239,137.89 are deposited in the mortuary reserve fund, for the protection of outstanding insurance contracts. The per capita surplus is $28.56.

The order aims to develop a practical Catholicity among its members, and its four degrees serve to impress upon candidates the nature and sacredness of their obligations to Church and state. In 1904 the Knights of Columbus presented $50,000 to the Catholic University in Washington for a chair of American history.

Rev. M. J. McGivney,
Middletown, Conn.

Knights and Ladies of Honor, a fraternal beneficiary society founded in the United States in 1877. In 1902 it reported a membership of 63,000; benefits disbursed since organization, $19,000,000. The benefits disbursed in 1902 amounted to $1,173,000. The society has a Supreme Protector, 16 grand lodges, and 1,160 sub-lodges.

Knights of the Golden Circle, a secret organization in the United States, established a few years before the Civil War, and formed with the object of destroying the Republic and setting up a great Southern empire with negro slavery as its cornerstone, and also with the purpose of controlling the great commercial interests of cotton, sugar, and tobacco. With its centre at Havana, Cuba, the "Golden Circle" intended to embrace in the territory of the new government a radius of 1,200 miles, and to include parts of Central America. The organization was never fully consummated, although thousands of persons joined in the movement and many lodges or councils were instituted.

Knights of the Golden Eagle, a secret society founded in the United States in 1873. It had in 1903, 15 grand castles, 800 sub-castles

and 75,597 members. The benefits disbursed during 1902 amounted to $231,794.

Knights of Honor, a fraternal benevolent society founded in the United States in 1873. Its membership in 1902 was reported at 62,173; benefits disbursed since organization, $71,231,447, and during 1902 the amount was $3,074,649. It has a supreme dictator, 36 grand lodges, and 1,918 subordinate lodges.

Knights Hospitallers. See HOSPITALLERS.

Knights of Labor, an American labor organization which originated among the garment-cutters of Philadelphia in 1869. It was founded by 10 members of the trade under the leadership of Uriah Stevens (q.v.), as a secret society, with a rather elaborate ritual. It grew slowly at first; though workingmen of all trades were admitted, it was not until 1872 that the second local assembly was formed, but in that year 27 locals were organized, all in Philadelphia; the first local organized outside that city was that of the gold-beaters of New York. In its first organization politicians, physicians, lawyers, and liquor-dealers were excluded from membership; the two latter classes are still excluded. The first general assembly was held at Reading, Pa., in 1878, where seven States were represented. At this meeting a declaration of principles was adopted which remains substantially the same: the purpose was declared to be the "organizing, educating, and directing of the power of the industrial masses," in order to "make industrial and moral worth, and not wealth, the true standard of national and individual greatness," and to "secure to the workers the full enjoyment of the wealth they create." To secure these aims, the organization demanded certain legislative remedies, including the referendum, the establishment of a bureau of labor statistics, abrogation of class laws, prohibition of the employment of children under the age of 15, abolition of the contract system on public works, and of the convict-labor system, and reforms in the financial and land laws; and in the industrial field it proposed to "establish co-operative institutions which will tend to supersede the wage-system," to secure both sexes equal rights, and gradually to reduce the hours of labor to 8 per day. In 1881 all secrecy was abolished, and in 1882 a revised constitution adopted, in accordance with which the organization consists of local assemblies, of not less than 10 members, of whom three fourths must be wage-earners or farmers; district assemblies, formed by not less than five locals, and the general assembly, which meets annually for the election of officers and the transaction of business. The executive officers are a general master workman, general worthy foreman, general secretary-treasurer, and general executive board. The constitution provides also for the support of strikes approved by the executive board after all attempts at conciliation have failed. The organization grew rapidly after this time, till in 1886 delegates at the general assembly represented over 300,000; at that time, however, dissensions began which resulted in a split and the formation of the American Federation of Labor (q.v.). Though the organization remained powerful for several years, its numbers began to decrease, and in 1903 it reported only 40,000, and its influence gradually declined. In 1890 'The Journal of United Labor' was established; later the name was changed to 'Journal of the Knights of Labor,' and it is the official journal of the organization.

The Knights differ radically from the trades unions in the basis of their organization; their ideal is to organize labor without distinction of trade, and to harmonize individual and trade interests with the interest of the whole; though locals may be organized on trade lines, no autonomy of trades is allowed. This and the fact that the general executive board tried to exercise a too centralized authority were among the chief causes of dissatisfaction. Strikes were at one time condemned by the general assembly (1880), but later the organization took part in a number of strikes and also made use of the boycott; violence has been at all times condemned. Knights of the Maccabees of the World, a fraternal beneficiary association having its general offices at Port Huron, Mich. An association bearing this name was first organized in the city of London, Canada, in the year 1878, by W. D. McLaughlan and several other gentlemen of that city. The Association grew rapidly, and its tents, as its local lodges were called, sprung up all over the Canadian provinces and in many of the States of the American Union.

The Association takes its name from the Maccabees, a chivalrous and religious people whose history is given in the apochryphal writings of the Old Testament. The leading character in this history was Judas Maccabeus, a valiant soldier and one of the foremost generals of the period in which he lived. During the wars in which the Maccabees were engaged and in which he was their leader he required that a portion of the fruits of all their victories should be set aside for the benefit of the widows and orphans of those who had fallen in battle.

It was this particular practice and characteristic that probably suggested to Mr. McLaughlan and his co-laborers the name for their new society, because the purpose of this society, as set forth in their laws, was to unite fraternally all white male persons of sound bodily health and good moral character, between the ages of 18 and 70 years of age, and to provide for such members benefits in case of disability, and to the beneficiaries of such members benefits in case of their death.

The main purpose of this Association is to provide social and fraternal intercourse for its members, and benefits in the way of insurance to the families of deceased members. It does not now provide for the payment of other than temporary disability benefits in case of sickness or accident, and death benefits as above stated.

It has distributed about twenty-three millions of dollars among its disabled members and the beneficiaries of its deceased members. Its rates of contribution are based upon the Fraternal Congress Mortality Table and 4 per cent.

Its death benefits are provided under two plans, one, the "whole life" plan, in which its rates of contribution are uniform throughout the continuance of membership; the other, the "term" plan, under which the rate of contribution continues until the member reaches the age

of 65, when it changes and becomes uniform for the balance of life at $3 per month per $1,000. Careful medical examination is required of all benefit members. Its accumulated funds 1 May 1905 amount to about $4,250,000. Its work is conducted on the lodge system under ritualistic ceremony. Its form of government is thoroughly representative, every member having a voice in the conduct of its affairs, making of its laws, the election of its officers, and the fixing of their compensation.

In 1904, the name of the Association was changed to "The Knights of the Maccabees of the World." The general meeting of the law-making body (the Supreme Tent) is held once in three years, at which the members are represented through delegates chosen from subordinate tents, conventions, and great camps. In the interim between the meetings of its governing body its affairs are administered by a board of seven trustees, consisting of the supreme commander and six others elected by the Supreme Tent. The board of trustees has the general custody and management of the funds of the Association; under its direction all investments are made, the laws of the Association requiring that all investments shall be made in government, State, and municipal bonds.

Knights of the Modern Maccabees, a fraternal beneficiary society. The order derives its name from the ancient Maccabees, a chivalrous and religious race, whose history is portrayed in the first and second books of the "Maccabees," apocryphal writings of the Old Testament, dating back to 175 B.C. The exact meaning of the name "Maccabees" is veiled in obscurity, but by some is held to be derived from a Hebrew term signifying "a hammer." The ancient Maccabees were in the habit of putting aside a goodly portion of the "spoils" of victory for the benefit of the widows and orphans of those soldiers who had fallen in battle. Hence the conception of the "Modern Maccabees" as outlined in the objects of the order: "To unite fraternally all white male persons of sound bodily health and good moral character, who are socially acceptable, between the ages of 18 and 70 years of age, and to provide for life and disability benefits to those between the ages of 18 and 51 years." The name "Maccabees" was first applied in modern times to a society organized in London, Ontario, in 1878, which in 1881 became defunct. The plans of the organization proved to be crude and unbusiness-like, as the rate of assessments was fixed at 10 cents for all ages, and no medical examination was required. As the deaths came in at a rapid rate, those members who had been trained along careful business lines soon realized that the Order could not long exist with such loose methods, and hence an effort was made to change the laws and plans of the society. It was reorganized and incorporated under a special act of the Michigan legislature on 11 June 1881, which date has always been observed as the anniversary of the birth of the organization. This order, up to the year 1902, confined its membership to the State of Michigan, when the Great Camp, the governing body, voted to extend its jurisdiction, and it is now operating successfully in 28 States and Territories. Its present membership is approximately 130,000, 115,000 of whom reside in Michigan, while its ladies' auxiliary body, known as the Ladies of the Modern Maccabees, has about 90,000 members. The Great Camp meets biennially at such place as it may have determined at the previous session. No one but a regularly elected delegate is allowed to vote, no officer of the association being accorded this privilege. Delegates are chosen by county conventions of tents or local bodies, on the basis of 1 for each 300 members. In case the governing body should pass any law that would appear to be objectionable to the members, upon a petition of 5 per cent of the tents the matter must be submitted to a vote of the members in the local organizations, and if it fails of approval there it becomes inoperative. It is claimed that this is the only organization of this character that has its provision in its laws. There is no profit accruing to any one connected with the order, outside of the salaries which the members vote to pay the officers. The plan of collecting assessments is upon the current cost basis, no reserve fund being deemed necessary.

Knights of Malta, Ancient and Illustrious Order of, a secret society founded in Jerusalem, Turkey, and in the United States in 1889. There are now 5 grand commanderies, 233 subcommanderies, and 27,000 members. In 1902 benefits to the amount of $40,000 were disbursed.

Knights of Pythias, a brotherhood organized to disseminate the principles of friendship, charity, and benevolence. The order was founded at Washington, D. C., 19 Feb. 1864, by Justus Henry Rathbone and four associates. An official declaration affirms that "toleration in religion, obedience to law, and loyalty to government" are its three cardinal tenets. The theme upon which the entire fabric of the society rests is the story of Damon and Pythias,— friendship even unto death being a paramount doctrine. The order at present is confined, in its jurisdiction, to the continent of North America; efforts earlier in its history to include the world as its field of action having proved futile. The name chosen, Knights of Pythias, rather than the more historically accurate designation of "Knights of Damon," was probably due to dramatic license, the reasons for which, like that of poetry, are obscure.

Origin.— The first drama of Damon and Pythias was a comedy, written 1571 A.D. The next effort of record was produced by John Banim,— the Irish poet,— associated with Richard Talor Sheil, who took the liberty of transposing the characters, making Pythias the hostage instead of Damon. This play was a tragedy and was first performed at Covent Garden, London, England, 28 May 1821. It was from the dramatic version of the story of Damon and Pythias that the founder of the order drew his inspiration, and it is the source from which has flowed the great Pythian river,— changing even the name of the society. The introduction, by the Irish poet, of the "fair Calanthe," the *affiancé* of Pythias, suggests an auxiliary order in which woman might labor with the Knights of Pythias, but no official recognition has ever been accorded to a branch admitting women to membership.

Founder.— Justus Henry Rathbone was born in Deerfield, Oneida County, N. Y., 29 Oct. 1839. He fitted for college at Utica, and be-

came an *alumnus* of Madison University. His father, Justus Hull Rathbone, was a prominent attorney at Utica, N. Y., and his mother came of the famous Dwight family of New England. The original ritual was written during the autumn, winter, and spring of 1858–9, while Mr. Rathbone was a teacher in Michigan. He lived to see the order of the Knights of Pythias firmly established in all its branches,— with a membership of over 300,000. He died 9 Dec. 1889. On 27 July 1898, at Utica, N. Y., a monument raised to his memory was unveiled with imposing ceremonies. This memorial was erected by the order, from the proceeds of a 10-cents-per-capita voluntary contribution.

History.— On 15 Feb. 1864, in Washington, D. C., five clerks of the government met to organize the new order. Their names were: Justus Henry Rathbone, Robert Allen Champion, William Henry Burnett, and his brother, David L. Burnett, and Edward Sullivan Kimball, M.D. Four of these, including Rathbone, were members of the Arion Glee Club of Washington, organized in 1863. Rathbone and Champion were affiliated with the Improved Order of Red Men, the other three did not belong to a civic society. The first enactment recited that "This association shall not be a copy, or imitation, of any existing order, but that it shall be instituted independently, and be intensely American." The obligation administered was not altogether "in form," but proved sufficient. The ritual was then read by its author. "This work," said a survivor, "embodied practically all the tenets of the order of the Knights of Pythias, as now exemplified, although the arrangement was afterward changed somewhat, and its principal features were elaborated." The four eager auditors heard the dramatic possibilities which have made the society popular, wherever introduced, and parted to meet four evenings later, in a room in F Street, between 9th and 10th, N. W. Each agreed to invite other clerks to be present, it being Rathbone's suggestion that the membership be restricted to this class of employees in the governmental departments. One J. T. K. Plant was to be especially invited, because he belonged to several organizations, and was familiar with their methods and regulations. "Washington Lodge, No. 1, was organized in Temperance Hall, Friday evening, 19 Feb. 1864," so run the minutes. The number of members is not stated; but, at the close of the year, these had increased to 52. The "founder" was elected worthy chancellor, with associate officers: Vice chancellor, venerable patriarch, worthy scribe, assistant scribe, banker, assistant banker, worthy guide, inside steward, and four choral knights. Evidently the resolution, adopted on the 15th, had not yet gone into effect. The grand lodge of the District of Columbia, was formed 8 April 1864, with J. T. K. Plant as grand chancellor. The other grand officers followed the titles adopted by the subordinate lodge. Franklin Lodge No. 2 was organized at Washington Navy Yard 12 April 1864, and others followed in rapid succession. Then the order waned, until, 1 Aug. 1865, Franklin No. 2 was the only lodge in existence; and it was an acting grand, as well as a subordinate lodge. When the year 1865 closed, the membership in No. 2 was nearly 60 there was a treasury of $200, and the "sole survivor" was in a prosperous condition, notwithstanding a loss of $255.55 through its "banker." On 1 May 1866 the grand lodge was reorganized, and the order spread to other jurisdictions. When the supreme lodge was constituted, 15 May 1868, the grand lodges of the District of Columbia, Pennsylvania, New Jersey, Maryland, and Delaware were represented. Through many trials, beset at times with disloyalty within and litigation without, from this beginning sprang the great order of the Knights of Pythias.

Government.— This is representative, and threefold, like the society's tenets. It is divided into three departments, namely: Legislative, executive, and judicial. These are regulated by statutes based upon constitutional provisions. In these particulars, and, in its methods of administration, the order has differentiated itself from others of its class. The government is vested in a supreme lodge, the source of all authority in the order; in State and provincial grand lodges, possessing subordinate authority over 10 or more lodges; in subordinate lodges, which create the membership by the acceptance of petitioners, and conferring upon them the ranks of "page," "esquire," and "knight." The supreme lodge was incorporated 5 Aug. 1870, under an Act of Congress approved the previous 5th of May, and many of the grand and subordinate lodges are, also, corporations. The order has, in addition to its three ranks, or degrees, an "endowment" rank, the insurance feature; and a "uniform" rank, the military division,— affiliation with which is voluntary, and predicated on regularity and good standing in the lodge. The titles borne by officers naturally follow the ritualistic structure. In the supreme body, with the prefix "supreme," these are, a chancellor, vice chancellor, prelate, keeper of records and seal, master of exchequer, master at arms, inner and outer guards. The endowment branch is managed by a board of control, the president of which is a supreme officer; and the uniform rank is commanded by a major-general, who is, also, an elective official. Prefix "grand," and the first eight become the names of officers of grand lodges. With one or two ritualistic variations, the officers of a lodge bear the same titles, excepting the prefix. Representatives are accorded the honor of "grand" or "supreme" in consonance with the name of the body in which they are elected to take seats. The executives are, respectively, the supreme and grand chancellors, and the chancellor commanders of subordinates. The judiciary consists of tribunes nominated by the executives and confirmed by the legislative bodies. Collectively these constitute the courts of last resort in the supreme lodge, and in grand lodges Trials in subordinate lodges are conducted by committees. This judicial system has attained the dignity of a settled jurisprudence, the decrees of which are often recognized in actions brought in the civil courts.

Uniform Rank.— The organization of the display branch dates from 1878. The "rank" sprang at once into popularity, and the notable parade at Cincinnati in 1888 served to induce the supreme body to perfect its rules and regulations. Before that year creditable appearances had been made, but then trained soldiers, properly officered, were in line. Since that time the Pythian army has been a regular feature of all assemblages. "Not only this," says the major-general, commanding, "but the uniform rank

has been most cordially welcomed by those outside of the order, and business and professional men, in our towns and cities, take pride in their local companies; while, in military circles, it has been hailed as a worthy addition to the military organizations of this continent." The ritual is emphatically patriotic; and the offer made to the United States government by this army of disciplined troops, for service in the Spanish-American war, is worthy of note. The powers of this branch are delegated to a supreme assembly,— with a representation in the aforesaid governing bodies,— and the organization follows the lines of the United States army, the "uniformed knights" using the government tactics.

Nomenclature.— Within the recesses of "castle halls," the terminology of the ages represented by the terms "page," "esquire," and "knight," govern the speech of those assembled. The jurisdictions of supreme and the grand lodges are called "domains," and all assemblies of the Knights of Pythias, "conventions." Members address one another as "brother knight." Documents are dated by the Pythian era, beginning with 1864. To find it, subtract 1863 from the common era. For example· 1903 — 1863 = 40.

Statistics.— The reports for 1903 show 562,327 members, gathered in 6,992 subordinate lodges, governed by 54 grand lodges, and a supreme lodge. The total annual receipts are $7,130,074.32; expenditures for relief, $1,470,-129.71; cash on hand, $2,558,039.74; aggregate of lodge assets, $11,109,913.57.

H. L. Stillson,
Grand Tribune, Vermont.

Knights of the Round Table, the knights of King Arthur, according to some accounts 12 in number, famed for their valor, who sat at a round table in token of their perfect equality. Other versions of the legend give their number as 50 or more. The most famous of them are Lancelot, Tristram, Galahad, and Gawayne. See Arthur; Arthurian Legends; Grail, The Holy.

Knights of St. John and Malta, a secret society founded 1883. It has a grand encampment, 68 subordinate encampments and 3,227 members. Since organization the society has disbursed $551,000 in benefits; and during 1902, the amount was $65,000.

Knights Templars. See Masonic Fraternity, The.

Knightstown, Ind., town in Henry County, on the Blue River, and on the Cleveland, C., C. & St. L., and the Pittsburg, C. & St. L. R.R.'s, 34 miles east of Indianapolis. Near the town are the State Soldiers and Sailors' Orphans' Home. The town has excellent water power, natural gas, flour-mills, torpedo works and other industries, and owns the electric light and waterworks plants. Pop. (1890) 1,867; (1900) 1,942.

Knipe, Joseph Farmer, American soldier: b. Mount Joy, Lancaster County, Pa., 30 Nov. 1823; d. Harrisburg, Pa., 18 Aug. 1901. In 1842 entered the United States army, and served in the Dorr Rebellion in Rhode Island, and subsequently in the Mexican War. At the outbreak of the Civil War he entered the volunteer service and was commissioned colonel of the 46th Pennsylvania regiment in August 1861. In May 1862 he was made a brigadier-general for gallant conduct, and after the War was postmaster at Harrisburg, 1866–9.

Knit'ting, an industrial and ornamental art allied to weaving, but of much later origin. It does not appear to be more than three or four centuries old, and seems to have been first used in the manufacture of stockings. It consists in forming a series of loops with a single thread, through which another row of loops is passed, and so on consecutively. In hand-knitting, steel-wires are used to form the loops on. For manufacturing purposes hand-knitting has been entirely superseded by machinery (see Knitting-machine), which is constantly receiving new improvements. Hand-knitting, however, still forms an agreeable domestic occupation, and also furnishes many women in some parts of the world with means of subsistence.

Knitting-machine. Of the many kinds of knitting-machines in use, one of the best known has a bed-plate with a vertically projecting and grooved needle-guiding cylinder or bed, and which is secured to a table or other suitable support. On the bed-plate is a loose ring with a thread-guide for conducting the thread to the needles, and about the needle-cylinder is a revolving cylinder with an annular groove interrupted by a cam-portion and provided with adjustable cams, which govern the downward motion of the needles, and consequently the length of the loops, and raise the needles; two of these latter cams being needed for reversing the machine for knitting a heel or a flat web. The cam-cylinder is moved by a bevel-gear connected to a driving-crank, and when moved continuously in one direction knits a circular web; and this web may be narrowed as desired, to fashion the leg, by removing needles, and placing their loops on adjacent needles. One needle receives the thread within its hook, and is subsequently moved by the cam-cylinder so as to form the thread so taken into a loop. When the heel is to be formed some of the needles are drawn up, their loops thus being retained and the number of needles left in action corresponds with the width of the heel to be formed. The cam-cylinder is now to be reciprocated in opposite directions, and in order to keep the thread-guide in advance of the descending needles sufficiently far, so that the thread will be caught, pins are inserted in the bed-plate to engage the heel of the thread-carrier and stop it just before the cam-cylinder is stopped.

Knolles, nōlz, or **Knowlles, Richard,** English historian: b. probably Cold Ashby, Northamptonshire, about 1550; d. Sandwich, Kent, 1610. He was graduated at the University of Oxford in 1565, and became master of the grammar school of Sandwich. He wrote a 'General History of the Turks' (1603), the style of which is highly commended by Johnson, Hallam, and other critics. An improved edition, with continuations, by Sir Paul Rycaut, was published (1687–1700).

Knortz, nôrtz, **Karl,** American miscellaneous writer: b. Garbenheim, near Wetzlar, 28

Aug. 1841. He was educated at Heidelberg University and came to the United States in 1863. He taught in Detroit, Oshkosh, and Cincinnati, 1864–74, edited a German daily in Indianapolis for some years, and since 1892 has been superintendent of German schools in Evansville, Ind. Among his numerous works are: 'Tales and Legends of the North-American Indians' (1871); 'American Sketches' (1876); 'Longfellow' (1879); 'From the Wigwam' (1880); 'Indian Legends'; 'Pictures of American Life' (1884); 'History of American Literature,' in German (1891); 'Individuality' (1897); 'Child Study' (1899). He has very materially assisted in making American authors known in Germany.

Knot, a snipe (*Tringa canuta*) known in its migrations throughout the world, but breeding only in the extreme north, where its pale-green, spotted eggs have been found in only one instance. It appears in small flocks along all shores, and is a favorite with gunners under the names robin-snipe and gray snipe. Its plumage is a mingling of black and white suffused with a reddish tint on the under parts. The book-names refer to its habit of seeking its food just at the edge of the surface, where King Canute is fabled to have seated himself in defiance of the tide.

Knot, a term synonymous for a nautical mile. The log-line is divided by knots (or otherwise) into sections $\frac{1}{120}$ of a geographical mile in length, hence the number of sections run out in half a minute (the 120th of an hour) indicates the number of knots or geographical miles per hour at which the ship is going. The rate at which a vessel sails, or can sail, is usually given in knots per hour, the Admiralty knot or measured mile being 6,080 feet. It is longer than an ordinary statute mile by about one mile in seven; or the nautical mile of 6,080 feet = 1.151 statute mile.

Knot, Black. See FUNGI.

Knot-fungus. See FUNGI.

Knot-grass. See GRASSES.

Knot-root. See LABIATÆ.

Knots. See KNOTTING AND SPLICING.

Knott, nŏt, **James Proctor,** American legislator and legal scholar: b. near Lebanon, Marion County, Ky., 29 Aug. 1830. He studied law in 1846–51, was admitted to the Missouri bar in 1851, and entered practice at Memphis, Scotland County. In 1858 he was elected to the Missouri legislature, in 1859 was appointed to the office of attorney-general of Missouri to fill a vacancy and in 1860 was elected to that post. Having refused, at the beginning of the Civil War, to take an oath of allegiance which he considered too severe, he was for a time imprisoned in the St. Louis arsenal. In 1862 he removed to Kentucky, where he established himself as a practitioner at Lebanon; and in 1867–71 and 1875–83 served in Congress as Democratic representative from the 4th Kentucky district. He was long chairman of the House committee on the judiciary. In the 41st Congress he made his well-known speech on Duluth, ridiculing the pretensions of the lake town, and gaining a national reputation as a humorist. He was governor of Kentucky in 1883–7, a delegate to the Kentucky constitutional convention in 1891, professor of civics and economics in Centre College (Danville, Ky.) in 1892–4, and from 1894 professor of law and dean of the law faculty of Central University.

Knotting and Splicing, the fastening or tying of ropes or cords. There are hundreds of varieties of knots, most of which are used only on shipboard. Generally the requirements of a useful knot may be stated to be that it should neither "slip" nor "jam," that, while it holds without danger of slipping while the strain is on it, when slackened it should be easily untied again. The simplest knot is the common one tied on the end of a thread or cord to prevent it slipping. By passing a loop instead of the end of the cord the common slip-knot is formed; and a useful fixed loop is got by tying a simple knot, or the "figure of 8 knot" on the loop of a cord. One of the simplest and most useful running knots for a small cord is made by means of two simple knots. The most secure method of fastening a line to, say, a bucket is the standing bowline; and a running bowline is formed by passing the end through the loop thus making a running loop. Out of the score or so of methods of fastening a boat's painter the one which will be found most useful is the well-known two half-hitches. The timber hitch is useful for attaching a line to a spar or a stone, and the clove hitch is invaluable for many purposes. It is very simple and cannot slip. A simple method of fastening a rope to a hook is the blackwall hitch, where the strain on the main rope jams the end so tightly against the hook that it cannot slip. There are many methods for shortening a rope temporarily, one of them being the sheepshank.

Of the methods for uniting the ends of two cords the simplest and one of the most secure is the common reef knot, which must be carefully distinguished from the "granny," which will jam if it does not slip; the reef knot will do neither. For very small cords or thread the best knot is the weaver's. The fisherman's knot is a very useful one for anglers, and is formed by a simple knot in each cord being slipped over the other; when drawn taut it is very secure, and it is easily separated by pulling the short ends. A useful method of uniting large ropes is to tie a simple knot on the end of one rope and interlace the end of the other, and draw taut. This tie may also be made with the figure of 8 knot. For very large ropes the carrick bend is the simplest and most secure. The bowline bend is formed by looping two bowline knots into each other. For attaching a small line to a thick rope the becket hitch is very useful.

"Splicing" is the process employed to join two ropes when it is not advisable to use a knot. The three chief varieties of the splice are the short splice, the long splice, and the eye splice. The short splice is made by unlaying the ends of two ropes for a short distance and fitting them closely together; then, by the help of a marlinspike, the ends are laced over and under the strands of the opposite rope. When each strand has been passed through once, half of it is cut away and the remainder passed through again; half of the remainder being also cut away, it is passed a third time, and, when all the strands are so treated, they are hauled

taut and cut close. This reducing the thickness of the strands tapers off the splice. The long splice is employed when the rope is used to run through a block, as it does not thicken it. The ends of the two ropes are unlaid for a much longer distance than for the short splice, and similarly placed together. Then one strand is taken and further unwound for a considerable distance, and its vacant place filled up with the corresponding strand of the other rope, and the ends fastened as in the short splice. Other two of the strands are similarly spliced in the opposite direction, and the remaining two fastened at the original joining place. The eye splice is, as the term implies, used to form an eye, or round a dead eye.

To prevent a rope fraying at the ends a variety of methods are employed, the simplest being to serve or whip the end with small cord.

Knout, nowt, or noot, the official instrument of punishment formerly used in Russia, made in various forms, but usually being a whip of leather thongs artificially hardened, twisted with wire, etc. One hundred strokes were considered equivalent to a sentence of death, as the victim seldom survived.

Knowledge, Theory of. See EPISTEMOLOGY.

Knowles, nōlz, **Frederic Lawrence,** American writer: b. Lawrence, Mass., 8 Sept. 1869; d. Roxbury, Mass., 20 Sept. 1905. He was graduated from Wesleyan University in 1894 and was literary adviser of the Boston publishing firm of Dana, Estes & Co. Beside editing 'Cap and Gown' (1897); 'Golden Treasury of American Lyrics' (1897); 'A Year Book of Famous Lyrics' (1901); he was the author of 'Practical Hints for Young Writers, Readers and Book Buyers' (1897); 'A Kipling Primer' (1900); 'On Life's Stairway,' verse (1900).

Knowles, G. Sheridan, English painter: b. Manchester 25 Nov. 1863. He was educated at private schools and studied art at Manchester and London, working at the Royal Academy Schools from 1884 to 1888. From that date he has actively pursued painting as a profession and has exhibited in the Royal Academy every year. His pictures are popular and romantic genre, and many of them have been engraved. His principal works are: 'The Last Minstrel' (1889); 'The Return from the War' (1892); 'The Wounded Knight' (1895); 'Glasgerion' (1897); 'The Flight of Huguenots from France' (1900).

Knowles, James, English architect and editor: b. 1831. He was educated as an architect and among professional works of his are Tennyson's Surrey home, Aldworth; several churches in Clapham, and the fountain in Leicester Square, London. He originated the Metaphysical Society in 1869, edited the 'Contemporary Review,' 1870–7, and founded the 'Nineteenth Century,' of which he is the editor and proprietor.

Knowles, James Sheridan, Irish dramatist and actor: b. Cork, Ireland, 21 May 1784; d. Torquay, Devonshire, 30 Nov. 1862. He went upon the stage in 1806, but meeting with small success, taught elocution in Belfast and Glasgow. His tragedy of 'Caius Gracchus' was performed at Belfast in 1815 with success, and from this time he had a prosperous career. In 1845 he retired from the stage from scruples of conscience, and in 1852 became a Baptist preacher and published several theological works. In 1849 he received a pension of £200 a year from Government. Among his principal works are the dramas: 'Caius Gracchus' (1815); 'William Tell' (1825); 'Virginius' (1829); 'The Hunchback' (1832); 'The Wife of Mantua' (1833); 'The Love-chase' (1837); 'Love' (1839). In 1847 and 1849 he published two novels, 'Fortescue' and 'George Lovell.'

Knowles, Lucius James, American inventor: b. Hardwick, Mass., 2 July 1819; d. Washington, D. C., 25 Feb. 1884. He became a clerk in a shop at Shrewsbury, Mass., turned his attention to inventing, devised the Knowles safety steam-boiler feed-regulator, and constructed and operated several models of steam-engines. In 1843 he invented a machine for the spooling of thread, and this machine he manufactured at New Worcester in 1843–5. He then built spinning-machines for the manufacture of four- and six-cord thread, and manufactured cotton thread and warps at Spencer and Warren, Mass. (1847–53), and woolen goods at Warren (1853–9). Subsequently he manufactured a safety boiler-feeder, a steam pump, and a tape loom, under his own patents. He was elected to the lower house of the Massachusetts legislature in 1862 and 1865, and in 1869 became State senator.

Knowlton, nōl'tŏn, **Frank Hall,** American botanist: b. Brandon, Vt., 2 Sept. 1860. He was graduated from Middlebury College, Vt., in 1884, was assistant palæontologist on the United States Geological Survey 1889–1900 and palæontologist from the last named date. Among his scientific monographs are: 'Fossil Wood and Lignite of the Potomac Formation' (1889); 'Fossil Flora of Alaska' (1894); 'Catalogue of the Cretaceous and Tertiary Plants of North America' (1896).

Knowlton, Helen Mary, American artist and author: b. Littleton, Mass., 16 Aug. 1832. She studied art under William M. Hunt (q.v.) and Duverneck and has for 30 years taught art in Boston. Beside compiling Hunt's 'Talks on Art,' she has written 'Hints to Pupils in Drawing and Painting' (1879); 'Life of William Morris Hunt' (1899).

Knowlton, Thomas, American soldier: b. West Boxford, Mass., 30 Nov. 1740; d. battle of Harlem Plains, N. Y., 16 Sept. 1776. A farmer at Ashford, Conn., at the beginning of the Revolution, he was elected captain of a militia company organized after Lexington, and with 200 other Connecticut troops was sent to Charlestown. His detachment, ununiformed farmers with shot-guns, fought at Bunker Hill. On 8 Jan. 1776 he made a successful invasion of Charlestown, and subsequently became lieutenant-colonel of a regiment of Connecticut rangers. He was killed while leading his command, at the battle of Harlem Heights, and was highly praised by Washington in general orders.

Know-nothing Movement, The, a secret political association organized in the United States for the purpose of obtaining the repeal of the naturalization law, and of the law which permitted others than native Americans to hold office. It started in 1852 and existed two or three years. The principles of the Know-noth-

ing party were embodied in the following propositions (at New York, 1855): (1) The Americans shall rule America. (2) The union of these States. (3) No North, no South, no East, no West. (4) The United States of America — as they are — one and inseparable. (5) No sectarian interferences in our legislation or in the administration of American law. (6) Hostility to the assumption of the Pope, through the bishops, etc., in a republic sanctified by Protestant blood. (7) Thorough reform in the naturalization laws. (8) Free and liberal educational institutions for all sects and classes, with the Bible, God's holy word, as a universal text-book. A society was formed in 1855 in opposition to the above, called Know-somethings. Both bodies were absorbed into the two parties, Democrats and Republicans, at the presidential election in 1856.

The Know-nothing organization was primarily the result of foreign emigration. In 20 years from 1825 to 1845, the immigration amounted to 1,028,225. The consequence was a sharp awakening of native American prejudice and alarm. The sentiment first showed itself in New York, where the alien population had reached portentous proportions, in the estimation of citizens of the old stock. A native organization for political purposes was effected, and in 1844 it succeeded in electing James Harper mayor on a native American ticket. About this time began the great immigration due to the Irish famine, and in the five years from 1845 to 1850 there came in about as many aliens as had been received during the whole 20 years before. Native Americanism flamed up hotter than ever, and its political conflagration extended to other cities and States. The great volume of the Irish immigration was Roman Catholic, and animosity to that church gave it fire. At Philadelphia two Roman Catholic churches were destroyed in riots between natives and Irish; at Boston a convent was burned. Six native American representatives were elected to the 29th Congress, that of 1845, four from New York and two from Pennsylvania. Between 1850 and 1855 the immigration amounted to nearly 2,000,000; and the native spirit was aroused even more hotly. Moreover, the anti-slavery agitation, expressing itself in opposition to the extension of slavery to the Territories, was disturbing party allegiance, and special efforts were made to kindle the native American spirit into a hot flame, with an ulterior motive, it was believed, of turning the current of public sentiment into other channels.

In 1852 the Know-nothing organization, distinctly, made its appearance. It was so-called because it was a secret oath-bound fraternity, regarding whose objects and whose real name its members always answered when questioned: "I don't know." "Americans must rule America!" was its rallying cry, and relentless hostility to the increasing power of the Roman Catholic Church and a demand for the extension of the naturalization to 21 years were its main purposes. The Know-nothings started off brilliantly. In 1854 they carried the State elections in Massachusetts and Delaware, and polled a great number of votes in New York. In 1855 they elected governors and legislatures in New York and four New England States, and at the South they were successful or nearly approached success in nine States. In 1856 eight of the 32 States had native American governors, but in the presidential election of that year the party cast only about one fifth of the popular vote and obtained only eight electoral votes, or the votes of the single State of Maryland. In the 35th Congress, 1857, it had 5 senators and 14 representatives. In the next Congress it had 2 senators and 23 representatives, all of them from Southern States. Soon thereafter Know-nothingism went to pieces rapidly and no more of it was heard in politics. It had no representation in Congress after the 36th. See also AMERICAN PARTY.

Knox, nŏks, **Adeline Trafton,** American novelist; daughter of Mark Trafton (q.v.): b. Saccarappa, Maine, 8 Feb. 1845. She was married to Samuel Knox, a lawyer of St. Louis, Mo., in 1889. She has written: 'Katherine Earle' (1874); 'His Inheritance' (1878); 'An American Girl Abroad'; 'Dorothy's Experience' (1891).

Knox, George William, American Presbyterian clergyman: b. Rome, N. Y., 11 Aug. 1853. He was graduated from Hamilton College, Clinton, N. Y., in 1874, and from Auburn Theological Seminary in 1877. He subsequently was employed in missionary labors in Japan and was professor of philosophy and ethics in the Imperial University of Japan in 1880. On returning to the United States he became pastor of a Presbyterian Church in Rye, N. Y., and was a professor at Union Seminary, N. Y., 1897–9. He has written (in English): 'A Japanese Philosopher' (1893); (in Japanese) 'A Brief System of Theology'; 'Outlines of Homiletics'; 'Christ, the Son of God'; 'The Basis of Ethics'; 'The Mystery of Life'; 'The Christian Point of View' (1902).

Knox, Henry, American general and cabinet officer: b. Boston, Mass., 25 July 1750; d. Thomaston, Maine, 25 Oct. 1806. He was the 7th son of William Knox, a native of St. Eustatius, West Indies, who settled in Boston and became a shipmaster. After the father's death in 1762, the son was employed by a Boston bookseller, and in 1771 he opened a bookstore of his own. When a young man he threw in his lot with the patriot cause and spent his leisure studying books on the military art, supplementing his reading by observing and questioning the British officers stationed in Boston. His marriage (16 June 1774) to Lucy Flucker, the daughter of an aristocratic loyalist of Boston, did not prevent him from joining the Colonial army at the outbreak of hostilities in the spring of 1775. He fought in the battle of Bunker Hill and then aided in constructing the defenses of the camps around Boston. The army being in pressing need of artillery, Knox proposed to Washington the plan of bringing heavy cannon and stores from Fort Ticonderoga near the Canadian frontier. He set out (15 Nov. 1775) on this perilous enterprise with a squad of mounted men. In the face of great difficulties he succeeded in getting 55 guns, loaded them on sleds, with 2,300 pounds of lead and a barrel of flints, and reached Cambridge in safety (24 Jan. 1776). For this brilliant exploit he was warmly complimented by Washington. After his return he received his commission as colonel of the one artillery regiment, the appointment having been made by the Continental Congress (17 Nov. 1775). The cannonade of

Knox's batteries (on the night of 1 March 1776) enabled General Thomas to take possession of Dorchester Heights, which resulted in the evacuation of Boston by the British forces. In the summer of 1776 he was stationed at New York city with Washington, who found him a true friend and an able officer. In December he was promoted to brigadier-general of the artillery. He distinguished himself in the battles of Trenton and Princeton, and took part in the engagements at Brandywine, German town, and Monmouth. He helped (May 1777) General Greene in planning the defenses of the Hudson River. In the trying winter of 1777–8 he was in camp at Valley Forge, with his young wife. Many of Washington's letters refer to Knox in terms of high appreciation. He rendered valuable service in the operations against Cornwallis in October 1781, his skill as an artillerist being praised by the Frenchman, De Chastellax. He was made major-general (22 March 1782) and appointed to the command at West Point (29 Aug. 1782). Upon him devolved the delicate task of disbanding the army late in 1783. He had already formed the Society of the Cincinnati to keep alive the friendships of officers formed during the war.

Congress appointed Knox Secretary of War (8 March 1785), a position he worthily filled for ten years. In 1794 he was also at the head of the Navy Department, just organized. Owing to insufficient salary, he resigned from Washington's cabinet (2 Jan. 1795). His remaining years were passed at his home in Thomaston, Maine. Consult: Drake, 'Life and Correspondence of Henry Knox' (1873); Noah Brooks, 'Henry Knox, a Soldier of the Revolution' (1900).

EUGENE PARSONS,
Editor 'The World To-day.'

Knox, John, Scottish Protestant reformer: b. Giffordgate, Haddington, Scotland, 1505; d. Edinburgh 24 Nov. 1572. (The society of antiquaries of Scotland discussed the subject of his birthplace in 1858, when Mr. John Richardson of Haddington brought forward evidence that he was born in Giffordgate, a suburb of Haddington, and not in Gifford, a village near that town. He was supported in this view by Mr. Laing, the editor of the reformer's works.) After receiving his preliminary education at the grammar school of Haddington, he went in 1521 to the University of Glasgow, where for several years he studied scholastic philosophy and theology. Noted as a master of dialectic subtleties, he was ordained prior to 1530, and became a teacher of philosophy at St. Andrew's. The study of the fathers, especially of Jerome and Augustine, had shaken his religious opinions as early as 1535, but it was not till 1542 that he became an avowed and marked reformer. The long period of silence, before in mature age he explained his views with completeness, has been regarded as proof that he was naturally of a prudent and peaceful disposition, and not a turbulent partisan, as his after career would indicate. His reprehension of certain practices of the Church caused him to retire from St. Andrews to the south of Scotland, where he was declared a heretic. After the death of his friend George Wishart, he remained in retirement till he took refuge with many other Protestants (1547) in the castle of St. Andrew's, which the regent was vainly attempting to reduce. There for the first time he became known as a powerful preacher against the papacy. The regent, re-enforced by a French squadron, obliged the garrison to surrender. The terms of the capitulation were violated, and Knox with his comrades was transported to France, where he was imprisoned on the galleys for 19 months. He experienced extreme hardships, and on his release (1549) directed his course to England, where he was appointed to preach at Berwick and at Newcastle, and became one of the chaplains of Edward VI. For the boldness of his discourses he was several times called to account, but was able to vindicate himself. A bishopric was offered to him, but he declined it from scruples as to the divine authority of the episcopal order. On the accession of Queen Mary he fled from England to Dieppe, and passed thence to Geneva, where, after taking part in the memorable troubles at Frankfort and after a short visit to Scotland, he became pastor (1556) of a small English congregation. The two years of his residence in Geneva, in the society of Calvin, Beza, and other learned men, were among the happiest of his life. While in Scotland he had been cited to appear before an assembly of the clergy to be held at Edinburgh, and after his return to Geneva the citation was renewed, and he was condemned to be burned as a heretic, and the sentence was executed on his effigy. Against this condemnation he published the 'Appellation of John Knoxe.' He also wrote a tract entitled the 'First Blast of the Trumpet against the Monstrous Regiment of Women' (1558), a vehement attack on the political government of women, at a time when Mary of Guise was regent of Scotland and Mary Tudor queen of England, and the nearest in succession to both thrones were females. Invited by the Scottish Protestants to resume his labors in his native country, he landed at Leith in 1559. The queen regent had laid her plans for the forcible overthrow of the reformation. At a convention of the nobility and clergy in Edinburgh all the demands of the Protestants were refused. Several of the reforming preachers were summoned to appear at Stirling for trial, but by the dissimulation of the regent were prevented from attending and then outlawed for their failure. Knox hastened to meet them at Perth, where he preached against the "idolatry of the mass" and the veneration of images. At the conclusion of the service there was a violent outbreak. The images in the churches were demolished, the pictures torn from the walls and trampled under foot, the holy recesses invaded, and the "rascal multitude," as Knox calls them, did not stop till they had sacked and laid in ruins the houses of the Dominican and Franciscan friars and the Carthusian monastery. The queen regent advanced upon Perth with an army, but, finding the Protestants well prepared for resistance, proposed terms of accommodation which were accepted. The Protestants, in order to consolidate their strength, formed a religious bond or covenant, and began to be distinguished as the congregation, and their leaders as the lords of the congregation. Iconoclasm was a prominent feature in the Scottish reformation. Events similar to those at Perth followed at Stirling, Lindores, Cupar, St. Andrews, and other places. Knox had preached in the cathedral of St. Andrews with such success that the

magistrates united with the inhabitants in desolating the churches and monasteries, and in establishing the reformed worship. Meantime civil war raged throughout the kingdom between the regent, assisted by French troops, and the lords of the congregation. In political as well as ecclesiastical affairs Knox was a conspicuous adviser, and took up his residence in Edinburgh after an extensive circuit through the southern and eastern counties. After a contest of 12 months, the vigorous assistance rendered by Elizabeth, and the death of the queen regent while the English troops were investing Edinburgh led to a truce and to the summons of the Parliament to settle differences. Parliament assembled in August 1560, the reformed religion was established, and Roman Catholicism interdicted by law in Scotland. Soon after the arrival of the young Queen Mary (21 Aug. 1561) she summoned the influential and noted reformer to her presence. Six interviews are recorded between him and the queen, and the questions which she raised were discussed by him with a rude vehemence and rigor, which once drove her to tears. She caused his arrest on a charge of treason in 1563, but all the councillors except the immediate dependents of the court voted for his acquittal. The vehemence of his public discourses led him into frequent difficulties. In 1562 he disputed publicly for three days with Abbot Quentin Kennedy at Maybole; in 1565 he quoted certain texts which gave offense to the court, and was for a short time prohibited from preaching. He fled from Edinburgh when the queen returned from Dunbar after the death of Rizzio; and he preached a sermon at the coronation of the infant king at Stirling (29 July 1567). Under the brief regency of Moray, the work of Knox seemed to be completed, but after the assassination of Moray, civil and religious confusion returned under the regency successively of Lennox and Mar. Weakened by a stroke of apoplexy in 1570, Knox yet reappeared in the pulpit, but so violent was the enmity excited by his animadversions that he left Edinburgh for St. Andrews 5 May 1571. He returned in the following year, and his last energies were put forth in denunciations of the perpetrators of the massacre of St. Bartholomew's.— The doctrines of Knox embraced a Calvinistic creed and a Presbyterian polity. The "Order of Geneva," a liturgy which he shared in preparing for the use of the church at Frankfort, and subsequently employed in his congregation at Geneva, was introduced into Scottish Protestant churches in 1565. His character was marked by a stern realism, which could be beguiled by no social pretensions, no conventional dignities, no pompous traditions. From this sprang his scornful bitterness and his insensibility to the social graces and refinements which Mary exhibited. He was not a thinker except on political topics. His 'History of the Reformation of Religioun in the Realme of Scotland' is the best known of his writings. Consult: 'Lives,' by McCrie (1813); Taylor (1885); P. H. Brown (1895); Lorimer, 'John Knox and the Church of England' (1875); Carrick, 'John Knox and his Land' (1902).

Knox, John Jay, American financier: b. Knoxboro, N. Y., 19 March 1828; d. New York 9 Feb. 1892. He was graduated at Hamilton College in 1849, and was a banker till 1862 In that year he received an appointment from Secretary Chase, and subsequently had charge of the mint coinage correspondence of the Treasury Department, becoming in 1867 deputy comptroller of the currency. A bill which he proposed was passed with a few modifications, and is known as the Coinage Act of 1873. In 1872 he was appointed comptroller of the currency, resigning in 1884, to become president of the National Bank of the Republic, New York. In addition to various Reports, he published 'United States Notes' (1884, revised 1887).

Knox, Philander Chase, American lawyer and politician: b. Brownsville, Pa., 4 May 1853. He was graduated from Mount Union College, Ohio, in 1872; studied law and was admitted to the bar in 1875. He was assistant United States district attorney for the western district of Pennsylvania in 1876–7: resigning this position he took up the practice of law in Pittsburg in partnership with J. H. Reed. The firm's practice grew rapidly, and Knox became known as one of the most successful corporation lawyers in the United States; in 1892 he was counsel for Carnegie during the Homestead strike. April 1901 he was appointed attorney-general of the United States and held this office till June 1904 when he became senator from Pennsylvania. As attorney-general he was involved in the "anti-trust" agitation and dealt with the question from a purely lawyer's standpoint, and in 1902 brought suit against the Northern Securities Company and the so-called "Beef Trust" on the ground that they were violating Federal statutes.

Knox, Thomas Wallace. American journalist and traveler: b. Pembroke, N. H., 26 June 1835; d. New York 6 Jan. 1896. He went to Colorado in 1860 and there engaged in journalism, and during the Civil War served as volunteer aide. He made a journey around the world as a newspaper correspondent in 1866 and again in 1877, and wrote many popular books for young people. Among his very numerous published works are: 'Underground Life' (1873); 'How to Travel' (1880); 'Boy Travelers Series' (15 vols. 1880–94); 'Lives of Blaine and Logan' (1884); 'Decisive Battles since Waterloo' (1887); 'The Lost Army' (1894); 'Hunters Three' (1895); 'In Wild Africa' (1895); etc.

Knox College, a coeducational institution, founded in 1837 at Galesburg, Ill., as Knox Manual Labor College. The school was opened in 1841, and in 1857 the name was changed to Knox College. The original plan for founding and maintaining the school was to secure subscriptions to the amount of $40,000 and to purchase lands in the Mississippi Valley, at government price, the lands to be resold at a profit. Every subscriber who purchased 80 acres of land was given free tuition for one student for 25 years. In 1902 the productive fund amounted to about $250,000. The tuitions and other fees amounted to $14,526; the income from the productive funds and other sources was nearly $15,000. There are in the library about 10,000 volumes. In 1903 there were connected with the school 35 instructors and professors; and 700 students. A music department was established in 1883. The famous Lincoln-Douglas debate, in 1858, was held on the grounds of this college.

Knox-Little, William John, English Anglican clergyman and author: b. Stuartstown, County Tyrone, Ireland, 1839. He was educated at Cambridge University, took orders in the English Church, and after holding several curacies was rector of St. Alban's, Cheetwood, Manchester, 1875–85. Since 1885 he has been canon residentiary of Worcester Cathedral and vicar of Hoar Cross. He is an "advanced" churchman and has several times visited the United States, where he has preached in many Episcopal churches conspicuous for High Church leanings. He is a popular religious writer, and among his many books are: 'Meditations on the Three Hours' Agony of Our Blessed Redeemer' (1877); 'The Broken Vow: a Story' (1887); 'The Child of Stafferton' (1888); 'The Perfect Life' (1899); 'Studies on South Africa' (1899); 'Holy Matrimony' (1900).

Knoxville, nŏks'vĭl, Iowa, city and county-seat of Marion County, on the Chicago, B. & Q., and on the Chicago, R. I. & P. R.R.'s, 35 miles southeast of Des Moines. Here is the State Industrial Home for the Blind, court house, high school and public library. It is the centre of an extensive coal-mining, stock-raising and agricultural district, and has flour-mills, canneries and machine shops. Pop. (1890) 2,632; (1900) 3,131.

Knoxville, Tenn., city, county-seat of Knox County; on the Tennessee River, and on the Knoxville & A., the Knoxville, C. G. & L., the Southern, and the Atlanta, K. & N. R.R.'s; about 110 miles northeast of Chattanooga. It is connected with South Knoxville, on the south side of the river, by a magnificent steel bridge. The site is a picturesque one, being near the centre of the valley between ranges of the Alleghany and Appalachian Mountains, which are visible from several points in and about the city. It is built on a series of sloping hills and their intervening valley-like spaces; the average elevation above the sea-level being about 1,000 feet. It is the commercial centre of a large area of territory, embracing, besides the eastern division of Tennessee, also western North Carolina, southwestern Virginia, North Georgia, and a large part of eastern Kentucky. The rich coal fields which furnish so large a proportion of the fuel supply for the Southern States are from 25 to 60 miles distant from Knoxville. These are the Coal Creek and Jellico districts, and the operators of a majority of these mines have their headquarters in Knoxville.

History.—Knoxville was founded in 1791, by Gen. James White, who had been an officer in the American army in the War for Independence. It was named in honor of Gen. Knox, of Revolutionary fame, the first secretary of war. The first building, a block house, was erected for the protection of the pioneer settlers against the attacks of Cherokee Indians. For a number of years Knoxville was a government military post, barracks being erected for the accommodation of those in the military service. In those days Knoxville was the centre of interest in connection with Indian depredations so common in the settlement of Tennessee.

Trade and Manufactories.—For more than a third of a century Knoxville has been doing a large wholesale business. Wholesale merchants have reached out for additional markets into all the surrounding States. It has good shipping facilities and a branch of the Louisville & Nashville road, about 65 miles in length, is being built and when completed will give the city additional direct connection with the Northwest. During two thirds of the months of the year small steamboats ply on the Tennessee and French Broad rivers, above and below the city and do a large amount of local business. The growth in the number and the capacity of manufacturing establishments in the past decade has been very marked. More than 28 per cent of the entire population of the city is engaged in manufacturing. The chief manufactures are woolen and cotton goods, furniture and cabinet mantels, marble sawed and polished, bar iron, boilers, stoves, castings, coffins and caskets, iron fencing, ready-made clothing, beer, desks, and flour. The woolen and cotton factories, the marble works and the flour mills are large establishments. The growth of small manufactories in the past ten years is a feature that is attracting attention. The marble which is found in quarries at the very gates of the city is used for ornamental purposes in almost every large public or private building being erected in any part of the United States, and the hardwood cabinet mantels being manufactured here are sold in almost every State in the Union. The great abundance and close proximity of raw material — timber, a large number of varieties: coal, iron ore, marble, and zinc, make the place desirable as a manufacturing site.

Climate.—The near proximity of the tall mountains on either side, almost surrounding the valley of which Knoxville is so nearly the geographical centre, does much to modify climatic conditions, and to render them different from those of other cities situated in about the same latitude. The city and surrounding country has been comparatively immune against destructive storms. The average mean annual temperature for a period of 25 years, as shown by the local records of the Government Weather Bureau, is 57°, the mean summer temperature 74°; mean winter 40°; mean spring 57°; mean autumn 58°. The temperature in winter has occasionally gone as low as zero, slightly below, but has continued only for a short time. The maximum mid-day summer temperature has gone as high as 100°, but as a rule the nights are cool.

Banks.—There are eleven banks in the city, five of them national banks. Their combined capital is $1,050,000, with $472,000 surplus and undivided profits. The transactions of the clearing-house have trebled in the past ten years, and during the present year (1903) have averaged over a million dollars weekly.

Churches and Schools.—There are 42 churches in the city for the white population and 17 for the colored. All but one of these are Protestant. The leading denominations, reckoning on the basis of the number of communicants, are the Methodists, Baptists and Presbyterians, in the order mentioned. There are two Protestant Episcopal, three Christian, and two Lutheran churches. It is the seat of the University of Tennessee, the East Tennessee Female Institute, the Tennessee Normal College, the University (preparatory) School, and Saint Mary's Academy. The Knoxville College, for colored students, founded and maintained by the United Presbyterian Church, is located here. The public schools have ten

buildings for the white children, and four for the colored. About 100 teachers are employed. The school session is nine months in the year at an average annual cost of about $55,000. The State School for Deaf Mutes is located in Knoxville, also the Lyons View branch of the State Hospital for the Insane.

Benevolent Institutions.—Among the chief of these is the Industrial School for Juveniles, sustained at the expense of Knox County, capable of housing and giving instruction to 200 girls and boys; the Home for Aged Women and an orphanage. The Knoxville General Hospital was erected at a cost of more than $50,000, and is one of the leading institutions of its kind in the South.

Government.—The city is governed by a mayor and board of aldermen elected by the people for the term of two years, and a board of public works elected in the same manner. The assessed value of property for taxation is $14,000,000 which is not exceeding 75 per cent of its actual value. The bonded debt of the city is $1,200,000, most of which was created for paving streets, constructing sewers, building bridges, and other public improvements. The city is supplied with pure wholesome water, from the Tennessee River, by a private corporation which owns the water plant. The lighting plants, gas and electric, are also owned by private corporations.

Population.—The population by the census of 1900 was 32,637; in 1890 it was 22,535; in 1880 9,663; in 1870 8,682. In 1900 the colored population numbered 22.5 per cent of the whole and the foreign population 2.7. The increase in recent years has been very rapid, and it is claimed now (1903) with good reason, that the population of the city and close in suburbs, not embraced in the municipal limits, is at least 60,000.

WM. RULE,
Editor Knoxville 'Journal and Tribune.'

Knurr-and-Spell. See NUR-AND-SPELL.

Knyphausen, knĭp'how-zĕn, BARON **Wilhelm von,** German soldier: b. Lützberg 4 Nov. 1716; d. Cassel 7 Dec. 1800. Educated at Berlin, he entered the Prussian army in 1734, in which he became in 1775 a general officer under Frederick II. (the Great). He came to the United States in that year as second in command of the Hessians in the English service, and superseded Gen. von Heister as commander-in-chief in 1777. He fought at Long Island, White Plains, Brandywine, and Monmouth; and during the temporary absence of Clinton in 1780, commanded New York. In 1782 he returned to Germany, where he later became military governor of Cassel. He was a capable soldier, and had no high opinion of his unreliable mercenaries.

Koa'la, a remarkable marsupial (*Phascolarctos cinereus*) of the family *Phalangeridæ*, found chiefly in the interior of New South Wales, and known to the colonists as "native bear." It is about two feet long, and has a heavy, depressed, somewhat bear-like form, no tail, strong limbs with five digits armed with long claws on each, the inner digit on the hind feet and two inner on the fore feet opposable to the others, the ears large and like the rest of the body covered with a dense gray woolly fur. These characteristics fit it for an arboreal existence, and it lives altogether in trees, descending only occasionally to dig for roots. It is especially active at night and feeds on leaves and buds of eucalyptus trees. It is timid and defenseless, and is killed with clubs by the Australian blackfellows, who eat its flesh. Compare WOMBAT, and consult authorities cited under MARSUPIALIA.

Kobbé, kŏb'bā, **Gustav,** American author and journalist: b. New York 4 March 1857. He was graduated at Columbia University in 1877, and at its Law School in 1879; and has since been employed in newspaper and magazine work. He has published: 'The Ring of the Nibelungen' (1889); 'Wagner's Life and Works' (1890); 'My Rosary and Other Poems' (1896); 'New York and Its Environs' (1891); 'Plays for Amateurs' (1892); 'Miriam' (1898); 'Opera Singers' (1901); 'Signora, a Child of the Opera House,' a novel (1902).

Kobbe, kŏb, **William A.,** American general: b. New York 10 May 1840. He was educated in Germany till 1862 and was graduated from West Point in 1873. He served in the Civil War in the 7th New York regiment and rose to the rank of captain. In the war in the Philippines he was placed in command, in January 1900, of an expedition to the southern extremity of Luzon, and in March following was appointed military governor of the Province of Albay (Luzon), and Catanduanes Island, and temporary governor of the islands of Samar and Leyte. On the reorganization of the regular army in February 1901, he was appointed one of the new brigadier-generals.

Kobé, kō'bĕ, Japan, a treaty port and former municipality of the main island Hondo, on the west shore of the Gulf of Osaka, adjoining on the northeast the prefectural city of Hiogo (q.v.), with which it was united in 1892. It is the most important of the treaty ports with the largest trade, a fine harbor, docks, wharves for ocean steamers, ship-building yards, railway shops and other important industrial establishments. Kobé is well laid out with wide streets, electrically lighted. Pop. (1898) 215,780.

Ko'bold, a species of elf in the popular superstition of Germany, corresponding to the English *goblin*. The kobold is connected with a house or a family, and appears in bodily shape.

Koch, kŏH, **Robert,** German bacteriologist: b. Klausthal, Hanover, 11 Dec. 1843. He received a medical education at Göttingen (1862–6), was assistant-surgeon in the Hamburg general hospital, was in private practice at Langenhagen (Hanover), Rakwitz (Posen), and Wollstein (Posen), and in 1872 was appointed to the Imperial board of health. In 1882 he succeeded in isolating the tubercle bacillus, in 1883 was made privy councillor and became director of the cholera commission to India and Egypt. He discovered in 1884 the cholera spirillum, or comma bacillus, regarded as a positive test of the presence of Asiatic cholera. For this service he received by legislative act a gift of 100,000 marks ($25,000). In 1885 he was appointed professor in the University of Berlin, director of the newly established Hygienic Institute of Berlin, and also director of the Prussian board of health. He announced in 1890 the discovery of a substance called tuberculin, which, he asserted, would cause to cease the growth of the tubercle bacillus.

Subsequent experiment failed in the judgment of scientists to confirm his claim in connection with the treatment of human beings. Among his writings are: 'Beitrag zur Aetiologie der Tuberkulose' (1882); 'Ueber die Cholerabakterien' (1884); and 'Weitere Mitteilungen über ein Heilmittel gegen Tuberkulose' (1890).

Kock, Charles Paul de, shärl pōl dē kŏk, French novelist: b. Passy, France, 21 May 1794; d. Paris 29 Aug. 1871. He was the son of a Dutch banker who was guillotined in 1794. At 15 he was placed in a banking-house, but presently took to writing, and his reputation was soon established by such works as 'Georgette' (1820); 'Gustave, ou le mauvais Sujet' (1821); 'Mon Voisin Raymond' (1822). The last is regarded as the typical romance of its kind. His scenes are cast in the lower ranks of middle-class life. His narrative is a constant succession of stirring incidents without catastrophe. The incidents are always gay and lively, frequently somewhat gross, but scarcely to the extent of indecency. The worst feature of Paul de Kock's works is his style, which is barely presentable, a fault evidently due to deficiency of education. This accounts for his popularity being greater abroad than at home, as the defects of style disappear in translation. Besides his novels, which are very numerous, he wrote several dramas, chiefly taken from them. Consult: Trimm, 'La Vie de Charles Paul de Kock' (1873).

Ko'dak, a portable photographic camera of special type for taking instantaneous negatives. It is made in the form of a small box having a lens and a shutter in one side and a reflector on top by which the operator can focus the lens. When this has been done a button is pressed and the snap-shot is taken. The kodak is provided with a continuous roll of sensitized film on which successive negatives can be made.

Koehler, kē'lėr, **Robert,** American artist: b. Hamburg, Germany, 28 Nov. 1850. He came with his parents to the United States in 1854; was educated at Milwaukee, Wis., and learned lithography which he practised in Pittsburg, Pa., and New York. After studying drawing in the night classes of the National Academy of Design, he went to Munich where he learned painting under Loeftz and Defregger and chose genre as his special field of activity. His principal pictures are: 'Holiday Occupation'; 'Her Only Support'; 'The Socialist'; 'The Strike'; 'The Family Bible'; and 'Father and Son.' Since 1893 he has been director of the Minneapolis School of Fine Arts.

Ko'el, one of a group of East Indian and Australian fruit-eating cuckoos, of the genus *Eudynamis*, which are popularly known as "rain-birds." They are parasitic, but have many peculiarities, among which are the glossy black plumage of the males, and the fact that, contrary to the rule, the immature young resemble the males instead of the females, which have a reddish dress. A Philippines species (*E. mindanensis*) is locally called "phow." They utter loud whistling cries.

Kogia, kō'jĭ-a, the generic and ordinary name of the "pigmy" sperm whales of the Pacific, which differ from the true sperm whales (q.v.) in anatomical particulars, and conspicuously in size, not exceeding about 15 feet in length. There are several species of these cetaceans which belong mainly to the New Zealand region, although one species visits the coast of California, but they are little known.

Koh-i-Nûr, kō'ē-noor', or **Kohinoor.** See DIAMOND.

Kohl, Johann Georg, yō'hän gā'ōrg kōl, German traveler and historian: b. Bremen 28 April 1808; d. there 28 Oct. 1878. Nearly his entire life was devoted to travel and historical investigation in Europe and in North America, where he spent four years and published as the fruits of researches: 'Travels in Canada' (1855); 'Travels in the Northwestern Parts of the United States' (1857); 'History of the Discovery of America' (1861); and several essays on American cartography. Other works are: 'Travels in the Interior of Russia and Poland' (1841); 'The British Isles and Their Inhabitants' (1844); 'The Rhine' (1851); 'The Danube' (1853).

Kohl-Rabi, kōl-rä'bĭ, a botanical variety of the same species as cabbage (q.v.), from which it differs in the swelled, turnip-like stem with a tuft of loose leaves on the top. This bulbous stem, which may be six inches in diameter, is used for human and stock food, less in America than in Europe. Its quality and texture are less agreeable, except in very young plants, than are those of turnips and cabbage.

Kohler, ko'lėr, **Kaufmann,** American rabbi: b. Fürth, Bavaria, 10 May 1843. After completing his studies at the universities of Munich, Berlin, and Leipsic, he was chosen as rabbi in Detroit in 1869, and two years later elected rabbi of Temple Sinai, Chicago, where he introduced Sunday lectures, a novelty in those days. In 1879 he was called to Temple Beth El, New York. At his initiative in 1885 a rabbinical conference was held at Pittsburg, Pa., which formulated a platform for Reformed Judaism. In later years he frankly receded from the radical standpoint and assumed a more conservative position. In 1903 he was elected president of the Hebrew Union College. He has been a frequent contributor to the Jewish press, and in addition to various volumes and critical papers has written: 'Der Segen Jakobs' (1868), and a 'Guide to Instructions in Judaism' (1900).

Kohlsaat, kōl'sät, **Herman Henry,** American publisher. He was educated in the public schools of Chicago and Galena, Ill., and after acting as traveling salesman for several years for Chicago firms, became in 1880 a junior partner in a wholesale bakery. He subsequently acquired a fortune in the bakery business and other enterprises, and in 1891 became part owner of the *Inter-Ocean* of Chicago, and in 1894 owner of the Chicago *Times-Herald*, now *The Record-Herald*, and of the Chicago *Evening Post*.

Koko-nor, kō'kō-nôr', or **Kuku-nor,** a lake in Tibet, not far from the Chinese province of Kan-su. It lies 12,007 feet above the level of the sea. Its very salt waters, exquisitely blue in color, cover 66 miles by 40. It contains five islands, one with a Buddhist monastery.

Kokomo, Ind., city, county-seat of Howard County; on the Wildcat River, and on the Toledo, St. L. & K. C., the Pittsburg, C., C. & St. L., and the Lake Erie & W. R.R.'s; about 55 miles north of Indianapolis. It was settled in 1844 by

Daniel Foster, incorporated as a town in 1845 and chartered as a city in 1855. Kokomo is located in a region of good farms, but it is a manufacturing and commercial city. The chief manufacturing establishments are plate, opalescent and table glass works, potteries, steel-mills, a fibre-bond mill, stove works, rubber works, automobile factories, bit works, pulp- and paper-mills; all employing about 7,500 men. There are seven churches, a classical school, a high school, public and parish schools, and a public library. The three banks have a combined capital of $300,000. The government is vested in a mayor and 10 councilmen, elected biennially. Pop. (1890) 8,261; (1900) 10,609; (1903) 17,000, of which about 1,500 are Germans; 1,000 French, and 1,000 Irish.

Kolb's Farm, Engagement at. After the action at Pine Mountain (q.v.), 15 June 1864, Gen. Sherman closed in on the Confederate army defending Marietta and the railroad south to the Chattahoochee, and began the extension of his lines to the right. The Confederates made a corresponding move to the left, and on the night of the 21st Hood's corps of two divisions, Hindman's and Stevenson's, moved from the right, near the railroad north of Marietta, to the Marietta and Powder Springs road, near Zion Church, about four miles southwest of Marietta and a mile east of Kolb's Farm. Hood now occupied the extreme left of the Confederate line, and had been instructed by Gen. J. E. Johnston to endeavor to prevent any progress of Sherman's right toward the railroad, the course of which was nearly parallel to the Confederate left and centre, and which was seriously menaced by Hooker's and Schofield's corps. On the morning of the 22d Schofield had advanced one division, Hascall's, on the road from Powder Springs Church to Marietta, with orders to take position on Hooker's right, near Kolb's house. Hooker, in going to the right and forward, reached to the Marietta road at Kolb's, and made connection with Hascall's division. Williams' division, massed by brigades, held Hooker's right, Geary's division was on the left of Williams, and Butterfield's division was further to the left on the line of Howard's Fourth corps. Williams and Hascall had very sharp skirmishing in getting into position, and from prisoners taken of Hood's corps it was learned that Hood, supported by Hardee, was about to attack, upon which both Williams and Hascall were ordered to deploy their divisions, and they threw up breastworks, Hascall in heavy woods, and Williams, for the greater part, on open, commanding ground, giving good positions for artillery. The deployment had not been completed and but few breastworks had been thrown up when, about 5 P.M., Hood made his attack. As he advanced from the woods which had sheltered him and concealed his line, his right was met by a terrific fire of shell, case-shot, and canister, that tore great gaps in the line and partially broke up his formation; but he pressed on and, coming under still closer canister fire and deadly volleys of musketry, was repulsed after a most desperate struggle of less than an hour. The attack fell upon the divisions of Williams and Hascall, Williams losing only 130 killed and wounded, and Hascall a less number. Hood's loss was 1,012 killed and wounded and about 100 missing. Consult: 'Official Records,' Vol. XXXVIII.; Cox, 'Atlanta'; Johnston's 'Narrative.'

E. A. CARMAN,

Kol'lock, Mary, American painter: b. Norfolk, Va., 20 Aug. 1832. She studied at the Academies of New York and Philadelphia, as well as in the Julian school at Paris. In 1877 she was elected instructor in painting to the Ladies' Art Association of New York. She has been industrious in filling many canvases with her graceful landscapes and simple genre groups, and her latest works include: 'Road in Normandy'; 'The Italian Brigand'; 'Washing in Pont-Aven, France'; and 'The Gossips.'

Kolmar, kōl'mär, Germany, city and capital of Upper Alsace, formerly in the French department of Haut Rhin, 39 miles south of Strasburg. Its fortifications were destroyed in 1673, and it is now surrounded by boulevards, and entered by three gates. Here is the public library with 36,000 volumes, and some pictures by Schön, Albert Dürer, etc.; and the museum, where, among other curiosities, a remarkable aërolite is preserved, which fell near Ensisheim in 1492, and originally weighed about 284 pounds. The portion here weighs about 142 pounds. Kolmar has manufactures of printed goods, calicoes, silks, etc., besides cotton-spinning mills, tanneries, and chamois-leather works. It has a considerable trade in the manufactured goods of Alsace, and in iron, grain, wine, madder, etc.; and in colonial produce, with which it supplies Switzerland. In 1552 Kolmar was surrounded by walls and towers, and made an imperial free town. In 1632 it was taken by the Swedes, who maintained possession for two years. It was united to France in 1697 by the Peace of Ryswick, and surrendered to Germany by the Treaty of Versailles, 26 Feb. 1871. Pop. (1890) 30,411; (1900) 36,736.

Kolyma, kō-lē'mä, a river of Siberia, in the government of Yakutsk, which rises in the mountains of Stanovoi-Krebet. After a course of about 1,000 miles it falls into the Polar Sea. The chief tributaries are the Greater and the Lesser Aniuj and the Omolon, which enter it on the left not far from the sea. Afterward the river divides into two, and subsequently into three branches, forming a delta. The Kolyma has sufficient depth for any vessel, but navigation, especially at the entrance, is rendered dangerous by shifting sand-banks.

Kongo, kŏng'gō, or **Congo, Free State,** an independent State in Central Africa, constituted in 1885. It is bounded northwest and north by French Kongo and British East Africa, the dividing line being partly the Kongo itself and its tributary the Ubangi; on the east it is bounded by British East Africa, German East Africa, Lake Tanganyika, and British Central Africa; on the south by the Portuguese and British territories. It reaches the Atlantic at the mouth of the Kongo by a narrow neck of land. The territory has an area of about 900,000 square miles, and is divided into 15 administrative districts, namely, Banana, Boma, Matadi, the Falls, Stanley Pool, Kwango, Oriental, Kassai, Lake Leopold II., Bangala, Equator, Ubangi, Welle, Stanley Falls, Aruwimi, and Lualaba, each of these districts being under a commissioner. The northeastern portion of the State,

forming fully one third of the whole, is mostly under dense and almost impenetrable forest, but the remainder largely consists of arable land of considerable fertility. Among the cultivated plants are maize, millet, manioc, tobacco, coffee, sugar-cane, hemp, bananas, etc., and most of the fruits and vegetables of Europe have been found to thrive excellently. The wild animals include the elephant, hippopotamus, crocodile, buffalo, antelopes of various kinds, the chimpanzee, soko, etc. The imports consist mostly of woven goods, spirits, tobacco, and firearms, and the exports comprise ivory, rubber, ground-nuts, palm-oil, gum-copal, wax, etc. The climate is very unhealthful to white men, owing to the combination of great heat with a very moist atmosphere, but in a few of the more elevated spots it is much better. There are two rainy seasons, namely, October-December and February-May, the latter being much the wetter, and between these intervene the two dry seasons. There are not as yet many good roads in the State, but there are thousands of miles of navigable rivers. The Kongo is navigable from the sea up to Matadi, and again for 1,000 miles between Stanley Pool and Stanley Falls, but the portion between Matadi and the Pool is obstructed by cataracts. A railway has, however, been opened between these two places. The bulk of the inhabitants are of Bantu stock, but in the extreme north the proper negro type is found, and in some of the eastern parts of the State Arabs and other ethnical groups occur. Large numbers of the inhabitants are cannibals of the most pronounced type, and the vast majority are heathens.

After Stanley had proved the identity of the Lualaba with the Kongo, a Comité d'Etudes du Haut Kongo was formed under the auspices of Leopold II., king of the Belgians; and in 1879 this body commissioned Stanley to return to the Kongo region with a view to preparing for the development of its resources. He established his first station at Vivi, and afterward founded others at Isangila, Manyanga, Leopoldville, Equatorville, Stanley Falls, and elsewhere, several of these being connected by good roads. In 1884 the African International Association replaced the committee, and in the following year it secured the foundation of the Kongo Free State and the recognition of its independence by the Congress of Berlin. Trade and navigation on the Kongo and all the rivers, lakes, and canals connected with it were declared absolutely free, and the suppression of the slave-trade was provided for. Leopold II. was made sovereign, and Brussels was named as the seat of the government. In 1889 Leopold bequeathed his sovereign rights to Belgium. In 1890 the territories of the State were declared inalienable, and in that year also the right was reserved to Belgium of annexing it after 10 years. This convention expired on 3 June 1903, when the Belgian government decided to abandon the project of annexation, allowing the option to expire, the reasons given being popular opposition and the attitude of Great Britain. The central government, located at Brussels, comprises the king of the Belgians as sovereign, and a secretary of state, etc. At Boma there is a governor-general, under whom of course there are numerous officials. There is an army of native Africans, having an effective strength of about 16,000, commanded by European officers. Besides Boma, the capital, the chief stations are Banana, Matadi, Vivi, Isangila, Manyanga, Leopoldville, Mswata, Kwamouth, Bolobo, Lubolela, Equatorville, Bolombo, Stanley Falls, Nyangwe, Yambuya, Basoko, Benabendi, etc. Pop. estimated at from 14,000,000 to 30,000,000; number of Europeans (1898) 1,678 — mostly Belgians.

Kongo, or Congo, River, Africa, a large river in southwest Africa, flowing into the Atlantic Ocean in lat. 6° S.; lon. 12° 40′ E. Its estuary was discovered by the Portuguese, Diego Cam, in 1482; and the lower part of its course was first explored by Capt. Tuckey in 1816. The upper part of the river remained unknown till Stanley, by descending from Nyangwe on the Lualaba to the mouth of the Kongo (1876–7), proved the two rivers to be identical. The Kongo is formed by the junction of the Luapula and the Lualaba in about the same latitude as the mouth. Of these the former issues from the south end of Lake Bangweolo, bends northward, and flows into Lake Moero, on leaving which it pursues a northwesterly course. The chief inflowing river of Bangweolo is the Chambezi, which enters the lake on the east after flowing southwest from the mountains of northeastern Rhodesia. The Lualaba rises by several headstreams in the south of Kongo Free State and flows north and north-northeast through a series of lakes to its junction with the Luapula. The river thence flows north and slightly west to Nyangwe, receiving the Lukuga on the right from Lake Tanganyika, thus being connected immediately with the great lake system of Central Africa. It then follows a northerly course for about four degrees, near the equator turns to the northwest and holds that direction till it reaches about lat. 1° 45′ N., when it turns first west and then gradually southwest. About the place where the river first crosses the equator there are seven falls, called Stanley Falls; and about lon. 17° E. and lat. 2° 30′ S. there begins a series of cataracts and rapids. In this part of its course it receives some very large tributaries, the most important of which are the Aruwimi, the Rubi, the Mongalla, and the Mobangi (or Ubangi), which join it on the right, and the Boloko, Lopori, Ikelemba, Ruki, and Kwa, which join it from the left, the latter representing the collected waters of the Kassai, the Kwango, Sankuru, etc. Below the Livingstone Falls, near Stanley Pool, the course of the river, which is there contracted, again expands, till at its mouth it attains a breadth of 10 miles. It is navigable for about 110 miles from its mouth up to the cataracts, and above Stanley Pool steamers ply for about 1,000 miles. The amount of water which the river discharges is greater than that discharged by the Mississippi, the volume of water being next to the Amazon. The length of the river is estimated at 3,000 miles, and the area of its basin is about 1,600,000 square miles. Consult: Stanley, 'Through the Dark Continent' (1878).

Kongo-snake, one of the slender amphibians of the family *Amphiumidæ*, which take an intermediate place between the cœcilians and the salamanders as the lowest family of the tailed (urodelous) amphibians. Several genera occur in Asia and North America. The giant "salamander" (*Cryptobranchus maximus*) of the mountain-streams of Japan sometimes more than

five feet long, and the American hellbender (q.v.) are of the same family. The term "Kongo-snake," however, belongs specifically to the typical genus and species, *Amphiuma means*, which inhabits suitable localities in all the warmer parts of the United States, where it receives its name from the negroes of the Southern States. It is an eel-like creature, with very small, three-toed and almost useless limbs, one pair near the head and the other almost at the caudal extremity, which haunts shallow stagnant waters, is numerous in the southern rice-fields, and is superstitiously feared by many persons although perfectly harmless. It feeds on small fishes, snails, crayfish, insects, etc., which it darts upon in the water or roots out of the mud. It reproduces by eggs, deposited at the end of the summer in a damp place, as under a rotting log, which, provided with shells, are connected by a gelatinous cord, and are protected by the female who coils her body about them and afterward takes care of the young. The embryos have well-developed external gills, but these disappear with growth, and even gill-clefts are greatly reduced in adults. Consult: Cope, 'Batrachia of North America' (1889); Gadow, 'Amphibia and Reptiles' (1901).

Königsberg, kėn'ĭgz-bĕrg, Prussia, a seaport town, capital of the province of East Prussia and of the government of the same name, on the Pregel, about 4½ miles above where it enters the northeast extremity of the Frische Haff. It was once the Prussian capital, and the residence of the electors of Brandenburg, and still is a residence of the sovereigns and the place of coronation. It is surrounded by ramparts and detached forts. The larger part of the town is on the north bank of the Pregel, on hilly ground, a feature being an ornamental sheet of water with richly wooded banks, called the Schloss-Teich (Castle Pond). The older portion is divided into three parts — Altstadt, or Old Town, on the west, Löbenicht on the east, and Kneiphof, on an island of the Pregel. The town, provided with electric street railroads, has on the whole a modern appearance. The principal public buildings are the cathedral, begun in 1333, an interesting Gothic structure, situated in the Kneiphof; a new Gothic church in the Altstadt; the Haberberg Kirche, a conspicuous church in the southern portion of the city; the Schloss, or palace, a large building, containing apartments for the royal family, once the residence of the grand-masters of the Teutonic Order; the Schlosskirche, occupying a wing of the palace, in which Frederick I. in 1701 and William I. in 1861 placed the crown on their own heads as kings of Prussia; the old citadel of Friedericksburg; the handsome exchange, of recent erection; the university, founded in 1554 by the Margrave Albert, and hence called the Albertine, attended by 800 to 900 students, accommodated in handsome new buildings in the Renaissance style, and having connected with it a library of 220,000 volumes, a zoological museum, etc.; an observatory which the labors of Bessel have rendered famous, a botanical garden, a conservatory of music, museums, an ecclesiastical seminary, and other superior schools; town-house, law-courts, post-office, provincial government buildings, a theatre, a lunatic asylum, an infirmary, and several hospitals and benevolent endowments. The town contains other valuable libraries in addition to that of the university. The manufactures include machinery and iron castings, woolen cloth, yarn and thread, leather, sail-cloth, copper, steel, and ironware, chemicals, tobacco and cigars, pasteboard, vinegar, articles made of amber, earthen and stone ware, liqueurs, and artificial mineral waters. There are also breweries and distilleries, and some ship-building. Large vessels bound for Königsberg stop at Pillau, which is considered its port. The principal exports are grain, flax, hemp, oil-cake, bones, timber, etc. Königsberg is the seat of many important provincial courts and public offices. It was founded in 1255. In 1365 it became a member of the Hanse League; was the residence of the grand-master of Teutonic knights from 1457–1528: in 1626 was surrounded with walls; in 1657 it received a strong additional defense in the citadel of Fredericksburg, though the object of the margrave who built it is said not to have been so much to defend the town as to overawe its citizens. It suffered much during the Seven Years' war and from the French in 1807. Pop. (1900) 189,483.

Koo-cha-bee, koo-chä'bē, a food prepared formerly by the Indians from the dried pupæ of certain flies of the family *Ephydridæ*, which form in the water of some of the lakes of northern California and Nevada, and drift ashore in vast numbers in midsummer. They are dried, ground into meal, and baked into edible cakes. A similar food is obtained in Mexico by gathering the eggs of another aquatic fly of the same family, and is called "ahuatle."

Koo'doo, one of the largest species of antelope (*Strepsiceros kudu*), originally found throughout the entire southern and eastern parts of Africa but now nearly extinct in Cape Colony. The males bear great, rough, twisted horns nearly four feet long, and wound in a wide, open, spiral of about two turns; the females are hornless. Both sexes have short hoofs, a fringe of rough hair along the middle of the back and a similar one on the throat; and are marked with narrow vertical stripes on the flanks, a spinal band, and a chevron on the face, all of white. The koodoo lives in pairs or small parties in thick forests, especially on the rough hilly districts of Nyasaland. In many districts it has been decimated by the hide-hunters. A smaller species (*S. imberbis*) inhabits the low bushy countries of Somaliland and the Kilima Njaro region.

Kookas, koo'kaz, or **Kukas,** a sect of fanatical Hindus in the Panjab, which originated after the annexation of that territory to British India (1849), in consequence of jealousy of the equal political rights granted to the Mohammedans of that region under British rule. They are a body of reformers of extreme views, and are hence regarded with as much hostility by orthodox Sikhs as they are by the Mohammedans, whose rights they are anxious to invade. The chief right conceded to the Mohammedans by the British government of India, and objected to by the Kookas, is that of killing cows, which are regarded as sacred animals in the Sikh religion; and it was mainly this practice that led to the consolidation of the most violent and fanatical adherents of the Sikh religion into a distinct sect. Their number has been variously estimated at from 50,000 to 800,000. In 1871 they were incited to attack and massacre the

Mohammedan butchers who killed cows in different parts of the Panjab, but they were quickly suppressed by the British government.

Koo'soo, or **Kosin,** a bitter drug prepared from the dried flowers of an Abyssinian plant (*Brayera anthelmintica*), which contains much tannin, and is used as a vermifuge.

Kootenay (koo'tē-nā) **River,** a tributary of the Columbia, rising in British Columbia. It is 400 miles long. After flowing south into Montana and Idaho it again enters British Columbia.

Kopisch, August, ow'goost kō'pĭsh, German poet and painter: b. Breslau 26 May 1799; d. Berlin 3 Feb. 1853. He studied art in the Prague Academy (1815) and in Vienna. From 1819 to 1822 he continued painting, when an injury to his hand disabled him, and he started on travels through Italy, and in Rome and Naples applied himself to the study of local poetry and archæology. It was he who discovered the famous 'Blue Grotto' or 'Grotto of the Nymphs' on the island of Capri. He returned to Germany in 1828, and received the title of professor in Berlin. He removed to Potsdam in 1847 and occupied himself in writing an account of the royal castles there and in the neighborhood. Most of his pictures are mere sketches. His witty poems, clever stories, and translations, including one of Dante, are all included in his 'Gesammelte Werke' (1856).

Kopitar, kō'pē-tär, **Bartholomæus** or **Jernej,** Austrian philologist: b. Carniola, Austrian Hungary, 1780; d. 1844. He was educated at the German gymnasium of Laibach, and completed his studies at Vienna, where he became curator of the imperial library. In 1814 he set out on his travels through Europe, his tour embracing Germany, England, Italy and France, to which last country he went with the special mission of recovering the Slavic manuscripts carried off by the French in 1809. His contribution to philological science consists in pioneer work in Slavic grammar. His principal works are: 'Grammatik der slawischen Sprache in Krain, Kärnten, und Steiermark' (1808); 'Glagolita Clozianus' (1836); and 'Hesychii Glossographi Discipulus Russus' (1839).

Kopp, Georg, gā'ōrg kŏp, German cardinal and statesman: b. Duderstadt 27 July 1837. He was the son of a poor weaver and attended the gymnasium at Hildesheim. In 1856 he became a telegraph operator in the employ of the Hanoverian government. From 1858 to 1861 he studied theology and in 1862 entered the priesthood. He rose rapidly in his profession and in 1872 was made vicar-general at Hildesheim and three years later bishop of Fulda. His reasonable ultramontanism was exercised in bringing about a better understanding between the German government and the papal curia. Being elected member of the house of lords he obtained a mitigation of the harsh provisions which characterized the May laws. In 1887 with the approval of the Prussian government the pope appointed him prince-bishop of Breslau, and in 1893 he was made cardinal.

Kopp, Joseph Eutychius, Swiss antiquarian: b. Beromünster, Canton of Lucerne, 25 April 1793; d. Lucerne 25 Oct. 1866. He studied theology and philology in Lucerne and Freiburg, and in 1819 was appointed professor of Greek in the Lyceum of the former town. While serving in the legislative body of the republic, he was led as a "conservative Catholic" into such bitter controversy with the Jesuits, that in 1845 he was compelled to retire into private life and undertook a tour by way of Vienna to Rome, for the purpose of examining such archives as might throw light upon the history of his native country. He was elected corresponding member of the Academies of Berlin and Vienna. Self taught as he was, he became the Niebuhr of Swiss history, and proved how her true annals had been obscured by such legends as those of William Tell, etc. Among his chief publications are 'Geschichte der Eidgenössischen Bünde' (1862); 'Geschichtsblätter aus des Schweiz' (1856); 'Dramatische Gedichte' (1866).

Köppen, Peter Ivanovitch, pā'tĕr ē-vän'ō-vĭch kĕp'pĕn, Russian archæologist: b. Kharkov, Russia, 19 Feb. 1793; d. Karabagh, Crimea, 4 June 1864. He was educated at the University of Kharkov and subsequently traveled widely in order to procure historical and archæological material for his work. The outcome of his investigations, written in German, is comprised in the reports of the Academy of St. Petersburg, but among other works of his are: 'Kulturgeschichte Russlands' (1825) and his famous 'Ethnographical Map of European Russia' (1851).

Koran, kō'rạn or kō-rän' (Ar. *quran, qoran,* reading, from *qara,* read; with the Arabic article, *Alkoran;* also called *Furkan.* salvation, *Al-Mushaf,* the volume, *Al-Kitab,* the book, *Al-Dhikr,* the reminder or the admonition), the sacred scripture of the Mohammedans, written in Arabic and professing to be the revelation of Allah (God) to Mohammed. It contains a code for the government of all Moslem transactions, and is accepted by true Mussulmans as uncreated and eternal. According to orthodox Mohammedan belief it was written from the beginning in golden rays on a magnificent tablet in heaven, and was communicated to Mohammed on the night of Al-Kadr, in the sacred month of Ramadan, by the angel Gabriel, chapter and verse as they stand, on parchment made of the skin of the ram which Abraham sacrificed instead of his son Isaac, in a volume ornamented with precious stones, gold, and silver from paradise. Other traditions are different, one being that Mohammed was assisted in composing it by a Persian Jew and a Nestorian monk. Its revelations cover Mohammed's entire prophetic career, 610–632 A.D. It is the first work known in Arabian prose, its scattered discourses being preserved on stones, palm-leaf ribs, leather, etc. Except in a few instances, Allah is the speaker. Mohammed named the book at the time of imparting the first revelations, and the name was retained for the collection when this was made in 633 by Zaid, son of Thabit, under direction of Abu-Bekr, father-in-law of the prophet. The authorized text, ever since accepted, was produced under the caliph Othman, 650 A.D., from the fragments, originally thrown together without order, and afterward gathered in a volume with no attempt at arrangement, not long after Mohammed's death. In order to free the book from various readings, Othman commanded the destruction of all other copies, and in purity of

text the Koran stands alone among religious scriptures. The chronological order has never been clearly determined, and many conjectural rearrangements and subdivisions have been made by Mohammedan and other scholars.

In size the Koran is nearly the same as the New Testament; it is divided into 114 suras or chapters, each beginning: "In the name of God"; the suras have various subdivisions. The Koran is dogmatic throughout; from beginning to end it is dominated by the positive keynote: "There is no doubt in this book." Its author was indebted to many other writers. Of the sacred writings of the Jews he directly cites only the Pentateuch and the Psalms; of the New Testament, with which internal evidence shows him to have been acquainted, he cites nothing; but besides the religious writings of the Jews and Christians he knew the systems of the Magians, the Sabians, and other sects, from whom he derived many materials to be incorporated in a new religion for his own country, where numerous and diverse faiths already existed.

Mohammed lived much in solitude, meditating on his mission and his doctrine; he did not reject the teaching of any sect; asserted his desire to restore the purity of the true faith; announced as his fundamental doctrine the unity of God. This idea, together with conceptions of divine might, sovereignty, compassion, and other attributes of Godhead, is all-pervading in the pages of the Koran; "God is God," it declares, "and Mohammed is his prophet." He felt that the unity of God had been the essential doctrine of all true religion, in which custom and ceremony were but accidents. "We make no difference," he says, "between that which God has taught us and that which Abraham, Isaac, Ishmael, the twelve tribes, Moses, and Jesus have learned from the Lord." "God commands thee to receive the religion which he prescribed to Noah, which he has revealed unto thee, and which he imparted to Abraham, Moses, and Jesus." To Jesus Mohammed assigns a place in the seventh or highest heaven, in the immediate presence of God.

The Koran dwells much on the resurrection and the last judgment, setting these forth somewhat after the manner of the Apostle Paul: "When the trumpet sounds the second time, they shall rise quickly from the graves to appear before God." "A sound of the trumpet of judgment will assemble all men before my throne, and every one shall there receive the reward of his deeds." In its presentation of the last judgment the Koran resembles the teachings of the Jews and the Magians; in the passage of the narrow bridge to paradise — Al-Sirat, over the abyss of hell, finer than a hair, sharper than a razor; in the book wherein all the actions of men are set down, and the scale in which they are weighed. Quite Jewish and Magian also are the Mohammedan views of paradise. The doctrine of predestination as contained in the Koran was successfully employed by Mohammed to encourage his followers in the face of every trial and danger. Herein he probably availed himself of beliefs already widely held, especially among the Sabians, with their worship of intelligences supposed to reside in the heavenly bodies, controlling the lives of men and the course of events, and by the Magians, who held a system of dualism, the influence of these beliefs having exerted itself upon the Arabians.

In the matter of religious exercises Mohammed largely adopted such as he found, to those which were narrow or vague, giving more of universality and precision. The Koran prescribes prayer, fasting, alms, and the pilgrimage to Mecca; prayer embraces ablutions, purifications, and all other exercises needful to preparation for it; to those who sought to be relieved from these observances Mohammed replied, "Religion without prayer is nothing"; prayer he calls "the key to paradise." Surpassing the severity of the rabbis, he prescribed prayer five times a day, with the face of the suppliant turned toward Mecca. To give alms was always an Arabian practice, but the Koran makes it obligatory. Concerning polygamy, divorce, inheritance, etc., it follows the law of Moses and the decisions of the rabbis, adapting them to the prejudices and customs of the prophet's people; it forbids few of the old practices save idolatry; "God," it says, "intended that his religion should be easy, else, as he well knew, you would only become hypocrites."

Although the Koran is written in prose, the different parts of a sentence end in rhymes, and there is marked diversity of style, yet withal an impressive unity, characterized by a free and forcible eloquence unequaled in any other Arabic writings. The earlier utterances of the prophet seem often to be outbursts of unbridled imagination, though still the solemn words of prophetic earnestness proclaiming God with power to reach and sway the hearts of men. In later portions of the book the tone takes more of calmness; imagination is subdued; the author dictates extended passages to be taken down by his hearers. The highest elevations are where he speaks of the greatness of God and describes the last judgment, the pleasures of paradise, and the pains of hell.

The moral precepts of the Koran exhibit a lofty feeling of humanity and a profound sense of ethical law reduced to most practical forms. They inculcate all the noblest virtues and pieties — obedience to divine commandments, charity, humility, mildness, temperance, toleration, and the strong virtues of courage, faith, and justice. To death in the cause of religion it ascribes a peculiar merit. The influence of this book through many centuries and among many peoples has been vast, and it still controls the lives of a great portion of the human race. "From the Atlantic to the Ganges," says Gibbon, "the Koran is acknowledged as the fundamental code, not only of theology, but of civil and criminal jurisprudence; and the laws which regulate the actions and the property of mankind are guarded by the infallible and immutable sanction of the will of God." The divinity and authority of the Koran have at times been assailed among Mohammedans themselves. The first serious heresy, about 740, was suppressed by the execution of its chief author, but appeared again in the next century, and was not finally crushed out until 842, when Harun II. prohibited all discussion regarding the character of the Koran, which has since been everywhere held by Mohammedans in admiration as the great Arabian classic, and in reverence as the book of religious authority. Once each day it is read through in the mosques of the Sultan and in the adjoining chapels. By the faithful

it is never carried below the girdle; not without their own purification may they even touch it; and on walls, doors, banners, etc., its texts are frequently written.

Commentaries on the Koran are almost innumerable. The library of Tripoli, in Syria, is said to have contained no less than 20,000 of them. Many editions have been published in different countries. For English readers that of Sale (1734), with its comprehensive introduction, covering all the important aspects of Mohammedanism, is still of prime value. The translation of E. H. Palmer (1880) is authoritative, as is also that of Rodwell (2d ed. 1876). Several versions in German have appeared in which it was attempted to reproduce the rhyming style of the original: J. von Hammer's (1811), A. Sprenger's (1861–5), Fr. Rückert's (1888), and M. Klaproth's (1890). Other editions which have their special values are Hinkelmann's (1694), Maracci's (1698), and Flügel's (1883). Islam'; Deutsch, 'Islam'; Dozy, 'L'Histoire d'Islamisme'; Muir, 'Life of Mahomet and History of Islam'; Gibbon, 'Decline and Fall,' ch. L.; Irving, 'Mahomet and his Successors'; Carlyle, 'Heroes,' "The Hero as Prophet"; Lane, 'Selections from the Koran'; Johnson, 'Oriental Religions: Persia,' sec. "Islam"; Conway, 'The Sacred Anthology' (for many good extracts from the Koran); Hirschfeld, 'New Researches into the Composition and Exegesis of the Koran (Eng. trans., 1902). See ISLAM; MOHAMMED; MOHAMMEDANISM.

Ko'ras. See HOTTENTOTS.

Kordofan, kŏr-dō-fän', a province of Egyptian Sudan in lat. 12° 30′ and 15° 30′ N.; lon. 29° 20′ and 31° 30′ E.; between the White Nile and Darfur. The surface is generally flat and the soil naturally fertile. The principal articles of export are gum, hides, and senna leaves, all monopolized by the government as most lucrative; ivory, cattle, tamarinds, ostrich eggs and feathers, gold, salt, slaves, etc.; the imports spices, sugar, coffee, sulphur, rice, soap, cotton and linen cloth, etc. From 1821 onward Kordofan was subject to the Viceroy of Egypt, the country having been subdued by Mehemet Ali. In 1883 it took part in the successful Mahdist revolt, but was regained for Great Britain and Egypt in 1898. Pop. about 300,000, chiefly Arabs.

Korea, or **Corea** (from the native pronunciation of Chinese Kao-li — see *History;* Li Tan in 1392 revived the old name Cho-sen or Cho-sön, Chinese "morning freshness" or "dawn-land" — that is, "the east"; in 1897 the official name was made Dai Han). An Asiatic kingdom northeast of China, comprising a strip of coast and a peninsula projecting southward from Manchuria, divided from it by the great valleys of the Yalu or Amnok southwest and the Tuman northeast, both rising in the colossal peak of Paik-tu (White Head), 8,300 feet high. The Japan Sea divides it from Japan, whose southernmost island (Kiushiu) approaches its southern tip within 100 miles, separated by Korea Strait with large islands midway; to the west, Korea Bay and the Yellow Sea, marked off by Shantung peninsula, divide it from China. A dense archipelago fringes it south and west. Its parallels are from 34° 17′ to 43° N., or about the same as from Concord, N. H., to Wilmington, N. C., and average much south of Italy; its meridians, 124° 38′ to 130° 30′ E. It is about 600 miles long by 135 broad; area 80,000 to 90,000 square miles. Population probably 15,000,000 to 20,000,000.

Korea is traversed north to south by a mountain backbone of striking individuality: a perpetual zigzag, skirting the eastern shore with slender coast-lands, in a steep solid wall unbroken for hundreds of miles save by Yung-hing or Broughton's Bay at the northern neck. In the north it has summits 4,000 to 8,000 feet high, and at Cape Pelissier, about lat. 37°, culminates in Mt. Popoff (4,800 feet); thence the main chain turns southwest, and ends in the extinct volcano of Mt. Auckland (6,700 feet), on Quelpaert Island, while to the east it throws out low hills and plateaus. The islands of the southern archipelago, verdant rocks worn into the semblance of fantastic castellated ruins, are the ends of its spurs. On the eastern side the ridge is timbered to the summit; on the west almost treeless, and seamed with deep ravines shallowing out into broad fertile plains, occupying most of Korea. On the east below the boundary there is but one river of any size, the Nak-tong along the southeastern uplands, and almost no islands; the west has 10 considerable streams, and the coast is thickly notched with harbors and fringed with fertile islets.

The chief rivers are, from the north: The great Yalu or Amnok, a mile wide and rising 40 feet in flood, navigable 30 miles for seagoing junks, and 175 for boats, to Wi-wön. Opposite it the Tuman. The Tai-dong or Ta-tong, navigable for boats 75 miles to Ping-yang. The Han ("*the* river"), rising on the western slopes of the eastern ridge but 30 miles from the Japan Sea, draining nearly the whole breadth of the peninsula with two main arms, and flowing into a bay of the Yellow Sea among islands. About 30 miles up lies Seoul, the capital, and a line of small steamers runs between it and Chemulpo, on Imperatrice Gulf as much farther south; boats ascend nearly 100 miles more. The Nak-tong (above) empties into Korea Strait near Fusan, and is navigable 140 miles for vessels drawing 4½ feet. The best harbors are Gen-san and Port Lazareff, on Broughton's Bay; the best on the south coast is Fusan on Korea Strait. The tides on the west and south are very high and rapid, often leaving vessels stranded on mud banks.

The climate is much like that of the eastern coast of America in the same latitudes; the north and centre have very hot summers and severe winters; the south is like the Carolinas, and tempered by the ocean breezes. The Han is frozen in winter so that at Seoul, where it is 400 yards wide, is is available for cart traffic three months of the year, from December to February. The rainfall averages 36 inches, 22 in the crop season. A fall of only 4.1 inches in 1901 created a famine.

Flora and Fauna.— There is a great variety of excellent hardwood timber on the east slopes and the northern mountains; in the west it is scarce and sparingly used; lack of coal has caused much wasteful denudation in other parts. The one surpassing animal of the native fauna is the man-eating tiger, who fills the native proverbs and literature, depopulates whole vil-

lages, and even besieges houses for days, sometimes leaping on the thatched roof and tearing his way down through. Besides him there are leopards, tiger-cats, and foxes; deer, beaver, badgers, otters, martens, etc., and a great variety of birds.

Products.— The great native crop is ginseng, which grows wild in the Kange Mountains, and is extensively cultivated about Kai-seng; it is a government monopoly, and despite much smuggling, yields some $500,000 a year, or a ninth of the state revenue. Among other products are rice, wheat, millet, sesame, Indian corn, beans, cotton, hemp, and perilla (for oil and pigment). The domestic animals are few. The cattle are excellent, the bull being the usual beast of burden; the ponies very small but hardy, fowls good, pigs inferior. Iron ores of excellent quality are mined; and there are copper mines in several places. In 1886 the value of gold exported was $503,296; the silver output is very small. Three fourths of the trade is with Japan, and over four fifths of the remainder with China.

Government.— This is a hereditary absolute monarchy: till 1895 tributary to and receiving investiture from China, and like it in administrative forms, with officials appointed by examination in the classics. On the declaration of independence (see *History*), the entire system was abolished, as well as the privileges of the aristocracy, and a cabinet of 10 ministers in charge of different departments formed, who with five councillors form a grand council of state to lay measures before the emperor. Till 1896 the country was divided into eight *do* or provinces; it was then redivided into 13, including a metropolitan province around the capital. These are divided into 339 *kun* or prefectures, 7 under *pu-yan* or city governors; 4 treaty ports are under *kamni* ("trade overseers"), ranking with consuls. The revenue is about $4,500,000 a year. The standard is gold, and a native coinage is made, supplemented by Japanese paper and coin. The weights and measures are the same as the Chinese. There is an army of 17,000 men with foreign training and equipments, and a bodyguard of 1,000, but no navy.

Social Conditions and Education.— The usual dwellings are mud hovels thatched with straw, and the conditions of life for the masses, as in China, are hard and squalid; but actual distress is rare and beggars are few. Caste till recently was iron-bound, and no offices of even local importance could be held by other than nobles, who are distinguished by colored clothing and horsehair hats. Women are secluded; concubinage is allowed, but only one legal wife at a time. The immemorial system of education was almost wholly in Chinese, which contained the only written memorials needing it, and was of Chinese classics. But in 1894–5 a department of education was established, and a thoroughly graded public-school system, including normal training. There are also schools of foreign languages taught by speakers of the languages.

Religion.— See *History* for the vicissitudes of Christianity. There are now about 30,000 Roman Catholic and 2,500 Protestant natives. The popular religion is the degraded Shamanism (q.v.); the higher classes are Confucians; the anciently all-powerful Buddhism, crushed by the revolution of 1392, is slight and uninfluential, with a few ignorant monks.

Population.— The people are a mixed race of disputed elements, apparently Mongoloid and Aino with Manchu and Malayan infusions. As in all Eastern countries, where a census means a tax and conscription list (see CENSUS, par. 1), no accurate statistics can be had. An official census of adult males liable to tax in 1900 was 5,608,351; which must mean toward 20,000,000 total population, enormous as the figure is for an agricultural people on this size of territory. Foreign population 21,783, including 16,142 Japanese and about 5,000 Chinese.

The chief cities are Seoul (Han-yang), the capital, estimated at over 200,000; Ping-yang, perhaps 40,000; and Kai-seng. A trolley line nine miles long, built 1899, is operated in Seoul by Americans.

History.— The traditional founder of Korean nationality is the Chinese noble Ki-tse, who left China with 5,000 followers 1122 B.C., and established a kingdom with capital at Ping-yang. The first authentic history is the annexation to China 108 B.C. A century or so later it split into three princedoms, of which, about 960, Koryu (Kao-li) came to the front, probably from borrowing the higher Chinese civilization. It recast the administration upon the Chinese model, introduced Chinese methods and arts, and initiated several centuries of brilliant progress and prosperity, enriched by art and literature. Buddhism was the paramount religion, and developed a powerful and rigid ecclesiastical hierarchy. As a result, a Protestant movement took place, and in 1392 a revolution headed by Li Tan founded the present dynasty and expelled the priests. The capital (*seoul*) was fixed at Han-yang. When the Manchu power began to rise in the 15th century, China, to protect herself against its ravages, desolated a strip of fertile territory many thousand square miles in extent, then or early in the 17th century destroying four cities and many villages and removing 300,000 inhabitants; and down to 1875 this zone of 60 miles wide by 300 long was kept as a permanent buffer between China and Korea. During the rise of the Japanese shogunate out of the 16th century anarchy, Hideyoshi, as a preliminary to invading China, sent an army into Korea, rapidly overrunning it. But Korea is like Spain, easy to conquer and impossible to hold; and the stolid resistance of the natives, with the Chinese armies, gradually forced the Japanese out of the peninsula six years later, retaining Fusan on the southeast coast as a trading station. Thirty years later the Manchus, previous to their conquest of China, invaded it and exacted a tribute, which was continued to the Manchu dynasty in China; in 1653 it was reduced to a third, and for generations down to 1894, when it was finally abolished, had been only nominal, as an acknowledgment of Chinese supremacy and a trading license. But the Chinese wisely attempted no permanent occupation.

Korea had always as intense a determination to seclude herself from foreign influences as ancient Egypt, and practically the first knowledge obtained of it by modern Europe was through the shipwreck of some Dutch on the coast in 1653, though the Jesuit missionary Cespedes had entered it in 1594. In 1784 new missionaries came and planted Christianity in the peninsula,

despite steady persecution; in 1835 the French missionaries reinforced them. But in 1864 came a fiercer blast. The then king died childless, and his oldest widow set aside the natural successor, her nephew, and nominated Yi-Hevi, the present king — the 12-year-old son of a royal prince, Ni-Kung, whom she made regent. The latter was a savage reactionist, and let loose fire and blood to extirpate the foreigners, rigidly excluding all new ones. A futile French expedition was sent against him in 1866; the same year a stranded American schooner, the General Sherman, was burnt and her crew murdered in sight of Ping-yang. An American expedition sent in 1871 had no success. Meantime several nations were attempting to force Korea into treaties of commerce and gain trading privileges, but Japan was the first to succeed, having the ports Gensan and Fusan opened in 1876, and Chemulpo in 1880. Meantime the "neutral strip," for many years a nest of brigands and pirates, was abolished by Li Hung Chang in 1875. In 1882 Commodore Shufeldt negotiated a treaty of friendship between the United States and Korea, and thence on, other nations were rapidly admitted — Great Britain and Germany in 1883, Italy and Russia in 1884, France in 1886, Austria in 1892, and China in 1897.

The flood of new ideas and habits aggravated the conflict between the progressives and the reactionaries, in which the former won, and Korean embassies began to visit other countries,— Japan in 1880, the United States in 1883. The nativists raised an insurrection in 1884. The greatest breach with the past, however, was the result of the Chinese-Japanese war of 1894–5, one of the pretexts of which was the action of China in assuming the ancient suzerainty over Korea. It was at Ping-yang that the first heavy defeat was inflicted on the Chinese, and off the Yalu River that the Chinese fleet was destroyed. On 8 Jan. 1895 the king of Korea proclaimed its independence, and the Chinese Gate at Seoul was publicly destroyed with impressive ceremonies. In 1897 the king proclaimed the country an empire, named it Dai Han, and took the title of emperor. Under the Treaty of Shimonoseki, Korea became a «sphere of influence» for the Japanese, whose struggle against Russian encroachments culminated in the war of 1904–5 (see MANCHURIA). By the Treaty of Portsmouth (q.v.) Japan's preponderating interests in Korea were acknowledged, and notwithstanding violent native opposition, a strong Japanese protectorate was established in November 1905. The readjustment of finances, the building of the Fusan-Seoul railroad, and other civilizing projects, inaugurated a new era of pacific and industrial development.

Language.— Korea since early times has employed two languages: Chinese for writings and native Korean for speech, Chinese if spoken being an acquirement like French in America. The literature in Chinese is sometimes translated into Korean, however; and the recent Korean declaration of independence has produced a revival of appreciation for the native tongue, as with so many other nations from like causes. The reforms of 1897 were proclaimed in the vernacular.

Korean is of a not extreme agglutinative type, belonging to the polysyllabic branch of the Mongol-Tartar languages like Japanese, and unlike the monosyllabic Chinese; it is structurally unrelated to the latter, though it has very many Chinese loan-words, pronounced after its own phonology. Its resemblances to Japanese are far closer: mutual translations word for word, and even particle for particle, are quite feasible. The particles and grammatical terminations in both represent punctuation, emphasis, and inflection of nouns and verbs. The honorific vocabulary — almost a complete ceremonial language even in construction, to express relations between superiors and inferiors, and equals — is common to both. The differences are mainly euphonic: Korean vowels are heavily assimilated to those which follow, the syllables need not end with a vowel, and the spelling is as irregular as English, none of which is true of Japanese.

The grammar of Korean is extremely flexible and pregnant; like Chinese, the roots are invariable. There are no inflectional forms for number, person, or case, or conjugation of verbs, and no form for gender; all are indicated by particles without meaning, or whose meaning has been lost, affixed to the stem, and varying with its terminal letter, as consonant, vowel, or liquid. There are no pronouns of the first and second person; the third, with relational particles, serving for both. Development has expended itself on the verbs, which are marvels of varied, flexile, and ingenious expressiveness. Many words not primarily verbs can be turned into them (as in English), and these with the true verbs constitute 20 per cent of the entire vocabulary. The grammatical forms of the verb are said to average 300. Adjectives and adverbs are not distinguished from the verbs, and the prepositions are verb forms. All conditions expressed by inflections in Western languages — present, continuing, past, unfinished or completed, optative, subjunctive, potential, interrogative, participial, etc.— exist in Korean, and a vast number of others expressed by us in long sentences. Some verbs have no passive, but all have a negative voice. There is no number; the three persons in every variant are expressed by courtesy forms — one to or of superiors, one for equals, one for inferiors or of things. The syntax is positional, as with Chinese. The object precedes the verb or other governing word, the prepositions are postpositions, the adjective precedes the noun it qualifies and the adverb its verb or adjective (as in English). A dependent clause precedes its principal.

Korean has an alphabet of 25 letters, 14 consonants, and 11 vowels; a very simple and scientific one, analyzed by organs of speech. The vowels are a, ya, ŭ, yŭ, o, yo, u, yu, i, eu, â; with the diphthongs è, é, e'. The consonants are — labials, p, ph, m; dentals, t, th, n, l; palatals, ch, chh, s; gutturals, k, kh; laryngeals (?) h, ng final. There are no letters f, v, w, b, d, g, j, or z, though (except the first, which is replaced by p) they exist in speech. There is but one character for l and r, and neither of them can begin a word, their place being taken by n. The characters — women and children's only, the true "learned" characters being Chinese — are of an extreme simplicity, contrasting strongly with the complex Chinese; and there is a cursive form. This alphabet is called *onmun*, "the vulgar"; and there is a system called *nido*, in which the letters are grouped in the 199 possible combinations and learned by rote. The writing is in syllables, in columns from right to left, as with Chinese.

Bibliography.— The student must not neglect that rich quarry, the 'Korean Repository' (1893) and its successor, the 'Korean Review' (1901), published at Seoul. Consult also Griffis, 'Corea the Hermit Nation' (3d ed. 1889); 'Corea Without and Within'; Ross, 'History of Corea' (1891); Lowell, 'Chosön, the Land of the Morning Calm' (1886); Oppert, 'A Forbidden Land' (1880); Carles, 'Life in Corea' (1888); Gilmore, 'Korea from its Capital' (1893); Curzon, 'Problems of the Far East' (1894); Cavendish and Goold-Adams, 'Korea' (1894); Norman, 'Peoples and Politics of the Far East' (1896); Bishop, 'Korea and Her Neighbors' (1898); Gale, 'Korean-English Dictionary' (1897); 'Han-Yöng Cha T'yön: a Korean-English Dictionary' (1897); Scott, 'Corean Manual'; Underwood, 'Introduction to the Korean Spoken Language'; Kennan, 'What Japan has done in Korea' (1905).

Ko'ren, John, American statistician: b. Decorah, Iowa, 3 March 1861. He was graduated from Luther College in his native town and from Concordia Theological Seminary, St. Louis, and has since been prominent in investigations of the liquor problem, in State and municipal employ. He has published: 'Economic Aspect of the Liquor Problem'; 'The Liquor Problem in its Legislative Aspects' with F. Wines (1897–8).

Körner, Karl Theodor, kärl tā'ō-dōr kèr'-nĕr, German poet: b. Dresden 23 Sept. 1791; d. 26 Aug. 1813. After studies at Freiberg, Leipsic, and Berlin, young Körner, through Kotzebue's influence, was appointed dramatist to a Vienna theatre, and wrote light comedies, such as 'The Green Mask' and 'The Night Watches,' and some tragedies, of which 'Zriny' was the most successful. In the uprising of the German nation against Napoleon, Körner not only displayed heroic personal courage in many encounters, but wrote numerous patriotic songs. These were published in 1814 under the title of 'Lyre and Sword.' The most famous of these pieces is the 'Sword Song,' composed only a few hours before the author fell in a skirmish, between Schwerin and Gadebusch.

Kosciuszko, kŏs-ĭ-ŭs'kō, Pol. kŏs-choosh'-kō, **Thaddeus** (Polish TADEUSZ), Polish patriot: b. Mereczowszczyzna, Lithuania, 12 Feb. 1746; d. Soleure (Solothurn), Switzerland, 15 Oct. 1817. He was educated in the military school at Warsaw, and completed his studies in France. On his return to Poland he became suitor to the daughter of Sosnovski, marshal of Lithuania, but his love meeting no return he betook himself to America (1777). Having attracted the notice of Washington, he was appointed him engineer, with the rank of colonel, and afterward general of brigade. He performed excellent service and at the end of the war received the thanks of Congress, with the brevet of major-general. He returned to Poland in 1786, and on the occasion of the reorganization of the Polish army in 1789 was appointed major-general, and having declared for the constitution of 3 May 1791, he fought in the war which soon after broke out, with the rank of lieutenant-general. When Stanislaus Augustus in 1793 agreed to the second partition of Poland, Kosciuszko withdrew from the army and retired to Leipsic. At this time the legislative assembly in France conferred on him the title of French citizen. When a new insurrection broke out in Poland for the purpose of delivering the country from the Russians in 1794 Kosciuszko was recalled and made commander-in-chief of the insurgent army. He defeated the Russians at Raclavice, but at the battle of Maciejovice his army was defeated, and he himself wounded and taken prisoner. He remained in captivity for two years, and he then proceeded to England, and thence to America. In 1798 he returned to Europe on a mission from Congress to France, and contributed to bring about an understanding between the latter country and the United States. In April 1814, he addressed a petition to Alexander I., emperor of Russia, requesting him to grant an amnesty to all expatriated Poles, to accept the title of King of Poland, and to give that country a free constitution similar to that of England, but the petition remained without effect. In April 1817 he issued a letter of emancipation to the serfs on his estate of Siechnovice, in Poland. His death was occasioned by a fall from his horse. In 1818 his body was removed at the expense of the Emperor Alexander of Russia to Cracow, where it was buried in the cathedral, and a monument erected to him.

Consult: Lives by Falkenstein (1834), German; Chodzko (1837), French; Paszkovski (1837), Polish.

Kosciuszko, Mount, in Australia, one of the highest mountain peaks in the Muniong Alps, in New South Wales, near the frontier of Victoria. It is 7,308 feet high.

Kos'mos. See COSMOS.

Kossuth, kŏs-sooth', Hung. kŏsh'oot, **Lajos** (LOUIS), Hungarian patriot: b. Monok, Hungary, 27 April 1802; d. Turin, Italy, 20 March 1894. He came of a family of noble rank and of the Protestant religion, studied and practised law, and in 1832 entered the parliament of Pesth, becoming also editor of a newspaper circulated in writing. For persisting in publishing the parliamentary debates he was condemned to four years' imprisonment, but was released in 1840 before the end of this period. In 1841 he became editor of the Pesth 'Journal,' a paper that advocated very advanced views; and in 1844 founded the national league in opposition to the Viennese government. In 1847 he was elected to the Hungarian diet by the national party, and in 1848 became minister of finance in the Hungarian government. His influence had much to do in bringing about the revolution which followed, and in which he played the most prominent part, being appointed governor or dictator by his fellow-countrymen; but the intervention of Russia rendered all the efforts of the Magyars unavailing. He resigned his position in favor of Görgei (whom he accused of treachery), and in 1849 he found it necessary to take refuge in Turkey, where he was kept as a prisoner. Being released in 1851 through the influence of Great Britain and the United States, he soon after visited both these countries and was received in the most enthusiastic manner. He endeavored subsequently to induce Napoleon III. as well as Victor Emmanuel to act against Austria in favor of Hungarian independence, but without success. Though by the amnesty of 1867 he might have returned to his native land he did not do so, but lived chiefly in Italy, and was

1. Round Gate, on the Palace Grounds, Seoul.

2. Big East Gate, Seoul.

never fully reconciled to the union that had taken place between Austria and Hungary. His 'Memories of My Exile' appeared in English in 1880.

Ko'to, a Japanese musical instrument, having a long box, larger at one end than the other, and with a convex top over which 13 silk strings are strung and fastened tightly at each end, each string having a bridge. To tune the instrument it is necessary to move the bridges. The instrument is played with both hands like a harp.

Kotow, kō tow' or -tō', a Chinese form of obeisance; the ceremony of prostration, in which an inferior, kneeling, touches his forehead to the ground. Kotowing is unknown outside of China.

Kotzebue, August Friedrich Ferdinand von, ow'goost frēd'rĭH fĕr'dĭ-nänd fŏn kŏt'sĕ-boo, German dramatist and Russian official: b. Weimar 3 May 1761; d. Mannheim 23 March 1819. In 1781 he went to St. Petersburg, where, obtaining the patronage of the empress, he was made governor of Esthonia and ennobled. About 1800 he returned to Germany, and attacked Goethe and other great German authors who had refused to associate with him. In 1806 he went again to Russia, and lived from 1807 on his estate Schwartze, in Esthonia. In 1813, as counsellor of state, he followed the Russian headquarters, constantly writing to excite the nations against Napoleon. In 1817 he received a salary of 15,000 roubles, with directions to reside in Germany, and to report upon literature and public opinion. Kotzebue, who during the whole campaign had written in favor of the Russians, even at the expense of his native country, and had expressed the utmost contempt for liberal principles and institutions, was now odious in the eyes of most of his countrymen, and regarded as a spy. This feeling was so strong in the case of a young enthusiast named Sand, that he assassinated him as a traitor to liberty. Kotzebue wrote more than 100 plays, a history of Germany and other works, most of which are now forgotten. Two of his plays, 'The Stranger' and 'Pizarro,' are still performed on the English stage.

Kotzebue, Otto von, Russian navigator; second son of A. F. F. Kotzebue (q.v.): b. Reval 30 Dec. 1787; d. there 15 Feb. 1846. In his 17th year he accompanied Krusenstern in his voyage round the world. In 1815 he was appointed to the command of the ship Rurik, destined to ascertain the practicability of a northeast passage in the direction of Bering Strait. He discovered several groups of islands in the Pacific, and a large sound on the southeast of Bering Strait, which now bears his name; and returned after a three years' absence. The results of the voyage were published in a work called 'A Voyage of Discovery in the South Sea and to Behring's Strait in Search of a Northeast Passage' (1821–23). In 1823 he was commissioned by the Emperor Alexander to make a third voyage round the world. He returned in 1826, publishing the results of the voyage in a work which has been of great importance to hydrography, particularly that of the Pacific, 'Neue Reise um die Welt' (1830).

Kou'miss. See KUMISS.

Kuropatkin, Alexei Nikolayevitch, Russian soldier: b. 17 March 1848. He was trained for the army in the Imperial Military College and the Academy of the General Staff; was sent abroad to study military conditions in various European countries; in 1874 became a member of the general staff of the army; in 1876–7 assisted Skobeleff in the conquest of Khokand, Turkestan, and its reorganization as the territory of Ferghana; and in 1877–8 won high distinction in the Russo-Turkish war by his services at Plevna and the Chipka Pass. In 1878 he was made colonel and in 1878–9 was chief of the Asiatic bureau of the general staff. In 1880–1 he was in Middle Asia, where he commanded the main detachment against the Tekke-Turkomans, and, after a forced march of 600 miles across the desert, stormed Geok-Tepa, by which victory he won his greatest reputation. He was made major-general in 1882, lieutenant-general in 1890, governor of the Trans-Kaspian district and commander of the troops in that district in 1890, and minister of war in 1898. In 1901 he became general of infantry. At the outbreak of the hostilities with Japan, he was sent to command the Russian forces in the Far East. As a military writer he is favorably known by several volumes, including 'Kashgarie' (1879), for which he received the gold medal of the Imperial Russian Geographical Society; 'The Operations of the Troops of General Skobeleff during the War of Russia with the Turks' (1885); etc.

Kowloon', or **Kaulun,** a district in China, forming a peninsula at the mouth of the Canton River.

Koyunjik, koo-yoon-jĕk', or **Kuyunjik.** See NINEVEH.

Kraft, kräft, **Adam,** German sculptor: b. Nuremberg 1440; d. Schwabach, Bavaria, 1507. Nothing is known of his teachers, his student travels or his fortunes. His known productions begin with the seven reliefs (Stations of the Cross) set up in Nuremberg 1490 near the entrance of Saint John's Church; these are now in the German Museum, their original place being taken by sandstone copies. He executed many sepulchral monuments, and in the Church of Saint Sebaldus is the statue he made for Sebald Schreyer, 1492. In the choir of the same church is his bas-relief of three scenes from the Passion, the figures being life-size. He also carved the monument for the Pergerstorff family in the Frauenkirche (Church of St. Mary, the Virgin); that for the Landauer family in a chapel of the Church of St. Ægidius. His last work was the Entombment, a group of 15 life-size figures in the mortuary chapel of the Holzschuherschen family, a part of the Church of St. John (1507). He also executed several works of minor importance, as decorations of private and public buildings. His masterpiece is the tabernacle in the Church of Saint Lawrence which he took seven years (1493–1500) in completing. It is more than 50 feet high, and is an example of gorgeous Gothic carving enriched with numerous figures. At the foot he has placed his own portrait, life-size. His style is bold and vigorous, his conceptions are profoundly religious, and his power of life-like characterization is wonderful. He is the finest exponent of the Nuremberg school of Gothic sculpture.

Krait, one of the most dreaded of Oriental poisonous snakes (*Bungarus cœruleus*), nearly related to the cobras. It inhabits nearly all India and Ceylon, is very common in Bengal and southern India, and causes more deaths than any other snake, since in its pursuit of rats, lizards and snakes, it frequently enters camps and village houses; furthermore, its venom is astonishingly rapid in its effects. It reaches a length of four feet, has smooth scales, a ridge along the spine, no hood, and is bluish or brownish black with highly variable bars and markings of yellow and white. Other deadly species of the same genus of bungars or rock-snakes are the larger *raj-samp* or "king-snake" (*B. fasciatus*), noted for its active killing of cobras and other snakes; and other species in Ceylon and the Indo-Chinese region. Consult the works of Fayrer and of Ewart on the poisonous snakes of India, and the 'Proceedings' of the Zoological Society of London for 1899.

Krakatoa, a volcanic island in Sunda Strait, between Sumatra and Java; area, 6 square miles, formerly about 12 square miles. The island, now uninhabited, is known as having been the scene of a terrific volcanic eruption on the night of 26–27 Aug. 1883. The volcano had been practically inactive for over 200 years until May of 1883, when there were indications of an eruption, which culminated at the date mentioned. A number of explosions occurred, the noise of which was heard for many miles. A mass of rock, in the form of dust, ashes, and small stones, and of the volume of about a cubic mile, was thrown up for a considerable distance. The dust was projected, vertically, nearly 20 miles, and distributed to all parts of the globe by the upper air currents. The effect, especially as shown in brilliant sunrises and sunsets, was visible for many months. The disturbance created a series of extensive sea-waves which swept over the shores of Java and Sumatra, destroying many villages and causing the loss of more than 30,000 people. The wave-motion was observed in South America. About one-half of the island was destroyed, including the highest mountain. One immediate effect was the darkness which alarmed many people, and which made 27 Aug. 1883 known as one of the dark days.

Kraken, krä'- or krā'kĕn, the term, of Norwegian origin, applied to a fabulous sea-monster, generally assumed to be a gigantic squid (q.v.). It was first described by Pontoppidan, bishop of Bergen in Norway, but other old writers have accounts of substantially the same kind of monster. It is described as of enormous size; rising from the sea like an island about 1½ miles in circumference, with enormous mast-like arms with which it wrecked ships, created whirlpools, and realized all that was prodigious and strange in size, habits, and appearance. The kraken stories led to a similar creation by Victor Hugo in his 'Toilers of the Sea,' which, considered zoologically, is almost as far from possible truth as was that of old Pontoppidan.

Kra'nach, Lucas. See CRANACH.

Krausé, Lyda Farrington, "BARBARA YECHTON," American novelist and writer for young people: b. Saint Croix, W. I., 1864. She was for many years on the staff of 'The Churchman' in New York, and among her published books are: 'Christine's Inspiration' (1892); 'Toinette' (1897); 'A Young Savage' (1899); 'Fortune's Boats' (1900).

Krausse, krows, **Alexis Sidney,** English author and publicist: b. Islington, London, 1859; d. 27 Sept. 1904. He was educated at University College, London, devoted much time to foreign, especially Asiatic history and policy, and contributed largely to newspapers and magazines. Among the books he published are: 'Starving London' (1886); 'China in Decay' (1900); 'Russia in Asia' (1899); 'The Story of the China Crisis'; 'The Far East, its History and its Question' (1900).

Krefeld, krā'fĕld, or **Crefeld,** Prussia, a town in the government of Düsseldorf, 12 miles northwest of the town of Düsseldorf, and about four miles west of the Rhine. It consists of straight spacious streets and well-built houses; is the seat of several courts and public offices; contains churches for Roman Catholics, Old Catholics, Protestants, Mennonites, and Jews; a royal textile college, gymnasia, a monument of Moltke erected in 1897, hospitals, etc.; and is the principal locality in Prussia for the manufacture of silk and mixed silk goods, which was introduced by refugees from Juliers and Berg in the 17th and 18th centuries. The number of factories producing silk goods is about 120, exclusive of nearly 50 silk-dyeing works. The town also contains railroad shops, boiler-works, machine-shops, iron-foundries, chemical works, distilleries, sugar-refineries, soap-works, tanneries, paper-mills, etc. Krefeld came into the possession of Prussia in 1702, and except during the Napoleonic ascendency it has remained with her ever since. Pop. (1890), 105,376; (1900), 106,928.

Krehbiel, krā'bēl, **Henry Edward,** American musical critic: b. Ann Arbor, Mich., 10 March 1854. He was musical critic successively on the Cincinnati *Gazette* and the New York *Tribune*. His published works include: 'The Technics of Violin Playing' (1880); 'How to Listen to Music' (1896); 'Studies in the Wagnerian Drama' (1891); 'The Philharmonic Society of New York: a Memorial' (1892); 'Music and Manners in the Classical Period' (1898); 'Music of the Modern World' (1897). He also edited an 'Annotated Bibliography of Fine Art' (1897).

Krem'lin, a Russian citadel, especially the citadel of Moscow (q.v.). It lies in the centre of the city, and contains the royal edifices and churches, particularly the residence of the emperor.

Kremnitz, krĕm'nĭts, or **Cremnitz,** Hungary, a free mining town (called in Hungarian Körmöczbánya), in the county of Bars, in a deep valley surrounded by lofty hills, 15 miles northeast of Schemnitz. It consists of the town proper, surrounded by walls, and containing a castle; and of several large suburbs, in which are almost all the public buildings. There are some old churches, a Franciscan monastery of the 17th century, a mint, hospitals, etc. The manufactures consist of paper, delft-ware, vitriol, and cinnabar; but the prosperity of the town depends chiefly on the gold and silver mines in the vicinity. Pop. about 10,000.

Kre'osote. See CREOSOTE.

Kriegspiel, krēg'spēl ("war-game"), a game of German origin, played with maps on a large scale, and colored metal blocks, on the same scale as the map, representing bodies of troops of various strength (brigades of infantry, battalions of rifles, regiments of cavalry, besides artillery, engineers, etc.). The players are usually two on each side, and the game forms an exact miniature of tactical operations. It is played by alternate moves; each move represents the lapse of two minutes, and rules are given to determine the distance that each branch of the service may move over in that time. When two bodies of men on opposite sides come into contact, the weaker in numbers and position is held to be defeated; but when they are equal in these respects victory is determined to one side or the other by the use of a die.

Krieker, krē'kėr, a gunner's name for jacksnipe (q.v.).

Kris. See CREESE.

Krishna, krĭsh'na, in Hindu mythology, the eighth avatar of Vishnu and the most popular deity in the Hindu pantheon. See AVATAR; VISHNU.

Kriss Kringle, a sort of St. Nicholas. On Christmas eve, Kriss Kringle, arrayed in a fur cap and strange apparel, goes to the bedroom of all good children, where he finds a stocking or sock hung up in expectation of his visit, in which depository he leaves a present for the young wearer. The word means Christ-child, and the eve is called Kriss-Kringle eve. See ST. NICHOLAS.

Kronstadt, krŏn'stät, or **Cronstadt,** Russia, a maritime fortress in the government of St. Petersburg, and about 25 miles west of that city. It stands in the narrowest part of the Gulf of Finland, opposite to the mouth of the Neva, on a height of the long, narrow, rocky island of Kotlin, forming, both by its position and the strength of its fortifications, the bulwark of the capital, and the most important naval station of the empire. It was founded by Peter the Great in 1710, and has spacious, regular streets, with many handsome houses; Greek, Lutheran, English, and Roman Catholic churches; very large marine establishments, a navigation school, a naval arsenal, a cannon-foundry, a barracks, building-yards, docks, etc. The harbor consists of three separate basins — a merchant haven, capable of containing 1,000 ships; a central haven for the repair of ships of war; and the war haven, which, in addition to the other works of the place, is defended by the strong fort of Kronslot, built on two small adjoining islands. The chief disadvantage of Kronstadt as a port is the long period during which the harbor is blocked up by ice. The construction of a canal affording better access by sea to the capital has diminished the trade of Kronstadt, which in consequence will cease to be a commercial port. Pop. (1897) 59,539.

Kropotkin, Peter Alexeievitch, pā'tėr ă-lĕk-sī-ā'vĭch krō-pŏt'kĭn, Russian geographer and revolutionist: b. Moscow 9 Dec. 1842. He was educated in the Corps of Pages at St. Petersburg, and joining a regiment of Cossacks of the Amur went to Eastern Siberia as aide-de-camp to the military governor of Transbaikalia, becoming later attaché for Cossacks' affairs to the governor-general of Eastern Siberia. He was connected with a prison commission and strove to get some reforms introduced into Siberian convict prisons, but his efforts proved of no avail. From 1863 he devoted his energies to a scientific investigation of Manchuria and the neighboring parts of Siberia, and his work in this department gained him the gold medal of the Russian Geographical Society in 1864. In 1871 he was sent by the Geographical Society to Finland to study glacial phenomena. Arrested in 1874 for promulgating radical ideas of social reform, he was confined in the prison of the military hospital, from which he contrived to escape to England in 1876. In the following year he went to Switzerland, where he founded at Geneva an anarchist journal called 'Le Révolté,' but in 1881 was expelled by the Swiss authorities on the demand of Russia. Returning to England in 1882, he wrote and lectured against the government of Alexander III. Having gone to France, he was arrested by the authorities and condemned (Jan. 1883) to five years' imprisonment for participation in the International, but he was released in January 1886, in consequence of a strong appeal made by leading French and English savants. Since then he has lived chiefly in London, engaged in literary work. He has written much on scientific subjects and has contributed to various encyclopædias. His separate publications include: 'Paroles d'un Révolté' (1885); 'In Russian and French Prisons' (1887); 'La Conquête du Pain' (1888); 'L'Anarchie, sa Philosophie, son Idéal' (1896; Eng. trans. 1897): 'The State: its Part in History' (1898); 'Fields, Factories, and Workshops' (1899); 'Memoirs of a Revolutionist,' first issued serially in 'The Atlantic Monthly' (1899). Prince Kropotkin is one of the ablest representatives and most eloquent exponents of that theory of society known as anarchist-communism. He is opposed to all societies based on force or restraint, and looks forward to the advent of a purely voluntary society on a communistic basis. He desires to see the division of labor, which is the dominant factor in modern industry, replaced by what he calls the "integration of labor," and is a stanch believer in the immense possibilities of intensive agriculture. In 1901 he delivered a course of lectures at the Lowell Institute in Boston.

Krout, Mary H., American journalist: b. Crawfordsville, Ind., 3 Nov. 1857. She was for 10 years on the staff of the Chicago *Inter-Ocean,* has traveled extensively as a staff correspondent and is the author of 'Hawaii and a Revolution'; 'A Looker-on in London' (1899); 'Alice in the Hawaiian Islands' (1899); etc.

Kruger, kroo'gĕr, **Stephanus Johannes Paulus,** Boer statesman: b. Colesberg, Cape Colony, 10 Oct. 1825; d. Clarens, Switzerland, 14 July 1904. At 11 he accompanied his parents in the "great trek" or migration of Boers, whom the British administrators had antagonized, from the Cape Colony, — a movement which resulted in the colonization by Boers of Natal, the Orange Free State, and the Transvaal. He and his parents resided for a time in the Orange Free State, but they ultimately made their home north of the river Vaal. At 16 he was assistant to a field cornet, and not long afterward became a field cornet himself. From that time he was constantly connected with either the military or the civil government of the

Transvaal, and his force of character gradually brought him to the front. In 1863 he became commandant-general, and in that capacity put down civil feuds and defeated the Basutos. At the time of the annexation of the Transvaal to the British territories in 1877 he was vice-president under President Burgers. Upon the reorganization of the Boer government by the national committee in 1880, he again assumed the office of vice-president, and in the war of 1880–1 with Great Britain, he took a leading part. He was elected president in 1883, and re-elected in 1888, 1893, and 1898. He visited England in 1883 in order to obtain a revision of the Pretoria Convention of 1881, and before his return in the following year he secured its replacement by a new convention practically granting independence — except in so far as relations with foreign countries were concerned — and authorizing the renaming of the State as the South African Republic. Kruger's position in the republic was now one of almost unlimited influence and authority. The enormous influx of foreigners after the discovery of the rich gold deposits of the Witwatersrand created problems of the utmost gravity. The greed of the British South African Company was extreme, the Uitlanders complained of injustice, and the Boers on their part were determined to resist foreign aggression. A crisis presented itself in the so-called 'Jameson Raid' (q.v.) of December 1895, which was easily crushed by the Boers, and at the same time led them to look forward to another and greater struggle with the English and to accumulate a large supply of military stores. Kruger managed with much diplomatic skill the difficult matters connected with this affair. In the second war with Great Britain Kruger remained in the country till the fall of Pretoria (5 June 1900), then escaped into Portuguese territory, and thence 19 Oct. sailed for Europe, hoping to enlist some of the European powers on behalf of the Boer republics, but failing in this he took up his residence in the Netherlands. In the summer of 1901 he proposed visiting the United States for the purpose of inducing the government to give its moral support to the Boers, but on being informed that neither President McKinley nor after him President Roosevelt would receive him in other than a strictly unofficial manner, the project was abandoned. His wife died at Pretoria in July 1901. See also South African War. Consult: Van Dordt, 'Paul Kruger' (1900); Statham, 'Paul Kruger and his Times' (1898).

Krummacher, Friedrich Adolf, frēd'rĭH ä'dōlf kroom'mäH-ĕr, German theologian: b. Tecklenburg 13 July 1767; d. Bremen 4 April 1845. A minister in the German Reformed Church and a professor of theology, he became widely known by his 'Parables' (1805), which ran through many editions and are familiar in an English translation. They were as a rule short, written in simple prose, on such subjects as 'The Blind Man,' 'Life and Death,' 'The Hero,' etc. None of his other writings won popularity.

Krupp, kroop, **Alfred,** German inventor and metallurgist: b. Essen, Prussia, 26 April 1812; d. there 14 July 1887. He was a son of Friedrich Krupp (q.v.). In 1848 he assumed charge of the Krupp Steel Works at Essen and presently discovered the method of casting steel in very large masses. In 1851 he sent to the London Exhibition a block of steel weighing 4,500 pounds, and was able to cast steel in one mass weighing more than 100,000 pounds. Although he manufactured a great variety of articles for use in various peaceful industries, his world-wide fame arose from his production of the enormous siege guns used by the Germans when they invested Paris. Several of Krupp's processes in the manufacture of steel and in the making of cannon were very carefully kept from the knowledge of the outside world and only employees were admitted to his foundries.

Krupp, Friedrich, frēd'rĭH, German manufacturer: b. 1787; d. 1826. He established a small forge at Essen, Rhenish Prussia, in 1807, experimented in the making of cast-steel, the secret of which was then carefully kept in Great Britain, and was able in 1812 to manufacture some of the material. In 1818, on the site of the present large Krupp establishment, he built a small plant of eight melting furnaces, each with one crucible. He turned out a steel of excellent quality, though not perfectly successful; but demand for the product was then slight, despite its use for mint-dies and some other purposes, and the activity of the manufactory was correspondingly small.

Krupp, Friedrich Alfred, German gunmaker: b. Essen, Germany, 17 Feb. 1854; d. there 22 Nov. 1902. He was known as the "Cannon King" in Germany and was the son of Alfred Krupp, who invented a new Bessemer steel, out of which he made rifles and cannons, a seamless tire for car-wheels; and discovered a new method of hardening armor plate. His grandfather, Friedrich Krupp (q.v.), founded the steel industry of Essen, beginning in 1817 with two laborers. The present Krupp works cover 150 acres, and the daily output is about 1,877 tons. The Krupps have been head of the iron and steel industry of Prussia for many years; their establishment is one of the greatest in the world. Friedrich Alfred Krupp was the richest man in the empire. He was generous to his operatives, built for them 5,469 dwellings, each with its garden, besides providing convalescent hospitals and orphanages. He also maintained a pension fund of $4,125,000 for their benefit. He vastly improved the capacity of the business by taking in other steel works at Rheinhausen and in the neighborhood of Magdeburg; acquiring coal mines in Germany, and iron mines in Spain, as well as in Germany. The shipyards and engine shops of Kiel and Berlin which he amalgamated with the mining and founding business, were sources of great wealth, and he owned a fleet of steamers for the exportation of his goods. Thus although he took no active part in his business on its technical side (in which he differed from his father and grandfather) his skill in finance was so great that in 15 years he almost doubled his inherited fortune. Compare: Armor-plate; Iron and Steel Industry; and Ordnance.

Krupp's Steel. See Steel.

Krutt'schnitt, Ernest Benjamin, American publicist and lawyer: b. New Orleans 17 April 1852; d. New Orleans, La., 16 April 1906. He studied three years at Washington College (1867–70), and then entered its law school, being admitted to the bar in 1874. He had oc-

cupied many positions of prominence in New Orleans, and was particularly interested in its public schools, being from 1890 president of the board of directors. In 1898 he received the degree of LL.D. from Washington and Lee University. He was chairman of the Democratic State Executive Committee (1892–6) and later chairman of the Democratic State Central Committee. In 1898 he was elected president of the Louisiana Constitutional Convention.

Kryp'ton, a gaseous element discovered in the atmosphere by Ramsay and Travers, in 1898. (The history of this member of the argon group is so bound up with that of argon itself, that reference should be made to the article ARGON, and to the references there given.) Krypton was discovered in the last fraction remaining after the evaporation of a considerable quantity of liquid air. The residue consisted chiefly of argon, oxygen and nitrogen; but when the oxygen and nitrogen had been removed, a spectroscopic examination of what remained showed lines that indicated the existence of at least one new element, in addition to argon and helium. To this new element the name "krypton" was assigned, from a Greek word signifying "hidden," in allusion to the circumstances under which the discovery was made. (See also NEON and XENON.) Little is known, as yet, concerning the properties of krypton. When it was isolated by means of a tedious diffusion process, it was found by Ramsay and Travers to have a density about 40.75 times as great as that of hydrogen, and an atomic weight of about 81.5. The ratio of its specific heat at constant pressure to its specific heat at constant volume was found to be 1.66, as in the cases of argon and helium. Subsequent experiments by Ladenburg and Krügel have indicated a density of about 29.5, and therefore an atomic weight of about 59. Travers, in his book issued subsequently to these later experiments, makes no reference to them. Considerations based upon the periodic law (q.v.) appear to indicate that the results of Ramsay and Travers are the more probable; but this point is as yet undecided. Krypton exists in the air in the proportion of about one part in a million. It has the chemical symbol Kr, and appears to be as inert, chemically, as argon.

Ktistola'træ. See MONOPHYSITES.

Ku-klux (kū'klŭks) **Klan,** a secret organization founded at Pulaski, Tenn., in 1866. Formed originally for purposes of amusement only, it soon developed into an association of "regulators," and became notorious for the lawless deeds of violence performed in its name. The proceedings of the Ku-Klux in the Southern States were a feature of the determined struggle to withhold from the emancipated slaves the right of voting. The outrages and murders which convulsed the country in 1868–9 ended in the calling out of troops and the formal disbandment of the society in March of the latter year; but its name and often its disguises were used for years to cover the violence of political desperadoes. At the first meeting in 1866 a name was suggested — "Ku-Kloi," from the Greek "Kuklos," a band or circle. On the mention of this name some one cried out, "Call it 'Kuklux.' " Nearly all present were Tennesseeans, with only one or two from farther south. On the name being pronounced, a Georgia man present remarked: "Kuklux, that sounds like 'Cocletz,' our old society, called the 'Lost Clan of Cocletz.' " The Cocletz Indians were a clan, not a tribe, that had existed some 200 years previously. The name was adopted and the society provided for the following officers: A Grand Cyclops or President; a Grand Magus or Vice-President; a Grand Turk or Marshal; a Grand Exchequer or Treasurer, and two Lictors. There were the outer and inner guards of the "Den," as the place of meeting was designated. Each member was required to provide himself with the following outfit: A white mask for the face, with orifices for the eyes and nose; a tall, fantastic cardboard hat, so constructed as to increase the wearer's apparent height, and in shape like those placed on the heads of the heretics formerly burnt in the Portuguese and Spanish *auto-de-fes;* a gown or robe of sufficient length to cover the entire person. The color and material were left to the wearer's fancy, and each selected what would in his judgment be most hideous and fantastic. Each member carried also a small whistle, with which, by means of a code of signals agreed on, they held communication with one another. The Klan increased in numbers and in power, an *imperium in imperio,* until its decrees were far more potent and its powers more dreaded than that of the visible commonwealths which it either dominated or terrorized. In April 1867 the Grand Cyclops of the Pulaski den sent out a request to all the dens scattered over the South to appoint delegates to meet in convention at Nashville, Tenn., in the early summer of 1867. At the time appointed this convention was held. Delegates were present from the Carolinas, Alabama, Georgia, Louisiana and other Southern States. A plan of reorganization previously prepared was submitted to the Convention and adopted, and the delegates returned to their various States as secretly as they had come.

The grand officers were: The Grand Wizard of the Invisible Empire and his ten Genii. The powers of this officer were almost autocratic. The Grand Dragon of the Realm and his eight Hydras; the Grand Titian of the Dominion and his six Furies; the Grand Cyclops of the Den and his two Nighthawks; a Grand Monk; a Grand Exchequer; a grand Lictor; a Grand Scribe; a Grand Turk; a Grand Sentinel. The Genii, Hydras, Furies, Goblins and Nighthawks were staff officers. The gradation and distribution of authority were perfect.

One of the most important things done by this Nashville convention was to make a positive and emphatic declaration of the principles of the order. It was in the following terms:

"We recognize our relations to the United States Government; the supremacy of the Constitution; the constitutional laws thereof; and the union of the States thereunder."

This Nashville convention also defined and set forth the peculiar objects of the order as follows:

1. To protect the weak, the innocent, and the defenseless from the indignities, wrongs, and outrages of the lawless, the violent and the brutal; to relieve the injured and the oppressed; to succor the suffering, and especially the widows and orphans of Confederate soldiers.

2. To protect and defend the Constitution of the United States and all laws passed in con-

formity thereto, and to protect the States and people from all invasion from any source whatever.

3. To aid and assist in the execution of all constitutional laws, and to protect the people from unlawful seizure, and from trial except by their peers in conformity to the laws of the land.

The Klan had a very large membership; it exerted a vast, terrifying and wholesome power, but its influence was never at any time dependent on or proportioned to its membership. A careful estimate placed the number of Kuklux in Tennessee at 40,000, and in the entire South at 550,000. The organization was disbanded in March 1869.

Kubelik, Jan, yän koo'bĕ-lēk, Bohemian violinist: b. Michle, near Prague, 1880. He studied at the Prague Conservatory and subsequently performed at semi-private musicales. In 1898 he appeared at a public orchestral concert and in 1900 with the Berlin Philharmonic Society, and made his début in London in June of that year. Subsequently he made a brief but successful tour on the Continent and in England, and in December, 1901, came to the United States, where he was most enthusiastically received.

Kûblai Khan, koob'lī khän (more properly KHÜBILAI KHAN), called by the Chinese Chi-Tson, Mongol emperor: b. 1214; d. 1294. He was the founder of the twentieth Chinese dynasty, that of the Mongols or Yuen. He was a grandson of Genghis Khan, and in 1259 succeeded his brother Mangû as Khagan or Grand Khan of the Mongols, and in 1260 he conquered the whole of northern China, driving out the Tartar or Kin dynasty. He then ruled over the conquered territory himself, and 19 years later added to it southern China, the dominion of the Song dynasty, which had originally summoned his assistance in driving out the Tartars from the north. Kûblai thus became sole ruler of an empire extending over a large part of Asia, as well as over those parts of Europe that had belonged to the dominion of Genghis Khan. He repaired the evils of so many wars by a wise administration, and by the encouragement which he gave to letters, commerce, industry, and agriculture, brought them all to a very flourishing condition. Marco Polo, the celebrated Venetian traveler, who lived 17 years at the court of this prince, gives some interesting information regarding him. Kûblai Khan is the subject of a poetical fragment by Coleridge.

Kuch Behar. See COOCH BEHAR.

Kuen-lun, kwĕn-loon', a great mountain system of central Asia, between the Himalayas on the south and the Thian-Shan on the north. It extends from the Pamir plateau in about lon. 75° E. eastward into China, terminating in about lon. 120° E. It varies in breadth, both extremities being compressed, its middle portion consisting of numerous more or less parallel chains. Nearly the whole group is between lat. 30° and 40° N. The most northern part on the west is a continuous mountain-wall having several names and being farther continued by the Nan-shan and other chains well into China. Toward the south are three roughly parallel shorter ranges, the last of which, with its eastern continuations, forms the southern boundary of a mountainous region in which are the Tsaidam salt waste and the Koko-Nor lakes. Between the last named group and one farther south the Hoang-ho rises. The most southerly chain of the central Kuen-lun is that of the Yang-la Mountains. The greatest elevation of the Kuen-lun is in the western ranges, and reaches over 22,500 feet, while the chief western ranges average about 20,000 feet. Most of the peaks of the eastern chains, in China proper, are under 17,000 feet.

Kugler, Franz Theodor, fränts tā'ō-dōr koog'lĕr, German writer on art: b. Stettin 19 Jan. 1808; d. Berlin 18 March 1858. He was appointed a professor of fine arts in the University of Berlin in 1833, and subsequently became a member of the Academy of Berlin. His works have undoubtedly exercised great influence on German art and culture; notably a 'History of Painting from Constantine the Great to the Present Times' (1837); 'Handbook of the History of Art' (1841–2); 'History of Architecture' (1856). He also wrote a 'History of Frederick the Great' (1840), which is popular in Germany. His 'History of Art' was continued by W. Lübke (q.v.).

Kuhns, koons, **Oscar,** American educator and author: b. Columbia, Pa., 21 Feb. 1856. He was graduated from Wesleyan University in 1885 and has been professor of modern languages there from 1890. He has written 'The German and Swiss Settlements of Colonial Pennsylvania' (1900); 'The Treatment of Nature in Dante's Divina Commedia' (1897); etc.

Kulturkampf, kool'toor-kämpf, a German term denoting the contest for political and legal rights waged between the authorities of Germany on the one hand and the authorities of the Roman Catholic Church on the other. The conflict was initiated by Bismarck in 1872 and had for its main point of dispute the control by the State of educational and ecclesiastical appointments. He urged that the declaration of Papal infallibility by the Vatican council in 1870 was an arrogation of rights dangerous to the state and that the Roman Catholic Church had assumed an attitude of aggression dangerous to the laws of the state. The ill feeling arising from the questions at issue led the Reichstag to pass a law in 1872 expelling the Jesuits from the German empire. The outbreak of the Kulturkampf, however, dated from the enactment of the May Laws (1873) aiming at state control of the clergy. The Roman Catholic bishops, clergy, and people refused to recognize the validity of the new laws. This opposition was met by still more drastic government measures and in 1875 all recusant priests were deprived of their salaries and all religious orders were abolished. The accession of Pope Leo XIII. prepared the way, however, for a resumption of friendly relations between the Imperial government and the Roman Catholic Church, and negotiations began in 1878 resulting in a nullification of the laws of 1873.

Kumas'si. See COOMASSIE.

Kumiss, koo'mĭs, a preparation of milk, whether cow's, mare's, ass's, or goat's, which is said to possess wonderful nutritive and assimilable properties, so that it is very valuable in the treatment of consumption, scrofula, chronic diarrhœa, and debility and emaciation in general. It consists essentially of milk in process

of fermentation, and cow's milk is what is used for making it in Great Britain. On the Asiatic steppes, where it has been long used as a beverage, it is made of mare's milk, but kumiss of mare's milk or goat's milk has a somewhat unpleasant smell. The manufacture of kumiss is carried on in Switzerland, Russia, and elsewhere. An analysis of a Swiss variety showed that it was composed of fully 90 per cent of water, nearly 3¼ of alcohol, rather more than 2 of sugar, about 1¾ each of butter and albuminates, besides lactic acid, free carbonic acid, and inorganic salts.

Kumquat, kŭm'kwŏt, a tree about six feet high, one of the *Citrus* group, closely related to the orange and growing in China and Japan. There are groves of it in the island of Chusan. The fruit, which is oval, is about the size of a gooseberry, and has a sweet rind and an acid taste. The Chinese make preserves of it, which are largely sold in American cities.

Kuntze, koont'sĕ, **Edward J.,** German-American sculptor: b. Pomerania 1824; d. United States 1870. After studying in the Academy of Fine Arts, Stockholm, Sweden, he took up his residence in London, but eventually (1844) went to New York, where he was elected Associate of the National Academy (1869). His reputation was made in the United States by his statuettes, among which that of Lincoln was extremely popular. He also executed figures of Shakespeare and Goethe on the same scale; while his statue of 'Psyche,' his bust of 'Mirth,' and his medallion portraits are all in their way excellent.

Kunz, koonz, **George Frederick,** American gem expert: b. New York 29 Sept. 1856. He was educated at Cooper Union, and became a special agent of the United States Geological Survey in 1883. He was placed in charge of the department of mines at the Omaha, Atlanta, World's Columbian and Paris Expositions. He has been president of the New York Mineralogical Club and vice-president of the American Institute of Mining Engineers, and is a member of many societies at home and abroad. Beside contributing innumerable papers on gems, minerals, etc., to magazines and reviews, he has published 'Gems and Precious Stones of North America'; and annual reports on the 'Production of Precious Stones,' in 'Mineral Resources of the United States,' etc.

Kunz'ite, the name of a recently discovered precious stone found in southern California; so called in honor of Dr. George F. Kunz, the special agent in charge of precious stones, United States Geological Survey, since 1882. It is a brilliant gem and is between the topaz and pink sapphire in color. A rose-lilac is the tint which marks this stone, a color new among gems; and its radiance is peculiar and beautiful.

Kunzite was brought to light in 1902 near Pala, in San Diego County, Cal., and was sent for classification to Dr. Kunz, the eminent mineralogist of New York. Much attention was attracted by the beautiful lilac-colored crystals, for nowhere in the country, not even in the American Museum of Natural History at New York, which has the finest collection of spodumene, under which the new gem was classed, had there been seen such remarkable and perfect specimens as these. Dr. Kunz identified the gem and described it; but Dr. Charles Baskerville, professor of chemistry in the University of North Carolina, finally subjected it to ultra-violet light, then to the rays of high penetrative power, and lastly to the bombardment of the corpuscles shooting out from radium, which resulted in some wonderful effects new to the scientific world. Of these effects Dr. Charles Baskerville, who took the liberty of naming the gem "Kunzite," for his friend, gives the following account:

"On examining this gem we directed our attention to discovering the effect of radium on precious stones. It was shown early in the experiments of the French mineralogist, Curie, that many diamonds phosphoresce, that is, glow in the dark, after being exposed to the emanations of radium. All diamonds phosphoresce with radium, as we learned by applying the test to about two thousand gems collected from some fifteen thousand. The gem in which we were particularly interested belongs to the class of spodumene. Mineral spodumene is usually obtained in large opaque whitish crystals, but from time to time small specimens, often richly colored and transparent, are found. The three characteristic varieties of the latter are a clear yellow gem spodumene of Brazil, the green hiddenite, or lithia emerald of North Carolina, and the lilac sometimes found in Connecticut. These are without doubt remnants of large specimens, which must have been elegant. Spodumene is very subject to alteration and has usually lost all its transparency and beauty of tint."

The California spodumene crystals are of a rose-lilac tint, varying with the spodumene dichroism, from a very pale tinge when observed transversely to the prism, to a rich amethystine hue longitudinally. No such crystals of spodumene have ever been seen before, and the discovery is of great mineralogical interest. The crystals have been etched by weathering and have a twinning like the hiddenite variety. When cut and mounted parallel to the base, they yield gems of great beauty. Baskerville, Kunz and Crookes have found this almost as luminously responsive to the action of radium as the diamond.

Kurdistan, koor-dĭs-tän' (Persian, "land of the Kurds"), an extensive territory of western Asia, comprehending the greater part of the mountainous region which borders on the western side of the great plateau of Iran or Persia, and stretches westward till it overhangs the low plains of Mesopotamia on the southwest, and reaches the borders of the Turkish provinces of Diarbekir and Erzerum on the northwest. Its limits, as nearly as they can be defined, lie between lat. 34° and 39° N.; and lon. 42° and 47° E., with an area of nearly 40,000 square miles. The surface is very mountainous, and is traversed by lofty ranges stretching northwest to southeast. The whole surface on the west of the Persian frontier is drained by the Tigris and the Euphrates and their tributaries. Unless Lake Van is considered as partly within the territory, there are no lakes of any consequence. The mountains are covered with forests of oak and other hard timber. Many of the valleys are under regular culture, with corn-fields, orchards, and vineyards. One of the most remarkable vegetables is manna, expressively called in Turkish *Kudret-hal-vassiz,* or the Divine sweet-

meat, which is used as food. Fine horses and oxen are bred, and sheep and goats are kept in large numbers.

The Kurds are a stout, dark race, well formed, with dark hair, small eyes, wide mouth, and a fierce look. Most of the men are armed, using lances, sabres, daggers, muskets, and pistols. Many of the tribes are still nomadic. The language is of the same stock as the modern Persian. The great body of the Kurds are Mohammedans. They care little for trade, although they send to Kirkuk, Hamadan, etc., gall-nuts, tobacco, honey, sheep-skins, and cattle; obtaining in return coffee, rice, leather, and clothing, chiefly cotton goods. Their allegiance to the Turkish sultan is but slight. The famous Sultan Saladin was a Kurd. It is very difficult to form even an approximate estimate of the whole Kurd population; the Turkish portion is supposed to contain about 2,500,000, and the Persian portion 400,000; but another estimate would give for these numbers 1,300,000 and 500,000 respectively.

Kuria Muria (koo'rē-ä moo'rē-ä) **Islands,** a group of islands situated off the southern coast of Arabia at distances varying from 10 to about 30 miles, with a total area of over 25 square miles. Guano deposits are found in these islands, but they are considered to be barren, and have very few inhabitants. In 1854 they were ceded to Great Britain.

Kuriles, koo'rīlz, a chain of islands in the North Pacific Ocean, belonging to Japan (q.v.). The chain extends southwest to northeast from lat. 43° 40′ to 51° N.; lon. 145° to 156° E. They are divided into the Great and the Little Kuriles.

Kuroshiwo, koo-rō-shē'wō (Japanese, "black current"), a current of the Pacific Ocean somewhat analogous to the Gulf Stream. It takes its origin in the great north equatorial current along the southeast of Asia, flows past the Philippine Islands and Formosa, which somewhat deflect it, past Japan, the Kuriles and the Aleutian Islands, and thence bends southward toward California. As it approaches the American coast the current increases in breadth. It is much inferior to the Gulf Stream both in volume and in high temperature. It was formerly thought that the Kuroshiwo had a moderating effect upon the Pacific coast climate of this continent, but this view has been abandoned by reason of the scientific knowledge that the prevailing winds of the North Pacific bring eastward the warmth and moisture which produce the climatic moderation observed upon its shores.

Kurtz, koorts, **Charles M.,** art expert: b. Pennsylvania about 1855. He was graduated from Washington and Jefferson College in 1876, studied at the National Academy of Design (New York), was for some time on the staff of the New York *Tribune,* was nine years editor of 'National Academy Notes,' and edited the 'Art Union Magazine' in 1884. In 1891 he withdrew from journalism and was appointed assistant chief of the department of fine arts in the World's Columbian Exposition (Chicago 1893). In 1894–9 he was art director of the St. Louis annual exposition, in 1899 was appointed assistant director of fine arts for the United States at the Paris exposition of 1900, and in 1901 assistant chief of the department of art at the Louisiana Purchase exposition.

Kusi, koo sē. See Coosy.

Kuskoquim, kŭs'kō-kwĭm, Alaska, the second river in size in the Territory, rising on the northern slopes of Mount McKinley, and after a southwestern course of over 500 miles, flowing through the wide estuary of Kuskoquim Bay into Bering Sea, about 200 miles south of the Yukon Delta. The trading stations along its banks are Kolmakof, Oknagamut, Odgavigamut, Gavimamutt and Bethel. The inhabitants in the region are chiefly Indians and Eskimos. Gold was discovered in the valley of the Kuskoquim in 1903.

Kutchin, kŭ-chĭn', a name given to the tribes of the Athabascan Indians who live near the Yukon River in Alaska, and in British North America. They are also called Loucheux and Quarrelers. They number less than 2,000.

Kutztown, koots'town, Pa., borough in Berks County, on the Philadelphia & R. railroad, 18 miles northeast of Reading. There is a normal school here and manufactures of flour, leather, shoes, hosiery, etc. Pop. (1900) 1,328.

Kuyp, Albert. See Cuyp, Albert.

Kuyper, kī'pĕr, **Abraham,** Dutch theologian and politician: b. Maassluis, Netherlands, 1837. After a course of theology at Leyden he became a preacher, and in 1874 was elected member of the lower house of Parliament, or Second Chamber, where he formed the Anti-Revolutionary party. He soon afterward quitted parliamentary life and launched out into the career of a publicist and journalist, still leading his party with great éclat. In theology he is the leader of staunch Calvinistic orthodoxy, and is opposed to all "modernism." In 1880 he founded in Amsterdam the Free University. His political organ is the 'Standaard'; his religious organ the 'Heraut.' Among his works is 'Ons Program' (1880); he has also edited the works of the Polish reformer Jan Laski, and is well known in the United States from De Vries's English translation of his 'Encyclopedia of Sacred Theology' (1898).

Kwalhiokwa, kwäl-hē-ō'kwä, a tribe of Athabascan Indians, formerly living on Willopah River, Washington, near the Lower Chinook Indians. They are frequently confounded with the Owilapsh or Whilpah.

Kwanza, kwän'za, or **Coanza,** kō-än'za, a large river of Portuguese West Africa. Rising in Lake Mussombo, it flows at first in a northeasterly direction, then north, and finally in a westerly and northwesterly course, and enters the Atlantic Ocean near lat. 9° 10′ S., not far south of Saint Paul de Loanda. In the lower part of its course there are many falls, the last being the Livingstone or Kambambe Falls, below which for a distance of about 170 miles the river is navigable for small steamers. Its total length is about 800 miles.

Kyanite, kī'a-nīt, or **Cyanite,** a native aluminum silicate, Al_2SiO_5, identical in composition with sillimanite and andalusite but very different in its physical properties. Its hardness varies on different faces from 4. to 7. Its specific gravity is 3.56 to 3.67. It is triclinic, the crystals usually being long-bladed, transparent or translucent, and of a beautiful sky-blue color in

the centre. Stout crystals of a grass-green color occur in North Carolina. The finest specimens come from Faido, Switzerland, occurring in paragonite schist. Cyanite abounds throughout the New England and Middle Atlantic States.

Ky'anizing, a process for preserving timber, cordage, etc., from the effects of dry-rot, named from an inventor of the name of Kyan. It consists in immersing the material to be preserved in a solution of corrosive sublimate and water, in the proportion of 1 pound of the former to from 10 to 15 gallons of the latter, according to the strength required. The time during which timber must be allowed to remain in the solution depends upon its size and thickness. For boards and small timbers 24 hours are required for each inch of thickness. This process is now almost entirely disused, as wood is much better preserved by being saturated with kreosote or coal-tar.

Kym'ry. See CYMRI.

Kyrie Eleison, kĭr'ĭ-ē ē-lā'ĭ-sŏn (from the Greek *Kyrie eleēson,* "Lord, have mercy"), an invocation following the introit of the mass. It is almost the only part of the liturgy in which the Roman Catholic Church has retained the use of Greek words. Just after the introit the priest celebrating the mass and the servers repeat alternately three times "Kyrie eleison," and then as many times in the same manner "Christe eleison," and so on alternately. When it is sung the leading singer takes the part of the priest, and the choir that of the servers. The introduction of the Kyrie into the mass is attributed to Pope Sylvester I., in the beginning of the 4th century.

L

L the twelfth letter of the English and most of the other modern European languages. Its definitive form in the Greek alphabet is Λ, but in very early Grecian, Hebrew and Phœnician monuments it has the form ⅃ or L. Its name in Hebrew and Phœnician is lamed and in Greek lambda.

The sound of l is produced when the tip of the tongue is brought into contact with the palate behind the upper front teeth, and, with the jaws apart, the breath is emitted. The sound of r is produced in nearly the same way, but in sounding the r the tongue is not in contact with the palate and may vibrate. Thus these two letters represent sounds that are much alike. But there are nations that cannot sound the r, as the Chinese and sundry other races; these substitute l for r: the technical name for this vice of utterance is lambdacism; the opposite vice is an inability to pronounce l, for which r is substituted, as by the Japanese. In languages whose syllabaries admit both these sounds the two letters are freely interchanged or confounded. In languages belonging to one common family, the Aryan, for example, a word which in one language has r, in another has l, and *vice versa;* examples: Lat. *prunus,* Eng. plum; Lat. *ulmus* (elm), Fr. *orme.* The like is seen in the formation of derivatives within one language. Thus in Latin the adjective termination *alis* (Eng. al, as in liberal) is changed to *aris* when the word has already an l: for example: from *peculium* comes *peculiaris,* from *auxilium, auxiliaris,* and *vice versa,* r for a like reason is changed to l: thus from *per* and *lucidus* comes *pellucidus,* from *inter* and *lectus, intellectus.* L is also substituted in one language for n in another; for example: Gr. *pneumon* (lung), Lat. *pulmo.* Or d and l are interchanged: Gr. *Odysseus,* Lat. *Ulysses;* the like is seen in the two Latin words *odor* and *olor;* and the Latin *lingua* was once written *dingua,* allied to Eng. tongue and Ger. *zunge.*

In Italian the l of Latin words is often changed to i: Lat. *planus, plumbum* (lead), Ital. *piano, piombo.*

In English l is often silent: palm, calm. In French *al* becomes *au; à le* becomes *au, cheval* (horse) plu. *chevaux;* and the English auburn is from Latin *alburnus.* In English and most of the other languages l, whether single or double, has one sound-value only, the same which it has in pale, pallid; but in French sometimes ll has a sound resembling that of lli in million: in Spanish ll may commence a word, for example: *llana* (wool), and is classed as a distinct alphabetic character: its sound-value is the same as that of ll in French.

L. E. L., the *nom-de-plume* initials of an English novelist, Letitia Elizabeth Landon, later Mrs. Maclean.

La, in music, the syllable which denotes the sixth note of the diatonic scale.

Laager, lä'gėr (Dutch, "a camp"), in South Africa, an encampment more or less fortified. The original Boer laager is an enclosure made of the wagons of a traveling party for defense against enemies.

Laaland, lâ'länd, or **Lol'land,** an island of Denmark, in the Baltic Sea. Its greatest length, southeast to northwest, is 36 miles; breadth, varying from 9 miles to 17 miles; area, 462 square miles. The surface, as implied by its name, meaning "low land," is so very little raised above the sea, that parts of it along the coast are subject to frequent inundations; and for a considerable distance around it the water is so shallow that there are few places in which vessels drawing 8 feet can approach it without danger. The soil, consisting generally of a heavy loam, is very fertile, and yields excellent crops of corn. Beans, hops, and hemp are extensively grown. Varieties of hardwood timber are abundant. Pop. 65,550.

Laar, or Laer, Peter van, Dutch painter: b. Haarlem, Netherlands, 1590; d. sometime after 1658. Early in life he went to France, and subsequently visited Italy (1623). Here he mainly resided at Rome, where he became associated with Claude Lorraine, Poussin and Sandrart. He was small and crooked in stature, and was thus called by the Italians "Bamboccio," and the comic scenes of rustic life painted in his style became known as "Bambocciads." He returned to Haarlem in 1639. He painted pastoral and banditti scenes, fairs, and such like rural incidents, with spirited and vigorous brush, although his coloring is somewhat hard. A masterpiece of his, 'The Market Crier,' is in the gallery at Cassel. Other pictures of his are to be found at Paris, Dresden, Vienna, Munich, etc. About 20 etchings from his hand are also extant, chiefly animals and landscape, which are spirited and finely executed.

Labadie, Jean de, French mystic and separatist: b. Bourg en Guienne 13 Feb. 1610: d. Altona, Prussia, 13 Feb. 1674. He was educated at Bordeaux by the Jesuits, and belonged to their order till 1639. He then quitted it, both because irregularities were detected in his conduct, and he was found to have adopted many very peculiar and extravagant views. For these he was cited before the Parliament, but fled to Geneva. At a later period he returned to France, and took up his residence in Amiens, whose bishop entrusted him with the visitation of the monasteries in his diocese. He also found a patron in

the archbishop of Toulouse. His zealous opposition to some of the clergy subjected him again to persecution, and to escape from it he, in 1650, went over to the Reformed Church, but not finding himself so comfortable as he expected, he thought he had received a call to found an apostolic church for himself. He now became a preacher in Montauban, and afterward, on being obliged to leave it, in the town of Orange, from which he proceeded successively to Geneva, Middleburg, and Amsterdam. In the last city he collected his followers into a distinct church or society under the name of Labadists. Toleration being now denied him, he in 1670 proceeded to Herford, where the Palsgravine Elizabeth gave him protection. Driven thence by an imperial edict in 1672, he went first to Bremen, and finally to Altona, where he held private meetings.

La Barca, lä bär'kä, Mexico, town in the State of Jalisco, east of Chapala, and 60 miles southeast of Guadalajara, on the International railroad between that city and the capital. The town was founded in 1529 by Nuño de Guzman, and during the Mexican war for independence the town was the scene of two serious battles. Pop. (1900) 10,000.

La Barre, Antoine Joseph Lefèvre de, French sailor: b. about the beginning of the 17th century; d. 4 May 1688. He rose to early prominence as an officer of the French navy, and was appointed governor of Guiana in 1663. He was successful in recapturing Cayenne which had been occupied by the Dutch. On being commissioned lieutenant-general he sailed for the West Indies, and, in a fight with the English in the Antilles, compelled them to raise the blockade of Saint Christopher. Succeeding Frontenac as governor of Canada in 1682, his irresolution in his negotiations with the Indians was so disastrous that he was recalled in 1684.

Lab'arum, the name given from the time of Constantine to the imperial banner. Eusebius has described it with much particularity. It was in the form of a long pike, crossed at a certain height by a beam, from which depended a banner richly embroidered with gold, and adorned with precious stones. The pike was surmounted by a crown of gold, enclosing within it a monogram of the two initial letters of the name of Christ.

Labat, Jean Baptiste, zhŏn bäp'tēst' lä-bä, French Dominican missionary and traveler: b. Paris 1663; d. there 6 Jan. 1738. In 1693 he went as a missionary to the French Antilles, landed at Martinique, and undertook the care of the parish of Macouba, which he superintended for two years, after which he was sent to Guadaloupe. His mathematical knowledge recommended him to the governor there, whom he accompanied during a tour through the island to assist him in selecting the points best adapted for works of defense. On his return to Martinique Labat received the office of *procureur-général* of the mission, in which an opportunity was afforded him of displaying the whole extent of his useful activity, at the same time that he served the government by his mathematical knowledge. In 1705 he was sent to Europe on business of the order, and landing at Cadiz, surveyed geometrically and scientifically the environs and the whole coast of Andalusia as far as Gibraltar. He returned to Paris in 1716. His 'Nouveau Voyage aux Iles de l'Amérique,' which has been translated into several languages, contains an account of the natural history, particularly of some of the smaller and less frequented islands; of their productions; the origin, customs, religion, and governments of the inhabitants. He also published a 'Nouvelle Relation de l'Afrique occidentale'; 'Voyage en Espagne et Italie'; 'Relation historique de l'Ethiopie occidentale'; 'Mémoires du chevalier d'Arvieu.'

Labédoyère, Charles Angélique Huchet, shärl än-zhā-lēk hü-shā lä-bā-dwä-yār, Comte de, French general: b. Paris 17 April 1786; d. there 19 Aug. 1815. He entered the army in his 20th year, and served with much distinction in Spain, Germany, and elsewhere. Napoleon raised him to the rank of general of division in 1815, and he fought with great courage at Waterloo. After the battle he hurried to Paris, and there distinguished himself by his hostility to the Bourbons. On the capitulation of Paris he followed the army behind the Loire, but returning to Paris, was taken, tried by court-martial, and shot.

Label, Union. See Union Label.

Labezares, Guido de, gwē-dō dā lä-bā-thä'rēs, Spanish adventurer: b. Bilbao, Spain, 1510; d. Manila 1580. He began his career in South America, from which he made a voyage to Java and Sumatra 1542. In 1550 he discovered the Bay Filipina, in Florida, and in the following year with Luna de Arellano visited and re-named the place Bay Santa Maria. He entered with Legaspi upon the project of conquering and converting the Philippine Islands. His success was complete in the matter of conquest and in 1574 he was appointed governor-general of Manila. By means of new fortifications he so strengthened the place against the Chinese corsairs and the Dutch pirates, that these were driven from the adjacent islands. In 1575 he took the position of lieutenant-governor, under a new governor-general sent from Spain, and kept his position until his death.

Labia'tæ, a natural order of dicotyledonous herbs or sub-shrubs distributed mainly in temperate climates. The species, of which there are more than 2,500, grouped in about 150 genera, are characterized by four-cornered stems; opposite, exstipulate leaves; two-lipped flowers generally in whorls, cymes or heads; and one to four achenes in a persistent calyx. They are noted for their volatile oils, which in many instances are of economic importance either as perfumes, or as flavorings. Some species are cultivated for ornament, but probably the best known are those which have been used for centuries for flavoring food, such as sage, thyme, savory, marjoram, mint, balm, and basil (qq.v.). The species used most frequently in perfumery are probably lavender, rosemary and patchouli. One species variously known as Chinese and Japanese artichoke, chorogi, and knotroot. *Stachys sieboldi* or *S. affinis* yields edible tubers which are eaten raw or cooked in Asia, France and to a small extent in the United States. Many labiates have at some time been reputed medicinal but are now rarely used except to disguise the taste of disagreeably flavored drugs. The best known genera represented in the United States are: *Nepeta* (catnip), *Mentha* (mint), *Origanum* (marjoram), *Salvia*

(sage), *Thymus* (thyme), *Marrubium* (horehound), *Satureia* (savory), *Lavandula* (lavender), *Monarda* (horsemint), *Ocimum* (basil), *Melissa* (balm), *Scutellaria* (skullcap), *Lamium* (dead nettle), *Calamintha* (calaminth), *Teucrium* (germander), and *Trichostema* (blue curls).

Labiche, Eugène Marin, ė-zhān mă-răn lă-bēsh, French dramatist: b. Paris 5 May 1815; d. there 13 Jan. 1888. He wrote, chiefly in collaboration with other authors, upward of 100 plays, many of them very successful. They are mostly distinguished by extravagant plots, and are full of droll situations. In 1880 he was elected to the Academy, and after that date ceased to write for the stage. His dramatic works were collected in 10 volumes (1878–9). Among the best of them may be mentioned: 'The Italian Straw Hat' (1857); 'Le Voyage de M. Perrichon' (1860); 'Moi' (1864). Consult: Matthews, 'French Dramatists' (1901).

Lablache, Luigi, loo-ē'jē lă-blăsh', operatic singer: b. Naples, Italy, 6 Dec. 1794; d. there 23 Jan. 1858. He studied at the local Conservatory della Pietá de Turchini under the guidance of Valesis, and made his début as a bass singer, *buffo Napoletano,* in Fioravanti's 'Molinara.' Later he enlarged his repertoire by singing in grand opera, and appeared as Mercadente in 'Elisa and Claudio.' His reputation soon extended over Italy. In his 20th year, when the triumph of Rossini was at its height, he stood forth as the greatest interpreter of that master, and reached the summit of his fame. A medal was struck off in his honor at Vienna in 1825. For the next 17 years he annually appeared in Italian opera in London, Paris, and St. Petersburg. He was equally admirable in comic and serious operas, and the school of music which he opened in Paris had considerable success in handing on the traditions of his style.

Labor. See AMERICAN LABOR.

Labor, American Federation of. See AMERICAN FEDERATION OF LABOR.

Labor and Commerce, Department of. See COMMERCE.

Labor Bureau, more properly the bureau of labor, a sub-department of the Department of Labor and Commerce. Originally the Bureau of Labor was a part of the Interior Department, but at the creation of the new department by the Congress 11 Feb. 1903, the bureau was transferred. It was organized in 1885, and Carroll D. Wright, who had been very successful as chief of the Bureau of Statistics in Massachusetts, was appointed Commissioner of Labor. At the end of three years Commissioner Wright had made such signal success in the new department that the bureau was changed to the Department of Labor, with independent functions. It has issued annual reports, special reports and bi-monthly bulletins of great educational value.

Nearly every State in the Union also has a labor bureau, or department of labor, the oldest being that of Massachusetts, organized in 1869. Several of the State bureaus, particularly those of New York and Connecticut, maintain free employment agencies. The Federal and State bureaus had published up to October 1903 only 500 volumes on labor topics. These State bureaus have been kept remarkably free from partisan politics, and those have been decidedly successful in the settling of labor disputes and in preventing strikes and lockouts. These organizations proved so successful that European nations soon followed the American example. In 1891 France organized a bureau of labor and in 1892 Germany followed with a labor commission. In 1893 a labor department under the direction of a Commission for Labor was instituted in England. Austra, Italy, Sweden, New Zealand, New South Wales and Canada have since established similar bureaus. Consult: Wright, 'The Workings of the Department of Labor,' and 'The Value and Influence of Labor Statistics,' in 'Monographs on Social Economics' (Washington 1901).

Labor Colonies, or agricultural communities, are common in Europe but almost unknown in the United States. They are maintained for the purpose of giving employment and training to individuals who, on account of misfortune or inefficiency, find it difficult to earn a living. In Holland there are four of these labor colonies, at Wilhelmsoord, Frederiksoord, Wilhelminasoord and Colony No. 7, which have been established for over half a century. They occupy 5,000 acres of land and have a membership of over 2,000. At La Chalmelle, France, is a colony established in 1892. It occupies 318 acres of land and has 300 colonists. In Germany there are 26 colonies all established since 1882. New Zealand has a government farm of 1,000 acres. In Belgium are two colonies which are practically penal institutions for vagrants and beggars. There are several colonies in England, and in the United States three small colonies have been established by the Salvation Army, one each in Colorado, California and Ohio. The most successful is the Colorado colony which has 150 members. The colony system in all the European countries is practically communism under government control, all the colonies being conducted on the co-operative plan.

Labor Congress, an assemblage, either national or international, of representatives of organized labor. In 1866 the first International Labor Congress was held at Geneva, Switzerland, about 60 delegates being present from England, France, Germany, Holland and Switzerland. The results of this meeting were the condemnation of the industrial employment of women, the advocating of technical education and the organization of mutual credit associations. At the congress of 1869, held at Basel, Switzerland, labor representatives were in attendance from Russia, Austria, Germany, France, England, Spain, Italy, and Switzerland. This assembly by a vote of 54 to 4 declared that landed property should be abolished. Other similar congresses were held at Dresden, 1871; The Hague, 1872; Paris, 1886; Berlin, 1891, and Zürich, 1897.

An International Socialist-Labor Congress was held in Paris in 1889. In 1891 a second Socialist-Labor congress was held at Brussels, at which 400 delegates were present from nearly every country in the world, including Canada and the United States. Among the topics discussed were: the eight-hour day, militarism, universal suffrage, and legislative protection of labor. At the congress of 1893 at Zürich, Switzerland, 385 delegates were present, and admission was denied to all avowed anarchists. The congress, now assuming definite organiza-

tion, met in London in 1896, and arranged to meet every four years thereafter. The anarchists were again denied admission, and resolutions were adopted opposing standing armies, advocating the nationalization of land and the socialization of industry.

The next meeting of the International Socialist-Labor Congress was held in Paris, in 1900, when the assembly discussed the laws regulating strikes and boycotts and favored the abolition of the capitalistic class. Resolutions were passed favoring a fixed minimum wage and the nationalization of mines. The congress for 1901 held 14 Sept. at Amsterdam, discussed the following questions: General strikes; general rules of political socialism; trades unionism and politics; colonial politics; international arbitration; the relation of the trust question to the unemployed problem; emigration. Of this organization which meets every four years there is a standing committee known as the International Socialist Bureau, which meets annually. The meeting for 1903 was held in Berlin.

Various national labor congresses are held in several countries, particularly in England, where an annual convention has been held since 1868. Congresses of anarchists convening under the disguise of labor have been held at intervals in Lyons, Havre, Brussels, Barcelona and other cities. See also LABOR UNIONS; SOCIALISM.

Labor, Court of (Industrial Department of the National Civic Federation). At a conference of representatives of capital and labor, held in New York 17 Dec. 1901, under the auspices of the National Civic Federation (q.v.), a permanent board was appointed to settle differences between the employees and the labor unions. On this board were 12 representatives of organized labor, 12 representative employers and 12 leading educators, clergymen and public men. On 18 Dec. 1901 the committee organized on a permanent basis, with Senator M. A. Hanna as chairman, and Oscar S. Straus and Samuel Gompers, vice-chairmen. The following statement was issued, indicative of the purposes of the committee:

"This committee shall be known as the industrial department of the National Civic Federation. The scope and province of this department shall be to do what may seem best to promote industrial peace; to be helpful in establishing rightful relations between employers and workers; by its good offices to endeavor to obviate and prevent strikes and lockouts; to aid in renewing industrial relations where a rupture has occurred. That at all times representatives of employers and workers, organized or unorganized, should confer for the adjustment of differences or disputes before an acute stage is reached, and thus avoid or minimize the number of strikes or lockouts. That mutual agreements as to conditions under which labor shall be performed should be encouraged, and that when agreements are made the terms thereof should be faithfully adhered to, both in letter and spirit, by both parties. This department, either as a whole, or a sub-committee by it appointed, shall, when requested, act as a forum to adjust and decide upon questions at issue between workers and their employers, provided in its opinion the subject is one of sufficient importance. This department will not consider abstract industrial problems. This department assumes no power of arbitration unless such powers be conferred by both parties to a dispute. This department shall adopt a set of by-laws for its government."

The committee since its organization has been instrumental in settling numerous troubles and disputes between capital and labor. See NATIONAL CIVIC FEDERATION.

Labor Day, in the United States, the first Monday in September, a legal holiday in all the States and Territories except Nevada, North Dakota, and Wyoming. In Louisiana it is observed only in the parish of New Orleans. The celebration of this day was inaugurated by the Knights of Labor, who in 1882 held a parade in New York, and again in 1884, when resolutions were passed to hold all parades on that day. Workingmen of all organizations then began agitation to have the day made a legal holiday, and in 1887 the first law to that effect was passed in Colorado. The day is celebrated by parades and by meetings addressed by prominent labor leaders. In Europe the celebration of the first of May as Labor Day was begun in 1890 with a demonstration in favor of the eight-hour day; it was at that time and for a few years later much feared and violently opposed by the various governments, and there were many clashes between the police and soldiers and the workingmen. It is now usually celebrated without trouble. In the United States, May Day is celebrated by the Socialist-Labor party, but there is no attempt to cease work on that day.

Labor Exchanges, a name erroneously applied to employment bureaus (q.v.). It was also a term given to a class of institutions founded by the followers of Robert Owen (q.v.) in 1832–5. These were designed to bring about an exchange of products of labor without the intervention of money. Many stores were founded but the plan was soon found impracticable.

Labor Legislation in the United States. The problem of protecting the laboring classes against the employing class is of relatively late development in the United States, owing to the superior prosperity of the laborers, the rapid increase in employments and competition for workmen. Of course, direct United States laws on the subject cannot exist, all such legislation being reserved to the States; the most the government can do is to set an example of short hours, high wages, and sanitary conditions in its own workshops or other employments, and make enactments for the District of Columbia. State legislation is too scattered and discordant to present in full; only a classification of the subjects of legislation will be attempted.

The Contract in General.— One of the fundamental principals of the common law, though not expressed in statutes, is that long contracts for personal service, which might end in a form of serfdom, will not be enforced beyond two years; in one State nothing beyond one year is enforceable; which implies that under these limits it could be, but no case has yet arisen. The notice to be given on quitting employment has been regulated in several States by an enactment that an employer shall give an employee the same notice which he exacts by withholding wages, requiring bonds, etc.

Rate, Form, Period, etc., of Wages.—There is no statute in any State fixing the rate of wages, nor would it be constitutional, in all probability. The nearest approach is an Indiana statute of 1899 providing a minimum of 15 cents an hour for manual labor. It is often provided in municipal orders, however, that work on contracts shall not be paid at less than current local rates. The wage-paying period has in some cases been legally fixed as weekly; it is not certain that this is either constitutional or wise. More common and of much less doubtful utility are the laws in some States forbidding the payment of wages in orders for goods, or anything but cash, and prohibiting companies from operating or being interested in stores or supply establishments, Maryland and Illinois have this in action; the Pennsylvania statute was held unconstitutional. Laws regulating fines and deductions, weighing, etc., have been enacted, and "screen laws" for the coal mines.

Hours of Labor.—This has been and is one of the most persistently fought of labor questions, but for adult work it has not been very successful thus far on the State-arena, the only statute establishing a general 8-hour law with enforced payment for overtime — that of Nebraska — having been declared unconstitutional. Wyoming by constitution, however, and Missouri and Utah by statute, have established an 8-hour day for the mines; and it is usual to fix 8 hours as a day's work where the contract does not specify any. This is also becoming customary in public work for States and cities, and will doubtless become universal. The State also claims the right to regulate hours in unsanitary or dangerous occupations. On the subject of children's labor, the Northern States east of the Rockies have generally a full and systematic body of legislation; efforts are making by the best citizens of the South to have its States adopt similar laws. These statutes restrict the labor of children under certain years (10 at lowest, more commonly 12 or 14) to a usual 10 hours a day, and 55 to 58 hours a week; 12 hours in Pennsylvania, but even there only 60 hours a week. It is also usual to order the hours arranged so as not to interfere with school hours, unless the children have reached a certain standard. Some States make these laws apply to adult women as well; some prohibit women's labor in the mines altogether.

Personal Liberty.—A number of enactments have been made to prevent intimidation of workmen by threats of loss of employment, etc.; and by pay envelopes or placards in work-rooms drawing menacing pictures of shutting down, discharging men, etc., if certain political results ensue. Forbidding men to join unions, forcing them to contribute to benefit societies, or to employ a company physician, etc., are legislated against.

"Government by Injunction" (q.v.).—The use of injunctions and proceedings for contempt to suppress labor riots has greatly incensed the workingmen, and in Kansas a statute has been passed which goes so far as practically to make it impossible to enforce any contract that does not sound in damages.

Health, Safety, Moral Conditions, etc.— The evils of the sweat-shop — tenement manufactures, mainly confined to clothing — have drawn out legislation, either extending the factory acts to them, or restricting the manufacture to members of the resident family and requiring a license. In factories, there are laws providing a given air space for each hand, and machine appliances for removing dust, guards for belts, shafts, dangerous machinery, elevators, etc., prohibition of cleaning machinery while in motion, sometimes of women or children cleaning it at all, fire escapes, etc. See FACTORIES AND FACTORY INSPECTION.

Employers' Liability.— This branch of law in America is almost entirely the creation of the past 20 years; so much so that a great and flourishing branch of accident insurance, unknown a generation ago, now takes in many millions of dollars in premiums annually. The employer has always been liable in damages to an employee for accident resulting from his own negligence, or defects in his plant, as from breaking machinery, bad floors, etc.; but not from the negligence of fellow employees. The latter has of late years been changed, so that the employer is now liable for all accidents in his service except where the employee's own negligence is the cause; and the large liability superinduced makes it needful to insure the hazard.

Labor, Organized. See UNIONISM.

Labor Union, The American, a Socialist-Labor organization founded in May 1898, as the Western Labor Union. At a convention held in Denver, Colo., in 1902, the scope of the organization was widened and the name changed. It favors international socialism, and the government of the body is more centralized than ordinary federations of trade unions. The Union is composed largely of trade unions in the States of Colorado, Idaho, Montana, Washington, and Wyoming. In 1903 it had 173 local unions, 5 district unions, and a membership of 150,000. The official organ is the 'American Labor Union Journal,' published at Butte, Mont.

Labor Unions. See UNIONISM.

Laboratory (from the mediæval Latin *laboratorium,* meaning workshop). The word is used to denote any room or building devoted to experimental investigations in technics and the sciences, or to the teaching of scientific and technical knowledge by means of experiments. The term is used to denote the work-room of a manufacturing chemist, or to the testing-rooms of an industry. In early times laboratories were used by the priesthood, who tried to throw a mantle of secrecy about them. Chemical operations were carried on in them and drugs and potions were made in them. Out of these early laboratories grew those of the Middle Ages. In this later period they were devoted to astrology, the making of drugs, potions and charms and to the search for the philosopher's stone by means of which it might be possible to change the baser metals into gold. Some of these laboratories were very important in their day, having the nobility for patrons, or being maintained at the public expense.

In 1683, a laboratory for academic instruction was opened at the University of Altdorf. Many private laboratories were established about this time, but their rapid development for instruction and research did not begin until the 19th century.

Among the first laboratories established, open to students, were those of Purkinje, who established a physiological laboratory at

Breslau in 1825; and the chemical laboratory established through the efforts of Baron von Liebig at the University of Giessen in the same year. The first physical laboratories for students were founded about 1846; one at Heidelberg, by Philipp Gustav Jolly; and one at the University of Glasgow by William Thomson — now Lord Kelvin.

The introduction of the laboratory into the educational system of the United States was made by the Rensselaer Polytechnic Institute, which established a chemical laboratory at about the same time as that established at the University of Giessen; and by the Massachusetts Institute of Technology, which also established a chemical laboratory. The movement for the establishment of laboratories in the United States was independent of that in Europe.

Among the great laboratories of the world may be noted that of the Royal Institution, established in 1800 by Count Rumford, which was to be devoted to the applied sciences, but which soon became the seat of great activity in researches in pure science, conducted by such men as Davy, Faraday, and Tyndall. The Physikalische Reichsanstalt, in Charlottenburg, near Berlin, is a very famous laboratory where there are departments devoted to research in pure science, and other departments for the study of the applications of science to industrial pursuits. In 1875 a Committee of Weights and Measures, made up of representatives of 18 nations, was organized for the purpose of reproducing and furnishing international metric standards to the members. A laboratory for their manufacture and for research was established near Paris. Great Britain has placed the control of a recently founded national laboratory, where standards of weights and measures are to be kept, duplicates made, instruments tested, and research is to be carried on, with the Royal Society. In the United States the Smithsonian Institution (q.v.) was established in 1846. Many important lines of research have been developed there, out of some of which have grown up some governmental departments; as the United States Weather Bureau and the United States Fish Commission. The United States government has established, by act of Congress, approved 3 March 1901, a National Bureau of Standards, a suitable building and equipment also being provided for. The bureau has the custody of the standards of weights and measures, and has power to manufacture duplicates, multiples and submultiples. It also has the power to officially test and calibrate physical and chemical apparatus and issue certificates for them. Research is to be carried on, when of great importance to commercial and scientific interests.

Laboratories for studying science by means of experiment, and for research, have been established in practically all American institutions of learning. In many preparatory schools and in an ever-increasing number of high schools, elementary laboratories are added for the study of physics, chemistry, and biology.

Laboratories for research and for testing form a part of many industrial enterprises, as in the manufacture of steel. The material is tested chemically at different stages of the process in order to determine the treatment in a subsequent process. Physical tests are made of its strength and density. Investigations are carried out with respect to the effect of different processes of manufacture on its physical characteristics. Another example is the laboratory of the manufacturing chemist, where he tests his product and seeks for new, better and cheaper processes of manufacture.

Many industries of to-day are based on processes devised and worked out in laboratories for research. Some examples are the great plants at Niagara Falls, where metallic aluminium, calcium carbide, sodium hydrate and many other compounds are made. The basis of the progress in applied electricity is research in physics and chemistry. In many lines of industry scientific research in public and private laboratories has made possible new and better processes. In those countries where there is the greatest activity in research in science and its applications there is also the greatest industrial activity.

Research in the biological sciences has helped to a better understanding of life and to its prolongation. The causes of many infectious and contagious diseases have been discovered, and effective methods of prevention and of combating them have been found. The Pasteur institutes in many large cities all over the world are witnesses to these facts.

A general outline and some of the details of construction, equipment, and uses of a few of the most common types of laboratories found in educational institutions of the present day are given below. Many laboratories where excellent work is being done are very much simpler than those described; and, on the other hand, some are much more elaborate in construction and equipment. Some features are common to them all, one of which is the lecture room, where experimental demonstrations are given before many students at one time.

Biological Laboratory.— It is necessary in the present instance to dwell but briefly on any particular subdivision of laboratories devoted to the study of biology. Biological laboratories in Europe were established during the early part of the last half of the 19th century. Louis Agassiz led the movement in the United States in the establishment of biological laboratories, by establishing a zoological laboratory at Harvard.

Agassiz also developed the modern marine laboratory which has led to the establishment of many such laboratories in all parts of the world. The researches in these laboratories have been of greatest value in the biological sciences. Among the marine laboratories of the world must be enumerated the great laboratory established in 1872 by Dr. Anton Dohrn at Naples. Specialists from all parts of the world go to this laboratory to do research work. The United States Fish Commission has established two very important marine laboratories in the United States: one at Woods Holl, Mass., the other at Beaufort, N. C., in 1899. Woods Holl was the centre of activity in 1871 and again in 1875. The first building of the present fish culture and experiment station was completed in 1884. This laboratory has been open to voluntary investigators, tables being assigned to them. The investigators have numbered among them men from the principal universities of the country, and much valuable work both of economic and scientific value has been done

there. The marine laboratory established at Beaufort, N. C., promises to be one of the greatest, if not the greatest, biological station in the world; larger than the one at Woods Holl or the one at Naples on the Mediterranean.

A second very important marine biological laboratory for research exists at Woods Holl, where scientists from many institutions congregate. This laboratory is devoted entirely to research. There are many other important biological stations along the Atlantic, Pacific, and Gulf coasts and a few on the Great Lakes.

The special appliances necessary to meet the needs of marine laboratories, are boats, both large and small, nets, apparatus for obtaining the vegetable as well as the animal life of the salt and fresh water bodies, and aquariums.

The epoch-making researches of Pasteur in France on bacteria have led to the establishment of important bacteriological laboratories throughout the world. The universities and colleges in the United States have many laboratories devoted to teaching and investigation along the different groups of the biological sciences.

The botanical laboratory is devoted to the study of the life of plants, and their classification according to their distinguishing characteristics and structure.

The laboratories for the whole group of biological sciences have much equipment in common. The laboratory rooms should be well lighted, preferably with north light and with window bars done away with as much as possible; the building should be situated so as to have a low horizon. This is important in microscopic and microphotographic work, in order to get a uniform lighting of the slide on the microscope stage. The rooms should be provided with tables, on which is placed a full equipment of reagents, staining and preserving solutions. Dissecting instruments are among the individual needs of the students. The microscopes for the more advanced work should have three objectives, one of comparatively low power, another of higher power, and the third an immersion objective. Microtomes are needed for cutting sections, to be mounted on slides for examination under the microscope. The photomicrographic camera aids very materially in the careful, systematic study of specimens. The negatives thus obtained are available for making lantern slides for projection purposes and for making enlarged photographs. In some lines of research work, as in bacteriology, culture media, in which the particular form of life may grow and multiply, may be used. Often the cultures must be kept for hours at a certain temperature, thus necessitating incubators, of which the temperature is regulated by thermostats. Frequently rooms are set apart for cultures. Dark rooms are essential for the development of negatives resulting from the photographic work.

Chemical Laboratory.— The chemical laboratory is one of the most important factors in the educational and industrial systems of our civilization. The rooms of the chemical laboratory should be well lighted and ventilated. Special lines of work should be isolated. The lecture room for demonstration purposes should be much the same in its general features as the physical lecture room (q.v.). The lecture room should be supplied with different gases, including common illuminating gas, oxygen, and hydrogen. The oxygen and hydrogen are generally supplied in heavy steel tanks under high pressure. A demonstration lantern should be conveniently placed. The table top should have one or two holes in it connected to the suction fan for carrying off fumes and gases, thus keeping them from being disseminated through the room.

The inorganic laboratories, for elementary purposes, may be divided into three principal divisions: first, that devoted to the study of the simple reactions by the beginner, who there learns experimentally what takes place in the simple reactions. as that of the production of hydrogen gas by pouring sulphuric acid on zinc, forming zinc sulphate and liberating the gas. The second division is that part devoted to qualitative analysis, where more complex reactions are studied and where the student learns to recognize and to test for the presence of the different elements. Under the third division is found quantitative analysis, which, as the name implies, is devoted to the study of the quantitative relations of compounds.

The work in these three divisions leads up to the more complex work of organic chemistry and research work. The equipment of these laboratories will give a general outline of the whole. Wide top tables should be provided. The tops should be impervious to water and as little acted on by acids as possible. Alberene stone is excellent material for such purposes. A good construction is to have the tops slope a little from both sides to the centre line, where a trough is placed to carry off the wastes to the sewer. Racks for the storing of bottles containing reagents should be placed so as to be easily reached by the students from both sides of the table. Beneath the top should be drawers and shelving so subdivided that each student may keep his apparatus separate. The tables should be provided with gas and water, with plenty of taps, and with electrical connections. Means should also be furnished for boiling under reduced pressure. For the experiments where noxious gases are given off, hoods should be provided, the bases being of the same material as the table tops, the sides and top of fixed glass with a glass window that may be opened in front. For ventilation within the hood there should be openings to a flue connected with a blower which produces a suction of the gases from the hood. One of the openings should be well toward the top and the other at the bottom of the hood. If artificial lighting is required it should be from above the glass top. Plenty of stop-cocks for gas, water, and suction should be provided for each hood.

Among the independent rooms needed, are those for the following purposes: A hydrogen sulphide plant is an absolute necessity, and it should be isolated to the extent of having a well ventilated room of its own. It should, however, be situated as conveniently as possible to the main divisions of the laboratory. Sometimes it may be advantageous to pipe the gas to different rooms. Near the quantitative laboratory should be a balance room well stocked with analytical balances supported on solid tables or wall brackets. A combustion room and a furnace room are often required. The furnace room should be

so located as to get a good draft or so as to be connected to a suction fan system. Dark rooms for photography and spectroscopy should have a dead black finish, and those for photography should be supplied with means for obtaining ruby light.

The study of the spectrum of gases makes it necessary to have a good induction coil to produce a spark spectrum, which may be viewed by the eye, or which may be photographed. The range of temperatures at which chemical phenomena are now studied calls for very high and very low temperatures, which means that the electric furnace and a liquid air plant are often desirable. Apparatus for distillation under different pressures, and for obtaining constant temperatures are very necessary in some phases of the work. The rooms for gas analysis should be so situated as to make it possible to have but small temperature fluctuations. A north exposure, thus getting rid of direct sunlight and yet getting good illumination, is preferable. The principal part of the equipment needed for gas analysis by the Hempel method includes gas buretts, to measure volumes, absorption pipettes for the different reagents used to absorb different gases, combustion pipettes and oxygen generators.

The physical chemistry laboratory requires much apparatus and equipment needed in physics and in the other divisions of chemical work, including analytical balances, thermometers, barometers, manometers, calorimeters, thermostats, motors, stirring gear, refractometers, spectrometers, apparatus for studying polarized light, ammeters, voltmeters, resistances, and many other pieces. Among the subjects studied in the student laboratory are density, viscosity, vapor pressure, boiling and freezing points, heats of fusion and vaporization, critical temperatures, pressures and volumes, heats of combustion, solubility and the various divisions of electrolysis and electro-chemistry.

Electrical Laboratory.— The student and investigator in the field of electricity should have a thorough grounding in general physics and physical laboratory methods. The student in the electrical laboratory becomes acquainted with the relations of electric currents, electromotive forces and resistances; and the production and transmission of electrical energy, electrical quantity, capacity, magnetism and the relations between electricity and magnetism. The laboratory should be of strong construction on account of the lines of shafting and the heavy machines used. In the general laboratory will be found for purposes of investigation: dynamos of the various direct and alternating current types; direct and alternating current motors, the latter covering synchronous, two-phase and three-phase motors, induction motors, and rotary converters. Portable and variable inductive and non-inductive resistances; portable and fixed instruments for measuring current, electrical pressure or potential and power should be plentifully supplied. The fixed machines, instruments, the private rooms and tables should have lines of wire connecting them with a central switchboard through which any desired grouping of stations may be made. Among the separate departments may be one for testing and studying transformers; one for investigating the magnetic properties of iron, steel and other metals; a potentiometer room in which to test and calibrate the instruments used in electrical measurements. Some interesting and important parts of the work are the investigation of the resistance and strength of insulators and conductors; the study of condensers and their effect in a circuit; the study of self and mutual induction and the measurements of them. Separate rooms which can be made dark, the walls of which absorb as much light as possible, or which can be made any color desired by a proper arrangement of coverings, where work in lighting and photometry may be performed, are also important parts of the equipment of an electrical laboratory.

The electrical engineering student should find it possible to make tests in all lines of his profession, approximating, as nearly as possible, actual working conditions in the commercial world. In order to give the greatest usefulness to the laboratory, the equipment should be kept abreast with the advances in the best engineering practice.

Engineering Laboratory.— Engineering laboratories have been developed within the past forty years along all lines of engineering and technical education. The divisions are many, but only a few of them will be considered here. The electrical engineering laboratory has been discussed above under the head of *Electrical Laboratory*. Under the division of Mechanical Engineering may be placed railroad engineering, marine engineering and the like. Among the subdivisions under Civil Engineering are mining engineering, hydraulic engineering, sanitary engineering and bridge engineering, for all of which laboratories have been developed.

The mechanical laboratory, as its name implies, treats of mechanics, the sources of mechanical energy and its transmission. The laboratory should be a solid structure with massive foundations for the heavy machines used. Boiler rooms, engine rooms, material testing rooms, and general experimental rooms on mechanical devices, are the requisites. The boilers tested comprise fire-tube, water-tube, and shell boilers. Tests are made of fuels, as to their steaming qualities, the ash, and flue gases, by means of calorimeters, gas meters, thermometers, thermo-elements, and balances. Engine tests may be made on many steam motors comprising steam turbines, simple slide valve, Corliss, and compound engines of high and low pressure types. For these tests are needed steam gauges, thermometers, indicators communicating directly with the inside of the cylinders, together with "reducing motions" for obtaining automatic records of the steam pressure within the cylinders during a complete stroke, from which data may be obtained by means of which to compute the energy put into the engine; and dynamometers to measure the output in useful work.

Another department is devoted to internal combustion motors. Under this class are included hot air engines, oil and gas engines, which require dynamometers, gas meters, and other measurers of the fuel supplied, and means for testing the products of combustion. In the mechanical laboratory, water motors, fans, blowers, air compressors, compressed air machines and tools, different methods of power transmission, as by shafting, gearing,

belts, ropes and chains, and the like, are studied. Measurements of the coefficients of friction of different substances are found, and the effects of lubrication by different substances are investigated. Lubricants are tested under various conditions, such as at various temperatures, pressures, and in the presence of different vapors or gases. The testing of materials is common to mechanical and civil engineering laboratories. It will be outlined under the latter head.

In the civil engineering laboratories, calculating and measuring instruments are tested and calibrated. Among these instruments are transits and levels, and all instruments having graduated circles, cross-hairs and spirit levels; steel tapes; chains and bars for measuring lengths; chronometers for measuring time; barometers and thermometers. Here also is studied the magnetometer; and by means of it the strength of the horizontal component of the earth's magnetic field. The variation and dip of the earth field are also investigated. The "acceleration of gravity" is determined.

In the hydraulic division of these laboratories are studied the flow of water in pipes, "skin friction," the flow of water through different orifices under different conditions, the flow of water over weirs and its measurement. This is very important in irrigation.

The laboratory devoted to the testing of materials is a very important one in all engineering work. All kinds of materials used in engineering work are tested. The apparatus required comprises machines for testing the resistance to compression, of tensile strength, of torsion and flexure of materials. Cements are tested for their resistance to tension and compression and for the length of time required for them to set. For the last test named, automatic apparatus has been devised which registers time and amount of "set." Forms in which to mold the briquettes, and water tanks in which to immerse them for setting, are among the required equipment. Tests on concretes are made in a similar manner. Abrasion machines are used to make tests on paving material and other material subject to wear.

Physical Laboratory.— The requirements of the modern physical laboratory depend greatly upon the work to be done, but a few of the chief requisites that are common to all may be noted. The housing and equipment of a physical laboratory is of very great importance. The building in which the laboratory is to be located should be so situated as to reduce to a minimum all jar and tremor, and to do away with all outside magnetic disturbances, such as those due to electric car lines.

Many rooms are needed for special divisions of the work; such as constant temperature rooms, which require special precautions in design and construction and which are best situated below ground. Special rooms are demanded for radiometers, spectrometers, potentiometers, and such other instruments as require constant conditions to insure good results. Dark rooms are necessary for work in light, which includes experiments requiring diffraction gratings, photometers and the phenomena of light in general. Since photography has become of very great practical importance, fully equipped dark rooms are desired; also a sky-light room where enlargements and reductions of negatives may be made, and lantern slides prepared. It should be possible to introduce sunlight into some of the rooms.

A lecture room in which experimental demonstrations may be given is a necessity, and much attention should be given to its arrangement. The lecture room should be well lighted but should be provided with arrangements for readily darkening it. The experimental lecture table should be placed so as to be easily seen from all parts of the room. This table should have water, gas, air blast, suction, water motors and other motors, sink, and terminals for obtaining direct and alternating currents. A solid masonry pier upon which to set up delicate apparatus and that requiring no vibration, should be provided. The table tops should be impervious to water and so far as possible acid-resisting.

An apparatus room in which is kept demonstration apparatus should be situated conveniently to the lecture room; general apparatus may also be kept there. The opening between the apparatus room and the lecture room should be large enough to admit the passage of large pieces of apparatus, and also to allow experiments to be set up on wheeled tables in the apparatus room, then wheeled directly into the lecture room.

Separate rooms should be provided for research work. It is desirable that it be possible to connect some of the rooms in suites, and to provide dark rooms for some of the suites.

Research rooms should contain water and gas, both ordinary illuminating and acetylene gas. They should have electrical connections to a central switchboard sufficient to obtain various types of current at one time. The floors of the building should be solid. Stone tables built in the walls form good supports for instruments, but there should be provided in some cases stone piers with independent foundations.

The general laboratories should have plenty of light and should be provided with separate rooms for some classes of work, as in light and sound, where it is often necessary to have darkened rooms. A heat bench or table should be provided; it should have an impervious top with enough pitch to drain into a central trough or hole to conduct away the waste. A rack with hooks above the bench, from which to suspend thermometers, is convenient. The rooms should be well supplied with tables, and along the walls stone shelving built in the walls, will be found useful. The dirt incident to primary batteries may be concentrated if all the cells be kept together, their terminals leading to a switchboard to which are connected the terminals of lines leading to the various stations in the rooms.

Some of the apparatus needed may be noted: projection lanterns for demonstration purposes: pulleys; weights; pendulums; machines for studying the acceleration of bodies; balances of different capacity and sensitiveness; vacuum pumps; pressure pumps; apparatus for comparing densities of substances; apparatus for testing the gas laws; calorimeters; thermometers; hydrometers; dividing engines; chronometers; chronographs; standard tuning-forks, some electrically driven; resonators; sirens; lenses; mirrors; prisms; spectrometers; radiometers; photometers; permanent and electromagnets; electroscopes; electrometers; many types of galvanometers, some for the measurement of electrical differences of potential or pressure, some for measuring current, and others for measuring quantity; ammeters; voltmeters; wattmeters:

bridges, for measuring resistances; condensers; Leyden jars; electric machines; potentiometers; and a plentiful supply of standard cells and resistance boxes.

The laboratory should also have storage batteries, and, if necessary, have its own dynamos in order to procure direct and alternating currents. An acetylene gas plant, and a compressor and liquefier for obtaining liquid air and other gases, are becoming necessary parts of the general equipment of a Physical Laboratory. A plant for the production of oxygen and hydrogen is also often desirable. A workshop in which to repair and build apparatus is a great convenience. The wiring and plumbing should be open and accessible as possible. All dark rooms as well as other rooms should be well ventilated, as it is often imperative for an observer to be confined in a room for hours at a time. Further reference to physical laboratory equipment will be found under the head of *Electrical Laboratory*.

Psychological Laboratory.— Since the establishment of the first psychological laboratory in Leipsic in 1875, by Wilhelm Wundt, where one room was devoted to apparatus and research, the development of the psychological laboratory has been rapid. One of Wundt's first students, G. Stanley Hall, established the first psychological laboratory in America at Johns Hopkins University in 1881.

The requirements of the psychological laboratory have increased very rapidly with the development of the subject, until its housing and equipment has become a problem of great importance and interest. Many rooms and much equipment are now required for a detailed study of the various subdivisions of the subject. Beside the rooms necessary in teaching psychology by means of experiments, other rooms for research are needed. Quiet and relaxation being often necessary, it is important to so arrange the rooms that the work of one student will in no way interfere with that of another student. The separate rooms should be provided with gas, electric lights, and water. Where absolute quiet is required, piping of all kinds should be excluded, the heating being done by indirect radiation if necessary, and only incandescent electric lighting being used. The rooms should be wired for electrical inter-communication between those which may likely be desired to be used in suites. They should also have wires leading to the rooms where chronometers and electrical recording devices are located.

For the study of the sensations of light and the eye, its capacity and limitations, suites of rooms are desirable in many instances. These rooms should be capable of being either well lighted or darkened to any desired degree. The equipment of this part of the laboratory includes models of the eye and the muscles governing its movements, sectional models; apparatus for studying color sensations, color mixing, color blindness, contrast, brightness independent of the color sensation; apparatus for studying optical illusions, the sensitiveness of the retina at different points, the sensitiveness of the eye to changes in position, the sense of location, and the imperfections of the eye; and apparatus for studying reactions and reaction times.

The sensation of sound requires isolated rooms where the noises produced may not reach other parts of the laboratory, and for certain parts of the work, rooms that are sound and light proof. In this part of the laboratory the sensitiveness, range, and analyzing power of the ear are studied. The equipment for the work in sound comprises models of the ear; instruments for producing sound, such as tuning-forks, sirens, organ pipes, and other sources of vibrations; and resonators for analyzing complex sounds.

Other rooms are needed for studying the sense of heat and cold, pressure, pain, and the locations of the various end organs. The apparatus necessary is that required to produce the corresponding sensations. The effects of different sensations on the respiratory organs and heart action is another subject for investigation. Other parts of the laboratory are devoted to the senses of taste and smell. The equipment comprises the substances with which to test the various parts of the tongue, and also substances to produce different odors.

Among the special pieces of apparatus necessary may be mentioned the chronometer, the chronograph, electrically driven tuning-forks, sources of mechanical and electrical energy, and induction coils.

Medical Journal 1900–1); Cajori, 'History of Physics' (1899); Sanford, 'Experimental Psychology' (1898); Scripture, 'The New Psychology' (1897); Titchener, 'Experimental Psychology' (1901).

ERNEST BLAKER,
Assistant Professor of Physics, Cornell University.

Labori, Fernand Gustave Gaston, fĕr-näń güs-täv gäs-tôń lä-bō-rē, French lawyer and editor: b. Rheims 18 April 1860. He studied at the Rheims Lycée and for two years in Germany and England; took his degrees in the law faculty of Paris in 1881 and 1883, and was enrolled at the bar of the court of appeals in 1884; was secretary of the conference of advocates in 1887-8; took a high professional rank; and was especially prominent as counsel for the defense in notable cases, as the libel action by Compayré against Numa Gilly, and the trials of the anarchists Duval and Vaillant. In 1898 he defended Emile Zola (q.v.), accused of libeling the army and the president of the republic in the letter concerning the Dreyfus case. He was junior counsel to Demange in the defense of Dreyfus at the trial at Rennes in 1899, and thoroughly confuted his opponents by his logic and his brilliant cross-questioning. He did not make the final plea, but his 'Notes de Plaideric' were published in the 'Compte-rendu Sténographique In-extenso du Procès Dreyfus à Rennes.' On 14 August, while on his way to the court, he was dangerously wounded by a revolver bullet fired by a fanatic or mercenary. He was shortly enabled, however, to continue the case. In 1903 he defended the Humbert swindlers (see HUMBERT SWINDLE, THE). He was editor-in-chief of the judicial daily *La Gazette du Palais* in 1888–94; established the 'Revue du

Palais' and 'Grande Revue' in 1897; and published a 'Repertoire encyclopédique de Droit Français,' in twelve volumes (1898). See DREYFUS, ALFRED.

Labouchère, lä-boo-shãr', **Henry,** English politician and editor: b. London 1831. He was educated at Eton; was in the British diplomatic service in 1854–64, being at one time a member of the British legation at Washington; in 1865–6 sat in Parliament for Windsor; was then unseated on petition; but represented Middlesex in 1867–8 and Northampton in 1880–1902. During his parliamentary career he strongly advocated Home Rule. He was at one time part proprietor of the London *Daily News,* to which he contributed letters from Paris during the German siege (1870–1) over the signature 'The Besieged Resident.' In 1876 he established and became editor of 'Truth,' a weekly journal in which he has expressed his opinions with great vigor. Indeed, as both parliamentary speaker and journalist, Labouchère gained an important place in English public life through his wit and incisiveness.

Laboulaye, Edouard René Lefebvre, ã-doo-ãr rė-nã le-fãvr lä-boo-lã, French publicist and jurist: b. Paris 18 Jan. 1811; d. there 25 May 1883. He studied law and in 1842 he joined the Paris bar. He was a close student of the great German writers on jurisprudence, whose works and researches he introduced to his countrymen in a series of able essays, written in an admirable style. The Academy of Inscriptions and Belles-Lettres crowned his 'Histoire du Droit de Propriété Foncière' (1839), and elected him to its membership in 1845. An 'Essai sur la Vie et les Ouvrages de Savigny' (1840), was followed by 'Recherches sur la Condition civile et politique des Femmes depuis les Romains jusqu'à nos Jours' (1843), and an 'Essai sur les Lois criminelles des Romains concernant la Responsibilité des Magistrats' (1845), both crowned by the Academy of Moral Sciences. In 1849 he was appointed professor of comparative legislation of the Collège de France. After the foundation of the Second Empire he constantly strove to rouse opposition to it, and in several published works as well as in his lectures held up the American constitution to the admiration of his countrymen. He sacrificed his popularity, however, by his support of the plebiscite in 1870, and soon afterward he resigned his chair at the Collège de France. After the fall of the Empire he was elected for Paris in 1871. In 1875 he was elected a life senator. Besides the works above-mentioned he wrote: 'Histoire des Etats-Unis d'Amérique' (1854); 'Etudes Contemporaines sur l'Allemagne et les Pays Slaves' (1854); 'Souvenirs d'un Voyageur' (1857); 'Liberté Religieuse' (1858); Etudes sur la Propriété Littéraire en France et en Angleterre' (1858); 'Abdallah' (1859), an Arab romance; 'L'Etat et Ses Limites' (1863); 'Paris en Amérique' (1863), an ingenious and extremely popular satirical romance; 'Contes Bleus' (1863), a series of admirably told tales; 'Nouveaux Contes Bleus' (1866); 'Prince Caniche' (1868), another extremely popular satirical novel; 'Contes et Nouvelles' (1868); 'Discours Populaires' (1869); 'Questions constitutionnelles' (1872); 'Lettres politiques' (1872); 'La Liberté des Enseignements' (1880); and 'Trente Ans d'Enseignement au Collège de France' (1888), a posthumous collection of lectures. He translated into French several of Channing's works and the 'Memoirs and Correspondence of Franklin.'

Labrador. *History.*—The peninsula of Labrador is doubly distinguished as the first part of North America to be discovered by Europeans, and by being the last portion of the continent in which large areas remain unexplored by white men.

Lief, the Norseman, voyaging westward from Greenland in the year 1000 reached its northeastern part and sailed south along its Atlantic coast to more temperate regions. Cortereal rediscovered this coast and traced it northward from the Strait of Belle Isle to the entrance to Hudson strait, in 1500. A cargo of Eskimo slaves carried by him to Portugal accounts for the name Lavrador given to the country. Jacques Cartier, on his voyage up the Gulf of Saint Lawrence, in 1535, outlined the southern coast of the peninsula; while the northern and western coasts were discovered by Henry Hudson in 1610. The valuable fisheries of the western Atlantic early attracted the fishermen of Europe and the town of Brest was founded, near the Strait of Belle Isle, in 1504. At the height of its prosperity about the year 1600 it contained upwards of 200 houses and was visited by fishing vessels from France, England, Spain, and Portugal.

Exploration.— Although the coasts of the peninsula were early known, their barren character and the mountainous-looking interior, which could only be penetrated by the ascent of difficult and dangerous rivers, long delayed the exploration of the interior and led to much misinformation concerning it. During the past 40 years surveyors of the Province of Quebec have accurately mapped the principal rivers of the southern watershed to their heads, thus giving a good idea of the geography of the southern third of the peninsula. The exploration of the more inaccessible northern two-thirds has been undertaken by the Canadian Geological Survey during the past 25 years and it has been the fortune of the writer to have been in charge of these explorations. In this work the northern and western coasts have been closely examined and exploratory lines have been carried along a number of the largest streams of the eastern, northern, and western watersheds. Much still remains unknown, but sufficient has been learned to give a good general idea of the geography and resources of these northern parts.

Topography.— The peninsula of Labrador forms the northeastern part of Canada and has an area of 511,000 square miles. Its southern boundary is an arbitrary line drawn eastward 600 miles from the south end of Hudson bay to the Gulf of Saint Lawrence, thence 500 miles along the north shore of the gulf to the Strait of Belle Isle. The Atlantic coast runs north-northwest 700 miles to the eastern entrance of Hudson strait; the south shore of the strait has a general trend of west-northwest for about 500 miles, while the western boundary is a north-and-south line along the east side of Hudson bay, and is 800 miles in length. The Atlantic coast is indented by many long, narrow bays, or fiords, of which Hamilton inlet is the largest, extending inland 150 miles, while several of the others exceed 50 miles in length.

Abrupt, partly-wooded hills surround the fiords and rise from 1,000 to 5,000 feet above their deep waters. Numerous rocky islands fringe the coast outside, and afford protected navigation for long distances in the channels between them, thus rendering the coast an ideal one for a safe summer cruise amid scenery rivalling in beauty and grandeur that of the coast of Norway.

The southern and northern coasts are similar in character to that on the Atlantic, but are on a scale less grand, while the eastern shores of Hudson bay are generally low and fringed with shallow, dangerous waters.

The peninsula as a whole may be considered a plateau that rises somewhat abruptly from the sea on the north, east, and south sides and more gently from the west to heights varying from 1,500 to 2,500 feet. The only mountain range lies close to the sea along the northern half of the Atlantic coast with summits rising from 3,000 to 6,000 feet above the ocean.

Geology.— The crystalline rocks which form the peninsula belong to the earliest crust of the earth, the newest dating back to Huronian time. Since then the plateau has stood continuously above the level of the sea and has been subjected to the degrading action of atmosphere and stream. Great thicknesses of rock became rotten and rains and small streams removed much of the loose material from the heights to the depressions while the larger rivers cut deep valleys into the granites and other hard rocks. In recent geological times a thick cap of ice covered the peninsula moving slowly outward from the interior. This motion of the ice removed the rotted rock from the hills and deposited it in the valleys thus blocking many of the deep river valleys and reducing the surface of the interior to a general level with a gentle slope toward the coasts. No physical changes have occurred since the melting of the ice-cap and the interior country is still slightly undulating with low ridges of rock, or of glacial drift separated by wide shallow valleys.

Lakes.— Myriads of lakes great and small occupy the lower parts of the valleys and are connected by networks of streams so that canoe travel is possible in any direction. Mistassini and Michigamau having areas exceeding 500 square miles are the largest, while dozens of others range in surface-area from 50 to 250 square miles.

Rivers.— The rivers in the central portion flow in the depressions without distinct valleys and in fact are chains of lake-expansions connected by short stretches of rapids. As they approach the coast they fall into their ancient valleys cut deep below the surface of the plateau. The descent is usually abrupt and is often accompanied by a great development of power and beauty. The Hamilton river, one of the largest streams of Labrador, falls from the surface of the plateau into its ancient valley about 200 miles above its mouth. The descent of 900 feet is accomplished in a distance of less than 10 miles and includes one direct fall of 315 feet where the river shoots from a gigantic trough into a circular basin at the head of a narrow canon in which the last part of the descent is made. A rough estimate of the energy developed by the water in this descent gives the enormous sum of 9,000,000 horse-power. This wonderful display of energy and the grand beauty of the fall and canon place the Grand Falls of the Hamilton among the marvels of the world. With light rock-cuttings the river might be diverted into a side channel, where, passing through small lakes, it would fall sheer 700 feet into the ancient valley; this actually happens on a small scale when the river is in freshet.

Climate.— The climate of Labrador varies from cold temperate in the south to Arctic on the northern highlands and about the shores of Hudson strait; it is generally so rigorous that it is doubtful if the country will ever be fit for agriculture except in the southern valleys and on the low lands fronting the southern part of Hudson bay. In the interior the mercury often drops to 150° F. during the winter.

Forests.— The southern half of the peninsula is included in the sub-Arctic forest belt, which contains the following trees: White birch, aspen, balsam poplar, cedar, banksian pine, white and black spruce, balsam fir, and larch. The forest is continuous over the southern interior; to the northward of latitude 54° N. the higher hills are treeless, open glades appear and the trees branch from the ground. Proceeding north the size and number of the treeless areas increase rapidly until trees totally disappear on the northern third. At least one-half of the forests has been destroyed by frequent fires.

Resources.—Among the resources of the peninsula are the fur-bearing animals, all prized for their dark glossy pelts, and all fairly numerous throughout the region. Of these the most valuable are the silver fox, marten, otter, mink, beaver, cross, red and white foxes, and white and black bears. The barren-ground caribou of the interior and seals along the coasts are the chief source of animal food for the natives.

Fisheries.— The cod and salmon fisheries of the Atlantic coast have long been sources of wealth to Newfoundland. The fisheries of Hudson strait and Hudson bay are still undeveloped, but enough is known of them to predict their future great value. All the lakes and streams of the interior swarm with superior food fishes, including land-locked salmon, lake and brook trout, whitefish, pike, and pickerel.

Minerals.— The mineral wealth of the peninsula is totally undeveloped. Immense deposits of valuable iron ore have been found in the interior and along the northern and western coasts. Over great areas are found rocks similar to those from which the more precious metals — gold, silver, copper, and nickel are taken in southern parts of Canada, and they only await discovery by the prospector.

Population.— The total population is about 14,000, of which 8,000 are whites, living along the southern and eastern shores. The remaining 6,000 are Indians and Eskimos, the former being confined to the wooded country, while the Eskimos live along the northern coasts and on the northern barrens of the interior.

Government.— A strip of land along the Atlantic coast, extending from Blanc Sablon on the Strait of Belle Isle to Cape Chidley, is under the jurisdiction of the Government of Newfoundland. The Province of Quebec extends northward to near the parallel of 52° N. latitude; the East Main river to the west, and the Hamilton river to the east, being the division line between that Province and the District of Ungava, a portion of the Northwest Territory under the administration of the Dominion Government.

A. P. Low.
Of the Geological Survey of Canada.

Labrador Duck, a rather small handsome sea-duck (*Camptolaimus labradorius*), allied to the eiders, of the northeastern American coast; it bred in Labrador, and migrated in winter as far south as Chesapeake Bay, but was never very numerous, and became extinct about 1875, leaving only about 35 specimen-skins in the museums of the world. No very satisfactory theory exists to account for the closure of the species, since the fault does not seem chargeable to excessive shooting or disturbance of breeding-places. The race seemed to be waning, and an epidemic of disease or some weather-disaster destroying many eggs and young, may have been a final blow. The last one seems to have been killed in 1875. Consult: Stejneger, Vol. IV. ('Birds') of 'Standard Natural History' (1885); Lucas, 'Ann. Rept. Smithsonian Inst.,' 1888; Dutcher, article in 'The Auk,' January 1894.

Labrador Tea, or **Marsh Tea,** either of two species of heath of the genus *Ledum* (*L. latifolium* and *L. palustre*). They grow in the northern parts of both Europe and America, and are low shrubs with alternate entire leaves clothed underneath with rusty wool. The fragrant crushed leaves are used by the natives of Labrador as a substitute for tea. They possess narcotic properties, render beer heady, and are used in Russia in the manufacture of leather, yielding an oil known to druggists as ledum oil, rich in tannin and resinous properties. The plant finds a place in medicine as an astringent and tonic.

Labradorite, a plagioclase feldspar of the albite-anorthite series, corresponding chiefly to Ab_1An_3 (see FELDSPARS). It is, therefore, a silicate of aluminum, calcium, and sodium. It has a hardness of 5 to 6 and a specific gravity of 2.73. It ordinarily occurs in cleavable or granular masses, or as an essential constituent of certain basic eruptive rocks, such as norite, gabbro, diabase, basalt, dolerite or andesite. In these it is associated with some member of the pyroxene or amphibole groups. Labradorite abounds in the Adirondacks, but its type locality is along the coast of Labrador, where it occurs in pure masses of enormous size which exhibit a wonderful change of colors, from dull gray to a gorgeous blue, or more rarely green, copper-red, purple or yellow. It has been used as an ornamental stone, especially in inlaid work.

Lab'ridæ, a family of marine fishes, the grasses, representing the highly specialized suborder *Pharyngognathi* by a large number of beautiful and useful species inhabiting all the warmer seas, and traceable as far back as the Eocene period. These are brilliantly colored fishes usually elongate in form and of large size, with cycloid scales and thick fleshy lips. There are powerful teeth on the margins of the jaws, but none on the palate: while the united lower pharyngeals are much thickened and form a plate beset with rounded, rarely acuminate grinding-teeth. The upper pharyngeals are usually separate, bearing similar teeth. Jordan enumerates 60 genera and 450 species, "chiefly of the tropical seas, living among rocks or kelp." The typical genus *Labrus* is almost wholy European. The principal genera represented in American waters are *Ctenolabrus* (cunners), *Tautoga* (tautogs), *Harpe* (lady-fishes), *Pimelometopon* (fatheads), and *Iridio* (doncellas); and by some authors the parrot-fishes (*Scaridæ*) are included. Consult: Jordan's 'Review' of the family in 'Report U. S. Fish Commission for 1887.'

La Bruyère, Jean de, zhŏn dė lä brü-yār, French moralist: b. Paris 17 Aug. 1645; d. Versailles 10 May 1696. He was educated for the law, became treasurer at Caen, and through the influence of Bossuet, was employed in the education of the Duke of Bourbon, grandson of the great Condé, with a pension of 3,000 livres, and was attached to his person during the remainder of his life. In 1688 he published the 'Characters of Theophrastus,' translated into French, to which he added others of his own, in which he represented the manners of his time with great accuracy, and in a style epigrammatical, ingenious, and witty. The work contained 386 "characters"; the 4th edition (1689), 340 additional ones, while the 9th, in press at the time of the author's death, included over 1,100 "characters." Consult: Rahstede, 'La Bruyère und seine Charaktere' (1886); Allaire, 'La Bruyère dans la maison de Condé' (1886); Pellisson, 'La Bruyère' (1893).

Labuan, lä-boo-än', an island of the Malay Archipelago, belonging to Great Britain, situated on the northwest coast of Borneo; about 12 miles in greatest length by 7 miles in greatest breadth; area, 32 square miles. It is mostly low and marshy, and not very fertile, but it is well supplied with water, and has a good harbor at the settlement of Victoria, on its southeast side. Coal of excellent quality is plentiful, and has been mined for many years. The chief town is Victoria. Pop. 5,853, mostly Malays.

Labur'num, Golden-chain, or **Bean-tree,** a genus of trees and shrubs of the order *Leguminosæ*. The few species, which are natives of southern Europe and western Asia, are characterized by trifoliate leaves and brilliant yellow blossoms in pendulous many-flowered racemes produced during late spring and early summer. The larger species yield a very hard, heavy, tough, fine-grained, dark green or brown wood, which can be highly polished and is valued for inlaying, cabinet work, turning, etc. The species are also prized for ornamental planting in shrubberies, not only for their flowers, but also for their glossy foliage, which remains green until late in the autumn. No part of the plant is relished by insects, and all parts, but particularly the seeds, are reputed poisonous. Nevertheless, it is said, the young stems are greedily eaten by rabbits, and may thus be made to serve as a sacrificial protection to other shrubbery. The best known species, probably, is the English laburnum (*L. vulgare*), which sometimes attains a height of 40 feet but usually not more than 20 feet. It is hardy nearly as far north as Massachusetts. The Scotch laburnum (*L. alpinum*) is hardier, more erect and rigid, bears broader leaves and much longer and slenderer racemes of dark yellow flowers, and continues in blossom about two weeks later than the preceding. By some botanists it is considered only a form or variety of *L. vulgare*. Laburnums thrive in any well-drained soil in either partial shade or full sun. They are readily propagated by seeds generally spring-sown, and also by layers. Choice varieties, of which there are many, are grafted upon seedlings.

Lab'yrinth, a structure having numerous intricate winding passages. The legendary laby-

rinth of Crete, out of which no one could find his way, but became the prey of the Minotaur, was said to have been constructed by Dædalus. The hint of this legend was probably given by the fact that the rocks of Crete are full of winding caves. The Egyptian labyrinth was a building situated in central Egypt, in the district now called the Fayoum. The building, half above and half below the ground, contained 3,000 rooms. It was probably a place of burial. The labyrinth at Clusium, in Italy, was erected by the Etruscans, according to Varro, for the sepulchre of King Porsenna. Imitations of labyrinths, called mazes, were once fashionable in gardening. They were made of hedges; the best known is that at Hampton Court, near London.

Labyrinthodon'ta, or **Stegocephali,** a group of primitive four-footed animals, forerunners of modern amphibians and reptiles, whose remains are found fossil in Peruvian, Carboniferous and Triassic strata, and which are the oldest known lung-breathing terrestrial quadrupeds. They were first discovered through finding their footprints imprinted in the Triassic rocks (Keuper beds) of Germany, long before the actual fossilized remains were brought to light. The footprints were described at first as those of a hypothetical form to which the name *Cheirotherium* ("hand beast") was given. As geological science and research progressed, the remains of the labyrinthodonts were discovered, when a comparison of their structure with the footprints showed that some of the latter were made by these creatures; many of the tracks, however, are unidentified. Later, when a great variety of related remains had been discovered, the term *Labyrinthodonta,* which relates to the curious "labyrinthine" infoldings of the enamel-wall of the teeth, was restricted to a single group or suborder (also called *Stereospondyli*) within the general amphibian order *Stegocephalia.* This suborder contains highly developed and mostly large forms, characterized by the complication in tooth-structure above mentioned, and by co-ordinate anatomical distinctions. The principal genera are *Laxomma, Trematosaurus, Metopias, Capitosaurus, Mastodonsaurus,* and *Labyrinthodon,* the last including the most recent forms of the Upper Trias, at the close of which period the group appears to have become extinct. See STEGOCEPHALIA.

Lac, various products of the lac insect (*Coccus lacca* or *Carteria lacca*), for which see COCCUS. The insects infect the young branches and twigs of various Asiatic trees, especially figs, and excrete resinous and coloring matters under which they become buried often to the depth of more than a quarter of an inch. They are often so numerous at times of migration that the twigs seem to be concealed by red dust. In northern India and in Assam the production of lac is fostered by hanging infested twigs in non-infested trees, and regular collections are made each autumn and spring, the former being of greater commercial importance, the latter mainly for propagating purposes. Trees in ordinary vigor are considered best, and are said to furnish six or eight crops before being given a rest, though some trees may yield more than twenty crops.

Two methods are commonly employed in preparing lac for market. In the commoner, the twigs are broken or powdered and thrown into and kneaded in hot water to melt the resin, dissolve the coloring substance and separate the dead insect remains and wood. Several alternate washings and dryings follow in order to have the resin as free as possible from coloring matter. The dried lac is then suspended in coarse cotton sacks before charcoal fires. The bags are twisted to force out the resin, which is caught in films upon pieces of wood upon which it hardens and becomes commercial shellac. The finest quality is a light brown or deep orange. Imperfect removal of the coloring matter results in dark-colored lac. Button lac and plate lac are merely the drops of various sizes which missed the sticks and fell to the ground. The lac that falls to the ground from the trees is collected and sold as seed lac, a name also given to the resin before it is fused but after it has been purified by washing. The first water mentioned above is strained and evaporated, the purple pigment cut in cakes and marketed as lac dye. The other process of purifying the crude lac consists in crushing between rollers, mixing with water, stirring in a cylinder, precipitating the coloring matter with lime, removing the lac, withdrawing the water, pressing the precipitate into cakes and drying them in the sun. The resin, in this process, is melted by steam heat, poured upon tilted, flattened zinc tubes filled with warm water. After cooling it is marketed.

Lacs are prized because of their varnishing properties, because they can be highly polished when dry, and because they are translucent and, in some of the finer grades, transparent, thus allowing the grain of the wood to show clearly through them. They are also used for making the finest grades of sealing wax, vermilion and other colors being added to them after pulling and twisting to make them opaque.

Lac, or **Lak,** from the Sanskrit *lakshâ,* or *laksha,* that is, 100,000. In the East Indies it is applied to the computation of money. Thus, a lac of rupees is 100,000. A lac of rupees was equal to about $46,350. A lac of Sicca rupees was equal to about $50,000; 100 lacs, or 10,000,000 of rupees, make a *crore.* In 1835 the British government remodeled the currency of India, establishing a more uniform system, and the value of the rupee is now fixed at 32 cents.

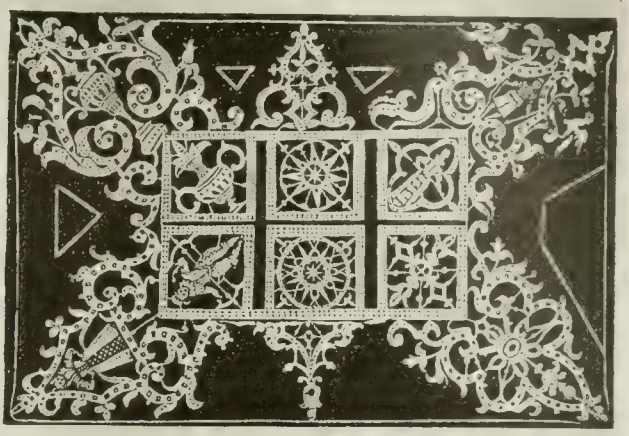
Lacaille, Nicolas Louis de, nē-kō-lä loo-ē dē lä-kä-ē, French mathematician and astronomer: b. Rumigny, France, 15 March 1713; d. Paris 21 March 1762. He was educated for the Church, but soon renounced theology for astronomy. He took an important part in the work of measuring an arc of the meridian, and in 1746 was appointed professor of mathematics in the Collège Mazarin. In 1751 he went to the Cape of Good Hope at the expense of the government, where he determined the position of some 10,000 stars with wonderful accuracy. As his departure from the Cape was delayed, he employed the interval in measuring a degree of the southern hemisphere. His works on geometry, mechanics, astronomy, and optics were numerous. Among them are: 'Leçons d'Astronomie,' and 'Astronomiæ Fundamenta'; 'Cœlum Australe Stelliferum'; 'Journal historique du Voyage fait au Cap de Bonne Espérance.'

Lacandones, lä-kän-dō'nēs, an Indian tribe living in Guatemala and Mexico. At one time numerous and powerful, they waged war against

the whites. There are now about 1,000 left, of whom a part are friendly to the white people, though retaining their native customs.

Laccadive (lăk'a-dīv) **Isles,** a group of small coral islands in the Indian Ocean, about 150 miles off the coast of Malabar. They form 20 separate reefs, containing, however, but 13 islands, only 8 of which are inhabited. The surface soil is naturally so barren that there is little or no spontaneous vegetation on the majority of the islands, and their prosperity must ever depend on the cultivation of the cocoanut. The natives of these islands, a race of Mohammedans called Moplas (of mixed Hindu and Arab descent), are a mild and inoffensive race and dwell in low, thatched, stone-built houses, and live poorly. Vasco de Gama discovered these islands in 1499. They were ceded to the British in 1792. Pop. 6,800.

Laccolith, lăk'ō-lĭth, or **Laccolite** (Greek, "stone-pit"), a mass of lava or intrusive rock having a mammiform shape supposed to be due to its spreading laterally when forced up from below, the rocks above it being lifted up into dome-like forms. Laccoliths were first described from mountains in Utah.



Lace. Authorities differ regarding what constitutes a lace fabric, whether we adhere strictly to the technical distinction of an ornamental open work fabric made with threads by knotting, twisting or stitching, or sewing with a needle, or include fabrics that resemble embroidery, made in combination with something woven. In some statements on the subject prepared for the writer some years ago by the late Dr. Thomas Wilson, one of our highest lace experts, it was set forth that lace is not a textile, because not woven, and that it was not embroidery, its peculiarity, and its principal difference from these being that it is made a mesh or loop at a time, each one being complete in itself, and not made on any previously prepared foundation. There are, however, netted fabrics which would never be called lace although made in the same way, because they do not work out an ornamental design or pattern. All authorities agree that lace is an ornamental fabric, the word ornamental being the one characteristic that distinguishes a lace fabric proper from a fine fishing net, or a Yucatan hammock, in which the threads are netted or twisted precisely as some forms of lace are made, though these articles are not lace. On the other hand, there are fabrics made with threads which have the appearance of lace, embodying in their fabrication artistic, graceful, or ornamental designs, but which are not lace, such as drawn-work, where the design is wrought in a woven fabric by drawing out certain threads forming the fabric, as well as other manipulation.

It is impossible to say when or where lace was first made. We know that the art of weaving is older than any written records, and that flax threads were wrought into fabrics by rude weaving processes in the early Stone age in Europe; and that the art was brought to a high degree of perfection in the later Bronze age. We know that attempts at ornamentation, in the form of more or less elaborate fringes are found in some of the delicate Egyptian linens of 4,000 years ago. The art of embroidering is likewise ancient, for it had reached a high state of perfection before the period of the Pharaohs, and has been practised by all countries and peoples from time immemorial. The art of lace making, however, must have developed, by a kind of evolution, from early attempts at the ornamentation of fabrics — possibly as early as the 12th century — these first attempts being mere loops of plaited or twisted threads in the form of small cords, attached to the hems of garments. In the earliest productions of lace there was a foundation of woven fabric, such as very fine linen, and the design was wrought by means of needle-point stitches, or darning, something after the manner of embroidery, the uncovered portion of the woven fabric being afterward removed, and a number of such designs skillfully joined together. Thus, from needlework or embroidery, which has come down from Bible times, we may imagine lacemaking was developed. The fabrication of the true laces, according to Dr. Wilson's definition of "a knotted or twisted fabric made one mesh or loop at a time," dating back no farther than the latter part of the 15th century, and it has been said that it is extremely doubtful if any particular specimen can be identified as having been made prior to the middle of the 16th century, at which time lace first appeared as a perfected fabric. The point lace of the earliest period of manufacture came nearer being what might be termed a pure art creation than that which followed in a later period; that is to say, the motive or design having been worked out from a thought in the brain of the maker, and not from a set pattern, as was the case in the fabrication of the later or second period needle-point laces. The earliest work is supposed to have been produced by nuns, and the patterns or motives not only give evidence of high artistic merit, with originality, but the practice of a patience on the part of the worker that would hardly be appreciated in this practical and rapid transit age. The designs from the period which followed were quite as beautiful, but were more set, and show the restrictive influence of copying rather than directly producing original forms as the work progressed.

Italy, France, Belgium, and Germany have all claimed the invention of lace-making, but the country to which the honor belongs is unknown. Dr. Thomas Wilson held it remarkable that lace-making should have sprung up, or been invented at about the same period by two entirely distinct processes without relationship or evolution between them, and that the people of the countries wherein either of the inventions was made were not only unknown to each other, but apparently neither had any knowledge of the process of lace-making invented or employed in the other country. One of these processes is by the employment of the needle and a single thread, wherein the work was perfected mesh by mesh, each mesh being completed as the work progressed. The other process was by the use of many threads at once, each one attached to bobbins for the purpose only of separating them, the meshes being made by twisting the threads a greater or less number of times. When each mesh is only partially completed, the thread is carried on to the next, and so on from side to side the entire width of the fabric. While the countries in which these processes were invented are unknown, the evidence points to Venice as the seat of the former, and to Belgium as the seat of the latter. By these two totally distinct

6. Mechlin point.
7. Relief point lace.

processes fabrics are produced so nearly alike as often to require an expert to distinguish the difference, which, though many times easily determined, yet not infrequently requires the aid of an expert.

It is seen, therefore, that there are two distinct classes of hand-made lace, though many varieties of each:—(1) needle-point lace, and (2) bobbin or pillow lace. Manufactured lace, a third class, is a recent invention, and while it has been the means of bringing a form of ornamental lace fabric within reach of everybody, it can never be compared with the exquisitely delicate and wonderful fabrications of hand-wrought lace, many examples of which are of priceless value.

Lace is chiefly made from linen, cotton and silk threads, usually of the finest numbers, and often specially prepared — some of the finest threads being spun in underground rooms where a damp atmosphere can be maintained, and where the only light is a single beam directed upon the work. Gold and silver threads have also been used, as well as other fibres than those named, such as aloe fibre, or ramie, which is now considerably used in machine-made laces. Mohair and fine wool have also been employed, and even horsehair has been used to stiffen portions of the work in some laces.

Point lace, or fabric made with the needle point, is the oldest known form, its most celebrated examples being the beautiful Venetian designs, and the exquisite French laces of Alençon and Argentan. The early French industry doubtless derived its inspiration directly from Venice, as Colbert, in the time of Louis XIV., is said to have brought from Italy 30 or more of the best lacemakers, and, encouraged by the king, this lace — also known as Point de France — soon became in such vogue that many establishments sprang up in other places in France to supply the demand.

In the oldest designs in point lace there was a foundation of delicate linen, as we have seen; there was also a reticulation of threads attached to a light frame, the patterns being worked over with the button-hole stitch upon these threads and into the linen foundation, which, as the work progressed, was completely hidden by the design. The portions of the foundation outside of the design were cut away, and a number of the design or patterns joined together by means of connecting threads. But sometimes no foundation was employed, the patterns simply wrought upon threads stretched upon the frame as above described, the button-hole stitch being employed. The Venetian point had attained a wonderful perfection by the middle of the 16th century, some of the examples in complexity of stitch, delicacy of design, and artistic merit being masterly conceptions.

Point d'Alençon and Brussels point are still manufactured, the former maintaining many of the distinctive characteristics for which it was so esteemed in the 17th century. Other varieties of needle-point or Guipure laces are Rose point, Portuguese point, and Maltese point. The first-named is especially characterized by the figures being worked in high relief.

Brussels point differs from the Venetian and French needle-point chiefly in the manner of making the stitch, a plain thread being used, and not overcast with the button-hole stitch. In early times Spanish point enjoyed a wide celebrity, but as much Flemish lace was imported into Spain, there was a decline in the industry, though point laces from the Spanish convents, in the early part of the last century, were very similar in character to the Venetian point. Point d'Espagne is said to have been merely a commercial name used in the 17th century, for which the French manufacturers were responsible. Point d'Angleterre owes its name to an effort on the part of the Flemish lace-makers to evade the restrictive measures which were adopted by Great Britain in the latter part of the 15th century, to encourage the home lace industry. The prohibition worked effectively, smuggling was difficult, and in time Flemish lace-makers were induced to settle in England, whereby some of the characteristics of Flemish laces have been perpetuated in the English pillow laces.

It has been claimed that pillow lace manufacture was the invention of Barbara Uttman, of St. Annaberg, Saxony, about 1561, though some authorities assert that she only introduced the manufacture, probably from Flanders. At any rate, paintings from an earlier period give evidence that lace was manufactured in Flanders at least half a century before her time. Pillow lace is made by working the design over a parchment pattern upon a pillow or cushion, the threads being wound upon bobbins. The method was to attach the pattern to the pillow, pins being inserted at regular intervals following closely the lines of the pattern or design. The figure is then wrought by twisting the threads around the pins to form the netted or open-work effect, which characterizes this form of lace. The Flemish laces of the 16th century became quite as famous as the Italian, and the art, as practised in Flanders, was early introduced into many countries of Northern Europe. Among the more important laces that are made with the pillow and bobbins, may be mentioned Brussels (both Saxony and Flemish), Mechlin, Lille, Chantilly, Valenciennes, Honiton, Buckinghamshire, and Limerick or Irish lace.

The Mechlin laces — sometimes called the queen of laces, and which formerly enjoyed a wide celebrity — are products of Mechlin, Antwerp, and Lierre. Ordinary Mechlin is made with a hexagonal mesh, as is also Brussels pillow. The Lille laces embody a simple pattern, marked by a thick thread, and are said to be "the finest, lightest, most transparent, and best made of all grounds." The Chantilly silk laces were also very simple in character, particularly in regard to their meshed grounds. The black laces were especially noted, and at one time were in high favor. Valenciennes is probably the most important pillow lace now manufactured in Belgium, the cities of Courtrai, Bruges, Ypres, Ghent, and Alost furnishing the larger part of the supply. That made at Ypres especially is the finest quality. Its predominant characteristics are richness of design, beauty of ground, and evenness of tissue. In this lace the mesh is diamond shaped and closely plaited, without twisted sides to the mesh.

The English laces are chiefly made in the counties of Buckinghamshire, Devonshire, and Bradford. Honiton is the best known of the pillow laces of Great Britain, and the most beautiful. It embodies original characteristics that give it an individuality, although it bears some

resemblance to Brussels. British point is an imitation of Honiton. Patronized by the late Queen and by other members of the royal family, Honiton soon became popular and its manufacture for many years has been important. Buckinghamshire is said to be an adaptation of the Mechlin, and the patterns to have been used since the 18th century. Laces are made in other places in England, and in Scotland, for the most part as household industries. As has been said, the Irish lace is made at Limerick; it is justly popular, and holds a high position. The lace industry of Russia is said to have been promoted through court patronage after the visit of Peter the Great to Paris. These laces are especially noted for the uniformity of their designs, or patterns.

We have been considering chiefly lace-making in Europe. In more modern times the art has been introduced into many countries, the European nations especially extending the manufacture into their colonies, the natives being the lace-makers. Even the natives of some of the South American countries practise the art, which was taught them by the missionaries of an earlier period, and which, handed down from generation to generation, has become identified with the people. The peasant women of Fayal have for many years produced an exquisite lace, with designs in high relief, the fibre used being finely prepared filaments of the *Agave Americana*, or "Aloe fibre" as it is known. This lace was formerly sold in Paris at very high prices; and it was claimed a few years ago that there were only 25 women on the island who were skilled in its manufacture. Among the beautiful peasant laces should be mentioned those of Russia, Germany, and Crete, though the Cretan lace manufacture has not survived. Malta produces a pillow lace in white and red threads which is noted, and pillow lace is made in Ceylon which somewhat resembles both the Malta and the Buckinghamshire. The natives of Madagascar, under French tuition, make a fabric resembling antique lace, which is an article of export. Wm. E. Curtis is authority for the statement that the women of Paraguay make a very fine pillow lace which is called Nanduty (Nanduti), the art having been taught them by the Spanish nuns. A native fibre is used which is described as soft and lustrous as silk. The designs are beautiful and the fabric indestructible. The lace is made in small squares and these joined together. In Dr. Thomas Wilson's valuable collection there are also some fine examples of aloe fibre lace from Corfu and Zante.

The third class of lace manufactured is that produced by machinery, the chief centres of the machine lace industries being Nottingham, England, and Calais, France. Nearly every kind of lace can be made by machinery, and the manufacture has been brought to so high a state of perfection, that some of the lace is difficult to distinguish from the fabrics produced by hand processes. While the enormous output and cheapness of machine lace has placed the fabric within reach of all classes, it is claimed that the demand for hand-made lace has not diminished, though prices have been affected.

It would be a hopeless task to endeavor to describe the complicated machines in use today, to make them understood, in so brief an account as appears in this place, and the student is therefore directed to the 'History of Machine Wrought Lace,' by Mrs. Bury Palliser, London, 1865–9, and to the 'History of Machine Wrought Hosiery and Lace Manufacture,' W. Felkin, 1867. The first attempt at the invention of a lace machine dates back to 1758 when a stocking weaver was able to produce upon a machine a lace in imitation of Brussels. The really practical machine, however, did not appear until 1809, the invention of Heathcote, which is said to have been suggested from machinery employed in the manufacture of fishing nets. A year or two later there were improvements by several inventors, Morley, Leaver, Clark, and others, which with subsequent improvements, have brought the lace machinery of to-day to such perfection. Machine lace is largely made from cotton, though the new fibre ramie has been employed to some extent, and with best results. This textile is very strong, with the lustre of silk, and takes color well. Some machine-made black ramie lace, a fourth of a yard wide, in the writer's collection of textiles, is an exquisite fabric.

Gold and silver lace, strictly speaking, is not a lace fabric, but rather a woven fabrication resembling in the finished state some kinds of embroidery. It is either made from fine filaments of gold and silver (threads), or from textile yarns or threads wound or otherwise covered with the metal.

CHARLES RICHARDS DODGE.
Commercial Fibre Expert, Washington, D. C.

Lace Bark, is derived from the inner bark of several species of trees, and is readily detached in sheets or layers like birch bark, each layer being a delicate network of fibre, which when gently stretched a pentagonal or hexagonal mesh is formed which resembles lace. The most commonly known species is the lace bark of Jamaica, *Lagetta lintcaria.* It is said that Charles II. was presented by the governor of Jamaica with a cravat, frill, and pair of ruffles made from this substance. The fibre can also be twisted into strong ropes, and in past time thongs and whips were made from it, with which the negroes were beaten. The lace bark tree of New Zealand is an Australian species, *Plagianthus betulinus,* more commonly known as the ribbon tree; its layers of bark showing the same beautiful lace-like texture as the Jamaica form. Another species producing a delicate, white lace-like tissue is the Birabira of South America *Daphnopsis tenuifolia.*

Lacedæmon, lăs-ę-dē'mŏn. See SPARTA.

Lacépède, Bernard Germain Etienne de la Ville, bār-nār zhār-măñ ā-tē-ĕn dė lä vēl lä-sā-pād, COUNT DE, French naturalist: b. Agen, France, 26 Dec. 1756; d. Epinay, France, 6 Oct. 1825. He abandoned the military profession, for which he was destined, and devoted himself to the study of natural history. His teachers and friends, Buffon and Daubenton, procured him the important situation of keeper of the collections belonging to the department of natural history in the Jardin des Plantes. In 1791 he was elected member of the legislative assembly, and belonged to the moderate party. Napoleon made Lacépède a member of the conservative senate, and conferred on him the dignity of grand-chancellor of the Legion of Honor. After the restoration he was made peer of France. He continued Buffon's 'Historie natu-

relle' with the titles 'Histoire des quadrupèdes ovipares et des serpents' (1788–9) and 'Histoire naturelle des reptiles' (1789), and published also 'Histoire naturelle des poissons' (1798–1803); 'Histoire des cétéces' (1804); etc.

Lacertilia, lăs-ėr-tĭl'ĭą, or **Autosauri,** the order of saurian reptiles which contains the lizards. These are distinguished from the serpents (*Ophidia*) to which they are most nearly allied by the fact that the right and left halves of the mandibles (lower jaws) are connected by a sutural symphysis, whereas those of serpents are connected by a more or less distensible cartilage. The great majority possess well-developed limbs, movable eyelids and cutaneous scales, covered by a horny epidermis, usually thin, but sometimes thick and rising into pointed projections. In a few degraded and burrowing forms the limbs have been greatly reduced, or one pair or even both pairs completely lost, while the eyes may have become buried beneath the skin and the scales nearly or wholly obsolete. The vertebræ are procœlous, except in some of the geckos, where they are amphicœlous; the ribs of the trunk articulate by their capitular heads only, the reduced tubercula being attached to the vertebræ by ligaments. The limbs are typically formed after the pentadactyl pattern; and the shoulder girdle and sternum are complete. The hyoid apparatus resembles that of birds. In the skull the quadrate bone is movable except in a few degraded forms. The skin is covered with scales formed within it, and the epidermis is horny, and is periodically shed in flakes; but in many cases these scales do not overlap and look like scales, but are represented by bony granules, giving a "pebbly" aspect to the surface; or these osteoderms (which never occur in snakes) may form in the ordinary scales. The skin contains no glands; but in many lizards abounds in chromatophores (q.v.) controlled by muscles whose action causes the variations in surface color of which many lizards are capable, and of which they avail themselves as an aid in hiding from their enemies. The group possesses strong power of regenerating lost parts and especially of renewing the tail, which in many families breaks off under a very slight strain.

The *Lacertilia* are a comparative development of the reptilian race, not traceable beyond the beginning of the Tertiary. Fragmentary remains of several existing families occur in the Eocene and Miocene rocks; and the Pleistocene river-deposits of Queensland, among which was a monitor-lizard 30 feet long. The line probably originated in the *Prosauria* (q.v.), represented by a single living form,—the tuatera (q.v.). Lizards are now scattered over all the warmer parts of the world, and seem to be increasing and developing. They are said by Hoffman to include 434 genera and 1,925 species.

The *Lacertilia* are divided into three suborders: (1) *Geckones*, equivalent to the family *Geckonidæ;* (2) *Lacertæ*, typical lizards, including the families *Agaenidæ, Iguanidæ, Zonuridæ, Anguidæ, Helodermatidæ, Varanidæ, Tejidæ, Lacertidæ, Scincoidæ* and others of minor importance; (3) *Chamæleontes*, with a single family.

For more particular descriptions see CHAMELEON; GECKO; LIZARD; and the names of various lizards, as AGAMA; GILA MONSTER; etc.

Lace'wing, a neuropterous insect of the families *Hemerobiidæ* and *Chrysopidæ*. About 40 species are found in the United States, the most common perhaps being the golden-eyed flies of the genus *Chrysopa*. These are greenish, ill-smelling, gauzy-winged creatures usually less than two inches long and feeding little or not at all in the adult state. The females lay their eggs upon the summits of silky threads, by which means they are protected from predaceous enemies. The larvæ, as soon as hatched, crawl down the threads and feed upon the first soft-bodied insect they reach — perhaps a brother. They are considered useful in destroying plant-lice, hence the name "aphis-lions" (q.v.), but in California they attack the larvæ of the useful ladybirds.

Lachaise, François d'Aix de, frăn-swä dā dė lă-shāz, French Jesuit confessor of Louis XIV.: b. Château d'Aix 25 Aug. 1624; d. Paris 20 Jan. 1709. He was the provincial of his order when Louis, on the death of his former confessor, appointed Lachaise to that office. The new confessor with admirable tact kept himself clear of the innumerable meshes of court intrigue. Jansenism was at the time a powerful factor in ecclesiastical and political circles, and the Jesuits were its most formidable adversaries, but Lachaise knew how to conduct himself under all circumstances with address, coolness, and sagacity; and never allowed himself to be drawn into violent measures against his opponents. That Louis XIV. married Mme. de Maintenon was owing principally to the counsels of his Jesuit confessor. Lachaise retained the favor of his monarch till his death, and Louis had a country-house built for him to the west of Paris, on an eminence which had received the name of Mount-Louis. Its extensive garden now forms the cemetery of Père Lachaise, the largest in Paris.

La Chaussée, Pierre Claude Nivelle de, pē-ār klōd nē-vĕl dė lă shō-sā, French dramatist, founder of the so-called "pathetic comedy" or melodrama: b. Paris 1692; d. there 14 March 1754. 'Le Préjugé à la Mode' (1735) by him, was the first French pathetic comedy. Of 18 dramas by him, among the best are: 'School of Friendship' (1737); 'Melanide' (1741); 'Love for Love' (1742); 'Pamela' (1743); 'School of Mothers' (1745); 'The Governess' (1747). His plays were all written in verse and followed strictly the rules of the classic drama.

Lachesis, lăk'ĕ-sĭs, in classical mythology, one of the three FATES (q.v.).

Lachine, lă-shēn', Canada, town in Jacques Cartier County, Quebec; on the Grand Trunk railway, eight miles southwest of Montreal; on Montreal Island, which is here connected with Caughnawaga, on the south bank of the Saint Lawrence, by a bridge. It is a popular resort for pleasure parties in the winter, and in summer is largely a residential place for Montreal business men. It has fine residences, churches, schools, a convent, etc. It is best known as the terminus of the Lachine Canal, nine miles long, connecting it with Montreal and built to carry steamers around the Lachine Rapids. All the commerce of Montreal by the Great Lakes passes through this canal. Lachine is also the terminus of the Ottawa line of steamers, and daily at noon in summer a steamer of the Royal

Mail Line leaves the town for Toronto, Hamilton, and Kingston. Lachine has some manufactories, and here are the electric works of the Lachine Power Company (1894–7) with a plant of 21,000 horse-power, designed to furnish power and light for the city of Montreal. The name was given to the site in 1669. In 1689 the Indians burned the town and massacred all the inhabitants. Pop. (1901) 5,561.

Lachlan, läk'lăn, a river of East Australia, rising in New South Wales, to the west of the Blue Mountains. The river makes a semicircular sweep north of about 240 miles, when, pursuing a generally southwest course, it is joined by the Murrumbidgee; the united stream afterward falling into the Murray. The total course is about 700 miles.

Lachmann, Karl Konrad Friedrich Wilhelm, Teutonic and classical philologist: b. Brunswick 4 March 1793; d. 1851. As a student at Leipsic and Göttingen his work lay in Italian, English, and Old German poetry, as well as in Greek and Latin. As a teacher he passed from various gymnasium positions to professorships in the universities of Königsberg and Berlin. His work in textual criticism, both in the early German and the classics, was epoch-making. Editions of Walther von der Vogelweide, Wolfram von Eschenbach, Lucretius (his greatest achievement), Catullus, Tibullus, Propertius, the New Testament, and Shakespeare's sonnets and Macbeth deserve mention among his numerous publications.

Lachrymal (lak'rĭmal) **Organs.** See Eye.

Lachute, la-shoot', Canada, town in Argenteuil County, Province of Quebec, on the Ottawa River; 44 miles from Montreal. It is an important shipping centre for farm and dairy products and has large paper mills, pulp mills, and wood-working industries. Pop. (1901) 2,024.

Lacinaria, lă-sĭn-ā'rĭ-a. See Liatris.

Lackawanna (lak-a-wŏn'a) **River,** a considerable stream which runs through the northeast part of Pennsylvania and flows into the Susquehanna at Pittston; length about 50 miles. Great quantities of the best anthracite coal are mined in the valleys adjacent to this river. The greatest thickness of strata belonging to the coal measures amounts in the central portion of the basin to nearly 1,800 feet. On each side they dip toward the central axis at angles sometimes exceeding 30°, gradually lessening till they are found in horizontal and undulating positions near the centre. Toward each extremity of the basin they gradually shelve upward till replaced by the outcrop of the older rocks.

Lacmus. See Litmus.

Lacon, lā'kŏn, Ill., town and county-seat of Marshall County, on the Illinois River, and on the Chicago & Alton railroad, 35 miles north of Peoria and 128 miles southwest of Chicago. Steamboats ascend the river as far as this point and there are a number of grain elevators and other shipping facilities here; manufactures of wagons, carriages, and woolen goods; a national bank, several newspapers and numerous churches. Pop. (1890) 1,649; (1900) 1,601.

La Condamine, Charles Marie, shärl mä-rē lä-kôn-dä-mēn, French scientist: b. Paris 28 Jan. 1701; d. there 4 Feb. 1774. He entered the military profession, but soon renounced this career, and devoted himself to the sciences. In 1736 he was chosen, with Godin and Bouguer, to determine the figure of the earth, by measurements to be made in the equatorial regions of South America, and remained abroad for eight years. In 1748 he was elected a fellow of the Royal Society of London, and in 1760 a member of the Academy of Sciences of Paris. His principal works are his account of his travels (1745), his work on the figures of the earth (1749), and that on the measurement of three degrees of the meridian in the equatorial regions.

Laconia, lā-kō'nĭ-a, formerly the name for a large tract of land granted by royal patent to Ferdinand Gorges and John Mason. It was located between the Merrimac and Kennebec rivers, the ocean, and the Saint Lawrence River of Canada. The present State of New Hampshire formed a considerable portion of Laconia.

Laconia, a territory in ancient Greece. See Sparta.

Laconia, N. H., city, county-seat of Belknap County; on the Winnipesaukee River, and on two divisions of the Boston & Maine railroad; about 28 miles north of Concord, the capital of the State, and 100 miles north of Boston. It was settled in 1780–2 by English people from the southern part of New Hampshire. It was incorporated as a town in 1852 and chartered as a city in 1893. It is in an agricultural and manufacturing section, in a beautiful lake region. Its charming scenery, cool climate and opportunities for fishing make it a favorite summer resort. Its principal manufactures are hosiery, railroad cars, machinery, lumber, and paper boxes. The hosiery mills employ about 1,200 operatives; and the car shops employ about 600 men. The State Home for Feeble-Minded Children is located here, also the State Fish Hatchery. The educational institutions of the city are the public and parish schools and the Gale Memorial library. The prominent buildings are 12 churches, an opera house, and the court-house. The three national banks have a combined capital of $200,000. The government is vested in a mayor and 14 councilmen. Pop. (1890) 6,143; (1900) 8,042.

C. N. Vaughan,
Editor of 'Democrat.'

Lacordaire, Jean Baptiste Henri Dominique, French preacher: b. Recy-sur-Ource 12 May 1802; d. Sorèze 22 Nov. 1861. After studying law in Paris he began practice in that city. He was in religion a deist of the Voltairian school, and it was only after reading the 'Essai sur l'Indifference' of Lamennais (q.v) that he came to the conclusion that Roman Catholicism was a primal factor in the development of political life. It was with this view that he determined to become a priest. Entering the Seminary of Saint Sulpice in 1824 he was ordained priest in 1827. In 1835, he was appointed preacher at Notre Dame, and always collected an audience that filled the building. He was, however, bent on a wider project, the revival of the Dominican order, the great order of preachers in France. With this view he revisited Rome in 1838, and after the usual novitiate became a Dominican. The Dominican

is originally a Spanish order, and was never popular in France, and Lacordaire had little success in establishing it there. He was in 1848 elected a member of the National Assembly. He was, however, rebuked by his bishop for calling himself a republican and retired from politics, in 1852. His honest indignation against the *coup d'état* expressed in a sermon roused the animosity of Napoleon III., and he was driven from the pulpit, and became director of the Lycée at Sorèze. Consult: Lives by Montalembert (1862); Foisset, 2d ed. (1874); Chocarne (8th ed. 1894); Greenwell (1877); Lear (1882); D'Haussonville (1895); Nicolas, 'Le Père Lacordaire et le Libéralisme' (1880); Fesch, 'Lacordaire, Journaliste' (1897).

La Cosa, Juan de, Spanish navigator: b. about 1460; d. November 1509. He was the companion of Columbus in the discoverer's voyage to Hispaniola in 1493 and settling at Santoña, in Aranham, made his living and reputation as a draughter of charts (1496). He accompanied Ojeda in an expedition to the Pearl coast in 1499; and in 1501 explored the northern coast of South America from Venezuela to Panama. In the course of an expedition on which he accompanied Ojeda, the party on landing in the bay of Cartagena was attacked by Indians, and he perished with his companions, of whom Ojeda alone escaped. His map of the New World, beautifully illustrated on vellum, is in possession of the Spanish government, and is the earliest known, having been made in 1500.

Lacoste, la-kōst, Sir **Alexander,** Canadian jurist: b. Boucherville, Quebec, 12 Jan. 1842. He was educated at the College St. Hyacinthe and at Laval University and was called to the bar in 1863. He began practising his profession in Montreal and after a brilliant legal career was appointed Queen's Counsel in 1880. He sat in the Legislative Council of Quebec 1882–4, became a Dominion senator in 1884, and in 1891 chief-justice of Quebec. He was knighted in 1892.

Lacquering, lăk'ėr-ĭng, the art of polishing or veneering with various preparations of lac (q.v.). It is used in many ways. In Tonking where the abundant production is the object of an important trade with the Chinese, it is so used only for varnishing, while in China the same product from the same sources contributes to most artistic applications. When the Annamites propose to lacquer an object, a box, for example, they first stop up the holes and crevices, covering all the imperfections with a coating of diluted lac by means of a flat, close short brush. Then they cover the whole with a thick coating of lac and white clay. This clay, oily to the touch, is found at the bottom of certain lakes in Tonking; it is dried, pulverized and sifted with a piece of fine silk before being embodied with the lac. This operation is designed to conceal the inequalities of the wood and produce a uniform surface, which, when completely dry, is rendered smooth with pumice stone. If the object has portions cut or sunk the clayey mixture is not applied, for it would make the details clammy, but in its place a single, uniform layer of pure lac. In any case, after the pumicing, a third coating, now pure lac, is passed over the piece which at this time has a mouse-gray color. This layer, known under the name of *sou lot,* colors the piece a brilliant black. As the lac possesses the remarkable property of not drying in dry air, the object is left in a damp place. When perfectly dried the piece is varnished and the desired color imparted by a single operation. If the metallic applications are excepted, the lac is colored only black, brown, or red.

The following formulas are in use:

Black.— One part of turpentine is warmed for 20 minutes beyond the fusing point; then poured into three parts of lac; at the same time *phcu dcu* (copperas) is added. The mixture is stirred for at least a day, sometimes more, by means of the *cai vay,* a large paddle.

Maroon.— This is prepared by a process similar to the preceding, replacing half of the copperas by an equal quantity of China vermilion.

Red.— The lac, previously stirred for six hours, is mixed with hot oil of *trau,* and the whole is stirred for a day, after which vermilion is added. The latter should be of good quality, so as to have it brilliant and unchangeable.

The operation of lacquering is then ended, but there are parts to be gilded. These are again covered with a mixture of lac and of oil of *trau.* When this layer is dry the metallic leaves are applied, which are themselves protected by a coating composed also of lac and oil of *trau.* All these lac and oil of *trau* mixtures are carefully filtered, which the natives effect by pressing the liquid on a double filtering surface formed of wadding and of a tissue on which it rests. It can only be applied after several months when the metallic leaf is of gold. In the case of silver or tin the protecting coat can be laid on in a few days.

The wood to be lacquered should be absolutely dry. In Japan when wood is well prepared and the faults have been corrected with pure lac it is dried, pumiced and covered with a coat composed of crushed flax mixed with glue. Then a layer of lac is applied and covered with a fine linen fabric which should perfectly adhere in all its parts. This first preparation, suitably dried, serves as a foundation for the successive applications of 33 layers. Each coating is rubbed with a fine-grained stone before drying in the moist chamber. This is done with the greatest precaution, so as to avoid impurities and dust. The last polish is obtained by rubbing with the powder of calcined deer horn. The piece is then ready to receive the application of gold or of silver, which is effected as follows: The design to be reproduced is drawn on very fine paper prepared with a mixture of glue and alum, and on the back of the paper the outlines are traced with a brush of fine rat's hair, dipped in lac previously boiled over a brisk charcoal fire. This paper is then applied to the object to be decorated, and it is made to adhere by rubbing with a spatula, either of minoki wood or of whalebone. When the paper is removed the design is found transferred damp and is rendered more distinct by the application of a white powder by means of a piece of wadding. With one of these transfer papers 20 reproductions can be secured, and the lines can be retraced with the boiled lac, it is said, so as to procure copies almost indefinitely. The outlines remain damp in consequence of the use of the boiled lac, and imperfections can be corrected. In this case the outlines are retraced with a pencil of

hare's hair lightly charged with a preparation of lac not boiled. This operation is delicate and requires great care not to displace the lac from the original outlines. When ended the whole is covered with fine gold, silver, or tin powder, as desired; the powder is applied by means of a piece of wadding. If the object to be decorated is of large dimensions the process is conducted on separate parts, and at each step the piece is placed in a damp closet tightly closed, so as to exclude the dust. When the metallic coating has hardened sufficiently the piece is taken out, and the design is covered with a fine transparent lac laid on with a brush of hare's hair. The gilding or silvering of the succeeding part is never attempted until the preceding has been completely dried in the damp chamber. All the parts of the object are finally rubbed with a piece of camelia wood charcoal in order to equalize the thickness, and then polished with the fingers moistened with a mixture of calcined deer horn powder and oil.

La Crosse, Wis., city and county-seat of La Crosse County, on the Mississippi River and the Chicago, M. & St. P., the C. B. & Q., the Chicago & N. W., and several other railroads; 200 miles northwest of Milwaukee, and 130 miles south of Saint Paul.

Industries, etc.— La Crosse is the centre of the farming, manufacturing and dairying trade of western Wisconsin, southern Minnesota and northern Iowa. There are manufactories of boots and shoes, plows, agricultural implements, boilers and heavy machinery, extensive carriage works, rubber mills, cracker and knitting factories, etc., large flour mills, pearl button factories, steel and corrugated roofing works, woolen mills, a large tannery, mammoth cooperages, five large breweries, affording a market for 150,000 bushels of barley and 100,000 pounds of hops per annum; extensive cigar manufactories and various other industries. The city has five banks with a combined capital of $805,000, and surplus of $400,000.

Educational Buildings, Public Institutions, etc.— La Crosse has a public library, the Washburn, containing 25,000 volumes, two business colleges, a high school, public school buildings and several Catholic and Lutheran parish schools. The city has a fine city hall, a Federal building, a convent, asylum for chronic insane, Saint Francis, the Lutheran, and La Crosse hospitals, opera houses, etc. There are numerous church edifices.

History and Government.— La Crosse was first permanently settled in 1841 by Nathan Myrick, John M. Levy and others. It became a village in 1851 and was incorporated a city in 1856. Under a revised charter of 1891 the government is administered by a mayor, elected every two years, and a council of 20 aldermen, one-half elected biennially. The council appoints the minor officials. The city owns and operates the waterworks, and has electric light and street railroad plants. Pop. about 35,000.

R. Calvert,
Secretary Manufacturers and Jobbers' Union.

La Crosse, a Canadian out-door game played with a ball and a stick of light hickory, bent at the top like a bishop's crozier. The stick is 5 or 6 feet in length. Strings of deerskin are stretched diagonally across the hooked portion of the crosse, forming a network. Only one ball is employed, made of india-rubber, and eight or nine inches in circumference. Posts or poles about six feet high, with a small flag at the top of each, complete the equipment. The players are usually 12 on each side, but their number as well as the distance of the goals apart, is nearly optional. The object of the game is for one side to drive the ball through their opponents' goal. The ball must not be touched with the hand or foot, but is scooped up from the ground with the bent end of the crosse, on which it is carried horizontally, while the player runs toward one of the goals, dodging his antagonists. The National La Crosse Association of Canada was organized in 1867.

Lactantius, Firmianus, often called the Christian Cicero on account of his pure Latin style, lived in the last half of the 3d century and at the beginning of the 4th. Constantine the Great made him tutor of his son Crispus. His most important work is the 'Institutiones Divinae,' a manual of Christian doctrine written to defend the religion to which he had been converted. His works appear in Migne's 'Patrologia,' and have also been edited by G. Laubmann and S. Brandt (Vienna 1891).

Lactarene, lăk'ta-rēn, the casein of milk as commercially prepared by being freed from fat, precipitated by an acid, thoroughly purified, dried, and powdered. It is insoluble in water, but is soluble in an alkali, such as ammonia, and in this form is used, like albumen, for fixing pigment colors in calico-printing. The cloth, after it has been printed, is steamed, the ammonia is driven off, and the pigment is thereafter able to resist the action of water.

Lactation. See Milk, Human.

Lacteals, lăk'tē-ălz, vessels which, together with the lymphatics, constitute one system for conveying a fluid or fluids from various organs of the body to the veins near their terminations in the heart. The fluid which the lacteals convey is milky after a full meal, and is called chyle, though during intervals of fasting it is a yellowish lymph, as in the lymphatics. The lacteal vessels commence on the intestinal villi, unite with one another in the mesentery and, after leaving the mesenteric glands, discharge their contents for the nourishment of the body into the receptaculum chyli, in front of the second lumbar vertebra. See also Lymph; Lymphatic Glands.

Lac'tic Acid ($C_3H_6O_3$). Scheele, in 1780, was the first to describe the acid present in sour milk. In 1832 Liebig and Mitscherlich showed it to be a distinct acid. Lactic acid is widely distributed: there are many modes of preparing it artificially; and its isomeric varieties, of which four have been described, have excited much attention. Its two principal kinds are fermentation lactic acid and paralactic or sarcolactic acid. The former is got from concentrated sour whey by removing the curd, adding lime, filtering, diluting with water, removing the lime with oxalic acid, evaporating, and extracting the lactic acid with alcohol. It is more usual, however, to get it by what is called the lactic fermentation, from sugar or saccharine

substances. The sugar is dissolved in water; to the solution is added decaying cheese and a quantity of fine, well-washed prepared chalk, and the mixture is kept for some weeks at between 86° and 95° F. Fermentation begins, and much lactic acid is formed, which combines with the chalk, and forms lactate of calcium. This salt is then decomposed by sulphuric acid, filtered, and the fluid is boiled with carbonate of zinc. Lactate of zinc is formed, which is collected and decomposed by sulphuretted hydrogen. The fluid filtered from the sulphide of zinc is evaporated, and the syrupy fluid which remains contains the lactic acid. Lactic acid is a syrup (specific gravity, 1.215) which remains liquid even at very low temperatures. It deliquesces in moist air, dissolves in all proportions in alcohol and water; has no odor, and has a purely sour taste. It cannot be distilled, or even heated, without undergoing decomposition, lactic anhydrides being formed; at a higher temperature carbonic oxide is evolved, and a variety of products distil over, and charcoal is left in the retort. By oxidizing agents, such as bleaching-powder and nitric acid, it is converted into oxalic acid; by oxide of manganese into aldehyde.

The paralactic or sarcolactic acid was observed in flesh by Berzelius in 1806, and he considered it the same as that derived from milk. Liebig showed that they were not absolutely identical, but the nature of their differences is at present unknown. This acid is readily got from the cold aqueous extract of flesh by adding a solution of baryta, coagulating and removing albumen, concentrating the solution, precipitating the baryta, filtering, and evaporating. The syrupy residue contains the acid. The calcium salt of the fermentation acid contains more water of crystallization; when heated it retains it for a shorter time; and it is more soluble than the sarcolactate. Again, the zymolactate of zinc contains more water, loses it more quickly on heating, but itself endures a much higher temperature without decomposition than the sarcolactate. The zymolactate is much less soluble in water and in alcohol than the other; the crystalline forms of the two salts also are different. The other salts of lactic acid are for the most part crystalline, and soluble in water. Lactic acid forms compound ethers and substitution acids.

Lactic Ferment, a minute organism which, under the microscope, is seen to consist of small elliptical cells, generally detached, but sometimes occurring in chains of two or three. It is developed in milk when it is allowed to stand for some time, and is the cause of the milk becoming sour, the sugar of the milk changing into lactic acid. It is also developed when cheese is added to a solution of sugar, and kept at a temperature of 35° to 40°. See also FERMENTATION.

Lactom'eter, or **Galactometer,** an instrument for ascertaining the different qualities of milk. Several instruments of this sort have been invented. One consists of a glass tube 1 foot long, graduated into 100 parts. New milk is filled into it and allowed to stand until the cream has fully separated, when its relative quantity is shown by the number of parts in the 100 which it occupies.

Lac'tose, sugar of milk ($C_{12}H_{22}O_{11}$), a substance obtained by evaporating whey, filtering through animal charcoal, and crystallizing. It forms hard, white, semi-transparent trimetric crystals, which have a slightly sweet taste, and grate between the teeth. It is convertible like starch into glucose by boiling with very dilute sulphuric acid.

Lactuca'rium, the brown viscid juice of the common garden lettuce, obtained by incision from the leaves and flowering stems, and dried in the air. It is a mixture of various substances, including lactucone, lactucin, lactucic acid, mannite, albumin, etc. Lactucarium is hypnotic, anti-spasmodic, and sedative, and has been recommended in cases in which opium is inadmissible, particularly for children. It has been administered with advantage in chronic rheumatism, diarrhœa, and asthma, in doses of two to five grains.

Ladd, George Trumbull, American educator: b. Painesville, Lake County, Ohio, 19 Jan. 1842. In 1864 he was graduated from Western Reserve College, and after spending the next two years in business, entered Andover Theological Seminary, where he was graduated in 1869. In 1869–71 he preached in Edinburg, Ohio; and was pastor of Spring Street Congregational Church, Milwaukee, Wis., 1871–9. He was called to the chair of philosophy at Bowdoin College in 1879 and held that position until he became professor of philosophy at Yale College in 1881. After the death of President Porter he was made Clarke professor of metaphysics and moral philosophy, which position he held till 1906 when he accepted a similar chair in Western Reserve University, Cleveland, Ohio. While still a student at Andover he prepared and published two important articles on the origin of the Synoptic Gospels in the 'Bibliotheca Sacra.' His published works include: 'Principles of Church Polity' (1882); 'Doctrine of Sacred Scripture' (1884); 'Lotze's Outlines of Philosophy' (translation, 5 vols. 1887); 'Elements of Physiological Psychology' (1887); 'What is the Bible?' (1888); 'Introduction to Philosophy' (1889); 'Outlines of Physiological Psychology' (1890); 'Philosophy of Mind' (1891); 'Primer of Psychology' (1894); 'Psychology Descriptive and Explanatory' (1894); 'Philosophy of Knowledge' (1897); 'Outlines of Descriptive Psychology' (1898); 'Essays on the Higher Education' (1899); 'A Theory of Reality' (1899); 'Lectures to Teachers on Educational Psychology' (in Japanese); 'Philosophy of Conduct' (1902). Besides his work as an author he has achieved remarkable distinction as a lecturer. During the academic year of 1895–6 he was chosen a member, for the year, of the Faculty of Harvard University and conducted a graduate seminary in ethics. Twice he has been invited by the Imperial Educational Society of Japan to deliver courses of lectures. In the summer of 1892 and again in 1899 he visited and lectured at Doshisha, Kyoto, Tokyo, Hakone, and Kobe. For his distinguished services to the cause of education he was admitted into audience with the emperor of Japan and by him decorated with the third degree of the order of the Rising Sun. In 1899–1900 he lectured on philosophy before the University of Bombay, India, and on the philosophy of religion at Calcutta, Madras, Benares, and elsewhere. His writings have

been adopted as text-books in Russia, India, Japan, and other countries.

His contributions to the science of psychology have been recognized by all experts. He was one of the founders of the American Psychological Association, was its second president and its delegate to the International Congress at Paris in 1900. He is a member of the American Society of Naturalists, American Oriental Society, of the Connecticut Academy of Science, American Philosophical Association, and of the New Haven Historical Society. Among the most permanent of his achievements is the founding of the psychological laboratory at Yale University, which, under his guidance, has become one of the best equipped in the world. From Yale there has proceeded a continuous stream of teachers of philosophy, whose success has been largely due to the teaching and influence of Professor Ladd.

Ladd, Herbert Warren, American journalist and politician: b. New Bedford, Mass., 15 Oct. 1843. After obtaining a high school education he secured a position on the staff of the New Bedford *Mercury*, and went to the field with the 43d and 44th Massachusetts regiments; his report of Gen. Foster's Tarboro march was published in the Boston *Journal* before the New York papers had news of it. He issued a Sunday edition of the *Mercury* to announce the battle of Fredericksburg, the first Sunday paper published in New England outside of Boston. In 1864 he entered the dry goods business and in 1871 formed the firm of Ladd and Davis in Providence, which in 1887 was incorporated as the H. W. Ladd Company, of which he was president. He founded the Commercial Club in Providence, was vice-president of the board of trade for two years, was a generous patron of Brown University, and in 1891 presented to the University a fully equipped astronomical observatory. In 1889 he was elected governor of Rhode Island, was a candidate for that office in 1890 and was defeated, but was re-elected in 1891.

Ladd, William, American philanthropist: b. Exeter, N. H., 1778; d. Portsmouth, N. H., 9 April 1841. He was graduated at Harvard College in 1797, and subsequently took an active part in organizing the American Peace Society, of which he was for many years president, and in behalf of which he labored efficiently until the close of his life. In the interests of this society he edited the 'Friend of Peace,' commenced by Dr. Noah Worcester, and the 'Harbinger of Peace,' and published a number of essays and occasional addresses on the subject of peace. He carried his views to the extent of denying the right to maintain defensive war, and caused this principle to be incorporated into the constitution of the American Peace Society.

Ladies' Catholic Benevolent Association, a fraternal society of Roman Catholic women organized at Titusville, Pa., in April 1900. The object of the society is the payment of death benefits. In 1903 there was a supreme council, 780 subordinate branches and 77,000 members. The amount of benefits paid during 1902 was $408,500.

Ladies of the Maccabees of the World, a fraternal beneficiary association, composed exclusively of women and officered and managed by women. It exists solely for the benefit of its members and not for profit, having a lodge system with ritualistic work and representative government, and granting life protection upon satisfactory medical examination. Its jurisdiction is world-wide, but its growth until 1904 has been in North America. It is now entering Great Britain and will extend to other foreign countries where conditions are favorable.

Name.—The name is derived from the Biblical Maccabean Dynasty, upon whose history and achievements the beneficial laws and ritualistic work are founded.

Founders.— The first Supreme Record Keeper was Miss Bina M. West. She established the association in the original 16 States of its jurisdiction, revised and developed its ritualistic work, assisted in combining the separate State jurisdictions under one central government, and instituted the system of general management. Hers was the responsibility of entering new States and unifying the forces of the old. To her efforts were joined in 1895 those of Mrs. Lillian M. Hollister, present Supreme Commander. The success of the Order is due largely to the combined efforts and executive ability of these two leaders. Miss West was born in Saint Clair County, Mich., the daughter of Alfred J. and Elizabeth Conant West, a descendant of Roger Conant, first governor of Massachusetts Colony. In 1891, when there were but 3,000 members in the State jurisdiction of Michigan, she was so signally successful as State organizer that she was made a member of the Great Executive Committee. When the Supreme Hive was instituted 1 Oct. 1892, with world's jurisdiction, she was one of its incorporators and founders. Serving continually as Supreme Record Keeper she has seen the association rise to a position of preeminence. The certificates in force amounting to $100,000,000 bear her signature, and in disbursing the Order's benefits she has signed warrants for nearly $4,000,000.

Mrs. Hollister entered the State jurisdiction of Michigan in 1891, and in 1893 became Great Commander of the Great Hive. Its membership then numbered 13,339, which increased to 30,418 during the two years and eight months of her administration. In 1895, while the Order was in its infancy with only 5,770 members, when representing the Great Hive of Michigan at the Supreme Hive Review, she was elected Supreme Commander and has managed the interests of the association with great success and ability.

History.— The origin of the Order dates back to 1886, when the first hive was organized in Muskegon, Mich. It maintained a social existence until 1890, when the benefit feature was introduced. The first hive in New York was organized at Grand Island, 11 March 1891; in Ohio, at Cleveland, 15 July 1892.

The Supreme Hive of the Ladies of the Maccabees of the World was organized in order to establish unity, its incorporators being members of hives in Michigan, New York, and Ohio. No attempt was made to work in the States where Great Hives were already established, but hives were instituted in States not yet organized. Direct representation in the World's Association was soon accorded Michigan, New York, and Ohio, all branches thereby becoming

recognized as parts of the Ladies of the Maccabees of the World. In 1898, Ohio transferred its benefit certificates and consolidated wholly with the World's Order. In 1899, New York took the same action, the total membership then reaching 72,424.

With uninterrupted success and prosperity, with 150,000 members and protection of $100,000,000 in force, this association is one of the greatest financial institutions among women of modern times. There is probably no other organization of women to-day, having the direction of business of such magnitude or so valuable to the individual member.

Government.—The government is representative. Business is conducted through the Supreme Hive, Great Hives, or State bodies and subordinate Hives or local branches. The subordinate Hive works under a charter issued upon the application of 20 ladies. Great Hives are composed of representatives of subordinate Hives, and meet triennially, amending State laws and electing State officers. The Supreme Hive is composed of representatives from each State. It meets triennially, and amends Supreme Hive laws, elects Supreme officers, and transacts other business of the Order. The business management is in charge of the Supreme Board of Trustees during the recess of the Supreme Hive. The Order is a representative organization of women, making its own laws, transacting its own business, and making and paying assessments and death benefits involving thousands of dollars, and doing other legitimate acts as outlined by its laws.

Nomenclature.— The officers are commander or president, record keeper or corresponding and financial secretary, finance keeper or treasurer, past commander, lieutenant commander, chaplain, sergeant, sentinel, picket, banner bearers, color bearers, and guards. Lodges are called hives, and meetings, reviews. Strict parliamentary procedure obtains, and the mode of address is formal. The ritualistic work is dramatic, forms, ceremonies, garb, mottoes, and emblems being based upon ancient Maccabee history, and typical of the purposes of the Association.

Statistics.—On 1 July 1904 there were 149,060 members gathered in 2,679 hives in 51 States, provinces, and countries. The total receipts of the Association since organization amount to $5,056,519.33; disbursements in death benefits, relief, and general expense, $3,082,272.21; balance on hand, $1,074,247.12, of which $829,070.27 is invested in government and municipal bonds, the securities required by the laws of the Order. No account is kept by the Supreme Management of the property and funds of Subordinate Hives, or the substantial amounts they expend in relief. The benefits are given upon the National Fraternal Congress Table of Rates, which is based upon the death experience of the older societies and leading life companies. The mortality rate of the Order itself is considerably below this experience. An annual valuation is made, the mortality experience computed, and the protective feature handled along scientific lines. Management expense is reduced to the minimum on a per capita basis of ten cents monthly. The Society prepares its own literature and supplies and also edits the 'Review,' a 16-page monthly sent free to its members. It is incorporated under the laws of Michigan, and authorized by the insurance departments wherever it operates.

BINA M. WEST,
Supreme Record Keeper.

Ladies of the Modern Maccabees, a fraternal beneficial society exclusively for women, founded in 1886, as a social organization, auxiliary to the Knights of the Maccabees. In 1890 it became a life benefit society. The name of the society is derived from the same source as that of the Knights of the Modern Maccabees (q.v.), and although bearing the name "Maccabees," is entirely distinct in its management and is governed by a different code of laws. The term "Modern" was only recently adopted to distinguish it from another organization bearing a similar name.

The society for a number of years after incorporation confined its work entirely to the State of Michigan, but when the membership had exceeded 70,000 the Great Hive voted to extend its jurisdiction and on 1 June 1905 the society was operating in 24 States and Territories, with a membership of 84,952 and 967 subordinate bodies or "hives." The order admits as life benefit members all white women, of good moral character and socially acceptable to its members, between the ages of 18 and 50 years, of course subject to the approval of the Great Medical Examiner. The social members, eligible between the ages of 16 and 70 years, pay the same membership fees, dues, and tax, as life benefit members, but are exempt from death assessments.

Certificates are issued for $250, $500, and $1,000, payable to the designated beneficiaries in event of death, or in case of permanent and total disability, they are payable one twentieth semiannually to the member herself. Five per cent from every assessment is placed in an "Emergency Fund" to be used when the interests of the order demand. On 1 June 1905 this fund amounted to over $115,000. Since the organization of the society there has been paid to beneficiaries of deceased members over $3,000,000, and in disability benefits over $75,000. A fund of $10,000 was voluntarily contributed for the endowment of two beds, one each in Grace Hospital, Detroit, and in Butterworth Hospital, Grand Rapids. Funds are now (1905) being raised to endow a third bed to be located in some city in the Upper Peninsula. The order has an official organ, edited monthly and containing the various reports of business transactions.

Ladoga, lä'dō-gä, the largest lake of Europe, situated in Russia, between the governments of St. Petersburg on the south, Olonetz on the east, and Viborg on the north and west; greatest length, north to south, 130 miles; average breadth, about 75 miles; area, 7,156 square miles. It receives no fewer than 70 streams, the principal of which are the Volkhov and Sias, which enters it on the south, and the Svir, which enters it on the east, bearing the surplus water of Lake Onega. It contains numerous islands, and its shores are generally low. Peter the Great Canal (1718–31) and the Alexander II. Canal (1861–6) connect the Neva and the Volkhov; Sias Canal (1764–1802) and the Empress Maria Feodorovna Canal (1883) connect the Volkhov and the Sias; the Svir Canal and the Alexander III. Canal connect the Sias

and the Svir. These canals form a navigable chain around the south of the lake.

Ladrones, la-drōnz′, or **Marianne** (mā-rĭ-ăn′) **Islands,** a group of 16 islands in the North Pacific Ocean, north of the Caroline Islands. Guahan is the southernmost and largest of these islands; and next in importance is Rota. The islands have a total area of 420 square miles. The inhabitants are tall, robust, and active, and naturally acute, lively, and ingenious. Their huts are constructed of palm-trees, and divided by mats into different apartments. The islands were discovered by Magelhaens in 1521, and were settled by the Spaniards. Magelhaens called them Islas de Ladrones (Thieves' Islands), because the Pacific pirates had a rendezvous here. Toward the end of the 17th century they received the name of Mariana or Marianne Islands, from the Queen of Spain, Marianne of Austria, the mother of Charles II., at whose expense the Jesuit missionaries were sent over, who settled here in 1667. The chief inhabitants are settlers from Mexico and the Philippines. The bread-fruit tree was first discovered here. Guahan (Guam) was ceded to the United States in 1898, and the rest sold by Spain to Germany in 1899. Pop. (1850) 65,000; (1900) 10,175.

Lady-birds, beetles of the family *Coccinellidæ*. This is a very large family of small beetles of rounded, convex form, usually shining and hairless. The head is retracted beneath the pronotum, the legs are short and hidden, and the elytra are usually brightly colored and marked with dark spots. These colors vary much in the same species, especially in the English *Coccinella septempunctata*,— the pet of children. The most widely known American species is the black one with two red spots (*C. bipunctata*), common all over the United States. These beetles live upon plants, shrubs, and trees, depositing their eggs in little bunches on the lower sides of the leaves. The worm-like maggots are active, searching the leaves for plant-lice, which are eagerly devoured, each kind of beetle choosing a special kind of aphid for its food. In this habit the ladybirds, which are sometimes extremely numerous, perform a valuable service, since their minute prey is highly injurious to the plants. See Scale-Insect.

Lady Chapel, a chapel dedicated to the Virgin Mary, and when attached to cathedrals, generally placed eastward from the altar. The lady chapel of Westminster Cathedral is that usually known as Henry VII.'s.

Lady-day, one of the quarter-days in England and Ireland, on which rent is made payable. It falls on 25 March in each year. In the Roman Catholic Church it is held as a great festival under the title of the Feast of the Annunciation. In the English Church it is observed as a feast. In France the day is termed Notre Dame de Mars.

Lady of the Lake, The, a poem by Sir Walter Scott, the most popular of his long narrative poems. The name is derived from the heroine, Ellen Douglas, who lived on an island in Loch Katrine.

Lady of Lyons, The, a play, by Bulwer-Lytton, originally called 'The Adventurer.' It was first produced in 1838.

Lady of Mercy, Our, Order of, a Spanish order dating from 1218. It was founded by James I. of Aragon, in compliance with a vow made during his captivity in France. Pope Gregory IX. approved the order in 1230. It was instituted to redeem Christian captives from the Moors. The order was extended to women in 1261. A branch order instituted in France was suppressed at the time of the Revolution.

Ladyfish, Banana-fish, or **Bone-fish,** the name of several different marine fishes conspicuous for elegance of outline and handsome coloring. They are found mainly in the tropical regions.

Lady's Fan, The. See Giants Causeway.

Lady's or **Fairy's Fingers, Glove, Thimble,** etc., are some among many gardener's names for the purple foxglove (*Digitalis purpurea*), in regard to which much provincial folk-lore might be cited. See Digitalis: Fox-glove.

Lady's Slipper, or **Moccasin Flower,** an orchid of the genus *Cypripedium*, several species of which grow both wild and cultivated in the United States. See Orchids.

Lady's-Smock. See Cuckoo-flower.

La'dysmith, South Africa, town of northern Natal, near the Klip River, 119 miles by rail north by west of Pietermaritzburg, and 322 southeast of Pretoria. It is situated in a hilly region about 30 miles east of the Drakensberg Mountains. During the South African war of 1899–1901 Ladysmith was besieged by a strong force of Boers. The complete investment began on 2 Nov. 1899 and the relief was not effected till 28 February of the following year, or 118 days after the Boers succeeded in isolating the town. The town was held by a garrison of about 10,000 men under Sir George White, and during the siege much damage was done by the shells of the Boer artillery. Disease also carried off many of the garrison and the inhabitants. The relief was effected by Gen. Buller after a hotly contested march by way of Pieters and Nelthorpe, to the east of the railway. Three previous attempts by the same general to relieve the town had to be abandoned owing to the strength of the Boer positions and to their superiority in long-range guns. The population numbers about 4,000.

Laennec, René Théophile Hyacinthe, rē-nā ta-ō-fēl ē-ä-sănt lĕn-nĕk, French physician: b. Quimper, France, 17 Feb. 1781: d. near Douarnenez, France, 13 Aug. 1826. He took his degree of doctor of medicine in 1814, and his professional reputation was already so high that in the same year he was appointed principal editor of the 'Journal de Médecine.' In 1816 he was appointed chief physician to the Hôpital Necker, and soon after made the notable discovery of mediate auscultation, that is, of the use of the stethoscope. The original discovery, however, is claimed for Auenbrugger (q.v.). In 1819 he published his 'Traité de l'Auscultation Médiate,' having read a memoir on the subject to the Academy of Sciences in the previous year. The remainder of his life was devoted to the perfecting of this new system of diagnosis, and so far as diagnosis is concerned his treatise has produced an effect not attained by any other work. The special study of Laennec was diseases of the chest, and by means of auscultation, either by

the direct application of the ear, or of the stethoscope as an auxiliary, he elucidated the pathology of these diseases, which were previously involved in the greatest obscurity.

Laertes, king of Ithaca and father of Ulysses. He had been one of the heroes engaged in the chase of the Calydonian boar, and in the expedition of the Argonauts. The absence of his son in the Trojan war plunged him into melancholy; but the return of Ulysses restored his energies, and he took part in the fight with the suitors of Penelope.

Lætare (lē-tā'rē) **Sunday,** called also MID-LENT, the fourth Sunday in Lent. The introit for the day in the Roman Catholic Church begins with the words 'Lætare, Jerusalem,' from Isaiah lxvi. 10; hence the name. On this day the music of the organ, suspended throughout Lent, is resumed.

La Farge, lą färj, **Christopher,** American architect: b. Newport, R. I., 5 Jan. 1862. He studied at the Massachusetts Institute of Technology 1880–1, and in the office of H. H. Richardson (q.v.), and in 1884, with G. L. Heins, took charge of the architectural works of his father, John La Farge (q.v.). Since 1886 he has been a member of the firm of Heins & La Farge, whose principal work is the Cathedral of St. John the Divine, New York. Other works that may be named are the Houghton Chapel at Wellesley College; the Roman Catholic Chapel at West Point; and St. Matthew's Church, Washington, D. C.

La Farge, John, American artist: b. New York 31 March 1835. He was the son of Jean Frédéric de la Farge, French midshipman, who escaped imprisonment at San Domingo, 1806, and eventually settled at Philadelphia. John La Farge began life in a lawyer's office in New York, became much attracted by the Arundel prints of Giotto, turned away from the commonplace of the Hudson River School, and with a deep appreciation of Japanese art found a friend and master in William Hunt. He originally developed a taste founded on Japanese literalism, Pre-Raphaelite conventionality and imaginative conventionalism. Japanese art has certainly determined the line of his success, and his windows in the palaces of New York and elsewhere are beyond criticism. The great 'Battle Window' in Memorial Hall, Harvard, the wall painting in Ascension Church, New York, are evidences of his skill as a colorist, however much we may criticise his inadequate conception, and weakness in drawing. Among his published works are 'Lectures on Art' and 'An Artist's Letters from Japan.'

La Farina, Giuseppe, joo-sĕp'pĕ lä fä-rē'nä, Italian statesman and historian: b. Messina, Sicily, 20 July 1815; d. Florence 5 Sept. 1863. He studied at the University of Catania; entered the law; implicated in a revolutionary conspiracy, was compelled to flee from Sicily (1837); and finally settled in Florence (1841), where he devoted himself to historical composition. Having returned to Sicily in 1848, he was there successively member of parliament, and minister of education, public works, and the interior. After the suppression of the revolution in Sicily (1849), he resided in France and Italy, was secretary of the National Italian society, and strongly advocated Italian unity. Following the war of 1859, he reorganized the National Italian society, of which he became president; in 1860 was sent to Sicily to represent Victor Emmanuel; and from 1861 sat for Messina in the Italian parliament. His chief work is 'Storia d'Italia dal 1815 al 1850' (2d ed. 1860). He wrote other historical studies, such as 'Storia della Revoluzione Siciliana nella 1848 e 49' (1851), dramas, and works of fiction.

La Fayette, Marie Madeleine Pioche de la Vergne, mä-rē mäd-lĕn pē-ōsh dė lä vėrny lä-fa-yĕt, COMTESSE DE, French novelist: b. Paris 16 March 1634; d. there 25 May 1693. All her life she was in the foremost literary circles, after marriage her house being a noted rendezvous of wits and scholars, including Mme. de Sévigné, La Fontaine, and La Rochefoucauld. Her first novel was 'The Princess de Montpensier' (1660); followed by 'Zaïde' (1670), which among her works ranks next after 'The Princess of Cleves' (1678), her most celebrated work, and one of the classics of French literature. She wrote also a 'History of Henrietta of England' (1720), and 'Memoirs of the Court of France for the Years 1688 and 1689' (1731). Consult Haussonville, 'Madame de la Fayette' (1891).
